Method 2. The preheating of the air increases both the dry- and wet-bulb temperatures, lowers the relative humidity, but does not alter the humidity ratio (pound water vapor per pound dry air). At a higher wet-bulb temperature but the same humidity ratio, more water can be absorbed per pound of dry air in passing through the washer, assuming that the humidifying effectiveness of the washer is not adversely affected by operation at the higher wet-bulb temperature. The analysis of the process occurring in the washer itself is the same as that explained under *Method 1.* The final desired conditions are secured by adjusting the amount of preheating to give the required wet-bulb temperature at entrance to the washer.

Method 3. Even if heat is added to the spray water, the mixing occurring in the washer itself may still be regarded as adiabatic. The state

[a]These averages taken from various city water main locations, with some actual values slightly higher and some lower than values shown.

point of the mixture should move in a direction determined by the specific enthalpy of the heated spray as explained in Chapter 3. It is possible, by elevating the water temperature, to raise the air temperature, both dry-bulb and wet-bulb, above the dry-bulb temperature of the entering air.

In each of the methods, 1, 2 or 3, the air leaving the air washer may require reheating to produce in the conditioned space the required dry-bulb temperature and relative humidity.

DEHUMIDIFICATION AND COOLING WITH AIR WASHERS

Cooling of the wet-bulb temperature of an air vapor mixture can be accomplished by an air washer if the temperature of the spray water is lower than the wet-bulb temperature of the air. Moisture removal is obtained when the spray water temperature is lower than the dew-point of the entering air. In these cases the final dry-bulb temperature and relative humidity of the leaving air are dependent upon the design factors of the air washer.

Both sensible and latent heat are removed in the process of dehumidification by cold spray water. Abstraction of sensible heat occurs during the entire time that the air is in contact with the spray medium. Latent heat removal takes place as condensation occurs. Therefore, the lower the spray temperature the greater the amount of moisture removal per pound of dry air, all other conditions remaining the same.

Washers with two or more banks of spray are usually selected for dehumidifying installations, whether for comfort or industrial installations. Generally such air washers cool the air to within one or two degrees (Fahrenheit) of the leaving spray water temperature; this differential will increase somewhat when the difference between the entering wet-bulb and leaving dew-point is relatively large.

Where a limited supply of cold water is available multiple stage washers may be used to great advantage. In such washers the cool water is pumped through the multiple spray systems in series and counterflow to the air flow. Such an arrangement brings the delivery air in contact with the coldest water, securing a maximum amount of cooling with economy of water.

When using cold well water or water from city water mains care should be used to secure accurate data on the water temperatures. Table 1 lists some approximate water main averages which may be used as a guide but they should be verified from local records. This is particularly true with city water main temperatures. In the case of well water temperatures Fig. 3 shows the approximate temperatures of water to be expected from wells at depths of 30 to 60 ft.

Air washers for dehumidifying and cooling usually have separate recirculating pumps. These pumps deliver a mixture of cold and recirculated water under the control of a three-way valve. The valve may be actuated either by a thermostat in the washer outlet or by a humidity or other controller in the space being conditioned.

Air washers for dehumidifying are very often furnished with direct expansion or water cooling coils within the washer space, in which case water for the washer sprays is entirely recirculated.

APPARATUS FOR DIRECT HUMIDIFICATION

Humidifiers may be divided into the following general types, according to the method of operation: (1) indirect, such as the air washer, which

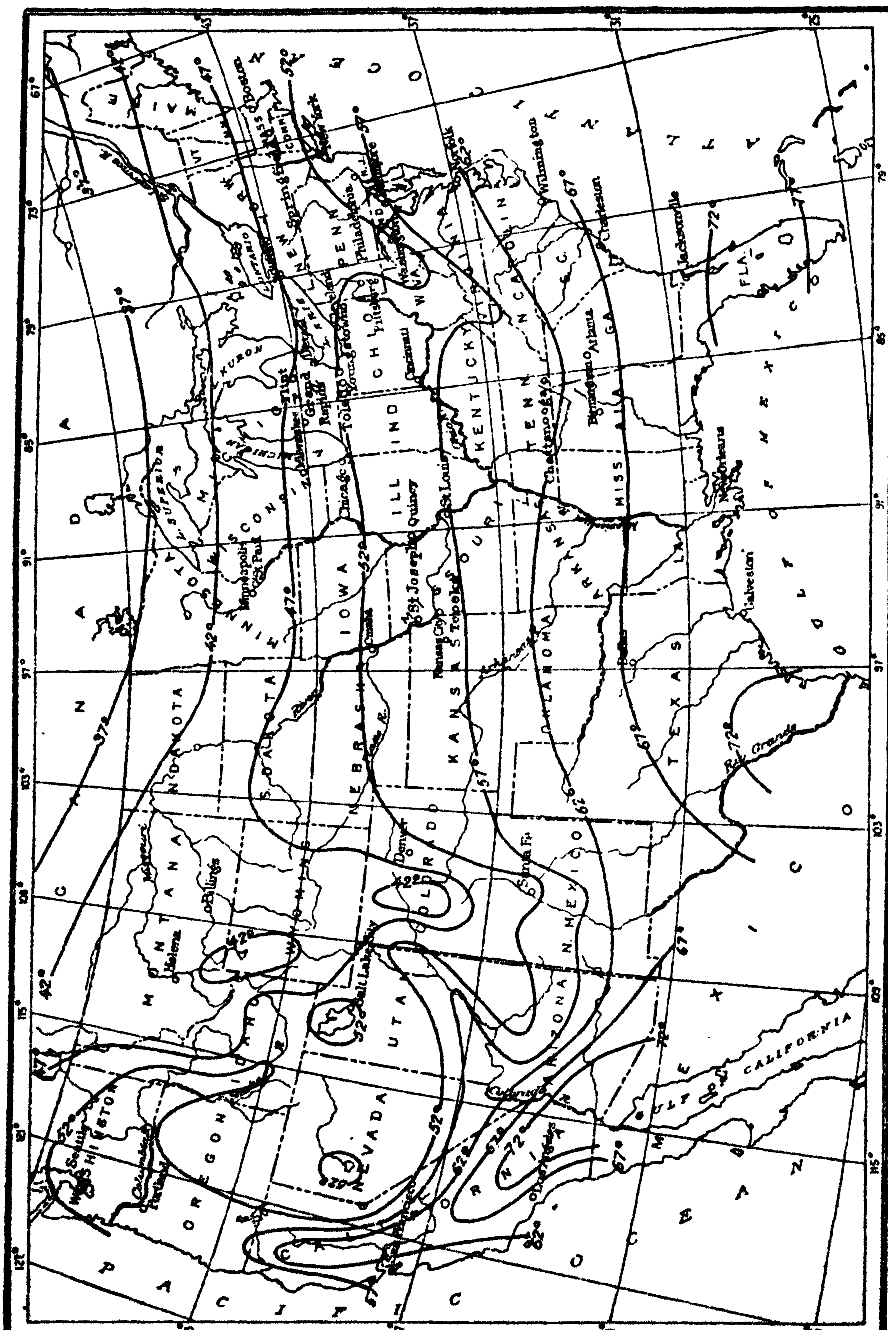

FIG. 3. APPROXIMATE WELL WATER TEMPERATURES AT DEPTHS OF 30 TO 60 FT[1]

introduces moistened air; and (2) direct, which sprays moisture into the room or introduces moisture by means of steam jets.

As in the cases of humidification by use of an air washer, the heat necessary for the vaporization of the moisture added to the air by direct humidification is secured either from heat stored in the spray water or by a transformation of sensible to latent heat in the air humidified. In the latter case the enthalpy of the air remains constant but the dry-bulb temperature of the air is reduced.

Direct humidification is usually preferable where high relative humidities must be maintained, but where there is little cooling or ventilation required. In comfort air conditioning, where both humidification and ventilation are required, the indirect humidifier is preferable. In industrial applications, where the cooling or ventilation load is large and where very high relative humidities must be maintained, a combined system employing both direct and indirect humidifiers is sometimes used.

Spray Generation

Spray generation is obtained by (1) atomization, (2) impact, (3) hydraulic separation, and (4) mechanical separation.

Atomization involves the use of a compressed air jet to reduce the water particles to a fine spray. With the *impact* method, a jet of water under pressure impinges directly on the end of a small round wire. Where *hydraulic separation* is employed, a jet of water enters a cylindrical chamber and escapes through an axial port with a rapid rotation which causes it immediately to separate in a fine cone-shaped spray. In the *mechanical separation* process, water is thrown by centrifugal force from the surface of a rapidly revolving disc and separates into particles sufficiently small to be utilized in certain types of mechanical humidifiers.

Spray Distribution

Spray distribution is obtained by (1) air jet, (2) induction, and (3) fan propulsion.

The air jet which generates the spray in atomizers also carries the spray through a space sufficient for its distribution and evaporation, and this method of distribution is termed *air jet.* Where distribution is obtained by *induction*, the aspirating effect of an impact or centrifugal spray jet is utilized to induce a current of air to flow through a duct or casing, and this air current distributes the spray. *Fan propulsion* obviously consists of the utilization of fans to entrain and distribute the spray.

Industrial type direct humidifiers are commonly classified as (1) atomizing, (2) high-duty, (3) spray and (4) self-contained or centrifugal.

Atomizing Humidifiers

There are several types of atomizing humidifiers which employ nozzles placed within the room and rely upon compressed air to effect complete atomization of the water so that it can be converted to vapor by the heat of the room air. Some of these nozzles depend upon an aspirating effect to draw the water into the nozzle and atomize it, others operate on a combined air and water pressure. It is usual for nozzles of the water pressure type to be controlled by a diaphragm valve actuated by the pressure of the atomizing air.

High-Duty Humidifiers

Water is supplied to high-duty humidifiers under high pressure (usually about 150 lb per square inch) through pipe lines from a centrally-located

pumping unit. The spray-generating nozzle which is of the impact type is located in a cylindrical casing. A drainage pan provides for the collection and return of unevaporated water which flows through a return pipe to a filter tank, from which it is recirculated. A powerful air current is forced through the humidifier by means of a fan mounted above the unit.

The air enters from above, is drawn through the head, charged with moisture, and cooled. It then escapes from the opening below at a high velocity in a complete and nearly horizontal circle. The spray is evaporated and the resulting vapor diffused. This distribution of fine spray over the maximum possible area promotes complete and rapid vaporization.

Spray Humidifiers

This type of humidifier consists of an impact spray nozzle in a cylindrical casing with a drainage pan below it. The aspirating effect of the spray nozzle induces a moderate air current through the casing which distributes the entrained spray. The general method of circulating and returning the water is similar to that employed for high-duty humidifiers. A suitable pump and centrally-located filter tank are required.

Self-Contained Humidifiers

The self-contained or centrifugal humidifier has the ability to generate and distribute spray without the use of air compressors, pumps, or other auxiliaries. These may be used either singly or in groups. In large installations, where suitable connections are provided to permit the cleaning and servicing of individual units without affecting the room as a whole, group control of the water and power may be employed.

ATMOSPHERIC WATER COOLING EQUIPMENT

In the operation of a refrigerating plant or a condensing turbine, one of the main problems is the removal and dissipation of heat from the compressed refrigerant or the discharged steam. This is accomplished ordinarily by first transferring the heat of the gas to water in a heat exchanger, from which water it may then be dissipated in a number of ways. If the plant is situated on the banks of a river or lake, an intake may be taken up-stream or at a considerable distance from the discharge, to prevent mixing of the heated discharged water with the inlet water. If the source of cooling water is a city supply or a well, the discharge water may be run into the nearest sewer or open waterway. Lacking an unlimited water supply, or in cases where purchased water is too expensive or where the water available contains dissolved salts which would form scale on the heat-exchanging apparatus, it is necessary to recirculate the water, and to cool it after each passage through the heat-exchanger by exposure to air in an atmospheric water cooling apparatus.

Air has a capacity for absorbing heat from water when the wet-bulb temperature of the air is lower than the temperature of the water with which it is in contact. The rapidity with which this transfer of heat occurs depends upon (1) the area of water in contact with the air, (2) the relative velocity of the air and water, and (3) the difference between the wet-bulb temperature of the air and the temperature of the water. The rate of heat dissipation is influenced further by many small factors[2] prevailing upon these primary ones, and complicating the design. Selection of equipment for any specified service must ultimately rest in over-all economic considerations established from reliable performance data.

As the heat content of the air increases, its wet-bulb temperature rises. (See Chapter 3.) Because it is impracticable to leave the air in contact with water for a long enough time to permit the wet-bulb temperature of the air and the temperature of the water to reach equilibrium, atmospheric water cooling equipment aims to circulate only enough air to cool the water to the desired temperature with the least expenditure of power.

In an air washer, humidifier or dehumidifier, the air is first conditioned by water to change its temperature and moisture content before entering the place of use. In water cooling equipment the temperature of the water is reduced by air at a lower wet-bulb temperature and the cooled water is used for the purpose desired.

Both types of equipment have a common basis of design in that the size of the equipment is determined by the quantity of air to be handled as well as the quantity of water required. In atmospheric water cooling the purpose is to cool water and the actual quantity of air handled is only incidental to this purpose. In the air washer, the purpose is to condition a fixed quantity of air and the quantity of water is varied as required.

Selection of Water Cooling Equipment

The proper size and type of water cooling equipment for a given installation cannot be determined accurately without considering the characteristics of all types, together with all requirement factors and other matters which influence the selection. Very few installations are exactly alike in details of requirements, and conditions governing performance and operation of the several types of water cooling equipment vary widely with geographical location as well as other considerations. It necessarily holds, therefore, that requirement factors and equipment characteristics are closely interlocked and deserve careful study as a related whole.

Before the characteristics of a specific water cooling apparatus can be judged desirable or undesirable the survey must conclude definitely the importance of each of the following items: first cost including all necessary auxiliaries, area, height, weight, effect of wind velocity and direction, drift nuisance, make-up water requirements and cost of chemical treatment if needed, total power for pumping (plus fan operation in the case of mechanical draft), maintenance, available locations (with due thought to possible future expansion, wind restrictions, space cost, proximity and accessibility, etc.), appearance, the equipment's operating flexibility for most economical conformance to varying loads or seasonal changes, and other considerations occurring with regard to a specific application.

Sizes of Equipment

Assuming a definite quantity of water, the size and design of atmospheric cooling equipment are affected by the following primary conditions:

1. Temperature range through which the water must be cooled.
2. Number of degrees above the wet-bulb temperature of the entering air to which the water temperature must be reduced.
3. Temperature of the atmospheric wet-bulb at which the required cooling must be performed.
4. Time of contact of the air with the water. (This involves height or length of the apparatus and velocity of air.)
5. Surface of water exposed to each unit quantity of air.
6. Relative velocity of air and water.

Items 1, 2, and 3 are established by the type of service and geographical location, while items 4, 5, and 6 depend upon the design of the equipment.

The establishment of a proper cooling range depends upon: (1) type of service (refrigerating, internal combustion engine and steam condensing). (2) wet-bulb temperature at which the equipment must operate satisfactorily, (3) type of condenser or heat-exchanger used.

Because the design of an entire plant is usually affected by the quantity and temperature of the cooling water supply, plants should be designed for cooling water conditions which can be most efficiently attained. The first consideration is usually the limiting temperature of the plant. For example, if an ammonia compressor refrigerating plant is to be designed for 185 psi head pressure as a normal maximum, the limiting temperature of the ammonia in the condenser is 96 F. Should the ammonia temperature go above this figure the head pressure will exceed 185 psi and power consumption increases. To obtain this head pressure, the temperature of the circulating water leaving the condenser must always be less than 96 F by an amount depending upon the size and design of the condenser, the quantity of water being circulated, and the refrigerating tonnage being produced. A condenser having a large surface per ton of refrigeration may be designed to operate satisfactorily with the leaving hot water temperature within 3 or 4 deg of the ammonia temperature corresponding to the head pressure, while a small condenser might require a 10 deg difference.

Table 2 lists several gases with data as to the temperatures and pressures for which commercial condensers are designed. Internal combustion engines have limiting hot water temperatures of 125 F to 140 F for closed systems, and 110 F to 120 F for open systems, depending upon the quality of the cooling water. The cooling of such fluids as milk or wort has variable requirements and is usually done in counter-flow heat-exchangers in which the leaving circulating water is at a much higher temperature than is the leaving fluid.

The temperature range, once the hot water temperature is approximately known, depends upon: (1) the maximum wet-bulb temperature at which the full quantity of heat must be dissipated, and (2) the efficiency of the atmospheric cooling equipment considered.

Design Wet-Bulb Temperatures

The maximum wet-bulb temperature at which the full quantity of water must be cooled through the entire range is never, in commercial

TABLE 2. CONDENSER DESIGN DATA

Gas	Maximum Pressure Desired in Condenser	Gas Temperature in Condenser F Deg	Leaving Hot Water Temperature F Deg	
			Best Condenser Design	Average Condenser Design
Steam	28 in. vacuum	101.2	97	93

Methyl chloride	102 psi[a]	100.0	96	92
Dichlorodi-fluoromethane	117 psi[a]	100.0	96	93

[a]Head pressure.

design, the *maximum* wet-bulb temperature ever known to exist at the location nor the *average* wet-bulb temperature over any period. The former basis would require atmospheric cooling equipment several times greater than normal size, and the latter would result during a large part of the time, in higher condenser water temperatures than those for which the plant was designed.

An accepted design practice for air conditioning cooling towers, evaporative condenser and spray ponds is to use the maximum hourly outdoor dry-bulb temperature which has been equaled or exceeded 2½ per cent of the total hours for the months of June to September and the maximum hourly wet-bulb temperature which has been equaled or exceeded 5 per cent of the total hours for the same period. Tabulation of these data has not been completed. The limited portion of such data as are available is given in Table 3, Chapter 15 for airport weather stations; for other localities design dry-bulb and wet-bulb temperatures in use locally are tabulated as a guide to design temperatures.

Equipment for steam turbine condensers and internal combustion engines is usually based upon somewhat lower design temperatures if peak loads occur at night or during winter months when outdoor temperatures are lower.

Knowing the hot water temperature and the wet-bulb temperature for which the equipment must be designed, the cold water temperature must be chosen to place the requirement within the effectiveness range of the type of atmospheric water cooling apparatus to be used. This effectiveness is expressed as the percentage ratio of the actual cooling effect to the maximum possible cooling effect. Since the wet-bulb temperature of the entering air is the equilibrium temperature to which the water could be cooled, the effectiveness of water cooling apparatus can be indicated thus:

$$\frac{(\text{hot water temperature} - \text{cold water temperature}) \times 100}{\text{hot water temperature} - \text{wet-bulb temperature of entering air}}.$$

Magnitudes of this effectiveness ratio will vary through wide limits in accordance with construction and conditions of operation. Values indicative of the commercial range of the effectiveness ratio are given in Table 3, although unusual designs may operate outside these ranges.

From consideration of the factors which include the cooling range and design wet-bulb temperature, the quantity of water required can be calculated from the amount of heat to be dissipated. The normal amounts of heat to be removed from various processes of the cooling equipment are:

Compressor Refrigeration: 220 to 270 Btu per (minute) (ton). Usual practice is to assume: 250 Btu per (minute) (ton) which is equivalent to 30 gal per (Fahrenheit degree) (minute) (ton).

Steam Turbine Condensers: 950 to 980 Btu per pound of steam. Usual practice is to assume 970 Btu per pound of steam.

TABLE 3. EFFECTIVENESS OF ATMOSPHERIC WATER COOLING EQUIPMENT

Equipment	Cooling Effectiveness—Per Cent		
	Minimum	Usual	Maximum
Spray Ponds	30	40 to 50	60
Spray Towers	40	45 to 55	60
Natural Draft Deck Towers	50	60 to 75	90
Mechanical Draft Towers	50	60 to 75	90

Steam Jet Refrigerating Condensers: 1030 to 1150 Btu per pound of steam. Exact value depends upon initial steam conditions.

Diesel Engine Jackets: 2500 to 4000 Btu per bhp per hour. Usual practice is to assume 3500 Btu per bhp per hour.

Natural Gas or Gasoline Engines: 4500 to 6000 Btu per bhp per hour. Usual practice is to assume 5000 Btu per bhp per hour.

Cooling Ponds

A natural pond is often used as a source of condensing water. The hot water should be discharged close to the surface at the shore line. Natural air movement over the surface of the water will cause evaporation and carry away heat. Because increased density due to the loss of heat causes the cooled water to sink to the bottom of the pond, the suction connection for intake water should be placed as far below the surface as possible, and at as great a distance from the discharge as practicable.

Spray Cooling Ponds

The spray pond consists of a basin, above which nozzles are located to spray water up into the air. Properly designed spray nozzles break up the water into small drops, but not into a mist because the individual drops must be heavy enough to fall back into the basin and not drift away with the air movement. The water surface exposed to the air for cooling is the combined area of all the small drops. Since the rate of heat removal by atmospheric water cooling is a function of the area of water exposed to the air, the difference in temperature between the water and the wet-bulb temperature of the air, the relative velocity of air and water, and the duration of contact of the air with the water, a much larger quantity of heat may be dissipated in a given area with the spray pond than with the cooling pond, because of (1) the speed with which the drops travel as they are propelled into the air and fall back into the water basin, (2) the increased wind velocity at a point above the surrounding structures or terrain, (3) the increased volume of air used, and (4) the vastly increased area of contact between air and water [3].

Spray pond effectiveness is increased by (1) elevating the nozzles to a higher point above the surface of the water in the basin, (2) increasing the spacing between nozzles of any one capacity, (3) using smaller capacity nozzles to decrease the concentration of water per unit area, and (4) using smaller nozzles and increasing the pressure to maintain the same concentration of water per unit area. Usual practice is to locate the nozzles from 5 to 7 ft above the edge of the basin, to supply from 5 to 12 psi pressure at the nozzles, using nozzles spraying from 20 gpm to 60 gpm each and spacing them so the average water delivered to the surface of the pond is from 0.5 to 0.7 gpm per square foot. Best results are obtained by placing the nozzles in a long relatively narrow area located broadside to the wind.

Spray ponds may be located on the ground, or they may be placed on roofs. To prevent excessive drift loss, or the carrying of entrained water beyond the edge of the pond by the air on the leeward side, louver fences are required for roof locations and for those ground locations where space is so restricted that the outer nozzles cannot be located at least 20 ft to 25 ft from the edge of the basin. Such fences usually are constructed of horizontal louvers overlapping so the air is forced to turn a corner in passing through the fence, and the heavier drops of water are thrown back, owing to their inertia. The louvers also restrict the flow of air, particularly at the higher wind velocities, and thus further reduce the

possibility of water being carried off. The height of an effective fence should be equal to the height of the spray cloud. Louver boards are preferably of red gulf cypress or California redwood supported on cast-iron, steel or wood posts. Where building ordinances forbid the use of combustible materials, sheet metal is customarily used.

Algae growths, during warm weather, in cooling towers and spray ponds may be eliminated while the plant is in operation by the use of potassium permanganate. This chemical can be dissolved at the rate of 1 lb in 1¼ to 1½ gal of hot water. About 10 parts of permanganate should be used per million parts of cooling water. Enough of the permanganate solution should be added periodically to cause the water to have a pink color for a period of from 15 to 20 min. The best results are obtained when sufficient quantities are added periodically at intervals of several weeks, the time intervals being dependent upon local operating conditions. The chemical is non-poisonous and non-corrosive when used as directed.

Natural Draft Spray Type Towers

Where not more than 30,000 Btu per minute are to be dissipated, the natural draft spray type tower is a satisfactory apparatus. The word *tower* in this connection is somewhat of a misnomer as the apparatus is essentially a narrow spray pond with a high louver fence. As usually built, the nozzles spray down from the top of the structure and the distance from the center of the nozzle system to the fence on either side is not more than half the distance that the nozzles are elevated above the water basin. Heights range from 6 ft to 15 ft and the total width of a structure is not usually greater than its height. Spray towers occupy less space on small jobs than spray ponds of equivalent capacities because the towers have a capacity of from 0.6 gpm to 1.5 gpm per square foot of tower area. The wet louvers add to the surface exposed to the air.

Natural Draft Deck Type Towers

In past years much of the atmospheric water cooling on refrigeration work has been done with natural draft deck type towers, which are also referred to as *wind* or *atmospheric* towers. These towers consist of heavy wooden or steel framework from 20 to 40 ft high and from 10 to 20 ft wide, having open horizontal lattice-work platforms or decks at regular intervals from top to bottom, and a catch basin at the foot. The hot water is distributed over the upper part of the structure by means of troughs, splash heads, or nozzles, and it drips from deck to deck down to the basin. The object of the decks is to arrest the fall of the water so as to present efficient cooling surfaces to the air, which passes through the tower parallel to the decks. The decks add to the area of water surface exposed to the air both by causing it to splash into fine droplets and to spread over the deck surfaces, but since some deck designs furnish a resistance to air flow, too many decks may be a detriment.

To prevent the loss of water on the leeward side of the tower, wide splash boards are attached at regular intervals from top to bottom. In some towers these boards or louvers extend outward and upward, usually with lower edge (which is attached to the frame of the tower) somewhat below the level of the outer and upper edge of the next louver board below it. Some louvering designs add *secondary* louvering to these *primary* louvers. In such designs the primary louvers are generally broader and do not slope so sharply nor overlap one another since their function is merely to return to the interior of the tower the water caught

by the secondary louvering which extends upward from each primary louver's outer edge to the next primary louver above. The individual slats which comprise the secondary louvering may be arranged either vertically in an overlapping staggered manner with air passage between, or set horizontally with their flat surfaces sloping inward and spaced so their edges over-reach but permit free air passage. Secondary louvering reduces drift loss on this type of tower materially.

Efficiency of a deck tower is improved, within limits, by increased height, increased length, or increased width. The first two increase the area of water exposed to the wind, and the latter increases the time of contact of the air with the water. Performance is best when the wind blows crosswise to the tower and decreases with obliqueness of the angle until the effect of a lengthwise wind is virtually nil.

Wind Velocities on Natural Draft Equipment

Since natural air movement is the prime requirement for a deck type tower, spray cooling tower, or spray pond, the apparatus must be designed to produce the desired cooling at times when the wind velocity is below average, when the wet-bulb temperature is at the maximum chosen for design, and when the plant is operating at full load. The apparatus must also, for best results, be located with its longest axis at right angles to the direction of the prevailing hot weather breeze. Table 3, Chapter 15, gives the average summer wind velocities in representative United States cities. Natural draft cooling equipment should be designed to operate properly with *not more than one-half* of the *average* wind velocity, and in no case for a wind velocity of more than 5 mph. Natural draft equipment must not be obstructed by trees, buildings, or other wind deflectors.

Mechanical Draft Towers

Mechanical draft towers usually consist of box-like shells, constructed of wood, metal, or masonry, in which water is distributed uniformly at the top and falls to a collecting basin at the bottom. The inside of the tower may be filled with wood lattice work over which the water drips, or the water surface may be presented to the air by filling the entire inside of the structure with spray from nozzles.

Air is drawn through the tower by induced draft fans or propelled through it by forced draft fans. Since the air flows at a constantly sustained and comparatively high velocity (by contrast with natural draft equipment which varies in performance with every change of the wind's direction or velocity) the air and water are brought into contact under controlled conditions resulting in more efficient transfer of heat from a given quantity of water into a given volume of air. The least possible operating cost is achieved by that tower design which delivers the desired performance for the lowest total power input, both to fans for air movement and to pumps for raising and distributing the water.

The effectiveness of a mechanical draft tower is improved by increasing height, area, or air quantity. Increasing the height increases the length of time the air is in contact with the water without affecting seriously the fan power required, but it increases the pumping power needed. Increasing the area while maintaining constant fan power increases the air quantity somewhat and because of lowered velocities it increases the time this air is in contact with the water. The surface area of water in contact with the air is increased in both cases. Increasing the air quantity decreases the time the air is in contact with the water, but, since a greater quantity is passing through, the average differential between the water

temperature and the wet-bulb temperature of the air is increased, and this speeds up the heat transfer rate. Increased air quantities are obtained only at the expense of increased fan power, which increases approximately as the cube of the air quantity. Air velocities through mechanical draft towers vary from 250 to 450 fpm over the gross area of the structure.

Inside type cooling towers, where required, draw air from the outside and discharge the exhaust air to the outside at a point considerably distant from outdoor air intake. These indoor cooling towers may be either of the wood filled or the spray filled type but in many cases an air washer similar to a conventional type of air washer is used.

Cooling Tower Design

The method of design of equipment for energy transfer from water to an air-water vapor mixture is similar to that used for absorption equipment. Details of this procedure are available[4, 5, 6] and its application to the problem of the cooling tower operating at atmospheric pressure is illustrated by the following development. The nomenclature used is as follows:

a = over-all average wetted area (surface of water drops plus wetted tower surface) square feet per cubic foot of tower volume.
c = specific heat of liquid water, Btu per (pound) (Fahrenheit degree).
e = effectiveness.
ε = natural base.
G = weight rate of flow of air, pounds of dry air per hour.
h = enthalpy, Btu per pound of dry air.
h_a = enthalpy of air-vapor mixture, Btu per pound of dry air.
h'' = enthalpy of saturated air-vapor mixture at water temperature, Btu per pound of dry air.
K = over-all energy unit conductance, Btu per (hour) (square foot over-all average wetted area) (Btu enthalpy difference per pound of dry air).
Ka = over-all rate coefficient, Btu per (hour) (cubic foot of tower volume) (Btu enthalpy difference per pound of dry air).
L = water rate, pounds per hour.
lm = logarithmic mean.
S = average cross-sectional area of cooling tower for air flow, square feet.
t = water-main body temperature, Fahrenheit degrees.
t_{wb} = wet-bulb temperature, Fahrenheit degrees.
V = tower volume, cubic feet.

Note: Subscripts 1 and 2 when used in equations refer to water entrance and exit sections respectively, for the counter-flow tower.

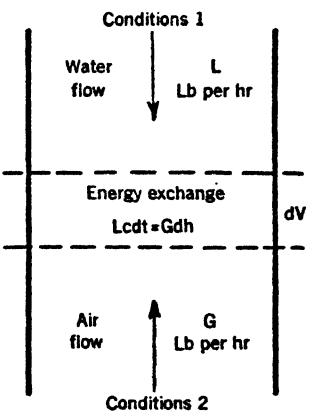

FIG. 4. SECTION OF TYPICAL COUNTER-FLOW TOWER

A section of a typical counter-flow tower is shown in Fig. 4. If the reduction in water rate due to evaporation within the volume is neglected, the energy balance for this differential section of the exchanger volume may be written as:

$$L\,c\,dt = G\,dh \tag{2}$$

The potential for net energy transfer due to heat and mass transfer from the water to the mixture in contact with it may be expressed with reasonable accuracy as the difference between the enthalpy of saturated air at the water temperature, h'', and the enthalpy of the main stream air vapor mixture[7], h_a. The rate of energy transfer is given by the expression:

$$Ka\,(h'' - h_a)\,dV \tag{3}$$

which equation defines the over-all rate coefficient, Ka; the latter being the product of the over-all energy unit conductance, K, and the ratio of the transfer surface to the exchanger volume, a.

Equations 2 and 3 are conveniently illustrated by means of the temperature-enthalpy diagram of Fig. 5. Equation 2 indicates that the

succession of air and water states existing in the exchanger sections must combine to form a straight line (for L = constant) on the temperature enthalpy diagram. The slope of this operating line is:

$$\frac{dh}{dt} = \frac{Lc}{G}$$

Since the heat capacity of water is approximately unity, this slope is the ratio of the water to the air rate. Equation 3 indicates that the potential for energy transfer at any section is the difference between the enthalpy of saturated air at the main-body water temperature at that section and the enthalpy of the air stream in contact with that water. This potential is the difference in the ordinates of the saturation and operating lines for the water temperature at the plane in the tower which is under consideration.

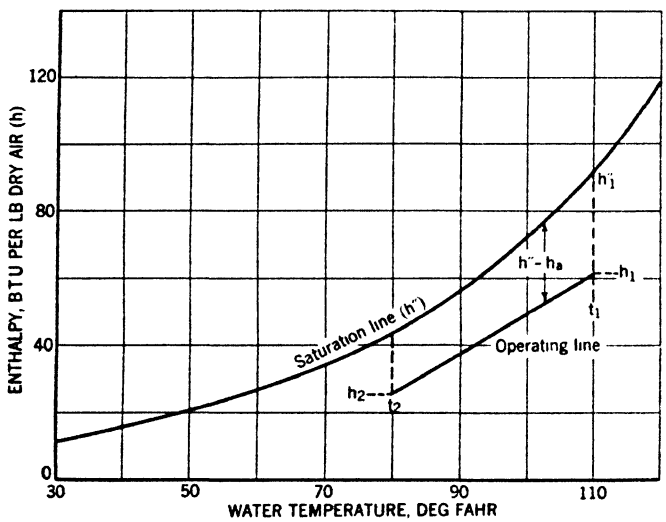

FIG. 5. TEMPERATURE ENTHALPY DIAGRAM FOR AIR WATER VAPOR MIXTURE SHOWING THE OPERATING LINE FOR EXAMPLE 1

Combination of Equations 2 and 3 results in the expression:

$$G\,dh = Ka\,(h'' - h_a)\,dV \tag{4}$$

Integrating this equation over the length of the exchanger:

$$\int_2^1 \frac{G}{Ka}\,\frac{dh}{h'' - h_a} = V \tag{5}$$

The integration of the left side of Equation 5 determines the tower volume required to achieve the desired energy exchange. This summation is readily accomplished for counter and parallel flow arrangements. G and Ka are usually independent of the tower volume and Equation 5 then becomes:

$$NTU = \int_2^1 \frac{dh}{h'' - h_a} = \frac{KaV}{G} \tag{6}$$

Where NTU is defined as the *Number of Transfer Units* and is a measure of the difficulty of the cooling process.

The integration is made numerically or graphically. In the graphical integration $\frac{1}{h'' - h_a}$ is evaluated as a function of h_a. This determination involves the use of the energy balance equation integrated from one section to the section in question. The area under the curve between any two abscissae is the number of transfer units required to change the air state from h_2 to h_1.

An approximate value for the number of transfer units can also be determined by a simple graphical method of direct construction on the temperature enthalpy diagram[8]. This method cannot be applied very satisfactorily to cooling towers as the operating range is small and the value of the NTU is near unity.

When the relationship between the enthalpy of the saturated air and the temperature is linear over the range of water temperatures involved, it can be shown[9] that the logarithmic mean of the terminal potentials, h_{lm}, is the correct driving force. This is true to a good approximation when the water cooling does not exceed 15 deg. The approximation to linearity may be determined by inspection of Table 1, Chapter 3, or the temperature enthalpy diagram of Fig. 5. If the logarithmic mean is a valid potential, Equation 6 may be written:

$$\frac{h_1 - h_2}{\Delta h_{lm}} = \frac{KaV}{G} \tag{7}$$

and the need for the numerical integration for the determination of the tower volume is eliminated.

The over-all rate coefficient, Ka, must be known if the tower volume is to be determined. Experiments conducted on towers containing different packing construction have yielded some magnitudes of this coefficient, evaluated on an over-all basis. These data are presented in Fig. 6 as a function of the gas mass velocity through the packing, and apply only to the particular packing structure for which they were obtained. The over-all rate coefficient (Ka) may also be a function of the water rate, since a reduction of the water rate may reduce the wetted area within the exchanger[5]. The results included in Fig. 6 probably represent magnitudes of Ka which were obtained for complete wetting. Within the cooling tower operating range the over-all rate coefficient for energy transfer is nearly the same numerically as the over-all rate coefficient for mass transfer. The conditions of test corresponding to the data presented in Fig. 6 are not well enough known in most cases to warrant recomputation of Ka. Therefore the magnitudes of the over-all rate coefficient for mass transfer presented in Fig. 6 may be used directly in Equations 5 and 6, the units of Ka in these equations being Btu per (hour) (cubic foot per pound of dry air).

Application of Design Procedure

A typical procedure which may be followed in designing a cooling tower is illustrated in the following Example 1.

Example 1. The rate of air flow, arbitrarily assumed in the data given, is related to the tower volume by economic considerations. A balance between air rate and tower volume rests on consideration of the costs of producing air flow and of the tower construction[10]. A counter-flow forced draft cooling tower is to cool 36,000 lb of water per hour from an initial temperature of 110 F to a final temperature of 80 F. Air having an initial condition of 65 F dry-bulb and 58 F wet-bulb temperature will be forced

through the tower counter to the direction of water flow at the rate of 30,000 lb of dry air per hour.

The cross-section of the tower is to be 8 ft x 8 ft and the packing is to be of the type producing a rate coefficient as indicated in curve No. 2 of Fig. 6. For this type of packing the average cross-sectional area for air flow will be 36 sq ft.

Solution:

Initial air enthalpy = 25.1 Btu per pound of dry air.

Final air enthalpy:

$$(h_1 - h_2) = \frac{Lc}{G}(t_1 - t_2)$$

$$(h_1 - 25.1) = \frac{36{,}000 \times 1}{30{,}000}(110 - 80)$$

$$h_1 = 61.1 \text{ Btu per pound dry air.}$$

A numerical integration (Table 4) is employed to determine the Number of Transfer Units (NTU) required. Temperature increments of 2 F are used between successive determinations of the quantity $\frac{1}{h'' - h_a}$. The energy balance indicates that the enthalpy increments corresponding to these temperature increments are:

$$\Delta h = \frac{Lc}{G}\Delta t = \frac{36{,}000}{30{,}000} \times 2 = 2.4 \text{ Btu per pound of dry air.}$$

The result of the integration is that the Number of Transfer Units required (NTU) = 1.72.

Unit gas mass velocity, $\frac{G}{S} = \frac{30{,}000}{36} = 830$ lb per (hour) (square foot average cross-sectional air flow area).

From Curve 2, Fig. 6, Ka = 138 Btu.

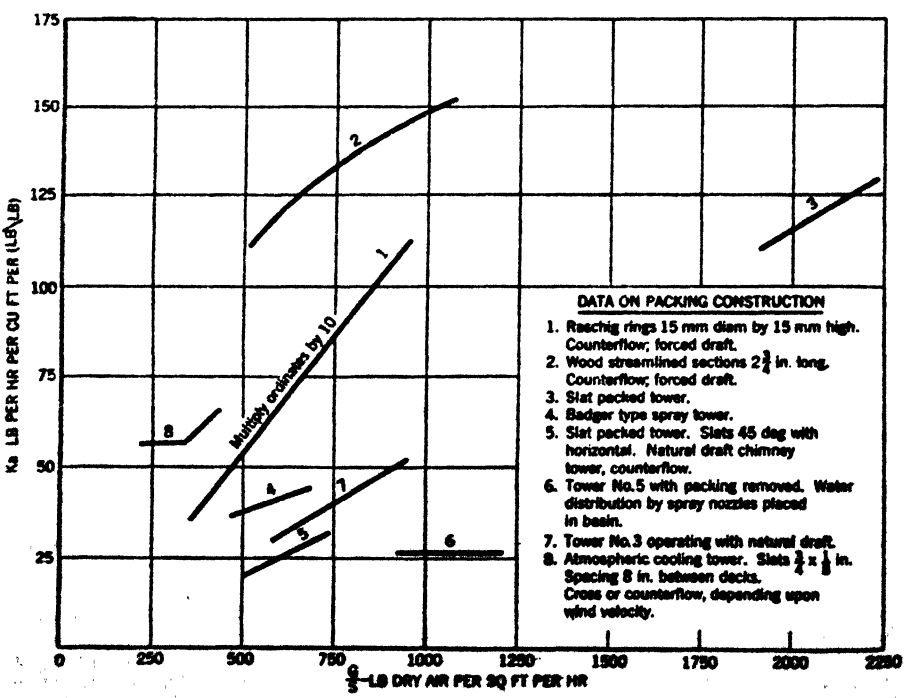

FIG. 6. UNIT CONDUCTANCES FOR VARIOUS TYPES OF PACKING CONSTRUCTION

The tower volume required is:

$$V = \frac{G}{Ka}(NTU) = \frac{30{,}000}{138} \times 1.72 = 217 \times 1.72 = 374 \text{ cu ft.}$$

Height of the packed section is:

$$\frac{374}{8 \times 8} = 5.9 \text{ ft.}$$

The graphical solution for the Number of Transfer Units required for the desired performance is plotted in Fig. 7. $\frac{1}{h'' - h_a}$ is plotted as a function of h, and the area under the curve from the initial enthalpy of the air, 25.1 Btu per pound, to the final enthalpy of the air, 61.1 Btu per pound is 1.72, the Number of Transfer Units required. The effect of the rapid decrease in potential due to the cooling of the water is indicated by comparison of area A_1, A_2, and A_3 of Fig. 7. Each represents the Number of Transfer Units required to achieve a water temperature reduction of about 10 F.

$$A_1 = 0.471\ NTU \text{ (110 to 100 F)}$$
$$A_2 = 0.595\ NTU \text{ (100 to 90 F)}$$
$$A_3 = 0.657\ NTU \text{ (90 to 80 F)}$$

The use of the logarithmic mean driving potential is illustrated by applying Equation 7 to Example 1:

$$NTU = \frac{(Ka)}{G}\frac{V}{} = \frac{h_1 - h_2}{\Delta h_{lm}}$$

$$\Delta h_{lm} = \frac{(h_1'' - h_1) - (h_2'' - h_2)}{\log_e \dfrac{h_1'' - h_1}{h_2'' - h_2}} = \frac{30.7 - 18.4}{\log_e \dfrac{30.7}{18.4}} = 24$$

$$NTU = \frac{61.1 - 25.1}{24} = 1.5$$

The Number of Transfer Units required as determined by use of the logarithmic mean driving potential equals 1.5 which compares favorably with the correct magnitude, 1.72.

TABLE 4. NUMERICAL INTEGRATION FOR THE NUMBER OF TRANSFER UNITS

Water Temperature Interval F Deg	Mean Water Temperature F Deg	Mean Air Enthalpy, h_a Btu per Lb Dry Air	Saturated Air Enthalpy, h'' Btu per Lb Dry Air	Enthalpy Potential $h'' - h_a$	$\frac{\Delta h}{h'' - h_a}$
80–82	81	26.3	44.6	18.3	0.131
82–84	83	28.7	46.9	18.2	0.132
84–86	85	31.1	49.2	18.1	0.133
86–88	87	33.5	51.7	18.2	0.132
88–90	89	35.9	54.4	18.5	0.130
90–92	91	38.3	57.1	18.8	0.128
92–94	93	40.7	60.0	19.3	0.124
94–96	95	43.1	63.0	19.9	0.121
96–98	97	45.5	66.2	20.7	0.116
98–100	99	47.9	69.6	21.7	0.111
100–102	101	50.3	73.2	22.9	0.105
102–104	103	52.7	77.0	24.3	0.099
104–106	105	55.1	80.9	25.8	0.093
106–108	107	57.5	85.1	27.6	0.087
108–110	109	59.9	89.5	29.6	0.081
					1.723

A variation of the design method according to Equation 6 is further possible [11] through the introduction of Equation 2 to yield

$$\int_{t_2}^{t_1} \frac{c\,dt}{h'' - h_a} = \frac{K a V}{L} \tag{8}$$

The advantage of this form is in the fact that the left side of the equation may be dealt with as a thermodynamic function only, while the right side depends upon the tower construction and operation. A series of performance curves may be determined from a graphic evaluation of the integral, which will serve either as a convenient means of analyzing experimental data to determine the conductance Ka, or as a rapid method of performance prediction, once the tower characteristic, $\frac{KaV}{L}$, is known. These performance curves may be expressed in terms of the following variables; approach to wet-bulb, cooling range, L/G, and wet-bulb

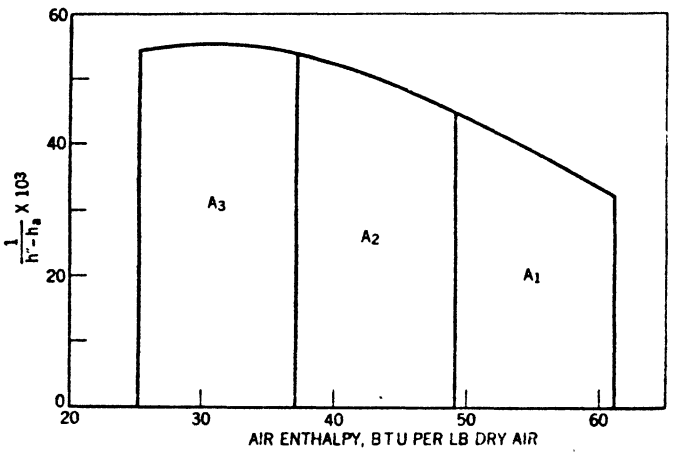

FIG. 7. GRAPHICAL INTEGRATION TO DETERMINE NUMBER OF TRANSFER UNITS REQUIRED FOR DESIRED OPERATING CONDITIONS OF EXAMPLE 1

temperature of the entering air; and as such they will serve to accurately cover the tower performance in consistent terms.

The application of the foregoing design method to atmospheric towers is difficult because rate coefficients and flow conditions are not yet well defined for such equipment. If these are known, application of Equation 7 to sections of the tower small enough to justify use of the logarithmic mean potential will yield the tower volume required for each section. The sections must be taken perpendicular to the path of water flow. A correction to adjust the logarithmic mean potential, evaluated as for counter-flow, to the reduced effectiveness of cross-flow, has been derived for heat transfer and may be applied to this case [12].

For small size counterflow spray towers intended for a low cooling range only considerable data [13, 14] are available on the performance of the spray system in terms of the logarithmic mean enthalpy potential. These data show the importance of proper nozzle arrangement and spray distribution within the tower. The greatest cooling effect is shown to be obtained in a region close to the nozzles; and the beneficial effects of

packing added in the lower section of the tower follow as increasing the cooling range.

Atmospheric towers operate with natural draft, produced in a vertical direction by the stack action of the tower structure, at zero velocity of the approach wind. Approach wind of sufficient magnitude (the magnitude depending on the baffle arrangement which is designed to reduce drift) will cause cross-flow augmenting the natural draft. An adequate design requires the consideration of both flow conditions.

Expression for Cooling Tower Performance

The performance of a cooling tower is described in terms of its effectiveness as an energy exchanger. The effectiveness is defined as the ratio of the energy actually exchanged to the energy available for exchange.

Effectiveness expressions:

Case 1. The slope of the operating line on the $t - h$ diagram exceeds the slope of the saturation line in the region of water temperatures considered.

$$e = \frac{h_1 - h_2}{h_1'' - h_2} \tag{9}$$

Case 2. The slope of the saturation line exceeds that of the operating line.

$$e = \frac{h_1 - h_2}{\frac{Lc}{G}(t_1 - t_{wb})} = \frac{t_1 - t_2}{t_1 - t_{wb}} \tag{10}$$

This equation represents the *approach to wet-bulb.*

Usual tower operating conditions conform to *Case 1.* Because of the curvature of the saturation line, operating conditions may present themselves to which neither *Case 1* nor *2* applies. Since a simple expression for the intermediate case is not available, the expression of *Case 1* may be utilized for the small number of operating conditions falling into the intermediate classification.

Make-Up Water

Since evaporation of water occurs in atmospheric water cooling equipment such evaporation loss must be replaced. Approximately 1 gal of water is lost for every 1000 gal of water cooled per degree of cooling range. There is also an additional amount of spill-over and drift water which must also be replaced. Replacement supply is usually regulated by a float control valve. Chemical treatment of the make-up water is very desirable to avoid excessive deposits in the condensers. Refer to Chapter 51.

Winter Freezing

It is obvious when atmospheric water cooling equipment is operated in freezing weather that the water may freeze. Such freezing may lower the efficiency of the operation. To obviate this freezing an attempt is made, in the case of the spray pond and spray cooling tower, to reduce the quantity of water fed to the apparatus. This reduces the pressure at the nozzles and thereby increases the size of the drops produced. Care must be exercised not to lower the quantity of water too much. On the deck tower the upper system may be shut off and a secondary distribution system put in service midway down the height of the tower. This gives the water less time contact with the air and thus keeps it above freezing. A mechanical draft tower can be protected by reducing the air

flow through the tower. Where intermittent operation of a system is employed, water in outside basins may cause considerable damage due to freezing. To prevent this, such basins are drained when out of service and on some small roof installations a tank large enough to hold all the water in the system may be installed inside the building. In such cases the pump should be protected from the freezing weather.

DEHUMIDIFICATION BY SORBENT MATERIALS

Definitions and Principles, Adsorbents, Dehumidification by Solid Adsorbents, Dehumidification Equipment Using Solid Adsorbents, Absorbents, Dehumidification by Liquid Absorbents, Dehumidification Equipment Using Liquid Absorbents, Calculation of Moisture Load, Vapor Barriers

---

DEHUMIDIFICATION as used herein is the reduction of the water vapor content of a given volume of air or other gas. The term thus describes a special case of dehydration which covers the removal of moisture in any form from matter. The degree of dehumidification required varies greatly with different applications and is one of the prime considerations influencing the choice of a method. Dehumidification may be accomplished by latent heat removal together with sensible heat removal, as described in Chapters 7, 37, and 43, or by the use of sorbents.

Sorbents are substances which have the property of extracting and holding other substances (usually gases or vapors, *e.g.* water vapor,) brought into contact with them. All materials are sorbents to a greater or lesser degree. The weight of water held by a substance will increase or decrease depending upon whether the vapor pressure of the water held by the substance is less or greater respectively than the partial pressure of water vapor in the surrounding atmosphere. As generally used, however, the term, sorbents, refers to those materials having a capacity for moisture which is large compared to their volume and weight. Such materials are divided into two general classifications:

1. *Adsorbent*—A sorbent which does not change physically or chemically during the sorption process. Certain solid materials, such as activated alumina, silica gel, activated bauxites, and activated charcoal have this property. The action of adsorbents, most of which adsorb some gases and condensible vapors besides water vapor, is selective. Thus, in the case of a mixture containing both water and organic vapors, silica gel would remove the water vapor in preference to the organic vapors, while the reverse would be true in the case of activated carbon. The selective property of adsorbents is made use of in some instances for the removal of objectionable and contaminating vapors from an air or gas mixture. (See Chapter 10.)

2. *Absorbent*—A sorbent which changes either physically, chemically, or both, during the sorption process. Calcium chloride is an example of a solid absorbent, while liquid absorbents include solutions of lithium chloride, calcium chloride, lithium bromide, and the ethylene glycols.

ADSORBENTS

The ability of an adsorbent to remove water vapor from a gas is explained by the fact that the vapor pressure of the water in the adsorbent (when in the reactivated condition) is less than the partial pressure of the water vapor in the surrounding atmosphere. For instance, when an active adsorbent is brought into contact with a gas of high humidity, there is a tendency for the vapor pressure of the water in the adsorbent to reach equilibrium with the partial pressure of the water in the surrounding gas, with the result that water is extracted by the adsorbent and its weight increased, while the moisture content of the gas is correspondingly reduced. (The adsorbent is said to be saturated for a given condition when equilibrium is attained.) The weight of water a given adsorbent will extract is dependent upon the relative humidity (ratio of the partial pressure in the gas to the saturation pressure at a given temperature) and the temperature of the adsorbent. The process is

reversible: if the temperature of the adsorbent is raised until the vapor pressure of the adsorbed water becomes greater than the partial pressure of the vapor in the surrounding atmosphere, water will be released by the adsorbent. After the adsorbent cools to room temperature, for instance, the vapor pressure of the water in the adsorbent falls below the partial pressure of the vapor in the atmosphere, and the adsorbent will again start extracting water. The elimination of water by the addition of heat is known as reactivation and is a means of regenerating the adsorbent so that it may be used repeatedly.

Adsorption is proportional to the amount of surface (internal and external) of the sorbent. The materials that are used commercially as solid adsorbents have a porous structure of sub-microscopic dimensions, which gives them extensive surface area. An adsorbent should meet the following requirements in order to be satisfactory for dehumidification purposes:

1. Have a high adsorptive capacity under normal atmospheric conditions.
2. Be chemically stable, resisting contamination from impurities.
3. Be physically rugged to resist breakdown from handling and use.
4. Be capable of reactivation at temperatures generally obtainable.
5. Be heat-stable at reactivation temperatures.
6. Have a weight per unit volume such as to avoid excessive bed dimensions.
7. Be available at reasonable cost.

Activated Alumina

Activated alumina is a granular porous material which removes by adsorption substantially 100 per cent of the moisture from gases, vapors, and certain liquids. Regeneration or reactivation may be accomplished by employing a heating medium at temperatures ranging from 350 to 600 F. After many cycles of adsorption and reactivation it is substantially as effective as originally and retains its original size and shape.

Activated alumina is produced by chemically controlled precipitation from a sodium aluminate solution resulting from the extraction of alumina from bauxite by the Bayer process. By subsequent processes this precipitate is converted into a highly porous adsorptive material. It is low in iron and silica, each normally less than 1/10 of 1 per cent. Commercially produced material is uniform in analysis and physical form.

Activated alumina is a partially dehydrated aluminum trihydrate containing about 7 per cent water and small amounts of soda, oxides of iron, silicon, and titanium, as well as very minor amounts of other elements indicated spectrographically. Substantially all of the soda is combined with silica and alumina as an insoluble constituent.

Activated alumina is inert chemically to most gases and vapors, is non-toxic, and will not soften, swell or disintegrate when immersed in water. High resistance to shock and abrasion are two of its more important physical characteristics. Commercial sizes range from a powder passing through 300 mesh screen to particles 1 in. in diameter. The sizes commonly used are 8-14 mesh and ¼ in. to 8 mesh. The average weight for most forms is 50 lb per cubic foot. Its high degree of purity warrants classification among commercially pure chemicals.

Silica Gel

Silica gel is a prepared form of silicon dioxide (silica) having an extremely porous structure which makes it an efficient adsorbent. It is

made by mixing predetermined concentrations of an acid, such as sulfuric acid, and a soluble silicate, usually sodium silicate, and allowing the mixture to set to a jelly-like mass called hydrogel. The product takes its name from its condition as a colloid at this stage of its manufacture. After setting, the hydrogel is broken into small lumps, washed, dried, crushed, and screened to the desired particle sizes and then given a final heat treatment or activation. The surface area of silica gel has been found to be in excess of 50,000 sq ft per cubic inch of product. Silica gel has high adsorptive capacity per unit weight and may be reactivated repeatedly at temperatures up to 600 F. Reactivation is generally accomplished by blowing gases through the silica gel at approximately 300 F, or by heating in a well-vented oven maintained at this temperature until no more moisture is given off. Silica gel is a high purity, rugged, non-toxic, heat-stable material, having a specific heat of 0.2 and is most inert. There is no change in the size or shape of the particles as it becomes saturated and no corrosive or injurious compounds are given off. It is available commercially in a number of grades, ranging in particle size from a 3 to 8 mesh product to an impalpable powder passing through a 325 mesh screen. The product generally used for dehumidification applications has a particle size of 6 to 12 mesh and a bulk density of between 40 and 45 lb per cubic foot.

Activated Bauxite

Activated bauxites are certain natural products which after controlled heat treatment have properties which make them suitable for use as solid adsorbents. They are marketed under different trade names by several processors. The activated bauxites consist primarily of Al_2O_3, Fe_2O_3, SiO_2, TiO_2, and H_2O in varying percentages. The surface area, adsorptive capacity, and other properties of the several products differ to some extent depending upon the source of the original material and its subsequent treatment. The available activated bauxites are durable products having a specific heat of about 0.24 and can be regenerated at temperatures between 300 F and 500 F. They are usually supplied in a number of particle sizes and have a bulk density of between 55 and 65 lb per cubic foot.

There are other solid substances having marked adsorbent properties, but details concerning them are not available.

DEHUMIDIFICATION BY SOLID ADSORBENTS

Since adsorption is primarily a condensation process, heat equivalent to the latent heat of evaporation of the vapor plus the heat of wetting, which is an additional amount of heat depending upon the vapor being adsorbed and the adsorbent used, is liberated. The sum of the latent heat of evaporation and the heat of wetting is known as the heat of adsorption. During adsorption it might be said that latent heat is transformed into sensible heat, which is dissipated into the adsorbent, into the metal of the adsorbent container, and into the gas mixture, resulting in a rise in temperature. Fig. 1 shows the relationship between temperature, vapor pressure, and moisture content of a solid adsorbent. These curves indicate the general performance of solid adsorbents, although the exact values vary for the different adsorbents and may vary even for different types of the same compound. The effects of vapor pressure and temperature upon the moisture content of an adsorbent

may be observed by referring to Fig. 1. When the given type of solid adsorbent is in equilibrium with air having a dry-bulb temperature of 70 F and 70 per cent relative humidity, that is, having a dew-point of 60 F or a water vapor pressure of 13.2 mm Hg, the water content of the adsorbent is 33 per cent. With air having the same dry-bulb temperature and a dew-point of 37 F, or a vapor pressure of 5.6 mm Hg, the water content is 20 per cent. The increase in weight for an activated solid adsorbent after it reaches equilibrium with a gas of any given water vapor content may be found by subtracting the residual water content (for example 6 per cent) from the equilibrium value. In the case of the two examples cited, the actual water gain would be 27 per cent and 14 per cent respectively. The effect of temperature upon the adsorptive

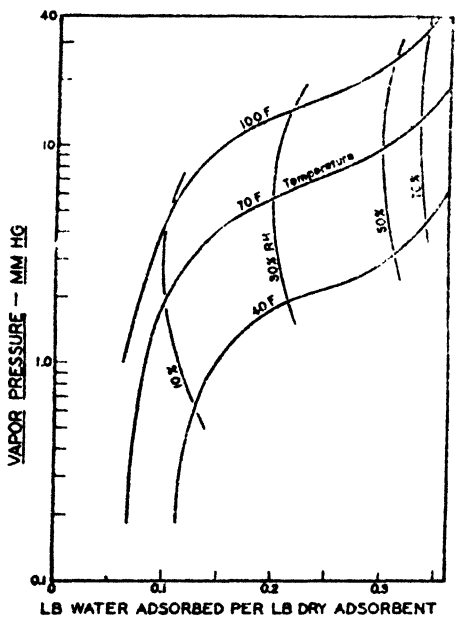

FIG. 1. TEMPERATURE—VAPOR PRESSURE —CONCENTRATION CHARACTERISTICS FOR A TYPICAL SOLID ADSORBENT

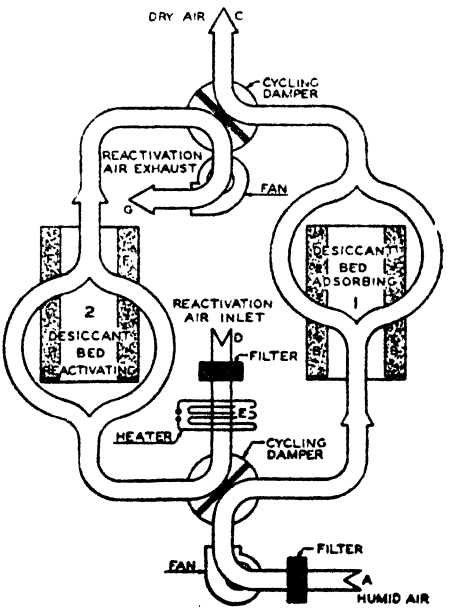

FIG. 2. A TYPICAL SOLID ADSORBENT DEHUMIDIFICATION UNIT AIR FLOW DIAGRAM

capacity may be observed by following the 5.6 mm Hg vapor pressure line. At a temperature of 70 F the moisture content of the adsorbent is 20 per cent, while at 100 F the equilibrium water content is 11 per cent.

In practice the temperature rise in the dehumidified air caused by the adsorption heat is approximately 10 deg F for each grain of moisture removed per cubic foot of air at atmospheric pressure. This temperature rise occurs progressively through the adsorbent bed and is an important consideration in predetermining the performance of a given design of apparatus. Data such as these, together with information covering other characteristics such as specific heat, resistance to air flow, etc., are of value in the basic design of adsorption apparatus. In the solution of air conditioning problems, however, reference must be made to performance data on established apparatus designs.

DEHUMIDIFICATION EQUIPMENT USING SOLID ADSORBENTS

A typical solid adsorbent dehumidification unit air flow diagram is shown in Fig. 2. The apparatus consists of two adsorbent containers (adsorbers) with necessary interconnecting piping, valves, and auxiliaries consisting of filters, fans, activation air heater, controls, and in some instances a cooler for the dehumidified air. Before entering the adsorber the air to be dehumidified is drawn into a filter to remove dust and other impurities. In passing through the adsorbent bed, the moisture content of the air is reduced and the dehumidified air is then introduced into the space or process requiring it. While the first adsorber is dehumidifying the air, the second adsorber is being reactivated by means of outside air drawn through a filter and heater in which its temperature is raised to 300 F. The heat may be supplied by electric heating elements, steam coils, the direct products of combustion of gas, oil, waste heat, or any other convenient source. In passing through the adsorbent bed, the hot gases supply the necessary heat for releasing adsorbed water from the adsorbent and then carry it out of the adsorber to the activation gas outlet, where it is exhausted to the outside atmosphere. In some instances a thermostat placed in the activation outlet connection shuts off the activation fan and heater when the adsorbent is completely reactivated, as indicated by a rapid rise in the temperature of the outlet activation gas. The length of the adsorption period may be controlled by a timing device which changes the valves or dampers from the adsorbing to the activating position, or by a humidistat located in the dehumidified air connection or in the dehumidified space. The majority of commercial units are time controlled.

In applications where a continuous stream of dehumidified air is not required, a single adsorber type unit may be used, while in other cases where a continuous stream of dehumidified air is required, a multiple number of adsorbers or even a continuously rotating system may be used.

If the air to be dehumidified is very warm, and especially where exceedingly low dew-point dehumidified air is required, it is advantageous to install a pre-cooler to reduce the temperature of the inlet air. In this way the working temperature in the adsorber is lowered and the over-all performance appreciably increased. Some equipment manufacturers install cooling coils in the adsorbent beds for the same purpose, while others divide the adsorbent bed and install coolers between the sections.

Dehumidification equipment is employed to the best advantage where the air conditioning problem is primarily one of obtaining low relative humidity control rather than temperature control. This requirement is found in the case of the preservation of inactive naval vessels where the interior of the ship must be kept at a relative humidity below 30 per cent to avoid corrosion, mold, mildew, and other moisture damage that occurs at humidities substantially in excess of this figure. Other advantageous applications for dehumidification systems are found in industrial processes where low relative humidity atmospheres are required during the manufacture as well as for preservation of the finished products. Dehumidification with cooling may be used to advantage in work-rooms or other spaces occupied by humans, where the moisture load is high in comparison to the sensible heat load. In many instances where independent control of temperature and humidity is important dehumidification is used to advantage in conjunction with cooling.

ABSORBENTS

Any absorbent substance may be used as a dehumidifying agent if it has a vapor pressure with respect to water lower than the partial pressure of the water vapor in the mixture from which the moisture is to be removed.

Solid Absorbents. The substances used are generally the solid forms of the liquid absorbents. Calcium chloride is frequently used because of low cost. At present they are used principally in small desiccating chambers and in small dryers of the cartridge type, through which air is forced under pressure.

Liquid Absorbents. These are primarily water solutions of materials in which the vapor pressure is reduced to a suitable level by controlling the concentration and temperature of the dehumidifying solution. Water solutions of the chlorides or bromides of various inorganic elements and certain organic compounds are the liquid absorbents used in air conditioning.

In addition to having suitable water vapor pressure characteristics, an absorbent to be satisfactory should also meet the following requirements:

1. Be widely available at low cost.
2. Be non-corrosive, odorless, non-toxic, and non-inflammable.
3. Be chemically inert against any impurities in the air stream.
4. Be stable over the range of use.
5. Must not precipitate at the lowest temperature to which the apparatus is exposed.
6. Have low viscosity and be capable of being economically regenerated or concentrated after having been diluted by the moisture absorbed.

DEHUMIDIFICATION BY LIQUID ABSORBENTS

In liquid absorption systems the air-vapor stream is brought into intimate contact with the absorbent solution by passing the air stream through a tower into which the brine is introduced as a finely divided spray, or by passing the air through a tower or contactor which is continuously sprayed with the brine, thereby presenting a large surface of absorbent to the air to be dehumidified. The difference in the partial pressure of the water in the concentrated brine and the partial pressure of the water vapor in the air causes the water vapor to be given up by the air to the brine until equilibrium is approached. The water vapor is condensed during this operation, and its addition to the absorbent solution results in a decrease in the concentration of the solution. As the water vapor condenses the latent heat of condensation is released in the absorbent solution. An additional, frequently appreciable, quantity of heat known as the heat of solution or heat of mixing is also released. The heat released as the result of condensation and mixing is directly transferred to the brine, to the equipment, and to the air being dehumidified, thereby causing a rise in temperature.

A modified system includes means for removing heat from the absorbent solution, either within the contactor or externally. Thus the temperature of the solution may be higher than, equal to, or lower than that of the air, depending on the chemical employed and the ultimate use of the dehumidified air.

Fig. 3 shows the relationship between temperature, vapor pressure and moisture content of a typical absorbent of the *inorganic* type. These curves indicate the general performance of such absorbents, although the exact values vary for the different compounds.

When the given absorbent is in equilibrium with air having a dry-bulb temperature of 70 F and a relative humidity of 70 per cent, *i.e.* having a dew-point of 60 F, or a water vapor pressure of 13.2 mm Hg, the water

content of the solution is 4.8 lb water per pound of anhydrous absorbent. With air having the same dry-bulb temperature and a dew-point of 37 F, or a vapor pressure of 5.6 mm Hg, the water content is 2.1 lb per pound of absorbent. Therefore, when a solution of 2.1 lb water per pound of absorbent is exposed to an atmosphere of 70 F and 70 per cent relative humidity, it will absorb an additional 2.7 lb of water in reaching equilibrium.

The effect of temperature on the absorptive capacity may be observed by following a constant vapor pressure line in Fig. 3. At a temperature of 70 F and a vapor pressure of 13.2 mm Hg the moisture content is 4.8 lb

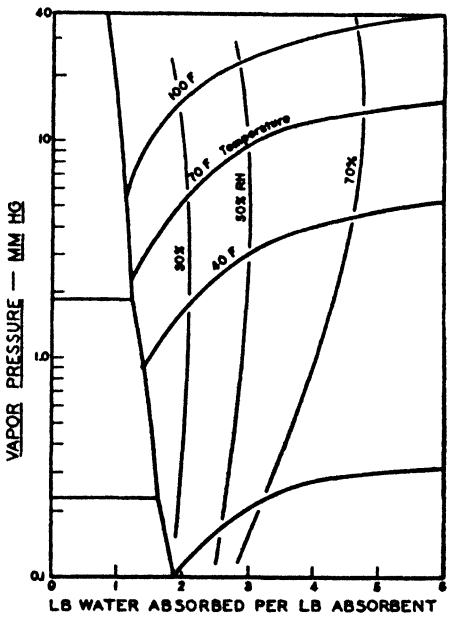

FIG. 3. TEMPERATURE—VAPOR PRESSURE —CONCENTRATION CHARACTERISTICS FOR A TYPICAL INORGANIC ABSORBENT (HALOGEN SALT GROUP)

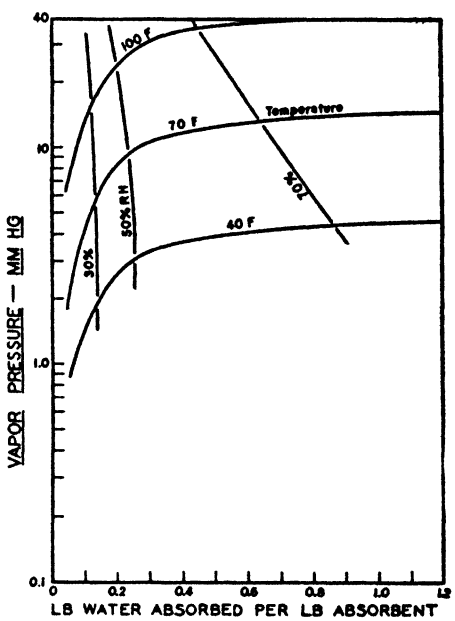

FIG. 4. TEMPERATURE—VAPOR PRESSURE —CONCENTRATION CHARACTERISTICS FOR A TYPICAL ORGANIC LIQUID ABSORBENT

water per pound of absorbent. At 100 F the moisture content is 1.8 lb water per pound of absorbent.

Fig. 4 shows the relationship between temperature, vapor pressure, and moisture content of a typical liquid absorbent of the *organic* type.

DEHUMIDIFICATION EQUIPMENT USING LIQUID ABSORBENTS

One type of system utilizing liquid absorbents includes an external interchanger having essential parts consisting of a liquid contactor, a solution concentrator, a solution heater and a cooling coil all as shown in Fig. 5. The contactor and cooling coil are located in the wet air stream. The air to be conditioned is brought into contact with an aqueous brine solution having a vapor pressure below that of the entering air, resulting in a transfer of moisture from the air to the brine solution. This results in a conversion of latent heat to sensible heat which raises the solution temperature and consequently the air temperature. The temperature

change of the air being processed is determined by the cooling water temperature and the amount of moisture removed in the equipment. Control of leaving air temperature may be obtained by precooling the absorbent solution in a suitable surface cooler, by tap, well, or chilled water.

The excess water of condensation, which dilutes the brine, is removed in the solution concentrator. This is a low pressure steam heat exchanger which over-concentrates a portion of the weak liquor and returns it to the main brine reservoir for re-cycling. The concentrator operates in the manner of an evaporative condenser, whereby moisture is evaporated from the brine by the heating coils into a stream of regeneration air taken from and rejected to the outside atmosphere. Low pressure steam is normally used for heating the brine. When it is desirable or necessary to use gas or electricity, an auxiliary low pressure steam boiler is usually

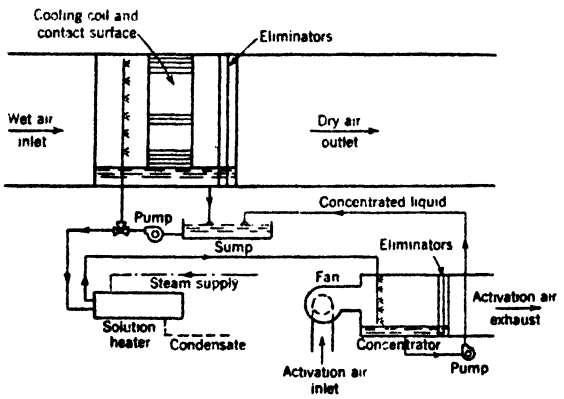

FIG. 5. LIQUID ABSORBENT EQUIPMENT IN WHICH SOLUTION COOLER AND CONTACTOR ARE COMBINED

added to the equipment. Concentrators operating on a simple boiler principle have not as yet been commercially practical.

It should be noted that the solution concentration phase is the reverse of the absorption process. During concentration the aqueous vapor pressure of the solution is greater than that of the surrounding air, while during dehumidification, the reverse is the case. Utilization of this principle permits winter humidification by heating (instead of cooling) the solution pumped to the contactor. Water is thereby evaporated into, instead of being condensed out of, the conditioned air stream. This requires dilution of the brine externally to the contactor, rather than concentration.

CALCULATION OF MOISTURE LOAD

Calculation of the dehumidification required to maintain lower than normal moisture content in a given room begins with determination of the rate of moisture gain in the room from all sources. It is common practice when maintaining a low humidity ratio to recirculate a large percentage of the air in the room through the dehumidifier, and to add only enough outside air to meet the needs of the problem. The humidity ratio of the mixture of outside and recirculated air and the dehumidifier performance data can be used to calculate the humidity ratio of the air leaving the dehumidifier. The difference between the humidity ratio of the air in the room and that of the dehumidified air entering the room

represents the effective dehumidification per pound of air. The rate of internal moisture gain in grains per minute divided by the effective dehumidification in grains per pound of air equals the air quantity required in pounds per minute. The following typical example using arbitrary values shows a general method of determining the dehumidifying requirements. Sensible heat determination considerations are discussed in other chapters and are purposely omitted here.

Example 1. A solid adsorbent dehumidifier having performance characteristics as shown in Fig. 6 is to be used to maintain inside conditions of 73 F and 20 per cent relative humidity, *i.e.* 24.1 grains per pound of dry air, 30 F dew-point, in a room, 20 ft x 30 ft x 10 ft high, having a total wall, ceiling, and floor surface area of 2200 sq ft. Outside design conditions are 72 F dew-point (118.4 grains per pound).

Internal sources of moisture are: 4 occupants; an open natural gas burner using 15 cu ft of natural gas per hour; an open top water tank, having an area of 2 sq ft exposed surface, in which water is maintained at 87 F, with air movement over the water surface being 100 fpm. Determine the quantity and condition of the dehumidified air to be supplied to the room.

Solution. The internal moisture gain consists of items 1 to 5.

		Grains Per Minute
1. From occupants:	$4 \times 1800/60 =$	120
1800 grains per person per hour is obtained from Fig. 7, Chapter 12, by interpolation between curves C and D.		
2. From burned gas:	$15 \times 650/60 =$	162
1 cu ft natural gas produces approximately 650 grains of moisture.		
3. From exposed water surface:	$2 \times 20 =$	40
Evaporation from water surface is assumed to be 20 grains per (minute) (square foot) at 87 F water with air movement of 100 fpm.		
4. From infiltration:	$\frac{6000}{60 \times 13.56} \times (118.4 - 24.1) =$	696
One air change, 6000 cu ft, assumed per hour (see Chapter 8).		
5. Moisture transmitted through room surface:	$\frac{2200}{60} \times 3 \times (0.783 - 0.176) =$	67
Permeability assumed to be 3 grains per (square foot) (hour) (inch Hg vapor pressure difference on two sides of wall).		
Total moisture gain from internal sources		1085

Let q be the air delivered to the room, pounds per minute. Let it be assumed for this problem that 85 per cent of the air is recirculated and 15 per cent is outside air. Enough air must be supplied to replace leakage from the system or to satisfy normal ventilating requirements for the occupants of the room as given in Chapter 12, whichever is greater. The amount is estimated from experience or obtained by test.

The humidity ratio of the mixture of recirculated and outside air entering the dehumidifier is then:

$$\frac{0.85q\ (24.1) + 0.15q\ (118.4)}{0.85q + 0.15q} = 38.3 \text{ grains per pound entering dehumidifier.}$$

For the dehumidifier shown in Fig. 6, for 38.3 grains per pound in entering air, the leaving humidity ratio will be 6.5 grains per pound.

Effective dehumidification in the room is 24.1 — 6.5 or 17.6 grains per pound of supply air.

Then $q = \frac{1085 \text{ grains per minute}}{17.6 \text{ grains per pound}} = 61.6$ lb air per minute ***minimum*** that must be supplied to the room to maintain 30 F dew-point.

Note that this figure represents the minimum requirement for the arbitrary conditions set forth and that in practice safety margins should be added to the outside air percentage figure and to the calculated internal moisture gain.

VAPOR BARRIERS

The walls enclosing a dehumidified space are subjected to a vapor pressure differential. The pressure of the vapor outside the walls tends to force moisture through the walls into the dehumidified zone of relatively low vapor pressure. As this process can be an unnecessary load on the dehumidifying equipment, provisions should be made for keeping the vapor transfer to a minimum. Also, if the space is cooled below the ambient dew-point there is a possibility that condensation may occur within the walls unless vapor transfer is controlled. For these reasons

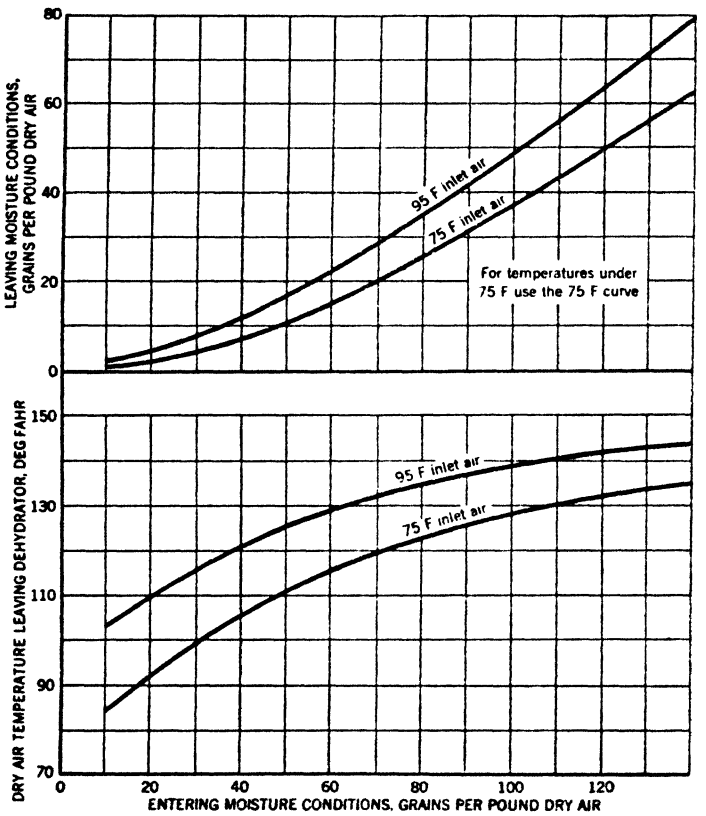

FIG. 6. PERFORMANCE DATA FOR TYPICAL COMMERCIAL SOLID ADSORBENT DEHUMIDIFIER

a vapor barrier should be located within the wall construction as near to the high vapor pressure side as feasible. To be effective a barrier must be continuous and should be so located within the structure that it will be protected from rupture.

Some types of insulation are supplied with the vapor barrier attached. Asphaltic paints, asphalt impregnated and surface coated papers, laminated papers, and combinations of metal foil and kraft papers are among the types of available barriers. Sheet metal linings have been used in rooms where moisture transmission must be eliminated. In existing construction, barriers may be added to the surface of the walls by application of proper paints or the addition of foil or laminated impregnated paper.

When vapor permeability is expressed as grains per (hour) (square foot) (inch of mercury pressure differential) a value not exceeding unity indicates a proper vapor barrier. Moisture vapor transmission rates for various materials are listed in Table 24, Chapter 15.

The formula for the amount of moisture vapor transmitted through a wall is:

$$W = \mu A (P_1 - P_2)$$

where

W = total moisture vapor flow, grains per hour through the wall.
μ = permeability, grains per (hour) (square foot) (unit vapor pressure differential).
A = area of the wall, square feet.
P_1 = vapor pressure on the humid side of the wall, and
P_2 = vapor pressure on the other side of the wall, both in units consistent with the pressure units of the transmission coefficient.

The over-all moisture transfer coefficient for a wall consisting of a combination of several materials in series may be calculated by combining the permeabilities (μ_1, μ_2, μ_3, etc.) of the individual materials according to the formula:

$$\mu = \frac{1}{\frac{1}{\mu_1} + \frac{1}{\mu_2} + \frac{1}{\mu_3} + \ldots \frac{1}{\mu_n}}$$

Example 2. Find the moisture transfer through a wall of 1000 sq ft area if the permeability of the wall is 0.45 grains per (square foot) (hour) (inch Hg) and the air conditions are 85 F dry-bulb with 65 per cent relative humidity outside and 90 F dry-bulb with 20 per cent relative humidity inside.

Solution. The vapor pressures are therefore $0.65 \times 1.21 = 0.787$ in. Hg outside and $0.20 \times 1.42 = 0.284$ in. Hg inside.

The vapor transfer of the wall is therefore $1000 \times 0.45 (0.787 - 0.284) = 226$ grains per hour.

Allowance should be made in design load calculations for imperfections in application of vapor barriers and consequently some judgment is necessary in determining the quality of the workmanship.

REFRIGERATION

Theory and Cycle Calculations: Definitions, Simple Refrigeration Cycles, Complex Refrigeration Cycles, Pipe Sizes and Friction Losses, Air Refrigeration Cycle, the Steam Jet System, the Absorption System, Ice Systems, Storage Systems, the Reverse Cycle; Equipment and Arrangements: Types of Compressors, Condensers, Expansion Valves, Evaporators and Coolers, Equipment Selection

---

WITH the increasing use of all-year comfort air conditioning installations the importance of refrigeration to the air conditioning engineer has been greatly magnified. The details of equipment operation, maintenance, and design remain problems for the refrigeration engineer, but the air conditioning engineer does retain a responsibility to the customer which requires some knowledge on his part of the different refrigeration cycles and the relative merits of each. In order to assist in meeting this need, the present chapter has been divided into two parts, the first covering the fundamental technical relationships which govern the selection and analysis of an operating cycle and the second presenting brief discussions of some of the equipment and equipment arrangements which are most commonly used.

THEORY AND CYCLE CALCULATIONS

Definitions

The *ton of refrigeration* is a quantity unit which originated in the days when harvested ice was the principal source of summer cooling. By definition the *ton* is the cooling effect realized when one ton of 32 F ice melts to water at 32 F; since the latent heat of fusion of ice is 144 Btu per pound, the *ton* represents a unit cooling effect of 144 × 2,000 = 288,000 Btu. In common practice the ton is usually considered a rate (rather than quantity) unit and is taken as 288,000 Btu per day (24 hours) or 12,000 Btu per hour or 200 Btu per minute. Thus for air conditioning calculations, the size of the requisite refrigeration machine, expressed in tons, can be obtained by dividing the heat gain of the structure, expressed in Btu per hour, by 12,000. In equation form:

$$H_t = (\text{Btu per hour heat gain}) \div 12{,}000 \qquad (1)$$

where

H_t = load in tons.

The *working substance*, or *refrigerant*, is the fluid which carries heat through the refrigeration cycle from the evaporator, where heat enters the refrigerant, to the condenser where the heat is discharged to some cooling medium. The great majority of modern refrigeration systems use a liquefiable vapor as the working substance. By altering the pressure of the refrigerant its boiling temperature is changed, allowing the material to *boil* in the evaporator at a temperature sufficiently lower than that of the conditioned space to insure maintenance of an effective heat transfer rate from the space (or in some cases from a secondary cooling fluid such as brine or cold water) to the refrigerant. The vapor formed in the evaporator is then raised in pressure (by a compressor, or by the absorber-generator combination of the absorption system) until its new

boiling temperature exceeds the temperature of the available cooling medium; under these conditions heat transfer is established from the refrigerant vapor to the cooling medium with resultant condensation of the refrigerant. When condensed, the high-pressure liquid refrigerant is reduced in pressure and again allowed to *boil* in the evaporator.

Thermodynamically, a material for use as a refrigerant should have a large latent heat of vaporization since it is this heat quantity—subject to minor variations—which constitutes the working effectiveness of the refrigerant. Further, since the work required to compress a vapor increases rapidly with the pressure ratio, the thermodynamic characteristics of the fluid should be such that the required low-to-high temperature range can be achieved with only a moderate change in ratio. A further consideration, from the standpoint of practical operating effectiveness, is that the suction pressure should not be below atmospheric (to prevent leakage of air into the refrigerant lines) nor should the condenser pressure be excessively high (to prevent need for extra-heavy construction). The specific volume-specific enthalpy relationship is also important because some materials would have such low density, when in vapor form, that impractical compressor displacements would be needed to handle the suction vapor.

Properties of refrigerants are usually given either in tabular or graphic form. In contrast to the temperature-entropy plotting which is used almost exclusively in steam-power work, refrigeration problems are usually referred to a pressure-enthalpy chart. The advantage of pressure-enthalpy plotting is that linear distances on the chart correspond to energy gains or losses and the two types of processes, constant-pressure and constant-enthalpy, which occur most frequently in refrigeration cycles, can both be represented by straight vertical or horizontal lines. Tabular arrangements of refrigerant properties have the disadvantage common to all point representations, in requiring interpolation between given values, but have the advantage of an accuracy greater than that obtainable from a chart. Tables 1, 2, 3, 4, 5, 6 and 7 give the thermodynamic properties of seven of the more common refrigerants: dichlorodifluoromethane (F-12), monochlorodifluoromethane (F-22), methyl chloride, ammonia, carbon dioxide, monofluorotrichloromethane (F-11), and water; the first five of these materials are commonly used in reciprocating compressors, the last two in centrifugal machines, while water also finds use in steam jet systems.

Referring to Table 1, the first column gives the range of saturation temperatures likely to occur in practice. The second column gives the saturation pressure expressed in pounds per square inch absolute corresponding to a given temperature, while the next six columns give the three fundamental specific properties, volume, enthalpy, and entropy, of the saturated liquid and saturated vapor respectively. The last four columns give values of enthalpy and entropy for gases with 25 deg and with 50 deg of superheat; note particularly that the column heading *50 F superheat* means, not that the gas is at a temperature of 50 F, but that its temperature exceeds by 50 deg the saturation temperature corresponding to its actual pressure. Thus F-12 vapor at 38.0 psig and 91 F possesses 50 deg of superheat since its saturation temperature corresponding to 52.7 psia is 41 F.

The tabular arrangements of refrigerant properties are literally for saturated or superheated materials only. In many cases, however, the engineer must work with sub-cooled liquids. With an accuracy sufficient

for all practical purposes the specific volume and the enthalpy of any sub-cooled refrigerant can be taken as equal to the values read from the tables for a saturated liquid at the same temperature. Thus if F-12 at 121 psia and 40 F is passing through a pipe, its volume and enthalpy can be determined from Table 1 as 0.0116 cu ft per pound and 17.0 Btu per pound.

Frequently it is necessary to determine the properties of a *wet* vapor or of a mixture of liquid with some added vapor, such as is found at discharge from an expansion valve. This can be done from the tables by noting that the specific enthalpy of the mixture must be equal to that of the saturated liquid plus a fraction of the latent heat of vaporization equal to the fraction of refrigerant which is present in vapor form.

TABLE 6. PROPERTIES OF MONOFLUOROTRICHLOROMETHANE (F-11)

Consider, for example, F-12 with a quality (the per cent in vapor form) of 30 per cent; the enthalpy of this material would be equal to:

$$h_m = h_f + 0.30\ (h_v - h_f) \tag{2}$$

where

h_m = specific enthalpy of the mixture.
h_f = specific enthalpy of the liquid.
h_v = specific enthalpy of the saturated vapor.

Values of h_f and h_v are obtained from Table 1 for the actual pressure of the mixture.

By a reversal of this same procedure the tabular data can be used to determine the state of a mixture leaving an expansion valve. Consider a valve to which saturated liquid at pressure p_s is admitted and a mixture of saturated liquid and vapor at pressure p_d is discharged. The quality of the material at discharge is then determined by making use of the fact that the expansion process is completely irreversible, is a throttling process, and hence occurs without change in enthalpy. Thus the enthalpy of the mixture, h_m, is equal to the enthalpy of the saturated liquid at the entrance state, h_{fs}, and can therefore be read from the table.

Thus,

$$h_{fs} = h_m = h_{vd} - (1 - x)\ (h_{vd} - h_{fd}) \tag{3}$$

or,

$$x = (h_m - h_{fd}) \div (h_{vd} - h_{fd}) \tag{4}$$

where

h_{fs} = enthalpy of saturated liquid at entrance to expansion valve.
h_m = enthalpy of mixture.
h_{vd} = enthalpy of saturated vapor at discharge.
h_{fd} = enthalpy of liquid at discharge.
x = proportion of liquid in the mixture, decimal.

The refrigerant *cycle* is the series of state changes which occur in the conditioning processes needed to restore the refrigerant to a condition in which it will possess the ability to extract heat from the space to be cooled. For all compression-type systems the cycle consists of four processes: heat gain in the evaporator; pressure rise in the compressor; heat loss in the condenser; pressure loss in the expansion valve. The compression process is accomplished at the expense of energy added to the compressor in the form of shaft work and the expansion process could be carried out, if the economics of the system would permit, in an expanding engine with consequent release of energy as shaft work. In ordinary systems, however, the additional first cost and maintenance costs of an expanding engine so greatly exceed the advantage resulting from the work realized that such engines are not used and the pressure reduction is allowed to occur irreversibly in an expansion valve. Basically, then, a refrigeration cycle consists of two heat transfer processes and two pressure change processes, no work entering into the heat transfer processes and—in the simple cycle—no heat transfer occurring during the pressure-change processes.

Simple Refrigeration Cycles

The most common and least complicated type of refrigeration cycle is shown in Fig. 1 and is called the *simple saturation cycle.* For this system saturated vapor flows without gain or loss of heat from the

evaporator to the suction of the compressor. During passage through the compressor the energy added as shaft work goes entirely to increase the enthalpy of the refrigerant, and the compression process, which is assumed to occur irreversibly and without external heat transfer, is characterized by constant entropy. Thus the state of the superheated vapor leaving the compressor can be determined from the tables of thermodynamic properties by noting the discharge pressure and fixing also the entropy of the saturated vapor at entrance to the compressor.

Superheated vapor from the compressor flows to the condenser where desuperheating and condensation take place. From the condenser the refrigerant flows to the expansion valve, undergoes a constant-enthalpy pressure reduction and returns to the evaporator where it again removes a quantity of undesired heat. When the evaporator is arranged to permit direct cooling of room air by the refrigerant, the system is said to be

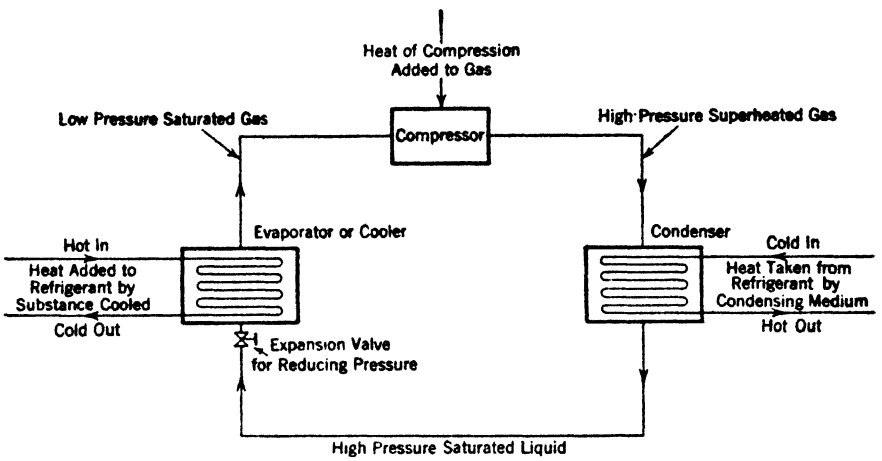

FIG. 1. MECHANICAL REFRIGERATION SYSTEM

of the *direct expansion* type, while a system in which the evaporating refrigerant cools water or brine, which in turn cools the air, is said to be *indirect*. Although many differences exist between most actual systems and that of the simple saturation cycle this latter is nonetheless of great value in that it provides an extremely simple method of rapidly achieving an approximate analysis of probable power requirements, compressor size, etc. Further, the equations used in analysis of a simple saturation cycle form the basis of the more complex treatments required for compound refrigeration cycles. For these reasons a typical simple saturation problem will be worked in detail.

Example 1. A simple saturation cycle carries a 7 ton load when operating between suction and discharge pressures of 52.7 psia and 121 psia with F-12 as the refrigerant. Determine: (*a*) the cooling effect provided by each pound of refrigerant, (*b*) the refrigerant circulating rate, (*c*) the horsepower required, (*d*) the quantity of heat to be dissipated from the condenser, (*e*) the required condenser cooling water, in gallons per minute, if temperature rise of water passing through the condenser is 8 deg, (*f*) the bore and stroke of a double acting cylinder (neglecting the effect of the piston rod) if speed of compressor is 500 revolutions per minute.

Solution. (*a*) Saturated liquid F-12 at 121 psia leaves the condenser and enters the expansion valve. The enthalpy of this material (from Table 1) is 29.68 Btu per pound and this must also be its enthalpy at entrance to the evaporator. Leaving the evaporator as a saturated vapor at 52.7 psia, its enthalpy is 82.82 so the refrigerating effect must be 82.82 − 29.68 = 53.14 Btu per pound.

(*b*) The refrigerant circulating rate is equal to the total heat to be picked up in unit time divided by the pick-up per pound of refrigerant or,

$$W_r = (7 \text{ ton} \times 200) \div 53.14 = 26.3 \text{ lb per minute.}$$

(*c*) The horse power required is equal to the increase in energy of the refrigerant passing through the compressor (expressed in Btu per minute) divided by the conversion factor 42.42, which is the number of Btu per minute corresponding to 1 hp,

$$(\text{hp}) = W_r (h_d - h_{vs}) \div 42.42 \qquad (5)$$

where

hp = horsepower.
W_r = refrigerant circulating rate in pounds per minute.
h_d = enthalpy of vapor at condition of discharge from compressor.
h_{vs} = enthalpy of saturated vapor entering compressor.

W_r is known from (*b*) and h_{vs} is the enthalpy of refrigerant as it enters the compressor in a saturated vapor state at 52.7 psia; thus $h_{vs} = 82.82$.

In order to determine h_d, the state of the refrigerant must first be determined at the compressor discharge. At the known suction state the entropy (from Table 1 for saturated vapor at 52.7 psia) is 0.16828 and, since the compression is assumed to occur isentropically, it therefore follows that the discharge state must have the same entropy at 121 psia. From the table the entropy of vapor superheated 25 deg is 0.17330, so the superheat, t_{sd}, possessed by the actual gas discharged from this compressor can be obtained by interpolation as,

$$\frac{t_{sd}}{25} = \frac{0.16828 - 0.16608}{0.17330 - 0.16608}$$

from which $t_{sd} = 7.6$ deg.

As the saturation temperature at 121 psia is 94 F the actual temperature, t_d, of the vapor leaving the compressor is, $t_d = 94 + t_{sd} = 94 + 7.6 = 101.6$ F. By the same kind of interpolation the enthalpy of the discharged vapor can be determined from the enthalpies given for vapor superheated 25 F and for saturated vapor,

$$\frac{(h_d - 88.10)}{(92.16 - 88.10)} = \frac{(0.16828 - 0.16608)}{(0.17330 - 0.16608)}$$

from which, $h_d = 89.34$ Btu per pound.

Then substituting into Equation 5,

$$(\text{hp}) = 26.3 (89.34 - 82.82) \div 42.42 = 4.03$$

(*d*) The rate of heat loss from the condenser, Q_c, must be equal to the sum of the energies picked up by the refrigerant in the evaporator and the compressor,

$Q_c = 53.14 + (89.34 - 82.82) = 53.14 + 6.52 = 59.66$ Btu per pound or $26.3 \times 59.66 = 1569$ Btu per minute. This same figure can, of course, be determined more directly by subtraction of the enthalpy of liquid leaving the condenser from the enthalpy of superheated vapor going into it, thus,

$$Q_c = 26.3 (89.34 - 29.68) = 1569 \text{ Btu per minute.}$$

(*e*) The cooling water rate (based on a gallon as 8.34 lb) is $1569 \div (8 \times 8.34) = 23.5$ gpm.

(*f*) The compressor size is fixed by the volume of gas which must be drawn into the machine per unit time. Saturated vapor at 52.7 psia has a specific volume, from Table 1, of 0.779 cu ft per pound, hence $26.3 \times 0.779 = 20.49$ cfm of gas must be handled. Assuming a volumetric efficiency of 90 per cent the compressor must then displace $20.49 \div 0.9 = 22.8$ cfm. The speed is given as 500 rpm and as the unit is known to be double-acting the displacement is therefore $(22.8 \times 1728) \div (2 \times 500) = 39.4$ cu in. If the unit were designed so that bore, d, and stroke were the same,

$$(\pi d^3) \div 4 = 39.4 \qquad d = 3.69 \text{ in.}$$

Coefficient of Performance

In order to permit evaluation of the effectiveness with which any given cycle operates, some term is desirable which would be comparable to the *efficiency* that is used for heat engines. In refrigeration the desired effect is heat extraction and the cost of achieving this extraction is the amount of energy which must be supplied as shaft work. Thus the ratio of refrigerating effect to the heat equivalent of the compressor work is used as a measure of effectiveness and is defined as the coefficient of performance, thus,

$$(\text{cop}) = (h_{vs} - h_{fc}) \div (h_d - h_{vs}) \qquad (6)$$

where

cop = coefficient of performance.
h_{vs} = specific enthalpy of saturated vapor entering compressor.
h_{fc} = specific enthalpy of liquid at discharge from condenser.
h_d = specific enthalpy of vapor at discharge from compressor.

The subscripts vs, d, and fc represent state points at suction and discharge of the compressor and at discharge from the condenser. Thus for the conditions of the simple saturation cycle which was used in Example 1,

$$(\text{cop}) = (82.82 - 29.68) \div (89.34 - 82.82) = 8.17.$$

This coefficient can be compared with that which would exist if the system were to operate on an ideal Carnot cycle for which the coefficient of performance would be,

$$(\text{cop}) = \frac{T_s}{T_c - T_s}$$

where

T_s = evaporator temperature, Fahrenheit degrees, absolute.
T_c = condenser temperature, Fahrenheit degrees, absolute.

In problem 1, T_s = 501 F (which is 41 F + 460) and T_c = 554 F (which is 94 F + 460) and,

$$(\text{cop}) = \frac{501}{(554 - 501)} = 9.6$$

The actual cycle is therefore 8.17 ÷ 9.6 or 85 per cent as effective as a Carnot cycle between the same temperature limits.

Influence of Suction Pressure

Brief consideration of the analytical procedure used in discussion of the simple saturation cycle will bring out the need for maintaining the suction pressure on any refrigeration system as high as the load will permit. As the suction pressure increases, for fixed discharge pressure, the enthalpy of refrigerant entering the evaporator remains unchanged, but the leaving enthalpy increases and hence the refrigerating effect increases. Further, compressor energy input is reduced not merely because of the greater enthalpy of the gas at suction, but also because of a reduction in the enthalpy of the superheated gas at discharge. Since the refrigerating effect is greater and the work less, it is obvious that there will be a substantial gain in the coefficient of performance.

The actual value of suction pressure on any system is obviously determined by the required temperature which must be maintained in

the conditioned space. For a direct expansion system the evaporator can be held at a temperature not much less than that of the conditioned enclosure except in cases where lower temperatures may be needed in order to establish a desired ratio of dehumidifying to cooling load. When dehumidification requirements dictate the use of unusually low evaprorato temperatures the increased operating cost should properly be charged against the dehumidification rather than the sensible cooling.

Influence of Discharge Pressure

In contrast to the suction pressure, the compressor discharge pressure should be kept as low as operating conditions will allow. This pressure must be high enough to provide a saturation temperature of refrigerant within the condenser which is greater than the exit temperature of the cooling water. The discharge pressure therefore is a direct function of the temperature of the cooling fluid and will automatically rise whenever the temperature of cooling water (or air) rises; it will also rise when the flow rate of the cooling medium is decreased.

Increase in discharge pressure (for fixed suction pressure) raises the enthalpy of the gas leaving the compressor, hence increases the work of compression. Further, the enthalpy of saturated liquid leaving the condenser increased with pressure so the refrigerating effect must decrease. Thus the effect of such a pressure rise is to require more work per pound of refrigerant handled and at the same time to necessitate an increase in the refrigerant flow rate.

Influence of Water Jacket

The preceding discussion has, in every case, assumed isentropic compression. Where exact performance data are not available this assumption is a desirable one since it leads to a conservatively large determination of the power required. In most actual systems the compression process departs from isentropic due to irreversible heat transfers which occur between the vapor in the cylinder and the cylinder wall and also because of intentional heat dissipation from the outside of the cylinder walls to the surroundings, or to a cooling fluid passing through a water jacket around the cylinder.

Exact measurement of the heat carried away in the jacket cooling water requires facilities which frequently are not available on field installations, but a reasonably close approximation to both the heat loss and the work requirement can be obtained from theory, providing the temperature of the gas leaving the compressor is experimentally determined. Knowing the temperature and pressure at both suction and discharge, the actual state points can be readily determined from the tables of refrigerant properties and the entropies and enthalpies thereby evaluated. Then the energy dissipation to cooling water can be calculated approximately from the equation,

$$Q_j = W_r\,(\Delta s)\,T_{avg} \qquad (7)$$

where

Q_j = energy dissipated to cooling water, Btu per minute.

W_r = weight of refrigerant, pounds per minute.

Δs = entropy change between suction and discharge.

T_{avg} = average temperature of gas passing through compressor, Fahrenheit degrees, absolute.

The work of compression is then given by the equation:

$$(\text{hp}) = [W_r (h_d - h_{vs}) + Q_j] \div 42.42 \qquad (8)$$

where

hp = horsepower.
h_d = enthalpy of vapor at compressor discharge.
h_{vs} = enthalpy of saturated vapor entering compressor.

From the form of Equation 8 it would appear that an increase in the energy loss to the jacket would result in a greater power requirement since the Q_j term is additive; actually, however, computation will readily show that the effect of an increase in the Q_j term is to *decrease* the horsepower since the rate of decrease of enthalpy difference will, in every case, exceed the increase in heat loss. Thus compressor cooling is highly desirable as a method of reducing power consumption.

Influence of Superheating and Subcooling

The most common departure from conditions of the simple saturation cycle is that resulting from admission of superheated vapor to the compressor. Thermodynamically, superheat is undesirable since the enthalpy increase required to compress a vapor through a given pressure range increases with superheat. Further, superheated vapor leaving an evaporator is usually an indication that the suction pressure is lower than necessary. Under practical operating conditions, however, superheat is almost universally used as a means of assuring complete vaporization of the refrigerant going to the compressor. With modern compressors operating at high speed and with relatively small clearance space it is particularly necessary to avoid admission through the suction valves of liquid refrigerant.

Another common departure of actual systems from the simple saturation cycle occurs because of subcooling of refrigerant in the condenser. Thermodynamically such subcooling is advantageous since it increases the refrigerating effect without affecting the unit energy requirements of the compressor. Further, it can be shown that for a fixed ratio of condenser cooling water to refrigerant circulating rate the total compressor power requirements will be greater when operating simple saturation than when operating with maximum sub-cooling. What is even more surprising is that condenser pressure may be lower for the sub-cooling cycle than for the saturation cycle; this condition results from the fact that, for the same capacity on a heavily loaded condenser, the refrigerant flow rate is less when there is sub-cooling.

Because of the advantages attendant upon the use of sub-cooling, many methods are in use for obtaining some sub-cooling effect outside of the condenser. One common procedure is to use the cold vapor leaving the evaporator to cool the liquid flowing from condenser to expansion valve. In this case subcooling is realized at the expense of superheating the suction vapor and thermodynamic analysis will show at once that a definite loss will accrue. The only conditions under which such a system can be justified are those for which the vapor would, in any event, pick up a comparable degree of superheat while en route to the compressor; in this event the deliberate superheating, with useful subcooling as a result, is preferable to the useless superheating which would otherwise occur. In small compressors having large surface area in relation to volume, a definite gain is usually accomplished by such interchange, because for such units there would be considerable heating in any event. On very

large compressors the loss in volumetric efficiency would more than offset any gain, and the capacity would be reduced. Somewhere between these two extremes, the exact point depending on the type of compressor, location of valves, etc., the two factors would offset one another.

Another somewhat unusual subcooling cycle allows cold refrigerant from the downstream side of the expansion valve to cool liquid refrigerant from the condenser down to the evaporator temperature. In such a case the *expansion* valve becomes a simple pressure-reducing valve since there is no vapor formation—hence no expansion—during passage of the liquid refrigerant through it. This system is theoretically identical, from the standpoint of thermodynamic effectiveness, with the simple saturation cycle.

Clearance and Conventional Volumetric Efficiency

Clearance, like displacement, is a characteristic—usually fixed—of a given compressor. In some cases clearance pockets are provided which place within the operator's control the ability to alter the clearance of the machine, but most moderate size compressors are built with fixed clearance. By definition the clearance is the percentage of the volume swept by the piston which is represented by spaces in the end of the cylinder (including valve spaces, etc.) when the piston is at the end of its stroke.

Because of the trapping of high pressure vapor in the clearance space, and its subsequent re-expansion, the suction valves of the compressor do not open until the piston has completed part of its stroke. Hence the volume of fresh vapor introduced into the compressor per stroke is less than the volume swept by the piston. The ratio of actual volume of fresh gas to swept volume is, by definition, the conventional volumetric efficiency, CVE. In equation form,

$$(\text{CVE}) = 100 - V_c \left[\frac{v_s}{v_d} - 1 \right] \tag{9}$$

where

CVE = conventional volumetric efficiency.

V_c = clearance, per cent of volume swept by piston, which is contained in spaces at end of cylinder when piston is at end of stroke (clearance includes valve spaces, etc.)

v_s = specific volume of gas at compressor inlet.

v_d = specific volume of gas at compressor discharge.

Values of v_s and v_d can be obtained directly or by calculation from the tables of properties of refrigerants.

Influence of Wiredrawing and of Piping Losses

The pressure drop which occurs during passage of the refrigerant through suction and discharge valves of the compressor is known as wiredrawing. Its effect is equivalent to that of a reduction in the evaporator pressure (but without the disadvantage of reduced refrigerating effect) and an increase in condenser pressure; hence it is undesirable. In analyzing a cycle, wiredrawing can be taken into account since it amounts to the interposition of a small *expansion valve* between the state point of vapor leaving the evaporator and that of vapor at start of the compression process; a similar equivalent valve can be considered as interposed at the end of the compression process and before the state point corresponding to the condition of the superheated vapor in the discharge line.

In exactly the same way representation on the ideal cycle can be given to the pressure losses that occur in the connecting piping. In each case the entire loss of a given line can be treated as though it occurred during passage through an equivalent expansion (or pressure reducing) valve located at any convenient place in the line. Data to permit evaluation of line losses are given in a subsequent section of this chapter.

Complex Refrigeration Cycles

The preceding sections have dealt only with refrigeration systems in which there is but one evaporator. When two or more evaporators are required, and the pressures differ in each, much greater opportunity is afforded the engineer for obtaining large economies through selection of one of the more complex cycles. Consider, for example, the refrigeration requirements of an air conditioning system which is to cool a very large volume of 90 F outside air down to a conditioned temperature of 40 F. A simple saturation system, operating with evaporator temperature less than 40 F, would accomplish the desired purpose, but at the expense of excess power requirements since 50 per cent of the sensible cooling load could instead be handled by an evaporator operating at a temperature somewhat less than 65 F. The more effective procedure in this case would be to place two direct expansion coils in series, the first operating at a temperature less than 65 F and the second at a temperature below 40 F. In this way approximately one half of the total load would be picked up at the higher evaporator pressure and therefore need be raised through a much smaller thermal height. The theoretical advantage of such operation can be visualized from the increase in Carnot effectiveness; assuming that the condenser temperature is 100 F, the coefficient of performance (cop) of the low temperature evaporator is,

$$(\text{cop}) = (35 + 460) \div (100 - 35) = 7.63$$

while that of the higher temperature evaporator is,

$$(\text{cop}) = (60 + 460) \div (100 - 60) = 12.97.$$

Since the load is assumed to be equally distributed between the two evaporators the cop of the series system is the arithmetical average of the values for the two evaporators or, $(7.63 + 12.97) \div 2 = 10.30$. Thus use of the series cycle would afford a theoretical saving in power of approximately one third.

One common fallacy, with respect to complex systems, is the misconception that a high evaporator pressure necessarily means a low power requirement. In many instances operating conditions will require use of series evaporators, but in a cycle for which the vapor leaving the higher pressure evaporator must be throttled to the pressure of the low pressure evaporator before entering the compressor, there obviously is no advantage resulting from the higher operating pressure of the one evaporator, since the refrigerant which it handles must be compressed through the same *lift* as though both evaporator pressures were the same. Consideration of this case brings out the fact that the effectiveness of a complete cycle depends upon the possibility of operating the system with suction vapor at different pressures. This can be accomplished through use of more than one compressor, or by means of special individual compressor arrangements which permit use of different suction pressures in the opposite ends of a double-acting machine, or introduction of vapor at two different pressures into the cylinder of a dual-effect compressor.

Compound Compression Cycles

In large systems the compression process can be carried out in steps as the refrigerant passes through a number of cylinder ends arranged for operation in series. Thermodynamically the advantage of compound compression arises from the fact that intercoolers can be placed between the stages of compression to extract heat from the vapor and thereby cause the over-all compression process to more closely approach the ideal condition of isothermal compression. Essentially, such intercoolers—whether of the water or the flash refrigerant type—serve the same purpose as a cooling jacket, but with greater effectiveness because of the more satisfactory heat transfer conditions.

Multiple Expansion Valves

In the simple saturation cycle the saturated liquid entering the expansion valve commences to vaporize as soon as its pressure starts to drop. The vapor produced during the expansion process has no further use, in terms of refrigerating effect, since it has already picked up its latent heat of vaporization as a result of heat which it has extracted from the unvaporized residue. Thus the instant such vapor forms, its usefulness is at an end, and to allow such material to undergo a further drop in pressure is uneconomical. Unfortunately, however, there is no effective means of extracting vapor continuously during the expansion

and re-compressing it. Thus in the simple cycle the flash vapor must necessarily be allowed to drop to evaporator pressure.

When a compound compression cycle is used there is at least one intermediate pressure at which flash vapor can be extracted. In such cases all refrigerant from the condenser can be dropped through a first expansion valve to the higher suction pressure and the flash vapor then extracted and returned to the compressor. Some of the resultant liquid refrigerant then passes through the high-pressure evaporator while the remainder proceeds through a second expansion valve in which its pressure is dropped to the valve corresponding to the low-pressure evaporator.

Pipe Sizes and Friction Losses

The effect on performance of pressure losses in the piping of a refrigerating system has already been discussed. In all cases frictional losses should be kept to a minimum and piping should be selected which will give the smallest loss consistent with over-all economy of the system. Actual losses vary, of course, with the physical characteristics of the particular refrigerants, but, by way of example, data will be given for one of the refrigerants, dichlorodifluoromethane (F-12) which finds wide use in air conditioning applications.

Tables 8, 9, and 10 give the pressure loss per 100 ft of piping (including an *average* number of fittings) for oil-free dichlorodifluoromethane;

tabular values should be increased if oil is flowing with the refrigerant. For copper pipe the tables are for type L tubing and are based on the outside diameter.

Common practice fixes suction line velocities between 1,500 and 3,000 fpm while 2,000 to 3,500 fpm is the accepted range for discharge lines. Velocities higher than those indicated will result in noisy operation while lower velocity in the suction line may result in the loss of entrained oil. Refrigeration for air conditioning usually involves wide variation in load, requiring double suction risers, one large and one small. The large riser should be trapped to insure oil return while the small riser should be

sized for a velocity of 3,000 fpm at minimum load; and the large riser then sized to handle the balance of the load at a velocity not less than 2,000 fpm. The total pressure loss in the suction piping, including valve losses, is usually between 2 and 3 psi while hot gas line losses are held to approximately 4 psi and liquid line losses are not greater than 5 psi.

As protection against re-condensation on the cylinder head of the compressor, a surge drum is sometimes installed in the discharge line close to the compressor; this protection is especially desirable on systems using evaporative condensers where sun effect during shut-down may be serious.

The Air Refrigeration Cycle

Fundamentally, the air refrigeration cycle is essentially the same as the vapor cycle. The only important difference is that, since air does not change phase between the compressor and the expansion valve, it is necessary—and is also advantageous—to replace the expansion valve with an expanding engine. There is no temperature change in a perfect gas (and air approaches in behavior such a gas) during a constant enthalpy pressure reduction and hence an expansion valve of the usual type would be ineffective as a means of achieving low temperature in an air system. By utilizing an expander, however, the desired temperature drop is obtained, and, with it, a release of a considerable amount of energy as shaft work. In most air systems the expander and the compressor are so

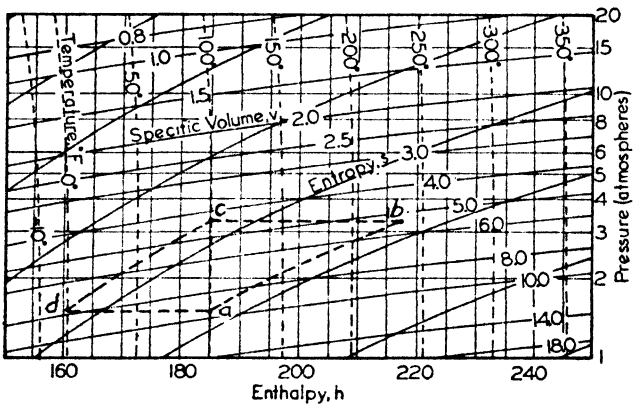

FIG. A. PRESSURE ENTHALPY DIAGRAM FOR DRY AIR

connected that work coming from the expander is supplied to the compressor and the remaining compressor work requirements are then made up from some external energy source.

For vapor cycles work could also be obtained by using an expander in place of an expansion valve, but since material going to the expander would be in liquid form the amount of energy released during the pressure drop (and partial evaporation due to flash) would be relatively small and in most cases insufficient to justify the increased first cost and complexity of the expander.

Fig. A shows the most important working section of a pressure-enthalpy chart for dry air. A typical air cycle is shown by the heavy dashed lines forming the abcd area. Dry air at 100 F and 7 psig (1.5 atmospheres) enters the compressor at a with enthalpy of 185 Btu per pound and is compressed isentropically to the discharge point b where its pressure is 35 psig (3.3 atmospheres), enthalpy 218 Btu per pound and temperature 240 F. From b this hot, high pressure air passes through a cooler in which its temperature and enthalpy are reduced (at constant pressure) to the initial values; point c gives the state of the air leaving the cooler. If, now, this air were allowed to pass through an expansion valve its state at discharge would be a and no refrigerating effect would be available. Actually the air at c goes through an isentropic expander and leaves at state d with enthalpy and temperature of 161 Btu per pound and 0 F.

The refrigerating effect for the cycle shown is enthalpy at a − enthalpy at d = 24 Btu per pound.

The work input to the compressor is 218 − 185 = 33 Btu per pound.

The work obtained from the expander is 185 − 161 = 24 Btu per pound.

The net work required for the cycle is then 33 − 24 = 9 Btu per pound of air per minute.

The coefficient of performance (cop) is 24/9 = 2.67.

The air circulating per ton of load is 200/24 = 8.3 lb per minute.

The power requirement is 9/42.42 = 0.21 hp per pound of air or 0.21 × 8.3 = 1.75 hp per ton.

The example given, based on isentropic compression and expansion, gives a simple and conservative method of checking an air cycle. In practice, better economy is obtained if the compression process approaches isothermal rather than isentropic; the expander preferably operates isentropically. To reduce the size of the expanding cylinder and to avoid frosting difficulties, the air system usually operates with a low

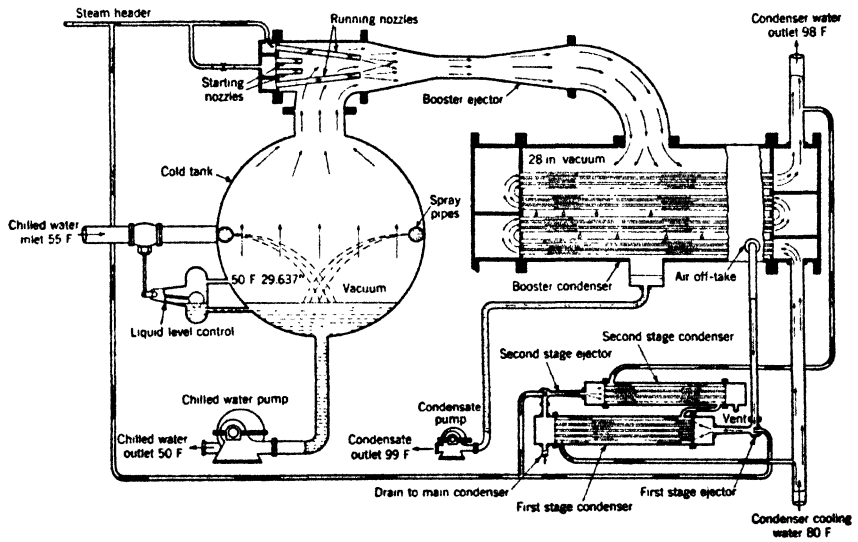

FIG. 2. DIAGRAMMATIC ARRANGEMENT OF STEAM JET VACUUM COOLING UNIT

pressure somewhat more than atmospheric. The usual compression ratio is about 4.

The principal advantage of the air system is that its refrigerant (air) is inexpensive and non-toxic. Serious disadvantages are size and cost of equipment and such a low coefficient of performance, that air refrigeration has no commercial importance today.

The Steam Jet System

The steam jet system under certain circumstances is desirable for use in air conditioning[1]. Steam supplies directly the power used for compressing the refrigerant, thus eliminating the losses connected with other methods of supplying energy. As the compression ratio between the evaporator and condenser under normal circumstances is large, the mechanical efficiency of the equipment is somewhat lower than that of the positive mechanical type compressor. The condensing water requirements are considerably greater, as both the refrigerant and the impelling steam must be condensed.

The steam jet system functions on the principle that water under high vacuum will vaporize at low temperatures. Steam jet boosters or com-

pressors of the type commonly used in power plants for various processes will produce the necessary low absolute pressure to cause evaporation of the water.

A diagrammatic representation of a typical steam ejector water cooling system is shown in Fig. 2. The figures correspond to an average representative system. The water to be cooled enters the evaporator and is cooled to a temperature corresponding to the vacuum maintained. Because of the high vacuum, a small amount of the water introduced in the evaporator is flashed into steam. As this requires heat, and the only source of heat is the rest of the water in the evaporator tank, this other water is almost instantly cooled to a temperature corresponding to the boiling point determined by the vacuum maintained. The amount of water flashed into steam is a small percentage of the total water circulated through the evaporator, amounting to approximately 11 lb per hour per ton of refrigeration developed. The remainder of the water at the desired low temperature is pumped out of the evaporator and used at the point where it is required.

The ejector compresses the vapor which has been flashed in the evaporator, plus any entrained air taken from the circulated water, to a somewhat higher absolute pressure and the vapor and air mix with the impelling steam on the discharge side of the jet. The total mixture then passes from the ejector into the condenser.

The slight amount of air which may be entrained in the cooled water is removed by a small secondary ejector which raises the pressure sufficiently so that the air can be discharged to the atmosphere. A secondary condenser is then necessary to condense the steam in the secondary jet.

While a single booster of smaller than 15 tons capacity is difficult to build, steam jet vacuum cooling units have been built for as small as 5 to 6 tons capacity. They can readily be built for steam pressures of from 5 to 200 lb per square inch and condenser water temperatures as high as 90 F. The steam consumption in pounds per hour per ton of refrigeration increases rapidly as the booster steam pressure is lowered. For example, the lowering of the booster steam pressure from 200 to 90 lb per square inch results in an increase in steam consumption of approximately 5 per cent, whereas a further decrease in booster steam pressure to 10 lb per square inch increases the steam consumption by approximately 72 per cent over that required at 200 lb per square inch.

The capacity of a steam jet system is usually controlled by controlling the number of boosters in use since the unit usually has several boosters operating on the same evaporator. Usually one booster is automatically controlled whereas the others are manually operated. The capacity is dependent, as for all compressors, upon the evaporator temperature, or in other words, the suction pressure. For example, the capacity is lowered approximately 17 per cent if the evaporator or chilled water temperature is lowered from 50 to 45 F. The capacity therefore can be controlled to some extent by regulating the evaporator temperature.

The Absorption System

The work needed for operation of a compressor is given by the equation, Work $= \int PdV$. If the working fluid which is undergoing the pressure rise does not change in volume, the required energy input to the com-

pressor would be negligible; assuming no change in kinetic energy of material between entrance and exit of the compressor the only energy required would be that needed to increase the flow work of the fluid. Calculation will show that energy needed to raise 1 lb of ammonia from the pressure of a 0 F evaporator to that of an 85 F condenser is greater by more than 100 times when the vapor is directly compressed, as compared with energy requirements when it is first absorbed in water ($1\frac{1}{2}$ lb of water per pound of ammonia vapor) and then pumped to the higher pressure. Thus the essence of the absorption refrigeration cycle concept is the idea of raising the refrigerant pressure when the refrigerant is in liquid rather than vapor form.

The absorption and compression refrigeration cycles differ only with respect to the method of compression. Each cycle requires a condenser,

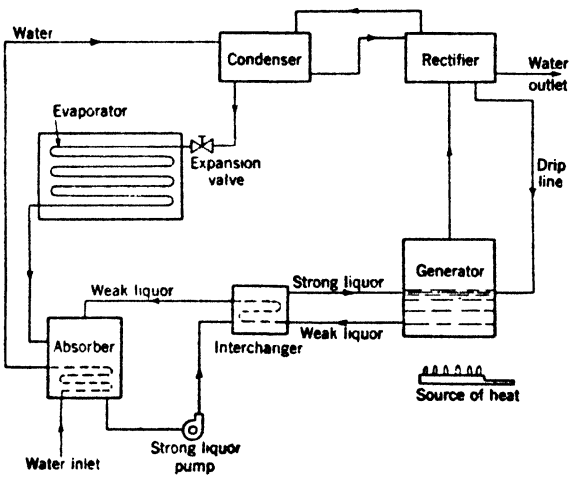

FIG. 3. CLOSED ABSORPTION SYSTEM

expansion valve, and evaporator, but the absorption cycle utilizes three major equipments in place of the mechanical compressor; these equipments are the *absorber*, the *pump*, and the *generator*. Vapor from the evaporator is absorbed by a low temperature absorbent fluid which is then pumped to the generator where heat is supplied to boil off the refrigerant. The absorbent is now cooled and readmitted, through a pressure-reducing valve, to the absorber.

In addition to the three primary equipments of the absorption cycle it is necessary to provide auxiliary equipment, usually an analyzer and a rectifier, to remove from the refrigerant leaving the generator, insofar as is possible, the absorbent which vaporizes and leaves the generator with the refrigerant. Removal of this material is of great importance to effective operation of the system, since even a small concentration of absorbent in the refrigerant will suffice to reduce greatly the evaporator pressure required for maintenance of a given evaporator temperature. Thermodynamic analysis of absorption cycles is relatively complex and requires the use either of tables or graphs showing the equilibrium relationships and thermodynamic properties of the refrigerant-absorbent combination. Data of this kind are available in bibliography item 1 and a discussion of various absorbents is given in bibliography item 6.

Thermodynamically the effectiveness of a refrigerant-absorbent combination increases directly with its negative deviation from Raoult's Law.

Fig. 3 shows a typical absorption cycle flow diagram. Cooling water first goes through the absorber (where it extracts the heat of absorption which is liberated by the refrigerant vapor as it goes into solution), then through the condenser, and finally through the rectifier. Refrigerant from the evaporator enters the absorber where it goes into solution in the absorbent; the high concentration solution is then pumped to the generator where heat is supplied; the refrigerant (with some absorbent vapor) leaves for the rectifier and the warm low concentration solution is returned to the absorber. In the rectifier selective condensation occurs, the concentration of the absorbent in the condensate being much greater than its concentration in the entering vapor mixture; rectifier condensate is dripped back to the generator.

The total energy requirements of an absorption cycle greatly exceed those of a compression system, but the energy required is of low availability (heat) in contrast with the high availability requirements (shaft work) of the mechanical compressor. Thus in localities where heat and cooling water are obtainable at low cost, it will be more economical to use a large quantity of inexpensive thermal energy in preference to a much smaller quantity of expensive shaft energy. For most absorption systems the heat required will be from one and one-half to five times as much as the heat extracted in the evaporator; cooling water requirements are proportionally high.

Ice Systems

Cold water systems using ice as the cooling agent have been installed in many theaters, restaurants, funeral homes, churches and other places where short hours of operation and high peaks of cooling demand make this type of system desirable. A comparatively small quantity of ice in the water cooling tank of such a system can release refrigeration at a relatively rapid rate. For instance, neighborhood theaters having a peak demand of 1,200,000 Btu per hour (100 tons refrigeration) have found 8 ton capacity ice bunkers satisfactory.

In operation, the water in the air conditioning system is circulated over ice placed in an insulated box and is cooled to the 38 or 40 F range or higher if desired. This cold water is pumped from the ice bunker to air cooling coils or spray type air washers. The blowers, coils, air washer or air handling sections are the same as those parts in any system employing cold water as a refrigerant.

The ice water cooler or ice bunker is usually built at the installation in a location where it can easily be iced. It can be constructed of any desired material such as concrete, steel, or wood with an adequate amount of insulation to save the ice from one period of use to the next. The basic requirement is that the tank be durable and water tight. A typical bunker with connections to a coil type air conditioning system is shown in Fig. 4. About 60 cu ft of gross bunker volume are allowed per ton of ice capacity.

The shape of the bunker usually conforms to the available space. The one illustrated has overhead sprays, but if head-room is lacking the ice is placed on the floor of the bunker with the water returned around the lower part of the blocks from a perforated distribution pipe run along one

side of the bunker. To secure good circulation the supply water is extracted from a similar perforated pipe on the opposite side of the bunker.

The temperature of the water is controlled at a predetermined point by a thermostat in the supply line. If the temperature drops too low, a part of the return water is by-passed directly to the sump and is not cooled over the ice. In the larger systems it is customary to install an overflow control which, as the ice melts, discards the excess water through an economizer coil. The surface of the economizer is large in relation to the flow so that the water is warmed to 60 F or more as it is discharged from the system.

Storage Systems

In an attempt to lower initial equipment cost and operating expense, or increase the refrigeration capacity of an existing air conditioning

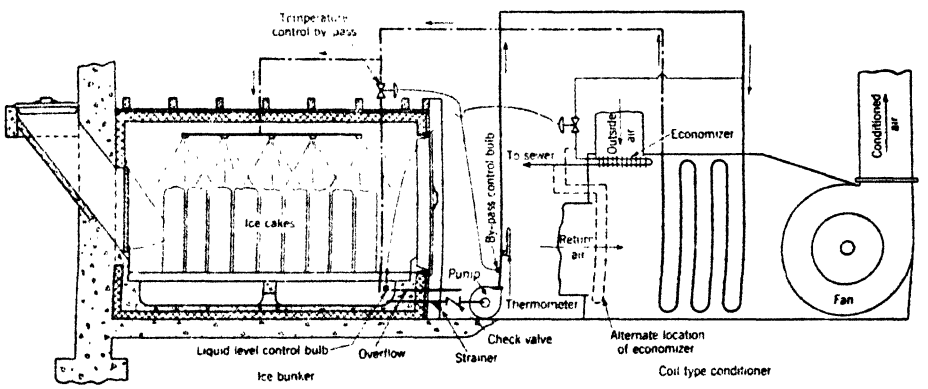

FIG. 4. TYPICAL ICE SYSTEM SHOWING BUNKER DETAILS

system, storage refrigeration has been utilized in a few applications. Some of the methods which have been adopted include the storage of refrigeration in the form of chilled water, chilled brine, ice on evaporator coils[2] and the accumulation of thin sheets of ice on copper plates in a steel tank[3]. If the peak load factor is low as compared with a long period of operation, such as in a restaurant, or if the hours of operation are short but the usage factor high as in a church, then it is possible to consider storage refrigeration. This method of accumulating refrigeration frequently makes it possible to use low cost off-peak electric power. Power costs may also be reduced by installing a smaller refrigeration plant, augmented by a storage system, and by operating it for longer periods.

The Reverse Cycle

The reverse cycle—frequently referred to as a *heat pump*—is identical in theory with the ordinary refrigeration cycle and differs only in the sense that the desired effect is a heat source rather than a heat sink. Since a condenser delivers more heat than is picked up by the evaporator (it discharges the heat equivalent of work supplied during compression) it follows that the effectiveness of a heat pump, its coefficient of perform-

ance, is greater than that of a refrigeration cycle operating between the same temperature limits.

In heating by the reverse refrigeration cycle energy is absorbed in an evaporator from some available source of heat, pumped to a higher temperature and delivered to a condenser[4]. The heat from the condenser is used for heating purposes. The compressor acts as a heat pump whose fundamental function is to raise the potential of the heat. The theoretical ratio of the heat delivered to the work of compression, the coefficient of performance, is given in Equation 10.

$$(\text{cop}) = \frac{T_c}{T_c - T_s} \tag{10}$$

where

cop = coefficient of performance.

T_s = absolute temperature of evaporator.

T_c = absolute temperature of condenser.

Thus, with a small spread of temperature between the evaporator and the condenser, 6 or 8 times as much heat may be obtained theoretically, and 3 to 5 times practically, as the work introduced. There are a number of limitations, however, the most serious of which is the lack of ready availability of a practical source of heat.

1. Well water is the most desirable since its temperature is higher than other sources even in the winter, and thus a large amount of heat may be removed in relation to the weight of water handled.

2. Air may be used but its specific heat is low and its temperature uncertain. When the most heat is needed, the temperature of the air is lowest, thus resulting in the least favorable temperature combination.

3. It has been proposed to obtain heat by freezing water but this is still in the experimental stage.

Some of the other factors which act as limitations are: the large temperature spread when using air as a source of heat and when attempting to cool with even moderately low outside temperatures, the frequent disparity between the size of the cooling load and heating load requiring extra equipment for a complete heating load, and the relatively high initial cost of equipment as compared to that at present available for heating by conventional means.

Because of these limitations, the present application of the system is largely limited to temperate climates, such as Florida and Southern California, or to heating only for intermediate seasons, or to other localities which have peculiar advantages as, for instance, the ready availability of well water. In these locations it is frequently possible to do all of the heating necessary with the refrigeration equipment so that the extra cost is only that of reversing the functions of the condenser and evaporator.

There are a number of reversed systems now in operation, particularly among utility companies, using well water as the source of heat. These systems range in size up to 320 hp. In the case of the largest system in operation at present, the cost of the electrical energy would have to be approximately 0.7 cents per kilowatthour in order to compete with oil at 6 cents per gallon.

A typical arrangement of a reversed cycle conditioning system where air is used as a source of heat is shown in Fig. 5. If the air seldom drops

below freezing, heat is often required in the morning and cooling during the afternoon in order to maintain comfortable conditions in such a system. The arrangement as shown lends itself to automatically changing over as required.

REFRIGERATION EQUIPMENT AND ARRANGEMENTS

Types of Compressors

There are many different types of compressors, using various refrigerants. Each type has its advantages for its particular application, and those generally used for air conditioning are of the following types:

1. Reciprocating compressors (commonly referred to as piston type).
2. Centrifugal compressors.

Reciprocating compressors are available in a wide range of sizes and types. Any of a number of refrigerants, including dichlorodifluoromethane

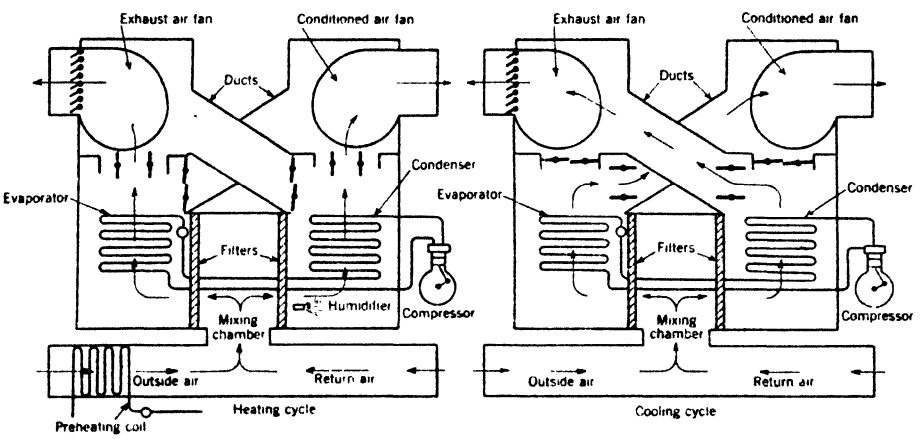

FIG. 5. SCHEMATIC OPERATION OF REVERSED CYCLE CONDITIONING SYSTEM

(F-12), methyl chloride, ammonia, carbon dioxide, and sulphur dioxide may be used in reciprocating machines. The first of these is used extensively in direct expansion systems of comfort air conditioning.

Compressors may be classified into two general types, (*a*) open type, (*b*) enclosed type. If the driving mechanism is external to the compressor, then the shaft must be brought out through the crankcase and a shaft seal or stuffing box must be used to prevent escape of the refrigerant. This type of compressor is known as an open-type compressor. When the driving mechanism is located within the crankcase of the compressor in such a way as to avoid the necessity of a shaft seal, the compressor is known as the completely enclosed or hermetically sealed type.

Open-type compressors may be further classified as belt driven and directly connected. A great number of direct-driven units are now being used which generally operate at higher rotational speeds than the belt-driven type.

The present tendency is toward forced lubrication of the bearings of compressors by means of an oil pump driven from the crankshaft, although there are many splash lubricated compressors on the market. The chief

advantages of the forced lubricated compressor are that the lubrication system requires less energy for its operation than the splash type, the oil can be easily filtered before it enters the bearings, and less oil is usually required.

The compressor capacity must be selected for and matched to the maximum load for the installation on which it is to be used. Air-conditioning loads, however, vary over a wide range, and a wide fluctuation in air conditions may result during periods of light load if on-and-off control of full compressor capacity is used. To prevent such undesirable fluctuation, several methods are employed to vary the capacity of reciprocating compressors, such as:

1. By-passing one or more cylinders, of a multi-cylinder compressor, from discharge to suction.

2. Rendering the suction valves of one or more cylinders of a multi-cylinder compressor inoperative. This is usually accomplished by depressing the suction valves.

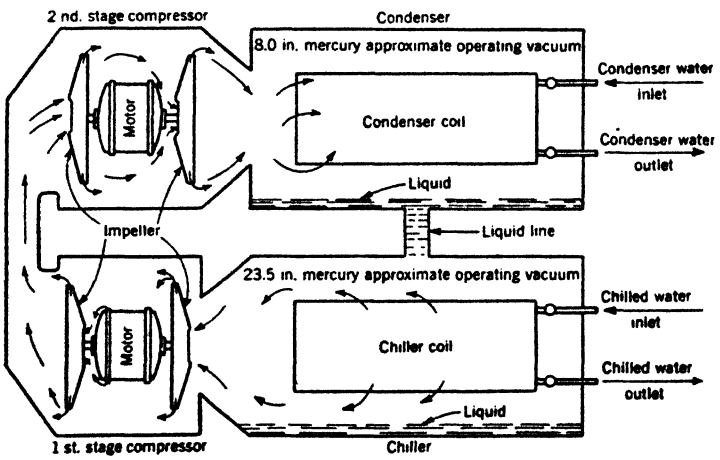

FIG. 6. ENCLOSED TYPE CENTRIFUGAL CONDENSING UNIT

3. Varying the speed of the compressor, usually by using variable speed or two-speed electric motors.

4. Using clearance pockets to control the quantity of refrigerant pumped.

5. Restricting the suction inlet to one or more of the cylinders of a multi-cylinder compressor either by an automatic modulating valve or by an *on* and *off* valve.

All of these methods, with the exception of variable speed, result in a slightly lower over-all compressor efficiency when in use, since the mechanical losses remain constant whereas the quantity of refrigerant pumped is lower.

Centrifugal compressors are used with very low pressure refrigerants; usually both evaporator and condenser work below atmospheric pressure. Water and monofluorotrichloromethane (F-11) are the refrigerants commonly used in centrifugal machines.

Compression of the refrigerant is accomplished by means of centrifugal force; therefore, this type of compressor is inherently suitable for large volumes of refrigerant at low pressure differentials. Two or more stages are usually required and high speeds are necessary to obtain good efficiency.

The evaporator is usually constructed as an integral part of the centrifugal type condensing unit, to chill water which is then circulated to the air conditioning system. This is done because it would not be economical to pipe these large volumes of refrigerant any distance.

Centrifugal compressors like reciprocating compressors can be divided into two general types, open and enclosed. In general, the open type compressor is geared to the driving mechanism, and operates at higher speed than the driving motor or turbine. A modern, completely enclosed, direct-driven centrifugal compressor is illustrated in Fig. 6.

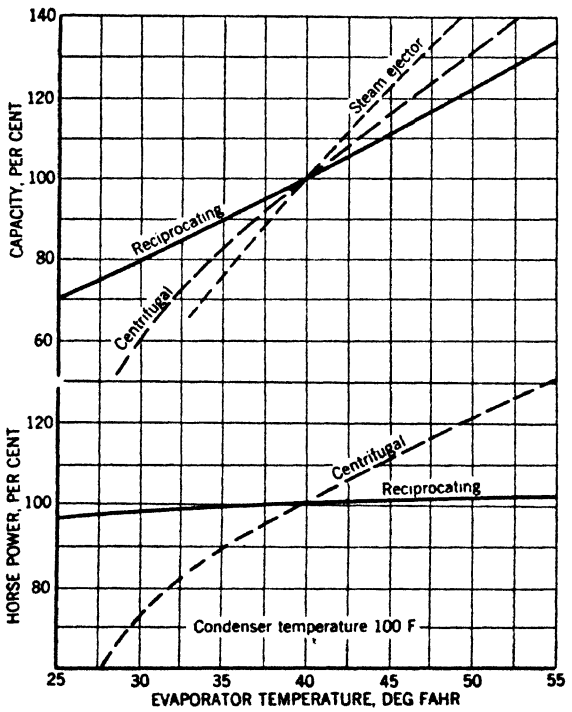

FIG. 7. PERFORMANCE CHARACTERISTICS OF COMPRESSION REFRIGERATION MACHINES AT CONSTANT SPEED

The compressor capacity can be varied by controlling the condensing pressure. This is accomplished by regulating the quantity and temperature of the condenser cooling water. The capacity falls off with increasing condensing pressure. Centrifugal compressors are seldom built for less than 50 tons capacity, since it is not practical to make impellers which pump much less than the volume of refrigerant required for this tonnage.

Characteristics of Compression Systems

The various types of compression systems have quite different characteristics of capacity and power with varying evaporator and condenser temperatures, as may be noted from curves in Figs. 7 and 8.

From Fig. 7 it may be observed that power requirements for the centrifugal compressor increase much more rapidly than for the reciprocating

compressor with increase in evaporator temperature. Similarly, the capacities of the steam ejector and centrifugal compressors increase more rapidly than those of the reciprocating compressor with increase in evaporator temperature. Thus, both the steam jet and centrifugal machines tend to be more self-regulating than the reciprocating. It is also evident from Fig. 7 that the steam jet equipment is best suited for operation at high evaporator temperatures.

The effect of condenser temperature upon the power and capacity of the different types of compressors is shown in Fig. 8. It may be noted that the power required by the reciprocating compressor increases rapidly with increase in condenser temperature, while the power curve for the

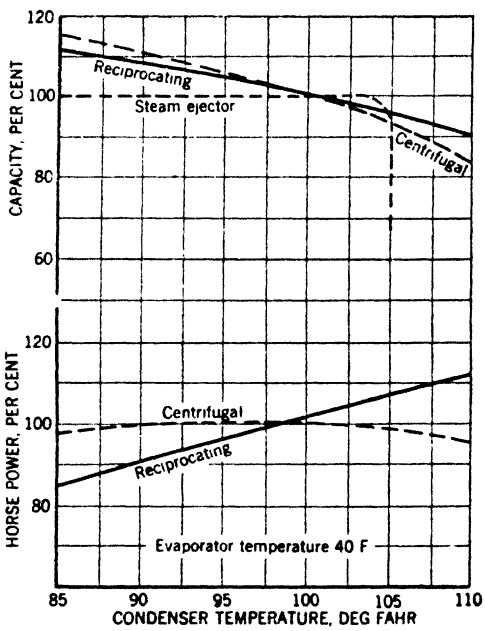

FIG. 8. PERFORMANCE CHARACTERISTICS OF COMPRESSION REFRIGERATION MACHINES AT CONSTANT SPEED

centrifugal compressor is relatively flat. It is also evident that the capacity of the steam jet compressor is independent of condenser temperature until a certain point is reached where it drops to zero. As previously stated, steam jet equipment requires more condensing water than other types of compression systems. Consequently, steam jet systems are well suited to those applications where condensing water is cheap, or where condensing water is rather high in temperature.

Condensers

Condensers used for liquefying the refrigerant are of three general designs: (1) *air cooled*, (2) *water cooled*, and (3) *evaporative* (combination air and water).

1. *Air cooled condensers* are seldom used for capacities above 3 tons of refrigeration, unless an adequate water supply is extremely difficult to obtain, as, for instance, in railway air conditioning. Even on fractional tonnage installations, air is used as the condensing medium only where

water is expensive or where simplicity of installation warrants the higher condensing pressure, and consequent higher power costs than would be obtained using water as the condensing medium.

The conventional air cooled condenser consists of an extended surface coil across which air is blown by a fan. The hot discharge gas enters the coil at the top and, as it is condensed, flows to a receiver located below the condenser. Air cooled condensers should always be located in a well ventilated space so that the heated air may escape and be replaced by cooled air.

The principal disadvantages of air cooled condensers are the power required to move the air and the reduction of capacity on hot days. This loss of capacity due to high condensing pressures on hot days requires that equipment of increased capacity be selected to meet the peak load. Thus at normal loads the equipment is oversized.

2. *Water cooled condensers* are of the double pipe type, the shell and tube type, or the shell and coil type. Double pipe condensers are arranged so that water passes through the inner of two concentric pipes and refrigerant circulates through the annular space between the pipes. Where possible, there should be counter-flow of the refrigerant and the condensing water to obtain maximum temperature differences. This type is usually used only with small condensing units.

The amount and temperature of the condensing water determine the condensing temperature and pressure, and indirectly the power required for compression. It is therefore necessary to determine a balance so that the quantity of water insures economical compressor operation.

Because there is a decided tendency to conserve the water in city mains and because most large cities are restricting the use of water for air conditioning and refrigeration equipment, it is often necessary to install cooling towers or evaporative condensers. Cooling towers, unfortunately, produce the warmest condensing water at the time when the load on the system is greatest, so that the refrigeration equipment must be designed to meet the maximum load at abnormal condensing water temperatures. If properly designed, this makes little difference in the efficiency of operation throughout the year except at those times when the condensing water temperature is highest. As this occurs only for 5 per cent of the entire cooling period it can be disregarded as a factor in establishing yearly operating costs.

The cooling tower has a certain advantage over the use of water from the city mains. Economies are possible when a cooling tower is used, which cannot be achieved by the use of condensing water from city mains. In certain localities, the lowest city water temperature during the summer months is from 65 to 70 F. This temperature range takes place for the entire cooling period, regardless of the outdoor temperature. With a cooling tower, the temperature of the condensing water may rise to 80 or 85 F under maximum conditions, but under less than maximum conditions the temperature of the water leaving the cooling tower drops considerably. It has been established that in these localities during 50 per cent of the time, the outdoor wet-bulb temperature varies from 60 to 70 F and the cooling tower water, for the same periods, varies from 65 to 75 F. When the outdoor wet-bulb temperature drops below 60 F, which occurs approximately 30 per cent of the time, the condensing water temperature is still lower. The cost of water used for condensing is small as the only water required is that used to make up the loss by evaporation

in the cooling tower itself. Refer to the section on Cooling Towers in Chapter 37.

Shell and coil condensers are in general use for medium sized condensing units, and consist of a coil of tubing mounted inside a shell. The cooling water passes through the coil.

3. *Evaporative condensers.* Due to the high cost of city water for condenser purposes, and due to ordinances in some localities prohibiting the discharge of large quantities of such water into the sewage systems,

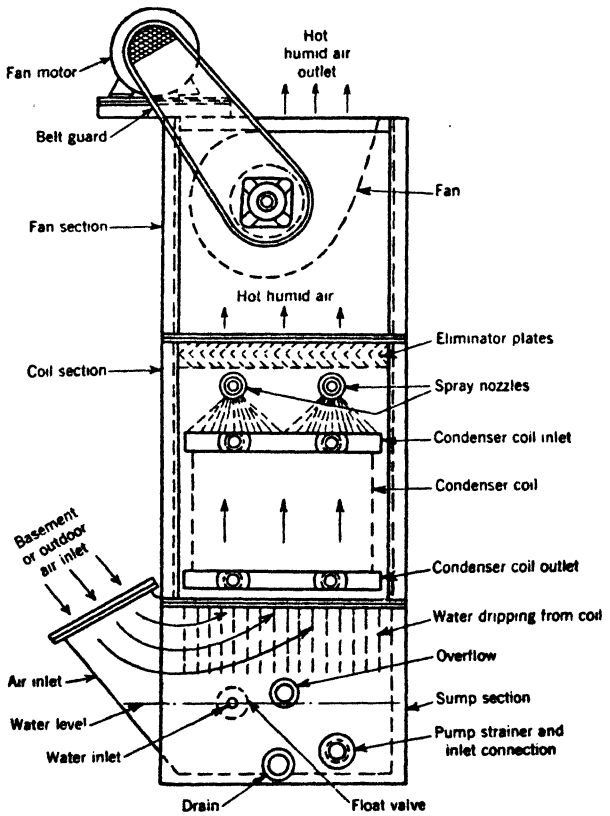

FIG. 9. SCHEMATIC VIEW OF AN EVAPORATIVE CONDENSER

there has been developed a condenser which uses a minimum amount of water on a finned surface, cooling it to approximately the wet-bulb temperature of the surrounding atmosphere.

The end view of a typical evaporative condenser is shown in Fig. 9. The fan draws the air over a finned tube condenser which is kept wet by a water spray. The discharge refrigerant gas from the compressor enters the top of the condenser coil and the liquid refrigerant is drained from the bottom of the coil into a liquid receiver and then circulates through the remaining portion of the system in the usual way.

The water is circulated through the spray nozzles and the level is maintained in the sump by means of a float valve. The eliminator plates are placed in the path of the water-air mixture so as to remove the

entrained water. The air leaving the unit is almost completely saturated, so that care must be taken in locating discharge ducts to prevent condensation.

Evaporative condensers are available in sizes up to 100 tons or more. These units use only a small portion of the water required for a water cooled condenser. The water is vaporized by the heat of the refrigerant so that each pound of water used extracts approximately 1000 Btu from the refrigerant, whereas under standard rating conditions where the water temperature rise is 20 F, each pound of water extracts only 20 Btu from the refrigerant. Including the water lost by entrainment in the discharge air, by overflow and stand-by evaporation, the water used is about 3 to 5 per cent of the amount that would be required for a water cooled condenser.

The evaporative condenser requires more maintenance, occupies greater space (must be located where air is available), and has a higher first cost than the water cooled condenser, but where the use of water is restricted

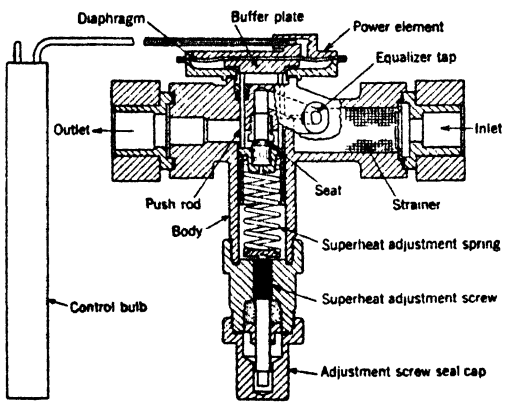

FIG. 10. TYPICAL THERMOSTATIC EXPANSION VALVE

or expensive, the evaporative condenser has become widely accepted. Compared with a water cooled condenser and cooling tower, which combination uses about the same quantity of water, the evaporative condenser has the advantage of lower cost and smaller space requirements.

Expansion Valves

The thermostatic expansion valve is a device to regulate the flow of liquid refrigerant so that the evaporator will always be used to best advantage. The evaporator coil must be kept as full as possible without any chance of liquid refrigerant entering the suction line. The expansion valve accomplishes this by regulating the supply of refrigerant, so that the temperature of the gas leaving the evaporator is always slightly higher than the temperature of the boiling refrigerant inside of it. This difference in temperature between the outgoing (suction) gas and the liquid refrigerant in the evaporator is called the superheat of the gas.

The operation of the thermostatic expansion valve can best be explained by means of a diagram, Fig. 10. A small refrigerant charge in the control bulb exerts a pressure through the tube to the upper side of the diaphragm, which tends to open the valve.

The magnitude of this pressure is determined by the temperature of the suction gas leaving the evaporator, as the control bulb is attached to the suction line at this point and is at approximately the same temperature. The suction pressure in the evaporator is transmitted through the equalizer tube and exerts an opposing force on the other side of the diaphragm in the direction to close the valve. This pressure corresponds to the temperature of the boiling refrigerant. The resulting force on the diaphragm is determined by the differential between the temperature of the suction gas and the boiling point of the refrigerant, which is the amount of superheat in the gas. If this temperature differential becomes greater (superheat increases), the resultant force on the diaphragm opens the valve and admits more refrigerant. The reverse is true if the superheat decreases, and the valve partly closes, thus admitting less refrigerant. The spring keeps the valve closed until the resultant force on the diaphragm corresponds to the desired superheat. The adjustment of the spring will change the amount of superheat to be maintained in the suction gas.

The selection of the expansion valve is, of course, determined by the capacity of the valve. The capacity of a valve with a given orifice is determined by the refrigerant used, the differential of pressure across the valve, and the amount the liquid is sub-cooled as it enters the valve. The expansion valves are usually rated at zero sub-cooling of the liquid, or 100 per cent liquid. Frequently special devices are used to properly distribute the refrigerant among the parallel paths of the evaporator. These distributing devices usually have considerable pressure drop. Where they are used, the pressure drop across the expansion valve is not the difference between suction and discharge pressures, as allowance must be made for the pressure drop across the distributing device. An equalizer connection from the evaporator suction line must be made to the underside of the diaphragm (see Fig. 10) whenever the valve outlet is not at the evaporator pressure so as to insure suction pressure at this point. When distributing devices are used, this equalizer connection is essential for proper operation of the valve. Another pressure drop allowance must be made for the liquid line, particularly when the liquid line has an appreciable vertical rise.

Whenever possible, expansion valves should be installed in a manner which will permit placing thermometer wells in the suction connection and allow sufficient room for free adjustment of the valve.

Evaporators and Coolers

The types of coolers used in connection with air conditioning work fall into three general groups. The *first*, is the direct cooling of water; the *second*, direct cooling of air; and the *third*, cooling of brine for circulation in a closed system, which can cool either water or air. One method of the direct cooling of water is to install direct expansion coils in the spray chamber so that the water sprayed into the air comes in direct contact with the cooling coils. Another common and efficient method of cooling spray water is to use a Baudelot type of heat absorber where the water flows over direct expansion coils at a rate sufficiently high to give efficient heat transfer from water to refrigerant.

Another type of spray water cooler is the shell and tube heat exchanger in which the refrigerant is expanded into a shell enclosing the tubes through which the water flows. The velocity of the water in the tubes affects the rate of heat transfer, and as the refrigerant is in the shell com-

pletely surrounding the tubes at all times, good contact and a high rate of heat transfer are insured. The disadvantage of such a system is that with the falling off of load on the compressor the suction temperature or the temperature in the evaporator drops and there is a possibility of freezing the water in the tubes, which, of course, might split the tubes and allow the refrigerant to escape into the water passage. This danger can be eliminated by automatic safety devices.

Another system of cooling spray water is to submerge coils in the spray collecting tank, or in a separate tank used for storage. The heat transmission through the walls of the coils, however, is low and a great deal

TABLE 11. BASIS OF EQUIPMENT SELECTION

400 and Over	Built up central systems using centrifugal compressors.	Built up central systems using steam jet.	

more surface is required than for any other type of cooler. However, with large storage tanks this type of cooling can be utilized to advantage.

When direct cooling of air is employed, the refrigerant is inside the coil and the air passes over it. Cooling depends upon convection and conduction for removing the heat from the air. The type of coil used can be either smooth or finned, the finned coil being more economical in space requirement than the smooth coil. The fins, however, must be far enough apart so as not to retain the moisture which condenses out of the air.

The indirect cooler, where brine is cooled by the refrigerant and the resulting cold brine is used to cool either air or water, introduces several other considerations. It is not the most economical from a power consumption standpoint, as it is necessary to cool the brine to a temperature sufficiently low so that there is an appreciable difference between the average brine temperature and that of the substance being cooled. This requires that the temperature of the refrigerant must be still lower, and consequently the amount of power required to produce a given amount of refrigeration increases due to the higher compression ratio. There are

other considerations which make such a system desirable. In the first place, where a toxic refrigerant is undesirable or cannot be used because of fire or other risks, especially in densely populated areas, the brine can be cooled in an isolated room or building and can then be circulated through the air conditioning equipment. This arrangement eliminates any possibility of direct contact between the air and refrigerant.

Equipment Selection

The selection of proper refrigeration equipment for any air conditioning job is of utmost importance for satisfactory results. The most important factors in the selection of the equipment are:

1. Loads (as determined by the conditions of the space to be cooled).
2. Economics (both initial and operating costs).
3. Codes (local safety codes must be adhered to and influence the type of system to be used).

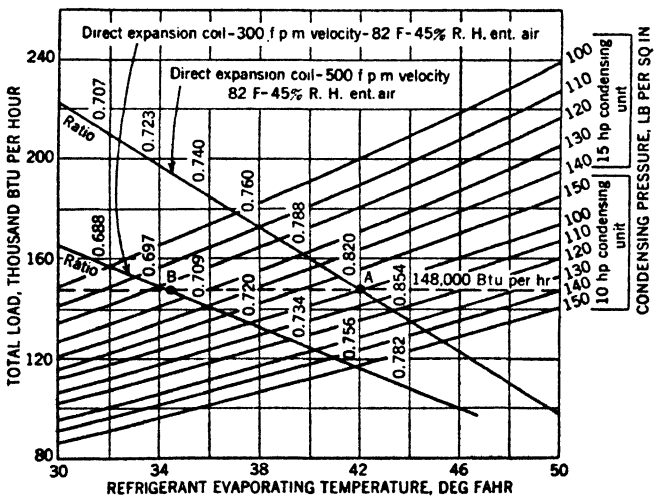

FIG. 11. COMPRESSOR AND COIL PERFORMANCE

A broad division of equipment to be used for a particular installation or application may be made on the basis of the magnitude of the load. Current general practice is outlined in Table 11.

Unit or *packaged* systems, consisting of a reciprocating compressor, condenser, evaporator, and fans, are generally used in the smaller sized jobs where electric power is available, as they are manufactured complete, ready to install and are the most economical (see Chapter 36).

The reciprocating compressor in the built-up central system (see Chapter 43) covers the widest range of application since it is applicable to either the direct expansion or indirect systems and can be driven by steam or gas engines, or by electric motors. The quantity of condensing cooling medium required is also less than for any other system with the exception of the centrifugal compressor, which uses the same amount.

Centrifugal compressors are used for large installations, and usually where the indirect system is required. The driving mechanism can be a

steam turbine or electric motor. The steam jet system is used where steam is available and cooling water can be had in large quantities.

It will be noted by referring to Fig. 7 that all systems using compressors have a common characteristic and that is that the capacity varies with the evaporating temperature. Not only can the equipment be selected to produce a given result, but the performance can be predicted under varying load conditions by the simple expedient of using the variable of evaporating temperature as the abscissa and the load or capacity as the ordinate in a series of curves.

Manufacturers of compressors and cooling coils furnish performance data for apparatus that can be plotted in the form of curves similar to those shown in Fig. 11. The performance of a compressor is plotted as a series of curves, each curve being drawn for a given condensing pressure. The performance of a direct expansion coil at two different air velocities is plotted on the same graph. The operating point will be, of course, where the two curves cross.

Data given in Table 12 illustrate two types of conditioned enclosures having the same total load of 148,000 Btu per hour, but with two different

TABLE 12. TYPICAL OPERATING CONDITIONS FOR TWO TYPES OF LOAD

Type of Enclosure	Load, Btu per Hour			Ratio Sensible to Total	Air Entering Coil		Operating Balance Point		
	Sensible	Latent	Total		F Deg	Per Cent R.H.	Evaporator Temp F Deg	Condenser Pressure Lb per Sq In.	Per Cent Sensible Heat
Restaurant	103,000	45,000	148,000	0.695	82	45	34.4	123	69.9
Office	121,000	27,000	148,000	0.820	82	45	42.2	100	82.1

ratios of sensible to total heat. In the case of the office with a ratio of 82 per cent sensible to total heat, the operating point *A* in Fig. 11 is found to be 42.2 F evaporating temperature with a face velocity of 500 fpm. In the case of the restaurant, with a ratio of 69.5 per cent sensible to total heat, the air velocity is lowered to 300 fpm and the evaporating temperature is lowered to 34.4 F as shown in point *B* of Fig. 11. In order to obtain the same capacity, a larger condensing unit is used. This illustration assumes zero pressure drop through the suction line. The pressure drop can be taken into account by shifting the compressor performance curves by the amount of pressure drop expressed in Fahrenheit degrees.

ABBREVIATIONS AND SYMBOLS IN CHAPTER

cop = coefficient of performance, ratio of refrigerating effect to the heat equivalent of the compressor work.
CVE = conventional volumetric efficiency.
d = internal diameter in inches.
H_t = cooling load in tons.
h_d = enthalpy of vapor at condition of discharge from compressor.
h_{fc} = enthalpy of liquid at discharge from compressor.
h_{fd} = enthalpy of liquid at discharge of expansion valve.
h_{fe} = enthalpy of liquid at entrance to expansion valve.

h_m = enthalpy of mixture.
h_v = enthalpy of saturated vapor.
h_{vd} = enthalpy of saturated vapor at discharge of valve or compressor.
h_{vs} = enthalpy of saturated vapor at state s entering compressor.
hp = horsepower.
p_d = pressure of saturated liquid and vapor at discharge of compressor.
p_s = pressure of saturated liquid.
psig = pressure pounds per square inch, gage.
psia = pressure pounds per square inch, absolute.
Q = quantity of heat, Btu.
Q_c = heat loss from condenser, Btu per pound refrigerant.
Q_j = heat dissipated in cooling water, Btu per hour.
s = entropy.
Δs = entropy change between suction and discharge.
T = absolute temperature, Fahrenheit degrees.
T_{avg} = average temperature, Fahrenheit degrees, absolute, of gas passing through compressor.
T_c = condenser temperature, Fahrenheit degrees, absolute.
T_s = evaporator temperature, Fahrenheit degrees, absolute.
t_{sd} = degrees superheat at discharge condition of vapor leaving compressor.
t_d = discharge temperature, Fahrenheit degrees.
V_c = clearance, percentage of volume, swept by piston, which is contained in spaces at end of cylinder when piston is at end of stroke (clearance includes valve spaces, etc.)
v_s = specific volume of gas at suction, cubic feet per pound.
v_d = specific volume of gas at discharge, cubic feet per pound.
W_r = refrigerant rate, pounds per minute.
x = proportion of liquid in mixture of vapor and liquid.

Chapter 40

AIR DISTRIBUTION

Standards for Satisfactory Conditions, Definitions, Mechanics of Air Distribution, Outlet Performance, Types of Air Outlets, Outlet Location and Selection, Directional and Volume Control, Return and Exhaust Intakes, Specific Applications

---

CORRECT air distribution contributes as much or more to the success of a forced air heating, ventilating, cooling or air conditioning system as does any other single factor. An air conditioning system may deliver the required quantity of conditioned air and still fail to give satisfactory room conditions because of poor air distribution. The scope of the chapter is limited to the air distribution within the conditioned space. Reference is made to the distributing duct system only insofar as it affects the performance of the air distribution outlet. See Chapter 41 for information on air duct design.

STANDARDS FOR SATISFACTORY CONDITIONS

The object of air distribution is to create within the space the proper combination of room temperature, air motion and humidity, whether by cooling, heating or ventilating. The purpose to be accomplished determines the factors to be controlled. For instance, in many industrial applications it is necessary to maintain proper standards throughout a large portion of the space; sometimes almost throughout the entire enclosure. In these cases design room temperature, room air motion and humidity will depend entirely upon the requirements of the product and its manufacturing processes.

If, however, comfort of the occupants is the principal objective, consideration of the occupied zone (floor to 6 ft above floor level) is primarily required. In order to obtain comfort conditions within this zone, standard limits have been set up as acceptable *effective temperatures*. This term comprises air temperature, motion, humidity and their physiological effect on the surface of the human body. Any variation from accepted standards of one of these elements may result in discomfort to the occupants. The same effect may be caused by lack of uniformity of conditions within the space or by excessive fluctuation of conditions in the same part of the space. Such discomfort may arise due to excessive room air temperature variations (horizontally, vertically, or both), excessive air motion (draft), failure to deliver or distribute the air according to the load requirements at the different locations, or too rapid fluctuation of room temperature or air motion (gusts).

In addition the noise level created by the introduction of supply air should be kept within acceptable limits, and streaking or smudging of walls or ceilings should be prevented.

With reference to permissible room air motion it is not possible to establish a specific standard covering the entire complex problem of air distribution. Velocities less than 15 fpm generally cause a feeling of air stagnation, whereas velocities higher than 65 fpm will disturb loose paper sheets on desks and may result in a sensation of draft. Air velocities of 25 to 35 fpm in the occupied zone are most satisfactory, but air motion of 20 to 50 fpm will usually be acceptable, particularly when the lower part of this range of velocity is used in cooling applications and the higher

values on heating jobs. In any case, it is certain that the effect of room air motion on comfort or discomfort depends on air temperature and direction as well as on velocity.

Reference should be made to Chapter 12, Physiological Principles, for information on effective temperature and comfort zones. Material in Chapter 42, Sound Control, covers acceptable room noise levels and noise generated by air outlets.

DEFINITIONS

The following definitions referring to air distribution equipment have gained general acceptance.

1. *Supply Opening or Outlet:* Any opening through which air is delivered into a space which is being heated, or cooled, or humidified, or dehumidified, or ventilated.

2. *Exhaust Opening or Return Intake:* Any opening through which air is removed from a space which is being heated, or cooled, or humidified, or dehumidified, or ventilated.

3. *Outside Air Opening:* Any opening used as an entry for air from outdoors.

4. *Damper:* A device used to vary the volume of air passing through a confined cross-section by varying the cross-sectional area.

5. *Grille:* A covering for any opening and through which air passes. A supply grille discharges air axially with a limited spread.

6. *Register:* A grille equipped with a damper.

7. *Free Area:* The total minium area of the openings in the air outlet or inlet through which air can pass.

8. *Core Area:* The total plane area of the portion of a grille, bounded by a line tangent to the outer edges of the outer openings through which air can pass.

9. *Mean Area:* The total of the core and free areas divided by two.

10. *Percentage Free Area:* The ratio of the free area to the core area expressed in percentage.

11. *Aspect Ratio:* The ratio of length of the core of a grille to the width.

12. *Vane Ratio:* The ratio of depth of vane to shortest opening width between two adjacent vanes.

13. *Plaque:* A ceiling outlet in which the supply air impinges against a plate or series of parallel plates and is discharged horizontally in all directions.

14. *Diffuser:* An outlet discharging supply air in various directions and planes, thereby effecting its mixture with the room air.

15. *Primary Air:* The air delivered to the outlet by the supply duct.

16. *Induction:* The entrainment of room air by an air stream.

17. *Internal Induction:* The induction of room air drawn into an outlet by the primary air stream. (Commonly called *aspiration*).

18. *External Induction:* The induction of room air by the air stream discharged from the outlet (commonly called *secondary air motion*).

19. *Induced Air:* The room air entrained by the primary air through internal induction or by the discharged air through external induction or both.

20. *Total Air:* The mixture of primary air and induced air.

21. *Induction Ratio:* The total air divided by the primary air.

22. *Throw (Blow):* The horizontal distance an air stream travels on leaving the outlet (grille) to a position at which air motion reduces to a maximum velocity of 50 fpm.

23. *Drop:* The vertical distance, the lower edge of the air stream drops between the outlet and the end of its throw.

24. *Rise:* The converse of drop.

25. *Envelope:* The outer boundary of an air stream moving at a perceptible velocity.

26. *Spread:* The divergence of the air stream in a horizontal or vertical plane after it leaves the outlet.

27. *Diffusion:* Distribution and mixing of air within a space, accomplished by an outlet discharging supply air in various directions and planes in order to effect the desired air conditions in the occupied zone of that space.

28. *Radius of Diffusion:* The horizontal distance from the diffuser outlet to the perimeter of the space, within which effective diffusion is accomplished and air motion in the occupied zone is reduced to 50 fpm maximum.

29. *Outlet Velocity:* The average velocity of air emerging from the outlet measured in the plane of the opening.

30. *Terminal Velocity:* The average air stream velocity at the end of the throw.

31. *Temperature Differential:* Temperature difference between primary and room air.

32. *Temperature Variation:* Temperature difference between points of the same space.

MECHANICS OF AIR DISTRIBUTION

In the mechanics of air distribution, two major problems are involved: (1) complete mixing of the primary air and air outside of the zone of occupancy in order to reduce the temperature difference and air motion to acceptable limits before the air enters the occupied zone; and (2) counteraction of the natural convection and radiation effects within the room.

The theory concerning the distribution of conditioned air within an enclosure is still incomplete and no general law governing outlet performance has been formulated. The characteristics and performances of the various existing types of outlets must therefore be evaluated largely by experimental work. Some progress has been made concerning the theoretical analysis of the characteristics of a primary air stream discharged in an unconfined space, i.e., a space large enough so that the primary air stream is not disturbed by contact with surfaces, or by adjacent streams. The approach to this problem is usually made by means of the momentum theory. Development of this theory has so far been confined to side wall distribution of air, because this is its most elementary application. Fundamentally, the same laws apply also to ceiling distribution, but a great amount of additional research is still required to adapt them to the more complicated conditions of deflection of air up to 90 degrees, spread up to 360 degrees and the resulting rapid induction. There is also an element of downward diffusion which usually is not obtainable with side wall grilles.

Momentum Theory

When air is discharged from an outlet into a free open space, the primary air stream entrains room air as it traverses the space. This entraining effect increases the cross-sectional area and reduces the velocity of the resulting air stream. Induction takes place with the conservation of linear momentum; this has been confirmed by tests which indicate that the momentum remains almost constant throughout the entire measurable length of the air stream. This relationship may be expressed by Equation 1:

$$M_1 V_1 + M_2 V_2 = (M_1 + M_2) V_3 \qquad (1)$$

where

M_1 = mass of primary air.
M_2 = mass of induced air.
V_1 = velocity of primary air.
V_2 = velocity of induced air (for practical use, $V_2 = 0$).
V_3 = velocity of the mixture.

If the velocity of induced air is zero, Equation 1 changes to:

$$M_1 V_1 = (M_1 + M_2) V_3$$

or,

$$\frac{V_1}{V_3} = \frac{M_1 + M_2}{M_1} = r \qquad (2)$$

Since in many applications the densities of primary and room air are about equal, air volumes may be substituted for mass and Equation 2 becomes:

$$\frac{V_1}{V_3} = \frac{Q_1 + Q_2}{Q_1} = \frac{Q_3}{Q_1} = r \tag{3}$$

where

Q_1 = volume of primary air, cubic feet per minute.
Q_2 = volume of secondary air, cubic feet per minute.
Q_3 = volume of mixture of primary air and induced air, cubic feet per minute.
r = induction ratio.

Jet Pattern From Round or Rectangular Openings in a Large Room

The relation between the shape of the discharge of a jet and the shape of the conventional outlet has long been the subject of research. It has been proved to be incorrect to assume that the jet retains the outlet shape when it discharges into a free open space [1]. Air streams from rectangular outlets having low aspect ratios develop a symmetrical or cone shape within a few diameters from the outlet face. From there on, the jet continues to expand at a fairly constant rate. Beyond 20 diameters there is very little difference between round and rectangular jets. The assumption can be made that the apex of the cone is in the same position for any jet having a small aspect ratio. For the more usual problems of the conventional room with outlets near the ceiling, there are insufficient experimental data to justify a definite statement on the effect of aspect ratio.

If the round or rectangular opening is divided into a number of orifices having straight sides, the performance of the air stream will be similar to that of a plain opening.

Velocity Across Jets

Results of many tests [1] indicate that the ratio of centerline velocity to average velocity is about 3, irrespective of outlet size, shape or initial velocity. This statement is true for stream cross-sections located beyond 10 diameters from the outlet, and is fairly accurate for distances up to 50 diameters. Experimental data are lacking for distances beyond 50 diameters.

Effect of Aspect Ratio on Entrainment

In slotted outlets, the air entrainment of the primary jet is a function of aspect ratio [1]. This effect is most pronounced when large changes in the ratio are made. A comparison between a slot of aspect ratio 24 and a square opening of the same area is given in curves *A* and *B* of Fig. 1. At a distance of 8 ft from the outlet, the entrainment of the slot is 8.1 as compared with 6.9 for the square, or an increase of about 17 per cent.

Curve *C* shows the further increase in entrainment obtained by using an aspect ratio of 48. An increase of 40 per cent is obtained over the 24 in. x 1 in. slot. This indicates that long narrow slots produce air streams that give high induction of secondary air.

Parallel Slots

The use of several slots in parallel to vary the rate of air entrainment depends mainly on the distance between the slots. If close together, the air pattern is about the same as for a single opening of equal area. Spac-

ing the openings farther apart gives an increase in entrainment as shown on curves D and E of Fig. 1. It will be noted that 2 openings 24 in. x ¼ in. located very close together will obtain an entrainment which is about the same as obtained with one 24 in. x ½ in. opening. However, if the slots are spaced 6½ in. apart there is a marked increase in entrainment.

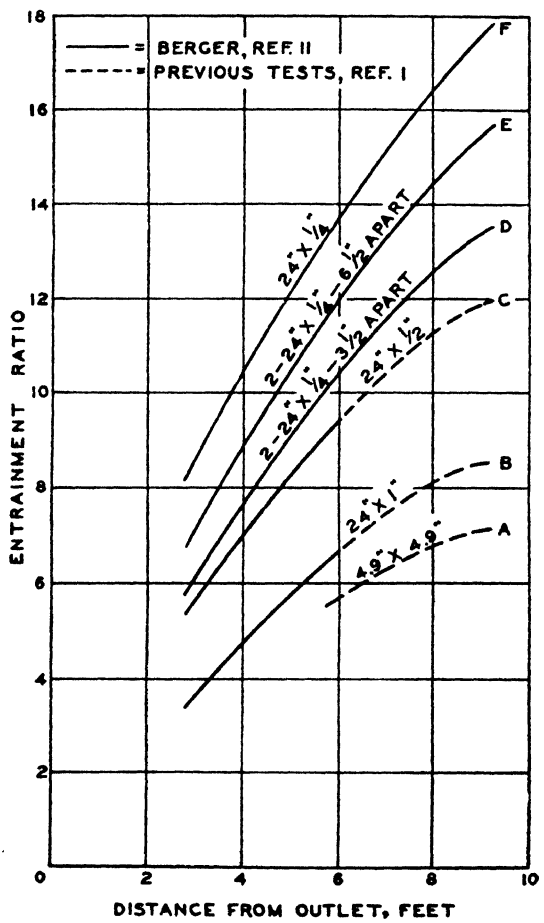

FIG. 1. TYPICAL RELATION OF ENTRAINMENT RATIO TO DISTANCE FROM OUTLET FOR SLOTTED OUTLETS. (BASED ON 800 FPM OUTLET VELOCITY.)

Throw

Equations for the throw of straight flow side wall outlets have been developed on the basis of the momentum theory. Equation 4 states the throw in terms of the area of the outlet and the primary air volume[2]:

$$L = 0.82 \frac{Q_1}{\sqrt{A_1}} \tag{4}$$

where

L = throw, ft.

A_1 = effective outlet area, in square inches = (gross measured area) x (percentage of free area/100) x (discharge coefficient).

The discharge coefficient is approximately 0.8.

Equation 4 has been developed under the assumption that the temperature of the supply air is the same as the temperature of the room air. It applies only to straight flow outlets with aspect ratios less than 16.

Equation 5 for the performance of straight flow outlets evolved from research[1] allows the calculation of the maximum residual velocity at any distance perpendicular to the outlet face. It applies for aspect ratios up to 50.

$$V_r = K \frac{V_1 \sqrt{A_1}}{X} = K \frac{Q_1}{X \sqrt{A_1}} \qquad (5)$$

where

V_r = maximum residual velocity in air stream, i.e., the highest maintained velocity at the given cross section in the room, feet per minute.

V_1 = average initial velocity across outlet, feet per minute.

K = Constant of proportionality.

A_1 = effective outlet area in square feet = (gross measured area) x (percentage of free area/100) x (discharge coefficient).

X = Normal distance from outlet face, feet.

Equation 5 together with Equation 6 (which reduces to Equation 7 if the jet angle is 20 deg) for the entrainment ratio,

$$\text{Entrainment Ratio} = \frac{0.785\ K}{R\ X \sqrt{A_1}} \left(\sqrt{\frac{A_1}{0.785}} + 2\ X \tan \frac{\Theta}{2} \right)^2 - 1 \qquad (6)$$

where

R = ratio of maximum residual velocity to average residual velocity.

Θ = jet angle or spread angle in degrees.

$$\text{Entrainment Ratio (20 deg jet angle)} = \frac{0.785\ K}{R\ X \sqrt{A_1}} \left(\sqrt{\frac{A_1}{0.785}} + 0.35\ X \right)^2 - 1 \qquad (7)$$

has been used to develop charts[3] which provide the graphical solution of problems involving the determination of the throw of air from slots and jets, the residual velocity, and the size of openings. (See Figs. 2 and 3). The charts apply only to *air discharging into room air of same temperature as the stream.* They can be used to determine the throw of air and entrainment ratios up to 40:1 with initial velocities of 1000 to 6000 fpm and with residual velocities of 100 to 1000 fpm. The charts furthermore are for use with sharp-edged orifices or slots, and *include the coefficient of discharge.* If air is discharged from an orifice with a well-rounded entrance or from a length of straight duct, the coefficient of discharge is unity and the actual area of the opening is the effective area. For such rectangular openings the effective diameter is the diameter of a circle with an area equal to the actual area of the rectangle. The following examples will illustrate the use of the charts:

Example 1: Air is delivered to a cooler through independent slots each 24 in. x 2 in. with an initial velocity of 2000 fpm. Determine the maximum residual velocity and the entrainment ratio at a distance of 15 ft from the slot.

From Fig. 3 the effective diameter = 6.2 in. = 0.52 ft. The number of effective diameters in 15 ft = 15/0.52 = 28.8.

From Fig. 2 at 2000 ft initial velocity read entrainment ratio = 6.6 and maximum residual velocity = 390 fpm. From tests it has been shown that the *average* residual velocity may be taken as ⅓ of the *maximum* or 130 fpm in this case.

Example 2: Using the data from *Example 1* determine the distance at which the maximum residual velocity will be 150 fpm.

From Fig. 2 at $V_1 = 2000$ and $V_T = 150$, the number of effective diameters is read directly as 73 and the throw of the air is therefore 73 x 0.52 = 38 ft.

Example 3: Air issues from a round orifice plate with an initial average velocity of 4000 fpm. It is to have a maximum residual velocity of 400 fpm at a distance of 30 ft from the opening. Calculate the size of the opening required and the entrainment ratio.

On Fig. 2 at the intersection of the curve of 4000 fpm, the entrainment ratio is read directly as 15 and the effective diameters of throw = 55.

Since 55 effective diameters are equal to 30 ft as required, 1 effective diameter = $\frac{30}{55}$ = 0.545 ft or 6.56 in.

On Fig. 3 vertically below intersection of 6.56 in. effective diameter line and equivalent round opening line read 8.5 in. in lower margin.

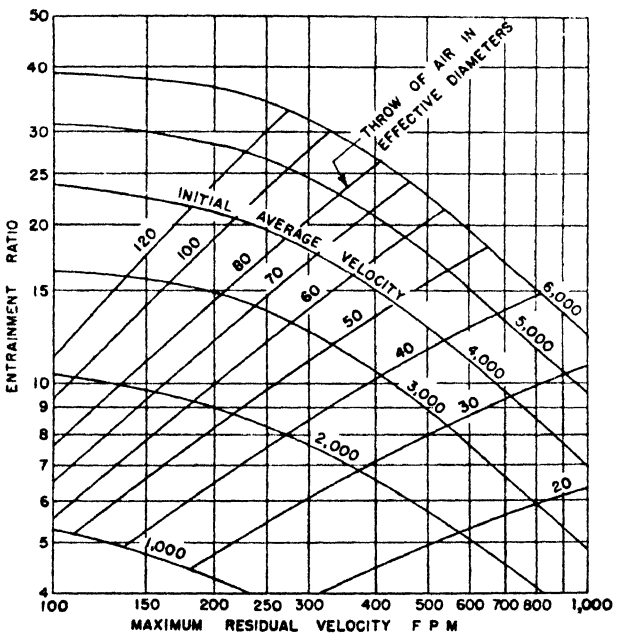

FIG. 2. RELATION BETWEEN INITIAL VELOCITY, RESIDUAL VELOCITY, ENTRAINMENT RATIO AND THROW OF AIR FROM JETS AND SLOTS

Example 4: A jet of air issues from a pipe or from air orifice having a well-rounded entrance (coefficient of discharge =1.0) and delivers air with the same velocities and with the same throw as in *Example 3*. What is the required diameter?

In this case since the coefficient of discharge is unity, the effective diameter of the jet is the actual diameter of the pipe or orifice, or 6.56 in., as obtained in *Example 3*.

Spread

The induction effect results in the spreading of the air stream. The total angle included by the air stream from straight flow outlets has been measured and found to be between 14 and 25 deg. The angle will depend on the type of approach, type of outlet and velocity.

The effect of vertical bars placed in the face of the outlet to increase the spread, may also be deducted from the momentum theory. Assuming that there are no horizontal deflecting bars and that the air spreads vertically through a total angle of 14 deg; that a uniform velocity exists at any section of the air stream; and that the conservation of momentum

principle applies down to a velocity of 60 fpm; the following approximate equations for throw are to be substituted for equation (4)[2]:

For a spread of 15 deg on each horizontal side $$L = 0.55 \frac{Q_1}{\sqrt{A_1}} \quad (8)$$

For a spread of 30 deg on each horizontal side $$L = 0.37 \frac{Q_1}{\sqrt{A_1}} \quad (9)$$

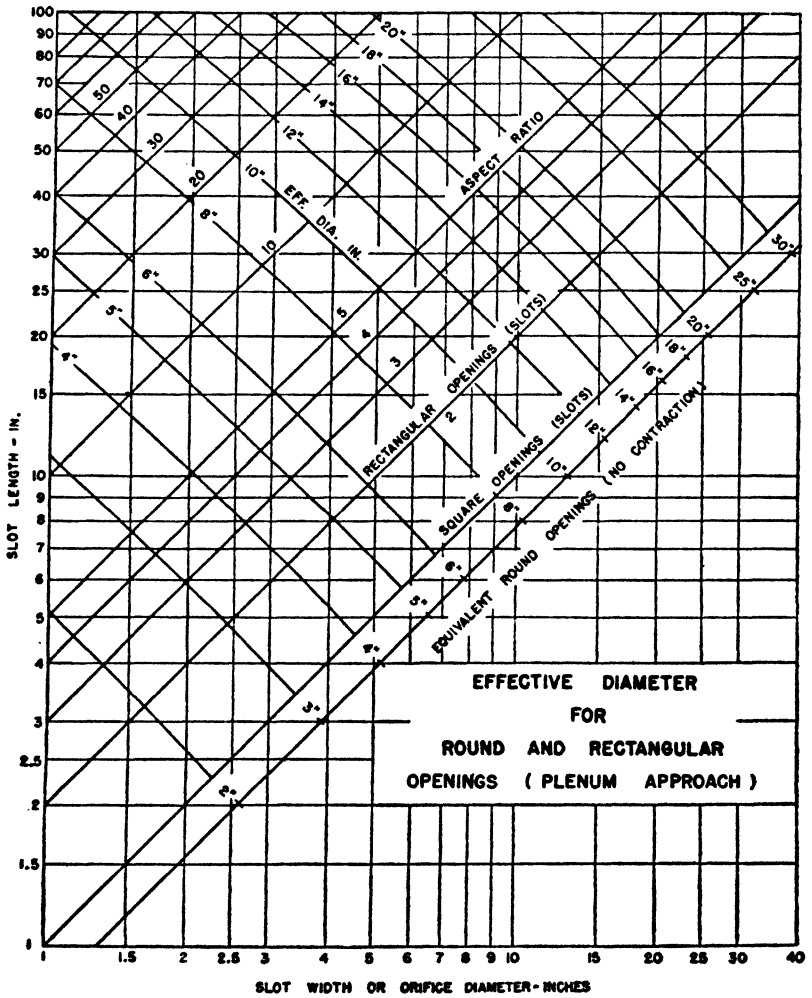

FIG. 3. EFFECTIVE DIAMETERS FOR ROUND AND RECTANGULAR OPENINGS (PLENUM APPROACH)

For a spread of 45 deg on each horizontal side $$L = 0.28 \frac{Q_1}{\sqrt{A_1}} \quad (10)$$

Guide Vanes

Vanes should have a depth of one to two times the spacing between the vanes. If the ratio of vane depth to spacing is less than one, effective control by means of the vanes cannot be obtained. Little improvement is obtained by increasing the ratio beyond two. The effect of various types of vanes is given in following paragraphs.

Straight Vanes. As mentioned previously, the included angle between both planes will be in the neighborhood of 14 deg, for a straight setting of the vanes as shown in Fig. 4.

Diverging Vanes. Such vanes set for an angular spread will have a marked effect on the direction and distance of travel of an air stream. An outlet having vertical vanes set straight forward in the center, with uniformly increasing angular deflection to a maximum at each end of 45 deg, will produce an air stream with a horizontal included angle of approximately 60 deg as shown in Fig. 4. The throw will be reduced one-half for such a vane setting. Increasing the divergence of the vanes reduces the air quantity handled by an outlet for a given duct static pressure. The primary function of the vanes is to spread the air horizontally. Spreading the air vertically entails the risk of hitting beams or other obstructions or of blowing primary air at excessive velocities into the occupied zone.

Converging Vanes. The blow of an outlet may be somewhat increased by converging the vanes of an outlet as illustrated in Fig. 4. Even with

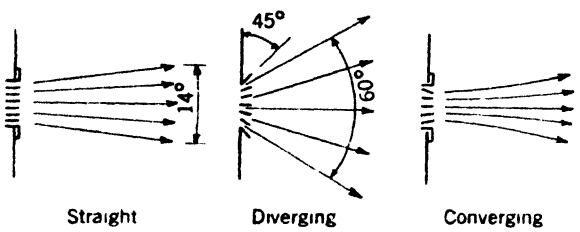

FIG. 4. SPREAD OF AIR STREAM WITH VARIOUS VANES

converging vanes, the resultant angle of spread of an air stream will not be less than 14 deg. The air converges for a few feet in front of the outlet, and then diverges more than if the vanes had been set straight.

Both the horizontal and vertical vanes of an outlet are important. After an installation has been made, many conditions of draftiness or stuffiness can be alleviated by some vane adjustment, provided an independent means for regulation of static pressure behind the vanes is included.

Vertical Drop and Rise

The distance that the lower edge of the air stream drops below the bottom of the outlet is important, since the air stream should not reach the occupied zone until the velocity has fallen to about 50 fpm. The drop (H, ft) is influenced by two forces; the natural vertical spread of the stream and the gravitational force due to the difference in density between supply air and room air. For air emerging at room temperature, the drop will be a function of the spread only and will be equal to:

$$H_1 = L \times \tan\left(\frac{\text{Spread Angle}}{2}\right) \tag{11}$$

where

H_1 = drop due to spread (when emerging air and room temperature are the same), feet.
L = throw, feet.

When there is a temperature difference between the air stream and the room, there is an *additional* drop which is approximately [4]:

$$H_2 = \frac{n_1 (t_r - t_{as}) L^{n_2}}{V_1} \tag{12}$$

where

H_2 = additional drop due to temperature difference, feet.
n_1 and n_2 = constants (tentative suggested values $n_1 = 5$, $n_2 = 1.2$).
t_r = room temperature, degrees Fahrenheit.
t_{as} = supply air temperature, degrees Fahrenheit.
V_1 = jet velocity, feet per minute.

It should be remembered, that the total drop $H = H_1 + H_2$. H_1 is positive for either heating or cooling; H_2 is positive for cooling, negative for heating. In consequence, there will always be a vertical drop in cooling, and a vertical rise in heating only if $H_2 > H_1$.

Another empirical equation for the *total drop* is[2]:

$$H = \frac{m\,(t_r - t_{as})\,L}{V_1} \tag{13}$$

where

m = constant (tentatively suggested value of $m = 16$).

In other words, for a given throw L the drop or rise increases as the temperature difference increases and the outlet velocity decreases. This equation is only valid, if a temperature difference exists between room air and supply air.

Room Air Motion (Wall Outlet)

One of the most important problems in air distribution is to achieve air motion in the occupied zone within acceptable velocity limits. Therefore, outlet performance and characteristics of the space have to be related to this air motion.

The air moving in the occupied zone is (for a side wall outlet) equal in quantity to the total air contained in the outlet stream at the end of the throw and it is generally moving in a direction opposite to the stream. Assuming that the maximum volume of air is in circulation when the air stream velocity V_s drops to 200 fpm, that the free area for return flow is 0.6 of the area of the wall in which the outlets are located, then, according to the momentum theory[2,4]:

$$V = \frac{Q_s}{0.6 \times A_w} \tag{14}$$

where

V = average room velocity, fpm.
Q_s = Volume of room air in motion, cfm.
A_w = area of wall in which outlet is located, sq ft.

Since $Q_s = Q_1 \times r$, (by definition); and $r = \frac{V_1}{V_s}$ according to Equation 3; the average room velocity is:

$$V = \frac{Q_1 r}{0.6\,A_w} = \frac{Q_1}{0.6\,A_w}\left(\frac{V_1}{V_s}\right)$$

or, with $V_s = 200$ fpm

$$V = \frac{Q_1\,V_1^{\frac{2}{3}}}{120\,A_w} \tag{15}$$

When Q_1, the volume of primary air, V_1, the velocity of primary air and A_w, the wall area are known, the average room velocity may be

calculated from Equation 15 in order to determine the acceptability of the air distribution system.

OUTLET PERFORMANCE

The factors of outlet performance, throw, drop, room air motion, capacity, temperature differential, dirt and noise place considerable limitations on the design of a satisfactory distribution system.

1. *Throw.* The throw of a wall outlet must be sufficient to produce satisfactory conditions over the area to be conditioned. Underblowing may cause heated air to rise too rapidly above the occupied zone and thus create excessive vertical temperature variation (stratification); in cooling operation it may cause cold air to drop into the occupied zone before a satisfactory mixing of supply and room air has been accomplished by induction and thereby create a condition of acute discomfort (draft). On the other hand, overblowing will result in objectionable downdrafts from any surface the primary air stream may strike.

On the average it is considered most practicable to select throw as ¾ of the distance toward an exposed wall or window, as shown in A of Fig. 5.

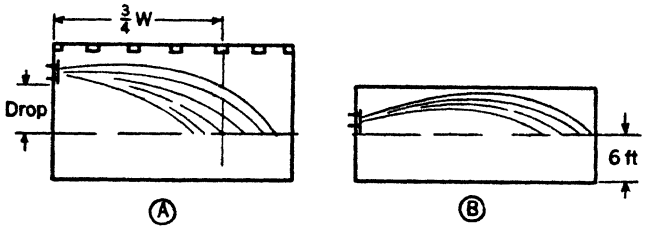

FIG. 5. THROW OF WALL OUTLETS

However, structural characteristics, mounting height, temperature differential and resultant drop or rise, or location of greatest heating or cooling loads strongly affect the selection of the optimum throw. In spaces with beamed ceilings, the outlets should be located below the bottom of the lowest beam level, and preferably low enough so that an upward or arched blow may be employed. The blow should be arched sufficiently to miss the beams and, at the same time, in such a manner as to prevent the primary or induced air stream from striking furniture and obstacles and producing objectionable drafts.

In the case of ceiling diffusers air is distributed with a spread of 360 deg horizontal. In addition there is a downward component of air motion. Therefore, both throw (radius of diffusion) and mounting height are important and interdependent factors. Due to the 360 deg spread of air diffusion the rate of induction will be higher and the throw shorter than that of a wall grille opening handling the same air quantity at the same outlet velocity. Therefore, ceiling diffusers will frequently permit the use of higher air velocities than wall outlets and consequently may be sized smaller to handle the same air volumes. If such ceiling outlets are installed flush with the ceiling, impingement of the air stream along the ceiling surface restricts induction of secondary air and the throw is increased approximately 20 per cent above that of an unrestricted air stream.

In the use of perforated ceiling plates as air distributing devices the term throw could hardly be applied in its proper meaning. Although this type of outlet can handle the greatest amount of air in proportion to room size, jet velocities must be kept low.

In all types of ceiling air distribution the following should be noted:

If cold air is used it must be brought to the proper temperature by mixing with room air before entering the zones of occupancy.

Air slightly above room temperature will usually be properly distributed by outlets selected for cooling.

When delivering warm air the same may be projected downward and the amount of dispersal of the jet varied to obtain proper mixing and control.

2. *Drop.* The outlets should be located so that the air stream at the termination of the blow is not less than 5 or 6 ft above the floor level. As illustrated in *B* of Fig. 5 the maximum permissible blow for a given ceiling height may be obtained by locating the outlet low on the wall, arching the blow, and sweeping the air across the flat ceiling. The air, as it traverses the room, will adhere to the ceiling. The objection to this method is the possible streaking of the ceiling with dirt.

3. *Room Air Motion.* Various features may cause room air motion to exceed acceptable standards. Some of these are: Excessive air discharge velocities; high air volume per cu ft of space (often referred to as number of air changes per hour); premature drop of cold air into the occupied zone; overblow causing spilling of high velocity air into the occupied zone; heating in severe climates by means of downward projection of hot air. It should be realized that these factors will not equally affect all types or designs of outlets at different temperature differentials, mounting heights, etc. For instance, certain outlets may safely handle more air per cubic foot of space at higher discharge velocities than others, and downward projection of supply air will sometimes not be considered excessive if the supply air temperature is substantially higher than the room temperature.

4. *Capacity.* The quantity of air to be handled is determined by the heating, cooling, or ventilating requirements. Manufacturers' rating sheets are usually consulted for selection of the proper number, size and type of outlets for a given air quantity. The basis of rating used should be carefully noted to make certain that resulting velocities are suitable for the application.

5. *Temperature Differential.* This is one of the most important factors affecting outlet performance. The quality of the temperature control, or the extent of the control problem, is directly a function of temperature difference. Obviously a system which carries under design conditions only a 5 deg difference between supply air stream and room temperature would require no control at all, for even a 50 per cent change in load could only effect a 2½ deg change in room temperature under the worst conditions. Because of the self-equalizing nature of most load factors, even this extreme is never realized. It is obvious that the greater the temperature differential between supply air and room temperature, the greater will be the change in room temperature for a given change in load. The use of outlets that give rapid mixing permits greater temperature differentials. These principles apply in both heating and cooling practice.

6. *Dirt.* Although the primary air may be carefully filtered, small particles of dirt and dust will not be captured by mechanical filters and may finally be deposited on the walls or ceiling. With ceiling outlets, dirt streaking may be minimized by carefully controlling the discharge of the outlets. With wall outlets, dirt streaking may be minimized by preventing direct impingement of the air on any ceiling or room surface. Floor outlets may offer objection as dirt collectors.

7. *Noise.* The increase of noise level caused by an outlet is primarily a function of its air discharge velocity and its size. The maximum accept-

able noise level in a space may dictate completely the selection of the permissible outlet velocity. In addition, however, noise may be caused by excessive restriction of free outlet area due to outlet design; by unnecessary turbulence due to one sided air flow through the outlet; or by the impingement of high velocity air on sharp edges. Such high frequency noises due to excessive turbulence are especially annoying (see Chapter 42 for discussion of permissible room noise levels and noise generation by outlets).

TYPES OF AIR OUTLETS

Two types of air supply outlets are commonly used; side wall and ceiling. A variety of designs has been developed for both types and the final selection depends to a large degree upon the specific problems arising in the air distribution system to be used.

In addition to the comments on use and application of outlets which follow, reference should also be made to sections of this chapter on Outlet Location and Selection as well as on Specific Applications.

Wall Outlets

Wall type openings in general use are: perforated grilles, vaned outlets, registers, slotted outlets, ejector nozzles, and wall diffusers.

1. *Perforated Grilles.* Due to the non-adjustability and small vane ratio these outlets, although inexpensive, have not met with favor as wall type supply openings. They are useful primarily where directional air control is unnecessary, and for return air intakes.

2. *Vaned Outlets.* Outlets equipped with either vertical and horizontal adjustable vanes or both are particularly suited to sidewall distribution. For proper control over the air flow, the vane ratio should be from 1 to 2. Outlets with non-adjustable vanes may be employed but they should only be used where the performance is not critical or can be adequately predicted. Vanes should be properly designed to prevent an increase of noise above permissible level.

3. *Registers.* Perforated grilles or vaned outlets equipped with a vane damper are termed registers. They are used primarily for residential heating systems, where the outlet distribution is not critical and low cost is of importance.

4. *Slotted Outlets.* Slotted outlets essentially consist of either flat steel plates containing a number of long narrow slots or a single long narrow slot. In order to give a good conversion from static pressure to velocity pressure, the sides of the slots are rounded to give a venturi effect. Due to their high aspect ratio, the slotted outlets have a greater induction effect than the comparable vaned outlets of equal area and consequently the throw is reduced. They are primarily useful where an unobtrusive means of distribution is desired, and where it is desirable to submerge the outlets into the room decoration and to minimize the effect of obstructions in the line of discharge. They are adaptable to narrow rooms having low ceilings. In this case the slots should extend the full length of the room. In all applications air quantity and distribution must be carefully planned as correction after installation is difficult.

5. *Ejector Nozzles.* These are outlets operating at high static pressure. They give a high conversion from static in the duct to velocity pressure in the outlet, and have a high induction effect due to their high outlet velocity. They are chiefly used for long throw and industrial process installations, such as drying, freezing, cooking, etc. Another type of ejector is

sometimes referred to as a *louver nozzle* having a 45 to 90 deg elbow, which can be rotated similarly to a universal joint about an axis perpendicular to the surface to which it is fastened. These outlets give a considerable degree of adjustability and are, therefore, desirable for use in confined spaces where spot cooling is employed. The use of very high velocities is gradually disappearing due to noise difficulties.

6. *Wall Diffusers.* These outlets incorporate design features originally developed for ceiling outlets and use therefore semi-conical or semi-pyramidal guide vanes instead of the straight vanes of the conventional side wall outlet.

Ceiling Outlets

Generally used ceiling outlets are: plaques, ceiling diffusers, and perforated ceilings and panels.

1. *Plaques.* Plaques are of simple design. The air from the supply opening impinges on a plate, which permits the air to be discharged horizontally in all directions. Plaques, although inexpensive, are difficult to control and are not generally satisfactory. In certain applications a properly designed plaque yields satisfactory results.

2. *Ceiling Diffusers.* Ceiling diffusers are round or rectangular outlets installed on or parallel to the ceiling, discharging supply air in a variety of directions and planes. Performance of the different designs varies according to principle employed. Some have no internal induction, but hasten external induction by supplying air in multiple layers. Others have internal induction and distribute air over an entire half sphere. The induction effect is greatest in the direction of the axis of the outlet, and least in the plane perpendicular to the axis and located at the ceiling level. Thus the induction is greatest in the vertical direction where the least throw can be tolerated and least in the horizontal plane at the ceiling where the greatest blow is both desired and permissible.

3. *Perforated Ceilings and Perforated Panels.* This method obtains air diffusion by discharging air through perforations in the ceiling, or part of the ceiling or walls. Some perforated panels feature a control plate frame which is inserted in the conventional ceiling duct. Supply air enters the plenum above the distribution plates through an adjustable air valve which can be set for varying air quantities and velocities. The advantages are unobtrusive appearance and the ready application of sound absorbing material to the design. Also, if designed properly, this system provides a low rate of room air motion and consequently lends itself to applications having high load or high ventilating requirements. The perforations should be kept free of accumulations of dirt, as clogging will cause uneven distribution and result in smudging of the ceiling. Best results are obtained in systems having efficient cleaning devices.

In present practice relatively low velocities are used because the perforated material offers only small resistance to the air flow. Therefore, great care must be taken to distribute the primary air at uniform velocities over the perforated panels to avoid uneven air distribution and primary air streams of undesirable velocities and direction.

OUTLET LOCATION AND SELECTION

In selecting the location of outlets, consideration must be given to the factors of physical construction, physical appearance, location of heating or cooling loads, and outlet performance:

1. The *physical construction* of a building, particularly of old buildings, immediately places limitations on the type of distribution system which can be employed. The first factor in the selection of outlet locations, therefore, is a consideration of the possible location of the supply duct, that is, whether it is above the ceiling, within the walls, through furred spaces above corridors, or in the conditioned space, etc. A particular method of distribution may be highly desirable but its execution, due to the location of beams and masonry walls, may be impossible.

2. The *physical appearance* of the outlets should conform to the esthetic appearance of the room. In factories, warehouses, etc., the esthetic demand may not be high; however, in department stores, clubs, theaters, etc., the location of the grilles may be dictated largely by such demands.

3. The *location of heating or cooling loads* in a room dictates to a great extent the general location of the outlets. The outlets should be located to neutralize any undesirable cold drafts or radiation effects set up by a concentration of the heating or cooling load. The problem can be divided into *natural loads* due to outside weather and *internal heat loads*.

In winter the natural or primary heating load is caused by exposed walls, windows and skylights. Heat is lost primarily through convection to these exposed surfaces. The convection currents or cold drafts drop down the exposed surfaces and seriously impair the comfort conditions in the room, particularly at the floor level near the exposed surfaces. The outlets should be located to counteract these down drafts. Two methods may be employed:

a. Direct counteraction of convection currents from cold surfaces can be obtained by locating the outlets to blow upward from beneath windows or exposed walls or to blow across the exposed wall. This method is desirable in small offices or bedrooms, or any location where people are seated or working near exposed surfaces. In northern climates, where the outside temperature may be constantly below 40 F, and the construction consists of uninsulated walls and single glass, this method of distribution is particularly useful for the maintenance of comfort requirements.

b. High induction by ceiling or wall outlets may be employed to nullify the convection currents from exposed surfaces. If outside temperatures are consistently below 40 F, and the exposed surfaces are not well insulated, the induction effort required for neutralization of the downdrafts is so great that the air motion in the room may exceed comfort limits unless care is taken in selection and location of the outlet. Where comfort conditions are not critical as in factories for heavy manufacturing, warehouses, etc., satisfactory results can be obtained even in cold climates. For uninsulated walls and glass areas some supplementary heating is often valuable. Wall diffusers, direct radiation or warm panels will satisfy these requirements for supplementary heating.

c. The location of exhaust or recirculated air openings at the base of large areas of glass is sometimes effective in reducing cold downdraft into the occupied space.

If a *concentrated source of heat* creating an *internal heat load* is located at the occupancy level of the room, the heating effect may be counteracted by blowing the supply air toward the heat source or by locating an exhaust or return grille adjacent to the heat source. The latter method will prove more economical, as heat will be withdrawn at its source rather than be dissipated into the conditioned space. Where a lighting load is particularly heavy (five watts per square foot) and located high in a conditioned space, it may be economically desirable to locate the outlets below the lighting load. Warm air from the lights will stratify near the ceiling and can be removed by an exhaust or return fan, the former being advisable if the wet-bulb temperature of the air is above the outside temperature, and the latter being preferable if the wet-bulb temperature is below that of the outside air. Either method reduces the requirements for supply

air. If the lamps are exposed, less saving can be realized than if enclosed, as a considerable portion of the total energy is radiant.

4. *Outlet Performance.* The laws of air distribution, previously discussed, will be found to exercise an important influence upon the design of an acceptable distribution system. This applies particularly to such features as throw, drop, capacity, room air motion, etc.

Procedure for Outlet Location and Selection

In determining outlet location and selecting the type of outlets it is customary to proceed as follows:

1. Study the plan of the building and note the amount of air to be supplied to each enclosure.

2. Select number of outlets for each enclosure considering air quantity required and distance available for throw or as radius of diffusion. The same factors, as well as distance from floor level available as mounting height, structural characteristics of the space and frequently consideration of appearance will determine the type of outlet used.

3. Arrange location of outlets in space. Usually the outlets will be evenly spaced to distribute air uniformly throughout the enclosure. Sometimes, however, more air should be supplied and directed towards zones of exceptional heating or cooling loads. An important point to consider is the combination of proper outlet location and efficient duct design (see Chapter 41). Consult manufacturers' tables for recommended location and spacing of outlets.

4. Select size of outlets according to air quantity handled, permissible throat or discharge velocities or effective throw, taking into consideration other factors such as noise level, static pressure resistance, etc. It will be generally found that most selection tables for grille type outlets are based on capacity and throw, whereas data for ceiling or wall diffusers are usually based upon capacity and permissible outlet velocity. Choice and arrangement of either type of outlet should however satisfy the requirements of all aspects of air distribution. Therefore, type, location and size of any outlet should be checked against manufacturers' ratings to determine whether the selection made would satisfy the requirements of the job. The most important questions to be considered are:

a. Can drafts occur because of divergence between rated throw (radius of diffusion) and distance between outlet and nearest obstacle of air stream (wall, beam, pillar, ledge, etc.)?
b. Can drafts occur because of excessive cooling temperature differential and too low mounting height of the outlet?
c. Can drafts occur because of too low velocity causing a drop in cooling installations?
d. Will the outlet operate at too high a velocity and thereby cause an excessive increase in noise level?
e. Will the outlet operate against an excessive static pressure resistance?

Balancing the System

In designing an air conditioning system it should be the aim of the engineer to size ducts and outlets in such a manner that proper distribution of supply air takes place. In practice, however, this is almost impossible and therefore additional means for regulating air distribution are required to *balance* the system. Some of these means are:

1. Reducing the effective area of some supply openings by blank-offs.
2. Placing dampers in the supply and return (exhaust) openings.
3. Placing dampers in the supply and return (exhaust) ducts.
4. Using combinations of dampers in both supply and return (exhaust) ducts.

In selecting the desired type of damper or balancing method the following points should be kept in mind:

1. Unfavorable effect on air stream and noise level should be avoided. This will often eliminate blank-offs and dampers installed in the supply and return (exhaust) openings, unless such dampers are of special design.

2. It should be possible to alter the volume control setting and measure the amount of air handled without difficulty. This will be particularly difficult to achieve in the case of blank-offs.

Generally speaking, it is most satisfactory to install dampers in the supply duct at some distance back of the outlets, so as to avoid disturbing the air flow. Dampers in both supply and return air ducts form the most flexible means of controlling supply of air to the room and static pressure within the room. Means of volume and directional control are discussed in detail in a following section of this chapter. Many types of air distribution control devices are now commercially available.

DIRECTIONAL AND VOLUME CONTROL

Duct Approaches to Outlets

In order to obtain proper direction of flow and distribution of air from outlets it is necessary that the air stream approaching the outlet be of uniform velocity over the entire connection to duct and perpendicular to the face.

Grilles and directional outlets cannot compensate for improper approach. Any attempt to secure a low face velocity and a high duct velocity by constructing an expanding chamber directly behind the grille is likely to be unsuccessful because the enlargement angle in even a straight duct cannot be greater than 7 deg at each side if the stream is to fill the outlet without turbulence.

In elbow outlets or stack heads at the top of vertical stacks it is necessary to provide splitters or guide vanes in the elbows regardless of the shape of the elbows whether of rounded, square or expanding types. Cushion chambers at the top of the stack heads have no beneficial effect. The direction of flow, distribution and velocity (measured 12 in. from

outlet) of the air, based on tests [5], are shown in Fig. 6 for various types of stack heads expanding from a 14 in. x 6 in. stack to 14 in. x 9 in. outlets, without grilles. The air velocity for each was 500 fpm in the stack below the elbow, but the direction of flow and the distribution patterns are generally indicative of performance obtainable with non-expanding elbows of similar shapes for a range of velocities 200 to 1400 fpm. Some of the conclusions drawn from the tests were:

1. Experiments with various elbow outlets on the 14 in. x 6 in. vertical stack [5] with stack air velocities of 200 to 1400 fpm indicated that enlargement of the outlet area, whether used in connection with square or rounded elbows, would not reduce either the angle of discharge (which was 20 to 30 deg above the horizontal) or the outlet velocity. The effect of the enlargement of the outlet was mainly to increase the reverse flow area in the lower part of the outlet, but in each case enlargement of the outlet reduced the static pressure in the duct below the elbow.

2. Splitters in the elbows had the effect of dividing the air stream into a number of streams flowing through rounded elbows and therefore lowered the angle of discharge, reduced or eliminated the reverse flow area, and made the outlet velocity quite uniform.

3. Turning vanes having 2 in. inner and 1 in. outer radii located in the center of the elbow were found most effective in improving performance in regard to angle of discharge, outlet velocity, and elimination of reverse flow area.

4. Pressure loss through stack heads may be reduced by use of splitters or turning vanes or by increasing the inner radius of an elbow. Considering the sum of the velocity and static pressure as a measure of the energy required to change the direction of the air stream and to deliver the air into the atmosphere, and considering the energy required for a plain fitting as 100 per cent, it was found that *turning vanes* dropped the energy requirement of square type stack heads to 45 per cent. Splitters reduced the energy requirement to 90 per cent in long radius elbows and to 74 per cent in short radius turns. In expanding heads splitters reduced the energy requirement to 58 per cent.

Side Outlets in Horizontal Air Ducts

When air is supplied to a room from side outlets in horizontal ducts it is necessary to use directive devices within the duct at each outlet in order to obtain a uniform velocity of delivered air and to obtain a direction of flow perpendicular to the face of the outlet. In tests [6] conducted with 3 in. x 10 in., 4 in. x 9 in., and 6 in. x 6 in. outlets in a 6 in. x 20 in. horizontal duct at duct velocities of 200 to 1400 fpm (in the 6 in. x 20 in. section) it was found that multiple curved deflectors produced the best flow characteristics. Vertical guide strips in the outlet were not so effective as curved deflectors. A single scoop type deflector at the outlet did not improve the flow pattern obtained from a plain outlet and was therefore not found to be desirable.

Ceiling Outlets on Horizontal Ducts

Ceiling outlets are usually installed below horizontal supply ducts so that the supply air has to make a 90 deg turn before entering the outlet itself. The shorter the connection between bottom of duct and outlet, the greater is the need for directive devices to obtain uniformity of flow. Generally speaking, conditions and remedy in such cases strongly resemble those for side outlets in horizontal air ducts. Ceiling ducts often have a rectangular cross section while the connections to the ceiling outlets are circular. It will then be quite difficult to install turning vanes successfully, particularly if the ducts are shallow and the connection areas are comparatively large. This will be the case, when more than one outlet is installed on one duct run and restrictions of duct area must be avoided. In such cases good results have been obtained by using a series of vertical guide strips, installed at right angles to the direction of air approach in the outlet connection where it leaves the horizontal air duct.

Volume Control

Various methods are used to regulate volume of supply and return (exhaust) air. Some of these accomplish only minor changes in volume; most of them however permit a range of adjustment from maximum air supply to complete shut-off.

When selecting type and location of such dampers, the following points must be considered, especially when the volume control feature is to be located near the air outlet itself: (1) deflection of air stream by the damper, need and feasibility of directional control; (2) increase of noise level due to irregular and localized high air velocities caused by damper operation.

The following types of volume control are most frequently encountered:

1. *Slide Damper.* A single plate which can be pushed across the duct. Since its operation changes the free area of air passage in a one sided manner it should not be located near any air outlet and is practical only where no intermediate setting between full open and closed is required.

2. *Hit-and-miss Damper.* Two slotted plates or discs, closely adjacent; by moving one of the two plates the respective slots may be opened or closed. This type of volume

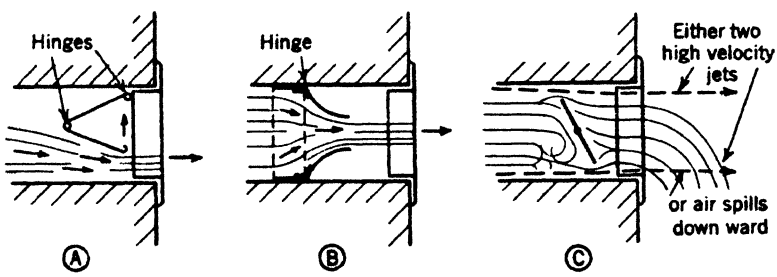

FIG. 7. EFFECT OF VARIOUS DAMPER ARRANGEMENTS DESIGNED FOR STRAIGHT BLOW

control may be installed close to an air outlet and it is easy to operate, but its main disadvantage is that even in the open position the air passage area is blocked by at least 50 per cent. This requires oversizing of the air outlet in order to avoid excessive increase of noise level.

3. *Splitter Damper.* A single blade sheet metal plate hinged at one edge, usually located at the branch connection of a duct or outlet. It is easy to operate but often causes irregular air flow in the duct. When used in connection with, and near an outlet additional directional control is required.

4. *Butterfly Damper.* A single blade sheet metal hinged in the middle, usually located in a straight duct run. It is easier to handle than a splitter damper, since only half the motion is necessary to change its setting. However, if located too close to an air outlet, it is objectionable because its operation frequently results in a condition whereby too high velocity jets are created along the sides of the duct or the air spills immediately downward into the occupied zone (see C Fig. 7).

5. *Louver Dampers.* Numerous designs have been developed incorporating a series of splitter or butterfly dampers across the duct or air outlet. Their main advantage consists in retaining greater uniformity of air flow and in requiring less depth for installation. Some designs provide for louver blades moving in opposite directions, and while decreasing free air passage area, retain a constant air flow direction along the axis of the duct air outlet connection (see A and B in Fig. 7).

RETURN AND EXHAUST INTAKES

The *selection of return and exhaust intakes* depends on: (1) velocity in occupied zone near intake, (2) permissible pressure drop through intake, and (3) noise.

1. *Velocity.* The effect of air flow through return intakes upon air movement in the room is slight. Air handled by the intake is drawn from

TABLE 1. RECOMMENDED RETURN INTAKE FACE VELOCITIES

INTAKE LOCATION	VELOCITY OVER GROSS AREA FPM
Above occupied zone	800 up
Within occupied zone, not near seats	600–800
Within occupied zone, near seats	400–600
Door or wall louvers	500–700
Undercutting of doors (through undercut area)	600

all directions, the velocity dropping off rapidly as distance from intake increases. The only locality where drafts may prove objectionable is adjacent to the intake. To prevent excessive air motion in this area due to the return intake, it is advisable to compute the total air motion toward the exhaust opening as outlined in Equation 14 where A is the exhaust wall area in square feet. Recommended return intake face velocities are given in Table 1.

2. *Permissible Pressure Drop.* The permissible pressure drop will depend on the choice of the designer. Table 2 gives pressure drop through plain lattice intakes as a function of free area and face velocity.

Proper pressure drop allowance should be made for control or directive devices.

3. *Noise.* The problem of *noise* generated by return intakes is the same as that for supply outlets. In computing resultant room noise levels from the operation of an air conditioning system, the return intake must be included as a part of the total grille area. The major difference between the supply outlets and return intakes is the frequent installation of the latter at ear level. When so located, it is recommended that the return intake velocity be not in excess of 75 per cent of the maximum permissible outlet velocity.

Outlet Location

The control of the room air motion for the maintenance of comfort conditions depends on the proper selection of the *supply* outlets. The location of the return or exhaust intakes do not critically affect air motion unless room air velocities in the occupied zone adjacent to the intake exceed comfort limits. The locations of return or exhaust intakes are however important for obtaining the desired room temperature equalization.

4. *Ceiling locations* for outlets are recommended for bars, kitchens, lavatories, dining rooms, club rooms, etc., where warm air will rise to the ceiling level. In heating installations, location of the return grilles in the

TABLE 2. APPROXIMATE PRESSURE DROPS FOR LATTICE RETURN INTAKES

Inches Water Gage—Standard Air

PER CENT FREE AREA	FACE VELOCITY, FPM						
	400	500	600	700	800	900	1000

80	0.02	0.03	0.05	0.07	0.09	0.11	0.14

ceiling or high on the wall will result in stratification of the conditioned air and a high percentage of the heated air will be drawn into the return duct before it has served its purpose. (Refer also to considerations outlined previously in section *Outlet Location and Selection* in this Chapter).

Some circular ceiling outlets combine the supply and return openings in a single unit. The return duct is in the center with the supply pattern on the outside. This method gives best results for cooling applications. The application for heating is more critical and requires consideration of ceiling height, amount of outside wall area, and number of air changes required. In some cases, stratification of warm air may cause short circuiting. Where the wall losses are a small part of the total, little difficulty is encountered with stratification.

Floor locations of outlets are used in heating installations for ceiling or side wall supply. When located so that air is drawn across exposed walls, the performance of the system may be somewhat improved. In general, floor locations tend to collect dirt and refuse.

Wall and door locations of outlets depending on their elevation, have the characteristics of either floor or ceiling returns. In large buildings with many small rooms, the return air may be brought through door grilles or door undercuts into the corridors and then to a common return or exhaust. The pressure drop through door returns should not be excessive; otherwise the air distribution to the room may be seriously unbalanced with the opening or closing of the doors. Outward leakage through doors or windows cannot be counted upon for dependable results.

SPECIFIC APPLICATIONS

For *theaters and auditoriums* the air distribution methods used are the downward distribution system with ceiling diffusers and the horizontal distribution system with ejector nozzles or wall diffusers. Fig. 8 shows both methods. Ceiling distribution is accomplished by ceiling outlets under main ceiling and balcony. It is indicated when main ceiling or balcony are cut up by architectural treatment or beams. The only critical points are under the balcony, and (occasionally) above the very rear of the balcony, where ceiling heights are low and where direct impingement of air is sometimes a hazard.

Wall or ejector distribution is particularly applicable for relatively long and narrow theaters. It is essential with this type of distribution that there be no interference with the movement of air throughout its entire path from the high velocity nozzles to the front of the theater. The ceiling should be smooth without projecting beams or obstructing ornamentation. For large theaters, relatively high velocities can be used. These will work satisfactorily if adjustable outlets are used to avoid areas of local turbulence.

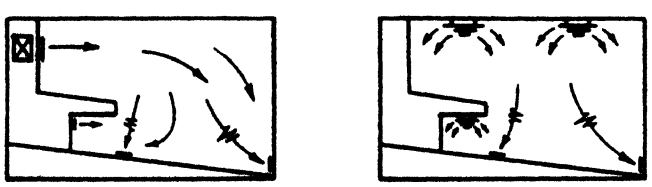

FIG. 8. AIR DISTRIBUTION METHODS FOR THEATERS, CHURCHES, AND AUDITORIUMS

In small or medium size theaters, it is sometimes practicable to use side wall or front wall distribution. For the satisfactory operation of such a system during the winter heating period, the returns should preferably be located at the floor level and near the front of the theater to prevent cold spots which may result from exposed wall convection or infiltration from exits.

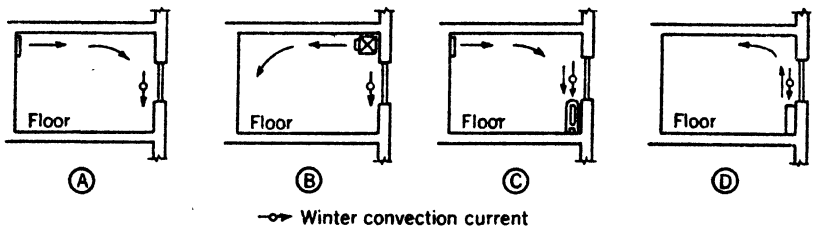

FIG. 9. DISTRIBUTION METHODS FOR SMALL ROOMS

A. Satisfactory for cooling. Unsatisfactory for heating in severe climates where the outside temperature is consistently below 40 F, and single glass and uninsulated walls are prevalent.

B. Performance approximately that of A when small diffusers are used in bottom of the duct.

C. Satisfactory for cooling. Satisfactory for heating if direct radiation is properly controlled.

D. Satisfactory for both cooling and heating. The air should be discharged slightly away from the wall, and for low velocities should be fanned out parallel to the wall.

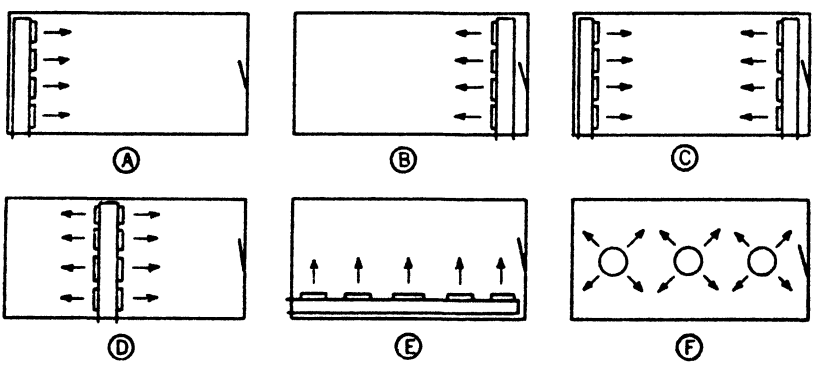

FIG. 10. SMALL STORE COOLING DISTRIBUTION

A. *Rear Wall.* High outlet velocity, satisfactory if properly designed; possibility of excessive air motion and drafts if used for wrong application.

B. *Front Wall.* High outlet velocity, results same as A.

C. *Front and Rear Walls.* Moderate room air motion, outlet blows should not impinge giving rise to down drafts in center.

D. *Center.* Moderate air motion, no impingement of air streams. Good results.

E. *One Side.* Moderate room air motion; should blow toward exposed wall. Good results.

F. *Ceiling.* Low room air motion. Good results. Outlets should be selected of sufficient size to allow for blocking when not located in perfect squares.

For *multi-room buildings* diagrams shown in Fig. 9 illustrate distribution methods for small rooms with exposed wall, such as offices, hotel (guest) rooms, hospital (patients) rooms, apartments, etc.

For *a small store* the cooling performance of various distribution methods is illustrated in Fig. 10. *Marine applications* of air distribution systems are given in Chapter 49.

AIR DUCT DESIGN

Pressure Losses, Friction Losses, Friction Loss Chart, Circular Equivalents of Rectangular Ducts, Elbow Friction Losses, Proportioning the Losses, Duct Sizes, Procedure for Duct Design, Air Velocities, Main Trunk Ducts, Velocity Method, Equal Friction Method, Duct Construction Details, Duct Heat Loss and Insulation

---

THE theoretical resistance of an air handling system can be computed from the methods and data given in this chapter. The actual resistance for any given installation, however, may vary considerably from the calculated resistance because of variation in the smoothness of materials, the type of joints used and the ability of the mechanics to fabricate in accordance with the design. It is best to select fans and motors of sufficient size to allow a factor of safety. Volume dampers should be installed in each branch outlet to balance the system, and the necessary allowance for this balancing should be made in calculating the pressure loss in the system.

The flow of air due to large pressure differences is most accurately stated by thermodynamic formulae for air discharge under conditions of adiabatic flow, but such formulae are complicated, and the error occasioned by the assumption that the gas density remains constant throughout the flow may be considered negligible when only such pressure differences are involved as occur in ordinary heating and ventilating practice.

The rate of flow of air in a duct may be obtained from Equation 1, which is developed as Equation 69 in Chapter 4:

$$V_m = 1096.5 \sqrt{\frac{h_w}{\rho_a}} \tag{1}$$

where

V_m = velocity of fluid, feet per minute.
h_w = velocity head or pressure, inches of water.
ρ_a = density of air, pounds per cubic foot.

For dry air (69.41 F and 29.921 in. Hg barometer) $\rho_a = 0.075$ lb per cubic foot [1]. Substituting this value in Equation 1:

$$V_m = 1096.5 \sqrt{\frac{h_w}{0.075}} = 4005 \sqrt{h_w} \tag{2}$$

The relation of air velocity and velocity head expressed in Equation 2 is shown diagrammatically in Fig. 1 for dry air at 69.41 F and 29.921 in. Hg barometer.

The drop in pressure in air distributing systems is due to the *dynamic* losses and the *friction* losses. The friction losses for turbulent flow (which occur in all practical air flow problems) are due to the friction of air against the sides of the duct and to internal friction between air molecules. The dynamic losses are those due to the change in the direction or in the velocity of air flow.

Dynamic losses occur principally at the entrance to the piping, in the elbows, and wherever a change in velocity occurs. The entrance loss is the difference between the actual pressure required to produce flow and the pressure corresponding to the flow produced; it may vary from 0.1 to

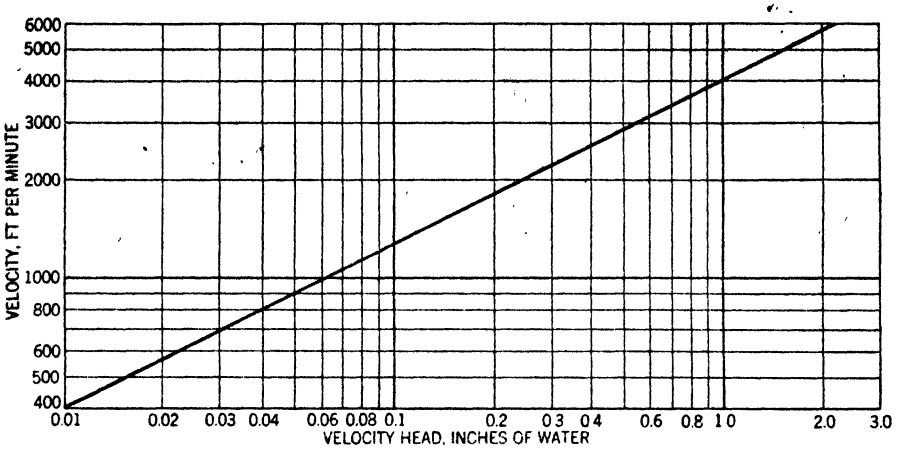

FIG. 1. RELATION BETWEEN VELOCITY AND VELOCITY HEAD FOR STANDARD AIR

0.5 times the velocity head. The pressure loss in elbows must also be allowed for in the design.

FRICTION LOSSES

Friction loss in *straight* ducts is most readily calculated by means of the Air Friction Chart, Fig. 2, which was developed by research at the A.S.H.V.E. Research Laboratory [2]. The range of the chart has recently been modified to include smaller air capacities and duct sizes, and the upper limit of air capacity has been somewhat reduced.

The chart, Fig. 2, is constructed from the basic flow equation:

$$h_f = f \frac{l}{D} \frac{V^2}{2g} \quad (3)$$

where

h_f = head loss due to friction, in feet of fluid flowing.
l = length of conduit, feet.
D = inside diameter of conduit, feet.
V = fluid velocity, feet per second.
g = acceleration due to gravity, 32.17 fps per second.
f = a non-dimensional friction coefficient, which for ventilation work depends upon Reynolds Number and the relative roughness of the conduit. Appropriate values of f were taken from the work of Moody [3].

The air friction chart is based on standard air at 29.921 in. of mercury barometer and 69.41 F, flowing through average, clean, round, galvanized metal ducts having approximately 40 joints per 100 ft. Fig. 2 should not be used to obtain values below the chart by extrapolation because critical flow would occur in this region and values so obtained would be unreliable. For the average application, it should prove sufficiently accurate, without corrections, for any air temperature from 50 F to 90 F, for any relative humidity, and for any normal variation in barometric pressure. For widely varying air pressures or temperatures, or for unusual duct conditions, the friction values obtained from the chart should be corrected.

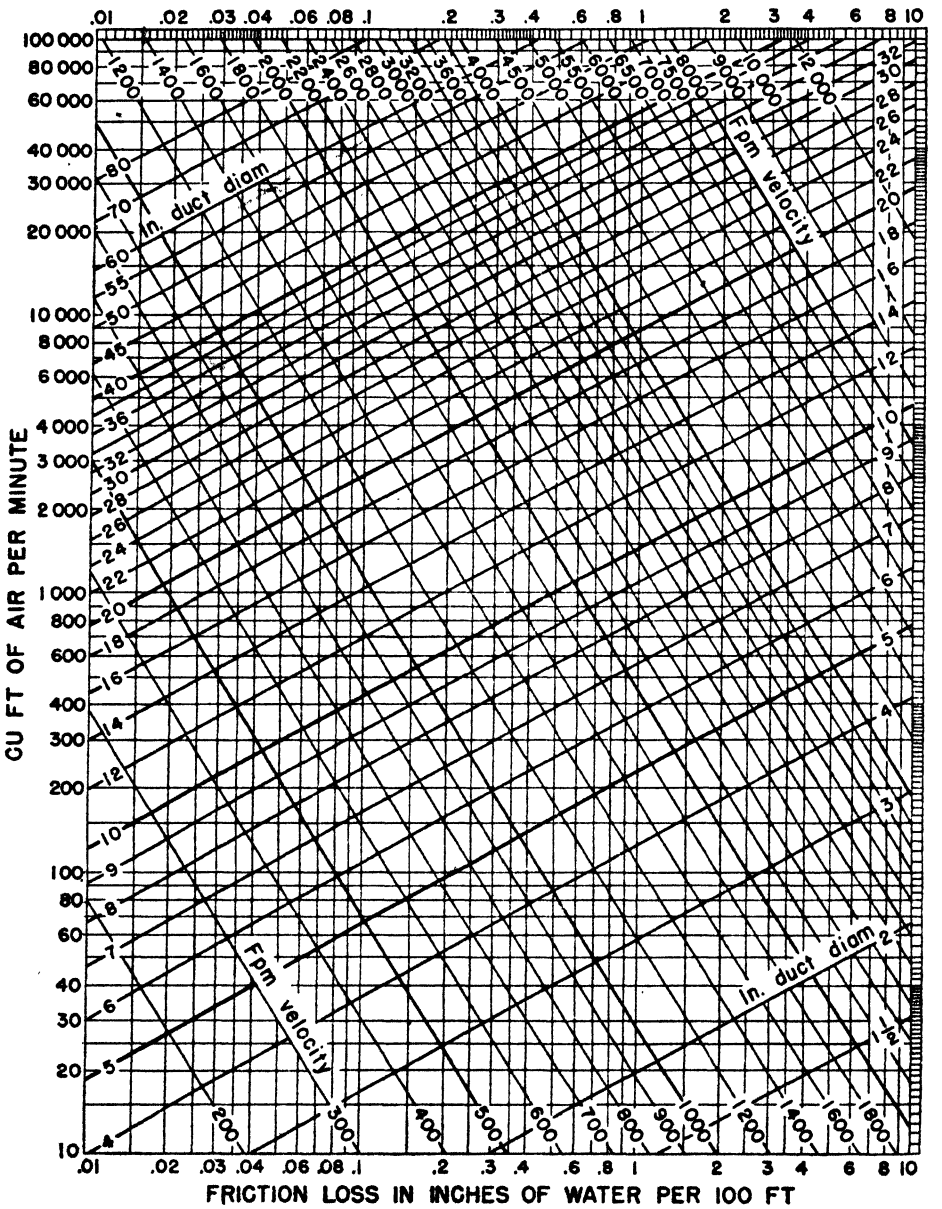

FIG. 2. FRICTION OF AIR IN STRAIGHT DUCTS

(Based on Standard Air at 29.921 In. of Mercury barometric pressure and 69.41 F flowing through average, clean, round, galvanized metal ducts having approximately 40 joints per 100 ft.) Caution: Do not extrapolate below chart.

For ducts of other than standard sheet metal construction, correction factors may be obtained from Fig. 3 [4]. The correction factors shown in Fig. 3 were computed for the values of ϵ, the roughness in feet, shown in Table 1 [4]. The correct friction loss for such ducts may then be determined by multiplying the losses obtained from Fig. 2 by these factors.

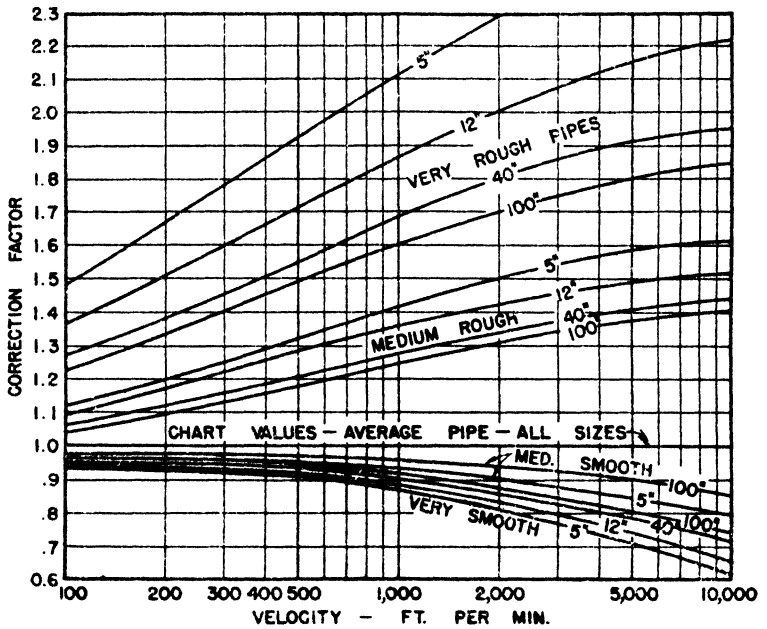

FIG. 3. CORRECTION FACTORS FOR PIPE ROUGHNESS

To correct for pipe roughness multiply friction loss obtained from Fig. 2 by correction factor obtained from Fig. 3

For ordinary ventilating work, friction may be assumed to vary directly as the density without serious error. If temperatures or viscosities are much different from standard, and if precise results are desired, corrections should be made by use of Equation 3, with the appropriate value of the coefficient of friction, f. However, the following approximate equations [2] are presented and will be found sufficiently accurate for most purposes.

For perfectly smooth ducts: $$h_o = h_s \left(\frac{\rho_o}{\rho_s}\right)^{0.81} \left(\frac{\mu_o}{\mu_s}\right)^{0.19} \quad (4)$$

For average ducts, $$h_o = h_s \left(\frac{\rho_o}{\rho_s}\right)^{0.90} \left(\frac{\mu_o}{\mu_s}\right)^{0.1} \quad (5)$$

For very rough ducts, $$h_o = h_s \left(\frac{\rho_o}{\rho_s}\right) \quad (6)$$

where

h = friction loss.

ρ = density.

μ = absolute viscosity.

h, ρ and μ may be in *any consistent units.*
Subscripts o and s refer to *actual operating* and *standard* conditions respectively.

The absolute viscosity of dry air at various temperatures is given in Fig. 4. The effect of relative humidity on viscosity may be neglected.

Examples 1 and 2 illustrate the use of Fig. 2 to determine friction loss and the use of Fig. 3 to apply a correction for roughness.

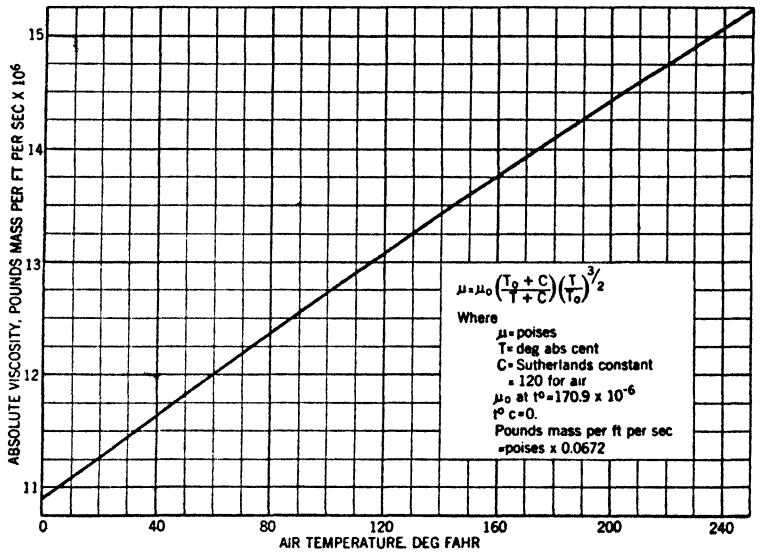

FIG. 4. TEMPERATURE—VISCOSITY CURVE FOR DRY AIR

Example 1. Assume that it is desired to circulate 10.000 cfm of air through 75 ft of 24 in. diameter galvanized duct. Find 10,000 cfm on the left scale of Fig. 2 and move horizontally right to the diagonal line marked 24 in. The other intersecting diagonal shows that the velocity in the pipe is 3200 fpm. Directly below the intersection it is found that the friction per 100 ft is 0.50 in.; then for 75 ft the friction will be 0.75 × 0.50 = 0.38 in. In a like manner any two variables may be determined by the intersection of the lines representing the other two variables.

Example 2. If the duct in Example 1 is very rough, instead of galvanized, with 40 joints per 100 ft, find the total friction.

On Fig. 3 find (by interpolation between 12 in. and 40 in. pipe) the intersection of the 24 in. *very rough pipe* line and the 3200 fpm velocity ordinate and at the left margin read a correction factor of 2. The friction loss in the rough duct is therefore 2 × 0.38 = 0.76 in.

Circular Equivalents of Rectangular Ducts

An air handling system is usually sized first for round ducts and, if rectangular ducts are desired, their sizes are selected to provide air carry-

TABLE 1. VALUES OF ROUGHNESS ε FOR DIFFERENT PIPES[a]

PIPE	DEGREE OF ROUGHNESS	ε ROUGHNESS IN FEET
Drawn Tubing	Very smooth	0.0000015
New Steel or Wrought-Iron Pipe	Medium smooth	0.00015
Galvanized Iron	Average	0.0005
Average Concrete	Medium rough	0.003
Average Riveted Steel	Very rough	0.01

[a]Used in computing values for Fig. 3.

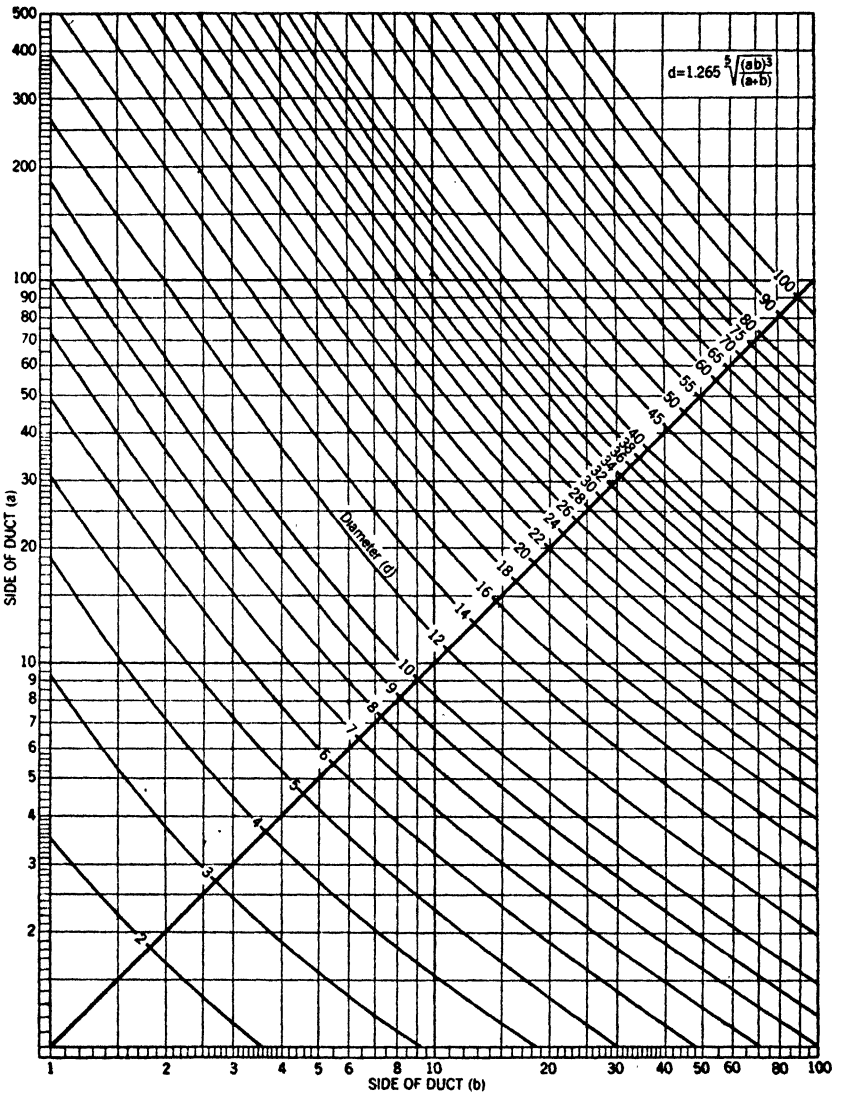

FIG. 5. RECTANGULAR EQUIVALENTS OF ROUND DUCTS

ing capacities equivalent to those of the round ducts originally selected. Table 2 gives directly the rectangular duct sizes equivalent to each size of circular duct in friction and capacity. The values in this table were obtained from the equation:

$$d = 1.265 \sqrt[5]{\frac{(a\,b)^3}{a + b}} \tag{7}$$

where

a = one side of rectangular duct, feet or inches.

b = other side of rectangular duct, feet or inches.

d = equivalent diameter of round pipe for equal friction per foot of length to carry the same capacity, feet or inches.

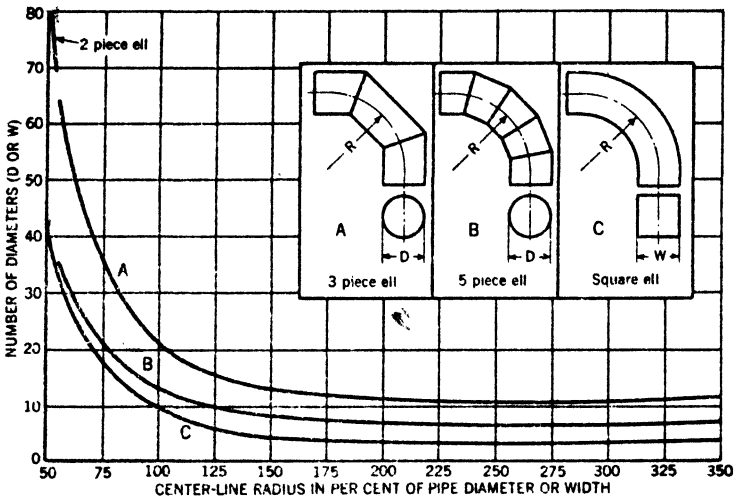

FIG. 6. LOSS OF PRESSURE IN ELBOWS

Rectangular equivalents of round ducts are also given in the curves of Fig. 5 which are plotted from data based on Equation 7. To use the chart, locate the diagonal curve giving the diameter of the round duct. The width and height of an equivalent rectangular or square duct may then be read as the abscissa and the ordinate of any point on the curve.

Multiplying or dividing the length of each side of a pipe by a constant is the same as multiplying or dividing the equivalent round size by the same constant. Thus, if the circular equivalent of an 80 x 24-in. duct is required, it will be twice that of a 40 x 12-in. duct, or $2 \times 23.3 = 46.6$ in.

A comprehensive study of equivalent duct sizes is to be made by the A.S.H.V.E. Research Laboratory for the purpose of determining whether Table 2 and Fig. 5 should be revised.

Elbow Friction Losses

It is customary to express the dynamic and friction losses in elbows as equal to a number of diameters of round pipe, or a number of widths of rectangular pipe, or equivalent length of duct [5]. The curves in Fig. 6 give the number of diameters or widths of pipe which have a frictional

resistance equivalent to the pressure drop in the elbows. Curves *B* and *C* are based on tests of round and square elbows [6] of ordinary good sheet metal construction.

Values obtained from Curve *A* should be used when there is any doubt as to quality of duct construction. It is suggested that this curve be used for rectangular elbows and five-piece elbows as it will thus allow an additional factor of safety without seriously affecting the design.

As indicated in Fig. 6, long radius elbows will offer much less resistance to the flow of air than short radius elbows. Experience has

[a]For more complete data see A.S.H.V.E. RESEARCH REPORT No. 1216—Effect of Vanes in Reducing Pressure Loss in Elbows in 7-Inch Square Ventilating Duct, by M. C. Stuart, C. F. Warner and W. C. Roberts (A.S.H.V.E. TRANSACTIONS, Vol. 48, 1942, p. 409).

Note A: Vane *A* made up of a large number of small splitters; *B* made up of a small number of large splitters bent on a large radius; *C* hollow vanes having different outside and inside curvature; and *D* four splitters with $R/W = 0.4$. Elbow same as *D* except 2 in. trailing edge on the end of each splitter, ELD in feet = 17.0.

Note B: The air velocity has no effect on the loss of elbows when the loss is expressed as equivalent length of duct.

shown that good results may be expected when the radius to the center of the elbow is 1.5 times the pipe diameter or duct width parallel to the radius. Examination of the curve will indicate that little advantage is to be gained by selecting elbows having a centerline radius of more than two diameters[7]. Elbows having a radius of more than three diameters show a slightly increased resistance due to the increased length of pipe but, when used, they reduce the over-all resistance of the system and therefore should not be avoided.

Where space conditions necessitate the use of short radius or miter elbows in square or rectangular duct work, turning vanes should be used to reduce the pressure losses. Rough or raw edges on the vanes should be avoided to prevent objectionable noise. Table 3 shows typical types

of vanes and gives the resistance, expressed in equivalent length of straight pipe, for a 7-in. x 7-in. elbow of each type.

The pressure loss through elbows of less than 90 deg may be assumed to be directly proportional to the ratio of the angle through which the turn is made. The resistance will vary widely for the large degree turns depending upon the aspect ratio and the length of straight pipe between the elbows but, for practical purposes, it may be assumed that the ratio remains proportional to the angle through which the turn is made. Reverse 90 deg elbow turns should be avoided wherever possible but, where used, the friction indicated in Fig. 6 should be doubled for the second elbow. Additional tests are needed on the loss of pressure in elbows and other types of duct fittings in order to reconcile the difference between values shown in Fig. 6 and results of more recent tests shown in Table 3. A study of this subject will be undertaken at the A.S.H.V.E. Research Laboratory for the purpose of obtaining such data.

PROPORTIONING THE LOSSES

The entrance loss through the outside air intake louvers will vary with the design of the louvers and method of connection to the system. The louvers and connecting duct will have a friction resistance of from 0.25 to 1.00 times the velocity pressure. Therefore, the total entrance loss will vary from 1.25 to 2.00 h_w. Common practice is to use 1.5 h_w for a 75 per cent free area louver with connecting duct having 15 deg tapered sides. Wherever air passes through a plenum space having a negligible velocity, allowance must be made for the loss in velocity head. This loss in velocity head may be taken as the difference in velocity heads in the plenum and the duct. Where the ducts are very smooth with long transformation fittings, a regain in static pressure is sometimes allowed, but ordinary construction does not warrant a consideration of this factor, and it is customary to neglect it. When it is allowed, the regain is estimated at one-half the difference between the velocity pressure at the fan outlet and at the last run of pipe.

Other losses of pressure occur through the heating units, at the air washer and at air filters. In the design of an ideal duct system, all factors should be considered and the air velocities proportioned so that the resistance will be practically equal in all ducts regardless of length.

DUCT SIZES

Ducts and flues for gravity circulation must be sized so that the friction loss will not exceed 50 per cent of the available chimney effect due to the temperature and height of the column of heated air. Duct systems for mechanical circulation may be sized so as to have much higher pressure losses than gravity systems. The total pressure of these systems is limited to the pressure which the fan will produce.

The general rules to be followed in the design of a duct system are:

1. The air should be conveyed as directly as possible at reasonable velocities to obtain the results desired with greatest economy of power, material and space.

2. Sharp elbows and bends should be avoided unless turning vanes are used.

3. Transformation pieces should be made as long as possible. The angle between the sides and axis of the duct should never exceed 30 deg and, where possible, 15 deg should be made the maximum.

4. Especial care should be taken to maintain a true cross-section and not to restrict the air flow either in transformation pieces or in elbows.

5. Rectangular ducts or flues should be made as nearly square as possible. Good practice limits the ratio between the long side and the short side to 3 to 1. In no case should this ratio exceed 10 to 1.

6. Wherever possible, ducts should be constructed of smooth material such as sheet metal. Where masonry ducts are used, proper allowance for the surface friction coefficient should be made.

7. The use of furred spaces, spaces between joists, etc., should be avoided unless lined with sheet metal.

Procedure for Duct Design

The general procedure for designing a duct system is outlined in the several items listed herewith:

1. Study the plan of the building and draw in roughly the most convenient system of ducts, taking cognizance of the building construction, avoiding all obstructions in steel work and equipment, and at the same time maintaining a simple design.

2. Arrange the positions of duct outlets to insure the proper distribution of air.

3. Divide the building into zones and proportion the volume of air necessary for each zone.

4. Determine the size of each outlet, based on the volume as obtained in the preceding paragraph, for the proper outlet velocity and throw.

5. Calculate the sizes of all main and branch ducts by either of the following two methods:

a. Velocity Method. Select the velocity in the various sections, reducing the velocity from the point of leaving the fan to the point of discharge to the room. In this case the pressure loss of each section of the duct is calculated separately and the total loss found by adding together the losses of the various sections of the continuous run.

b. Friction Pressure Loss Method. Proportion the duct for equal friction pressure loss per foot of length.

6. Calculate the friction for the duct offering the greatest resistance to the flow of air, which resistance represents the static pressure which must be maintained at the fan outlet or in the plenum space to insure distribution of air in the duct system. The duct having the greatest resistance will usually be that having the longest run, although not necessarily so.

Air Velocities

The air velocities given in Table 4 have been found to give satisfactory results in engineering practice. Where the higher velocities are used, the ducts should be cross-braced to prevent breathing, buckling or vibration, and should be constructed of heavier gage metal. At the higher velocities it is particularly important to design the ducts for minimum resistance. As high velocities at one point offset the effect of proper design in all other parts of the system, emphasis should be placed on the importance of air velocities, elbow design, location of dampers, fan connections, grille and register approach connections, and similar details. For industrial buildings, noise is seldom given much consideration, and main duct velocities as high as 2800 or 3000 fpm are sometimes used but, when these velocities are used, due consideration should be given to duct design, resistance pressure, fan efficiencies and motor horsepower. For department stores and similar buildings, 2000 to 2200 fpm are sometimes used in main ducts where noise is not objectionable and space conditions warrant it.

Where high velocity diffusing outlets are used, the duct velocity should not be less than the throat velocity of the diffusers, as dynamic losses

occur wherever velocities are stepped up or down. One recent trend in grille design is toward the use of much higher grille and branch duct velocities. Some installations have been made with velocities as high as 1600 fpm in branches and through the net area of grilles, but many of these have proven unsatisfactory because of noise and drafts.

Grille manufacturers publish selection tables which size the grilles for volume of air, temperature differential, and distance of throw. In following these tables, maximums should be avoided and the manner in which the duct connects to the grille should be given careful consideration. Most of the selection tables are based on straight approach to the grille. Elbow connections to supply grilles should be provided with turning vanes to equalize the face velocity. See Chapter 40 for a discussion of grilles.

TABLE 4. RECOMMENDED AND MAXIMUM DUCT VELOCITIES

DESIGNATION	RECOMMENDED VELOCITIES, FPM			MAXIMUM VELOCITIES, FPM		
	Residences	Schools, Theaters, Public Buildings	Industrial Buildings	Residences	Schools, Theaters, Public Buildings	Industrial Buildings
Outside Air Intakes[a]	700	800	1000	800	900	1200
Filters[a]	250	300	350	300	350	350
Heating Coils[a]	450	500	600	500	600	700
Air Washers	500	500	500	500	500	500
Suction Connections	700	800	1000	900	1000	1400
Fan Outlets	1000–1600	1300–2000	1600–2400	1700	1500–2200	1700–2800
Main Ducts	700–900	1000–1300	1200–1800	800–1000	1100–1400	1300–2000
Branch Ducts	600	600–900	800–1000	700	800–1000	1000–1200
Branch Risers	500	600–700	800	650	800–900	1000

[a]These velocities are for total face area, not the net free area.

Fan outlet velocities are discussed in Chapter 32 and will not be dealt with here except to indicate that fan noises should be given proper consideration.

Main Trunk Ducts

Main trunk ducts with branches are commonly used to convey the air from the fan to the grille or register outlets in preference to individual ducts from the fan to these outlets. The velocities in these ducts and branches vary according to the nature of the installation and the degree of quietness desired. The recommended velocities in Table 4, with good construction, should give satisfactory results. The maximum velocities indicated should not be used except where noise is not a deciding factor.

Velocity Method

The velocity method of designing a duct system involves the arbitrary selection of velocities for various sections of the duct system with the

highest velocities at the fan and progressively lower velocities toward the duct openings to the room. To find the total static pressure against which the fan must operate, the static pressure loss of each section must be calculated separately and the total loss found by adding the individual losses of the various sections of the run having the highest resistance. Usually this is the longest run but in some cases a shorter run may have more elbows, transformations, booster heaters, etc., which will cause it to have a higher resistance pressure. This method requires judgment and experience in choosing the proper velocities to approach equal friction for all lengths of run but many engineers believe that the velocity method is handier to use than other methods and will give satisfactory results for most practical applications. The air velocities given earlier in this chapter are helpful in choosing proper velocities. Adjustable dampers or splitters are used to regulate air quantities delivered.

Equal Friction Method

The equal friction method of design is sometimes preferred because it does not require nearly so much judgment and experience in selecting the proper velocities in the various sections of a system. The usual procedure in this method of design is to select the main duct velocity to be consistent with good practice from a standpoint of noise for a particular type of building. This velocity should be less than the fan outlet velocity. All main ducts and branch ducts are sized for equal friction per unit length by the use of Fig. 2, and Table 2 or Fig. 5.

In cases where the fan or factory assembled air conditioning unit has a limited external resistance, it is necessary to divide the available resistance by the total equivalent length of the longest or most complicated run of duct to determine the resistance per 100 ft and then to size all ducts at this resistance value. This will automatically determine the duct velocities and give the desired total duct resistance. A further refinement, which is sometimes used in large systems, is to size each branch duct so that it has a resistance equal to the resistance of the main system at the point of juncture. Even when this refinement is added, regulating dampers are recommended in each branch.

After the duct system is designed the frictional resistance is calculated and tabulated together with the resistance of all component parts. The fan is then selected for the required volume of air, static pressure and outlet velocity.

Typical calculations for design of an air distribution system are given in Examples 3 and 4.

Example 3. Fig. 7 shows a typical layout of an air distribution system which is applicable for ventilation of hotel dining rooms and offices. The volume of air in cubic feet per minute for the room is determined on the basis of the number of air changes per hour required. In the example shown, the room ventilated is a hotel dining room 135 ft x 85 ft x 15 ft. A 7½-min air change (8 air changes per hour) is assumed for proper ventilation, giving 22,935 cfm as the air required.

The free area of the outdoor air inlet is based on a velocity of 1000 fpm or 22,935 ÷ 1000 = 22.94 sq ft. The main duct velocity selected from Table 4 is 1250 fpm which gives a main duct area of 22,935 ÷ 1250 = 18.354 sq ft (60 × 44 in.). From Table 2 a 60 × 44 in. duct is approximately equivalent to 56 in. diameter.

Referring to Fig. 2, a volume of 22,935 cfm through a 56 in. diameter duct gives a resistance of 0.033 in. per 100 ft. The amount of air to be handled by each section of pipe is shown in Fig. 7, and by locating each of these values on the 0.033 in. friction line,

the round pipe sizes are obtained and then, referring to Table 2, the equivalent rectangular sizes are selected as shown in Table 5.

The pressure at the outlets nearest the fan will be greater than at the pipes farther along the run so that the former will tend to deliver more than the calculated amount of air. To remedy this condition, volume regulating dampers should be located at the base of each riser, or in each branch duct, and adjusted for proper distribution. At points where branches leave the main it may be advisable, depending upon the nature of the installation, to install adjustable splitters similar to those shown in Fig. 7 where the main duct divides into the 58 x 30 in. and 50 x 30 in. branches.

Resistance Losses for the System

(1)	Outdoor air intake, 1000 fpm velocity (1.5 heads × 0.0625)	0.094 in.
(2)	Filters (from manufacturer's tables)	0.250 in.
(3)	Tempering coil loss (from manufacturer's tables)	0.074 in.
(4)	Air washer loss (from manufacturer's tables)	0.250 in.
(5)	Reheating coil loss (from manufacturer's tables)	0.083 in.
(6)	Duct resistance:	
	The longest run is	= 150 ft
	Two, 58 x 30 in. elbows (150% ratio) $\frac{2 \times 13 \times 58}{12}$	= 126 ft
	Two, 30 x 15 in. elbows (150% ratio) $\frac{2 \times 13 \times 30}{12}$	= 65 ft
	Three, 15 x 30 in. elbows (75% ratio) $\frac{3 \times 35 \times 15}{12}$	= 131 ft
	Total equivalent run	472 ft
	472 ft at 0.033 in. per 100 ft	0.156 in.
(7)	Allowance for damper adjustment, 25% of 0.156	0.039 in.
(8)	Supply grille resistance (from manufacturer's tables)	0.036 in.
	Total static pressure loss of system	0.982 in.

The fan is selected from the manufacturer's ratings to deliver 22,935 cfm at a static pressure of 0.982 in. as outlined in Chapter 32.

Example 4. If the rooms and offices of the hotel building of Example 3 are to be served from a manufactured unit with a capacity of 22,935 cfm against an external resistance of 0.35 in., the known resistances are calculated as:

(1)	Outdoor air inlet	0.094 in.
(2)	Supply grille resistance (from manufacturer's tables)	0.036 in.
	Total known resistance	0.130 in.

Subtracting this from the total available resistance: 0.35 in. − 0.130 in. = 0.220 in. available for duct resistance and damper adjustment.

If 25 per cent is allowed for damper adjustment, the total allowable duct friction = 0.220 ÷ 1.25 = 0.176 in.

Known length of run	150 ft

The duct width is then estimated for the following elbow calculations:

Four 150% ratio elbows, 4 x 13 x 3.5 ft	182 ft
Three 75% ratio elbows, 3 x 35 x 1.5 ft	158 ft
Total estimated length	490 ft

The duct friction per 100 ft is then 0.176 ÷ 4.90 = 0.036 in. and the mains and branches are sized from the 0.036 in. friction line in Fig. 2.

If it is desired to size each branch for equal resistance, the total resistance back to the point of juncture is calculated and the branch is then sized in a manner similar to that outlined in Example 4.

TABLE 5. PIPE SIZES FOR EXAMPLE 3[a]

VOLUME OF AIR (CFM)	DIAMETER OF PIPE (INCHES)	EQUIVALENT SIZE OF RECTANGULAR DUCT (INCHES)
22,935	56	60 x 44
12,510	45	58 x 30
10,425	42	50 x 30
8,340	39	42 x 30
6,255	35	42 x 24
4,170	29.5	30 x 24
2,085	23	30 x 15

[a]Velocity through grilles (not shown) to be approximately 300 fpm.

DUCT CONSTRUCTION DETAILS

Straight sections of round duct are usually formed by rolling the sheets to the proper radius and grooving the longitudinal seam. Rectangular ducts are generally constructed by breaking the corners and grooving the longitudinal seam, although some fabricators still use the standing seam due to lack of equipment. Elbows and transformation sections are generally formed with *Pittsburgh* corner seams because this seam is easier to lock in place than the double seam, but complicated fittings such as double compounded elbows are usually constructed with double seam corners. The construction of these various seams as well as the types of girth connections are shown in Fig. 8. The application of the various slips and connections is outlined in Table 6. The end slip may be used wherever *S* slips are recommended. Where drive slips are used the end slip may be applied on the narrow side of the duct and the drive slips on only the maximum side. Ducts 25 to 30 in. in size should be reinforced between the joints, but not necessarily at the joint. Ducts 31 in. and up should be reinforced at the joint and between the joints; if drive slips are used the

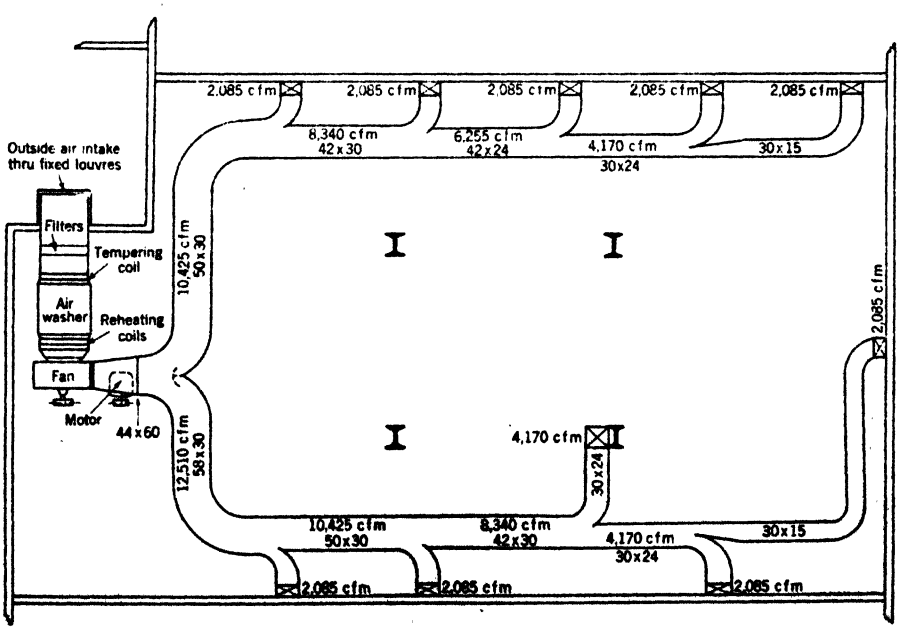

FIG. 7. TYPICAL LAYOUT OF AIR DISTRIBUTION SYSTEM

angles are usually riveted to the duct about 2 in. from the slips. It is good practice to cross-break or kink all flat surfaces to prevent vibration or buckling due to the air flow and accompanying variations in internal pressure. Round ducts are sometimes swedged 1.5 in. from the ends so that the larger end will butt against the swedge and are held in place with sheet metal screws. Where swedges are not used it is general practice to paste the joint with asbestos paper to insure a tight joint.

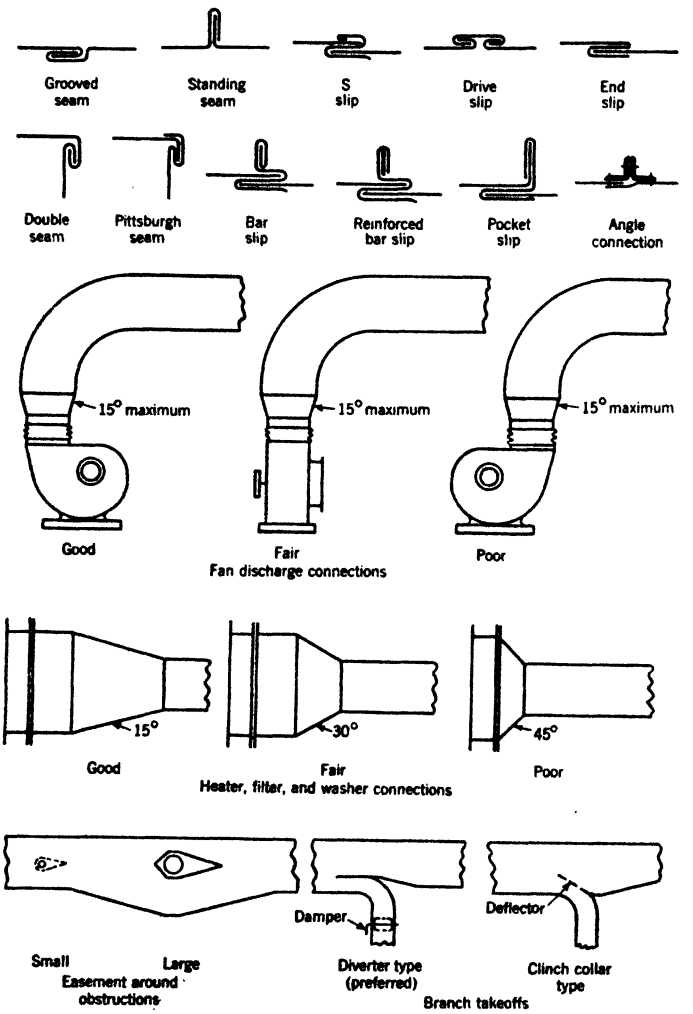

FIG. 8. SHEET METAL DUCT AND ARRANGEMENT DETAILS

The construction of elbows and changes of shape cannot be definitely outlined because of the varied conditions encountered in the field, but in general long radius elbows and gradual changes in shape tend to maintain uniform velocities accompanied by decreased turbulence, lower resistance and a minimum of noise.

Heavy canvas connections (asbestos cloth if there is a fire hazard) are recommended on both the inlet and outlet to all fans. The fan discharge connections shown in Fig. 8 are marked *good*, *fair*, and *poor* in the order

TABLE 6. RECOMMENDED SHEET METAL GAGES FOR RECTANGULAR DUCT CONSTRUCTION[a]

U. S. STD. GAGE	MAXIMUM SIDE, INCHES	TYPE OF TRANSVERSE JOINT CONNECTIONS[b]	BRACING
26	Up to 12	S, Drive, Pocket or Bar Slips, on 7 ft 10 in. centers	None
24	13 to 24	S, Drive, Pocket or Bar Slips, on 7 ft 10 in. centers	None
	25 to 30	S, Drive, 1 in. Pocket or 1 in. Bar Slips, on 7 ft 10 in. centers[c]	1 x 1 x ⅛ in. angles 4 ft from joint
22	31 to 40	Drive, 1 in. Pocket or 1 in. Bar Slips, on 7 ft 10 in. centers[c]	1 x 1 x ⅛ in. angles 4 ft from joint
	41 to 60	1½ in. Angle Connections, or 1½ in. Pocket or 1½ in. Bar Slips with 1⅜ in. x ⅛ in. bar reinforcing on 7 ft 10 in. centers[c]	1½ x 1½ x ⅛ in. angles 4 ft from joint
20	61 to 90	1½ in. Angle Connections, or 1½ in. Pocket or 1½ in. Bar Slips 3 ft 9 in. maximum centers with 1⅜ x ⅛ in. bar reinforcing	1½ x 1½ x ⅛ in. diagonal angles, or 1½ x 1½ x ⅛ in. angles 2 ft from joint
18	91 and up	2 in. Angle Connections or 1½ in. Pocket or 1½ in. Bar Slips 3 ft 9 in. maximum centers with 1⅜ x ⅛ in. bar reinforcing[d]	1½ x 1½ x ⅛ in. diagonal angles, or 1½ x 1½ x ⅛ in. angles 2 ft from joint

[a]For normal pressures and velocities (see Table 4) utilized in typical ventilating and air conditioning systems. Where special rigidity or stiffness is required, ducts should be constructed of metal two gages heavier. All uninsulated ducts 18 in. and larger should be cross-broken. Cross-breaking may be omitted on uninsulated ducts if two gages of heavier metal are used.

[b]Other joint connections of equivalent mechanical strength and air tightness may be used.

[c]Duct sections of 3 ft 9 in. may be used with bracing angles omitted, instead of 7 ft 10 in. lengths with joints indicated.

[d]Ducts 91 in. and larger require special field study for hanging and supporting methods.

of the amount of turbulence produced. An inspection of the heater connections shown in Fig. 8 will readily show that uniform velocity through the heater cannot be expected in the diagram noted *poor*. When obstructions cannot be avoided, the duct area should never be decreased more than 10 per cent and then a *streamlined* collar should be used. Larger obstructions require an increase in the duct size in order to maintain as nearly uniform velocity as possible. Branch take-offs should always be arranged to cut or slice into the air stream in order to reduce as far as possible the losses in velocity head.

The recommended gages for sheet metal duct construction are given in Table 6. Weights of sheet metal per square foot of surface for different gages are given in Table 7. The weights of various gages and the areas for any length of run of rectangular sheet metal ducts may also be determined from Fig. 9. The bottom scale represents the sum of the two sides of the duct and the oblique lines give the length of run in feet. Proceeding horizontally to the right from the intersection of vertical and oblique lines on the chart, the area of the duct may be determined in the first vertical scale. The scales to the right give the weights of the duct run for different gages of metal. In calculating the weights of duct, it is considered good practice to allow 20 per cent additional for weights of joints and bracings. Various weights and thicknesses of standard copper sheets will be found in Table 8.

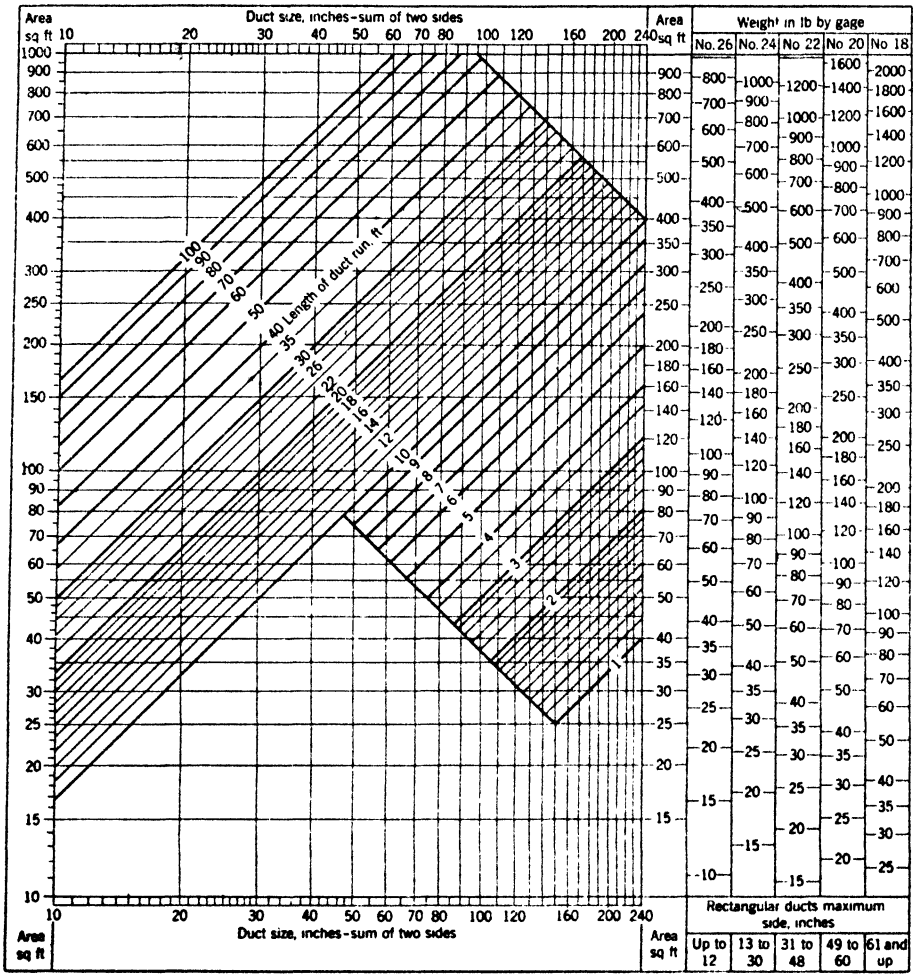

FIG. 9. AREA AND WEIGHT OF RECTANGULAR SHEET METAL DUCTS

HEAT LOSSES FROM DUCTS

The thermal transmittance U for ducts can be found as follows:

For uninsulated metal duct, $$U = \frac{1}{\frac{1}{f_i} + \frac{1}{f_o}} \quad (8)$$

For uninsulated non-metallic ducts, $$U = \frac{1}{\frac{1}{f_i} + \frac{x}{k} + \frac{1}{f_o}} \quad (9)$$

where U, f_i, f_o, x and k are as defined on page 769.

Where x is small and k is large, however, this factor $\frac{x}{k}$ is of little importance and may be neglected.

Film conductance f_i for air flowing in ducts apparently depends only on the velocity of the air and the diameter of the duct. A fairly reliable inside coefficient can be calculated from Schultz's modified equation:

$$f_i = \frac{0.32 V_a^{0.8}}{D^{0.25}} \quad (10)$$

[a]Galvanized sheets are gaged before galvanizing and are therefore approximately 0.004 in. thicker.

where

V_a = velocity of air in duct, feet per second.

D = inside diameter of duct, feet.

Film conductance f_o depends on a number of variables including temperature, diameter, and emissivity of the outer surface and can be calculated from data in Chapter 5. From this explanation, it is seen that it is unwise to recommend a given value of U for all uninsulated metal ducts.

The heat loss from a given length of duct can be expressed by:

$$Q = UPl\left[\left(\frac{t_1 + t_2}{2}\right) - t_3\right] \tag{11}$$

The heat given up by the air in the duct is:

$$Q = 0.24\ W\ (t_1 - t_2) = 14.4\ A V_m \rho_v\ (t_1 - t_2) \tag{12}$$

Equating (11) and (12):

$$\frac{t_1 + t_2 - 2t_3}{t_1 - t_2} = \frac{28.8\ A V_m \rho_v}{UPl}$$

Let $y = \dfrac{28.8\ A V_m \rho_v}{UPl}$ for rectangular ducts, and $\dfrac{7.2DV_m \rho_v}{Ul}$ for round

[a]Variations from these weights must be expected in practice.

ducts, and solve for t_1 and t_2:

$$t_1 = \frac{t_2 (y + 1) - 2t_3}{(y - 1)} \quad (13) \qquad t_2 = \frac{t_1 (y - 1) + 2t_3}{(y + 1)} \quad (14)$$

For low velocities and long ducts of small cross-section, a somewhat more accurate formula may be used as follows:

$$t_2 = \frac{t_1 - t_3}{e^{\left(\frac{UPl}{14.4 A \rho_v V_m}\right)}} + t_3 \quad (15)$$

Symbols used in these equations are listed at end of chapter.

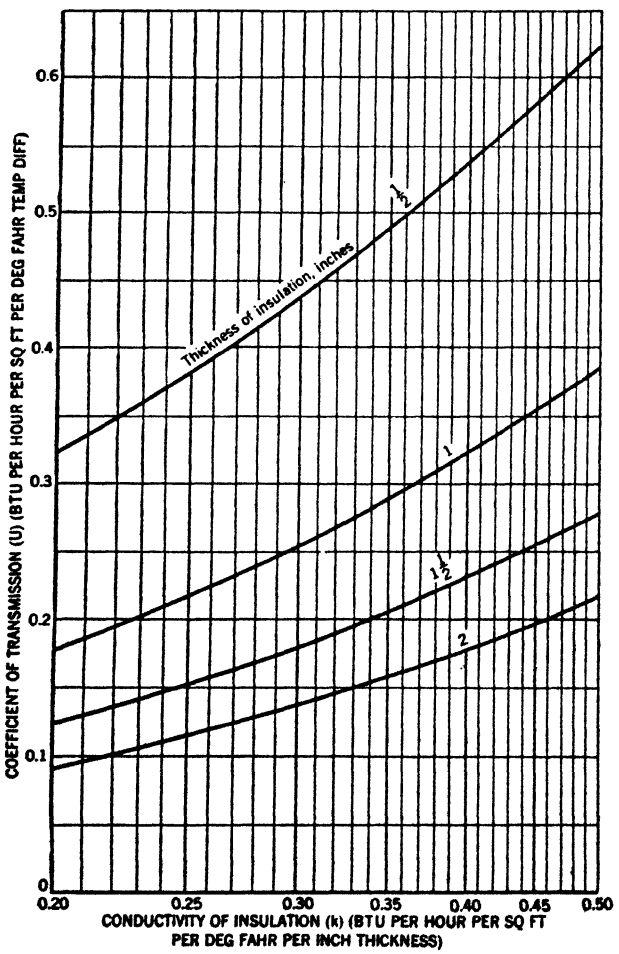

FIG. 10. HEAT LOSS COEFFICIENTS FOR INSULATED DUCTS[a]

[a]For round ducts less than 30 in. diameter, increase heat transmission values by the percentages shown.

THICKNESS OF INSULATION (Inches)	½	1	1½	2
21 to 30 in. Duct Diameter	1%	2%	3%	4%
12 to 21 in. Duct Diameter	3%	5%	7%	9%

In using Equations 13, 14, and 15, one of the duct air temperatures will be unknown and will be obtained by substitution of the other known or assumed values.

Heat loss coefficients for insulated ducts with various conductivities are given in Fig. 10. The conductivities of various materials, which are based on mean temperatures, ranging from about 70 to 90 F, will be found in Table 2 of Chapter 6. For cases where the mean temperature is other than that at which the test was conducted, a correction should be made. However, in most cases the effect of this factor will be small and may be neglected.

Example 6. Determine the entering air temperature and heat loss for a duct 24 × 36 in. cross-section and 70 ft in length, insulated with ½ in. of a material having a conductivity of 0.35 Btu at 86 F mean temperature, carrying air at a velocity of 1200 fpm, measured at 70 F, to deliver air at 120 F with air surrounding the duct at 40 F.

Solution. Referring to Fig. 10, the over-all heat transmission coefficient is found to be 0.49 Btu. From Table 1, Chapter 3 the density of air at 70 F and 29.921 in. Hg is found to be 1/13.348 = 0.0749 lb per cubic foot. Substituting these and the other given values in Equation 13:

$$y = \frac{28.8 \times 6 \times 1200 \times 0.0749}{0.49 \times 10 \times 70} = 45.3$$

$$t_1 = \frac{120\ (45.3 + 1) - 80}{45.3 - 1} = 123.7$$

Substituting in Equation 11:

$$Q = 0.49 \times 10 \times 70 \left[\left(\frac{123.7 + 120}{2} \right) - 40 \right] = 28{,}100 \text{ Btu per hour.}$$

For special considerations which apply to insulation of ducts in marine installations see Chapter 49.

LETTER SYMBOLS USED IN CHAPTER 41

μ_o = absolute viscosity of air under actual (operating) conditions, any consistent units.
μ_s = absolute viscosity of air under standard conditions, any consistent units.
ρ_a = density of air, pounds per cubic foot.
ρ_o = density of air under actual (operating) conditions, any consistent units.
ρ_s = density of air under standard conditions, any consistent units.
ρ_v = density of air at specified temperature at which velocity, V_m, is measured, pounds per cubic foot.
A = cross-section area of duct, square feet.
a = length of one side of rectangular duct, feet or inches. (Other side is b.)
b = length of one side of rectangular duct, feet or inches. (Other side is a.)
D = inside diameter of conduit, feet.
d = equivalent diameter, feet or inches.
e = Naperian base of logarithms = 2.718.
f = non-dimensional friction coefficient.
f_i = surface conductance (inside) Btu per (hour) (square foot) (Fahrenheit degree).
f_o = surface conductance (outside) Btu per (hour) (square foot) (Fahrenheit degree).
g = acceleration due to gravity, 32.17, feet per (second) (second).
h_o = friction loss under actual (operating) conditions, any consistent units.
h_f = friction loss, feet of fluid flowing.
h_s = friction loss under standard conditions, any consistent units.
h_w = velocity head or pressure, inches of water.
l = length of conduit, feet.
P = perimeter of duct, feet.
Q = heat loss through duct walls, Btu per hour.
t_1 = temperature of air entering duct, Fahrenheit degrees.

t_2 = temperature of air leaving duct, Fahrenheit degrees.
t_3 = temperature of air surrounding duct, Fahrenheit degrees.
U = thermal transmittance coefficient, Btu per (hour) (square foot) (Fahrenheit degree).
V = fluid velocity, feet per second.
V_a = velocity of air in duct, feet per second.
V_m = velocity of fluid, feet per minute.
W = weight of air through duct, pounds per hour.
x = thickness, inches.

---

IN ventilating and air conditioning a building or a room, the effect of the mechanical system employed must be considered on the acoustics of the space conditioned. It is important to consider also that the use of air conditioning often permits keeping the windows closed, thus giving relief from certain external noises, but at the same time increasing the necessity of providing adequate sound control.

It is assumed that in a given space the architect and acoustical engineer have produced a room or rooms which are satisfactory for speech, music, or other uses. The ventilating engineer's sole function is to ventilate and air condition these rooms properly so that they will be physically comfortable without adding any acoustical hazards.

UNIT OF NOISE MEASUREMENT

According to an international standard, two terms are used for noise measurement. The *decibel* (db) is the physical unit for expressing intensity or pressure levels. The *phon* is the unit of loudness level. The loudness level, in phons, of any sound is by definition equal to the intensity level in decibels of a thousand cycle tone which sounds equally loud. The decibel is defined by the relation $N = 10 \log_{10} \frac{I_i}{I_o}$, where N is the number of decibels by which the intensity flux I_i exceeds the intensity flux I_o. The intensity flux is the measure of the intensity of a sound wave and is defined in terms of watts per square centimeter passing through a unit area of wave front in a freely traveling plane wave. It is usually more convenient to select an arbitrary reference intensity for I_o and express all other intensities in terms of decibels above that level. For this purpose a reference intensity of 10^{-16} watts per square centimeter has been selected. This intensity is slightly less than the threshold of audibility for the average ear at a frequency of 1,000 cycles per second. This reference level also corresponds to a pressure of 0.0002 dynes per square centimeter for sound in air at usual room temperatures.

A stated sound level in decibels, unless otherwise defined, will thus be related to a threshold of 10^{-16} watts. For example, a level of 60 db above this reference threshold is 10^{-10} watts. In a similar manner, when sound measurements are given in actual intensity or energy units, they can be converted to decibels by this relation.

Since the decibel is based on a ratio, it can only be employed when related to a reference threshold level as given. Noise levels, which vary with frequency as well as intensity, must not only be related to this reference threshold level, but also to a reference frequency, which is taken as 1000 cycles. These terms and procedures may be found in Standards[1] published by the *American Standards Association.*

APPARATUS FOR MEASURING NOISE

Since the relative loudness to the ear, rather than the actual physical intensity, is the quantity in which engineers are usually interested, it has been found necessary to allow for the varying response of the ear at different frequencies in designing noise measuring equipment. It is most satisfactory to measure noise by means of a sound level meter, which usually consists of a microphone, a high gain audio-amplifier, and a rectifying milliammeter which will read directly in decibels. This meter is calibrated to give readings above the standard reference level and usually contains a weighting network to make it less sensitive at those frequencies where the ear is less sensitive. Three types of weighting networks may be provided. The "A" network is intended to provide relative frequency sensitivity corresponding to the characteristics of the ear at a loudness level of 40 decibels. The "B" network is weighted to correspond to the ear characteristic at a loudness level of 70 decibels. The meter may also be provided with a "flat" network which provides no weighting by frequency. For complete details on standards for sound level meters, refer to the information[2] published by the *American Standards Association.*

GENERAL PROBLEM OF SOUND CONTROL

As previously stated, the problem confronting the air conditioning engineer is that of designing a system which will operate without increasing the noise level in the conditioned space. To be sure that this is accomplished, it is necessary:

1. To determine the noise level existing without the equipment.
2. To ascertain the noise level which would exist if the equipment were installed without sound control.
3. To provide as a part of the installation sufficient sound control appliances to reduce the noise level substantially to that found in Item 1.

To accomplish this the engineer should have information of three kinds:

1. A knowledge of the noise levels currently considered acceptable in various rooms in order that he may have a basis on which to proceed.
2. A knowledge of the nature and intensity of the noise created by the various parts of the equipment.
3. A knowledge of how, when necessary, to vary and control the noise level between the equipment and the conditioned space.

In addition, the engineer should have sufficient information to predict the levels produced by noises which may be transmitted by the duct system from one conditioned space to another or from an outside space to the conditioned space. In either case, the designer must know the probable noise level at the point where the noise originates. From this he can compute the attenuation or transmission loss required in order to bring this level down to that required in the conditioned space. If there is likelihood of direct transmission through a duct, the attenuation required may be computed as shown on page 771. If the transmission is through dividing walls, it will be necessary to refer to published information on the transmission losses of standard building constructions[3].

Information concerning the noise levels created by ventilating and air conditioning equipment such as fans, motors, air washers, and similar items is not yet on a basis which permits tabular presentation, although certain manufacturers are prepared to offer such data and do state the noise producing properties of their products. A sound test code for fans

has been developed by the *National Association of Fan Manufacturers* which uses the flat response network of the sound level meter. However, when determining the noise generated by an air distribution system, it is customary to use the noise level of the fan as determined by the weighting network most nearly approaching the noise level of the space. In most cases this will be the noise level of the fan as determined on the 40 decibel weighting network. Refer to Table 1 for typical noise levels.

KINDS OF NOISE

To solve a sound problem of this type it is desirable to consider separately the several means by which noise reaches the room. This avoids to some extent the necessity of knowing the noise level at the source, and instead, places the emphasis on ascertaining the level at the point where the sound enters the room.

The noise introduced into a room or building by ventilating or air conditioning equipment may be divided into two general kinds depending on how it reaches the room with various sub-divisions:

1. Noise transmitted through the ducts.
   - *a*. From equipment such as sprays, fans, etc.
   - *b*. From outside, and transmitted through duct walls into air stream.
   - *c*. From air currents, including eddying noises.
   - *d*. Cross talk and cross noises between rooms connected by the same duct system.
   - *e*. Noise produced by the grilles.
2. Noise transmitted through the building construction.
   - *a*. From machine mountings as vibration.
   - *b*. From equipment through room wall surfaces.

The next step in the solution of this problem is to present data and discuss methods whereby solutions to the noise problem can be obtained when the allowable room noise level and the path through which the noise reaches the room are known.

NOISE TRANSMITTED THROUGH DUCTS

Operation of an air distribution system results in the generation of noise which may be transmitted through the ducts to the ventilated or conditioned room. The transmission of this noise may be controlled by the proper application of sound absorptive material within the ducts. The application of the absorptive material is a problem in balancing the room noise level requirements against the intensity of the noise generated. The four steps in the problem are:

1. Determination of acceptable room noise level resulting from the operation of the equipment.
2. Determination of noise level generated by the equipment.

The difference between items 1 and 2 in decibels is the over-all noise reduction required between the equipment and the room. In the discussion which follows reduction of noise will be referred to as *attenuation* of noise.

3. Determination of the natural attenuation of the duct system.
4. Selection of the proper sound treatment for the duct system.

The difference in decibels between the over-all attenuation required and the natural attenuation (3) is the additional sound attenuation to be provided by absorptive materials installed in the duct system or by special constructions designed to absorb sound. Experience has shown, for example, that where ventilating requirements permit, introduction of an expansion chamber or a change in area in the duct will frequently provide more reduction in low frequency noise.

DESIGN ROOM NOISE LEVEL

Measurements of noise levels have been observed by several investigators in various rooms and locations and are listed in Table 1. The values given were determined with the air conditioning or ventilation equipment not in operation, and with all windows and doors closed simulating the conditions of an actual installation.

This is an important consideration, for in offices or stores adjacent to busy thoroughfares the difference between the typical noise level in the

[a]These values are tentative. More detailed measurements by D. F. Seacord, Bell Telephone Laboratories (*Journal Acoustical Society of America*, Vol. 12, pp. 183-187, 1940) give average values and standard deviations of room noise in residences, offices, stores, factories, etc., in large American cities.

[b]For train standing in station a level of about 45 db is the maximum which can ordinarily be tolerated.

space with the windows and doors open and closed may be as high as 10 db. Minimum, representative, and maximum levels are given for each type of space. The values are intended to give the variation with respect to location and not to time, and may be roughly classified by the following:

Minimum loudness refers to: Spaces of expensive construction, typified by double windows, carpeted floors, heavy upholstered furniture, or acoustically treated walls and ceilings.

Representative loudness refers to: Spaces of average construction and furnishings which are exposed to external noises typical of the locality in which the space is usually found.

Maximum loudness refers to: (1) Any space of inexpensive construction, and bare furnishings where noise is not an important factor. (2) Spaces in close proximity to very intense street traffic or to intense factory noise.

In general, if the noise level in the space resulting only from the operation of the air conditioning equipment is equivalent to or less than the typical level given in Table 1, the installation will prove satisfactory. If the typical level and the equipment level are equal and heard together the resultant level will be 3 db higher than either of them alone.

In some cases it is desirable to keep the equipment noise level in the ventilated or conditioned room at such a value that it actually will not increase the noise level in the room to any measureable degree. This can be accomplished if the equipment noise at the room can be kept 10 db below the noise levels shown in Table 1.

NOISE GENERATED BY FANS

Noise generated by fan wheels may be divided into two classifications, rotational noise and vortex noise. In ventilation and air conditioning work, where the maximum ratio between the fan tip speed and the velocity of sound is not greater than 0.12, vortex noise is by far the most important. The rotational noise may be described as that due to the thrust and torque applied to the air. Vortex noise is that due to the shedding of vortices from the blade and is dependent on the angle of attack, velocity, air turbulence, and blade shape. Vortex noise is due to pressure variations on the blade as a result of variations of air circulation. Given the noise level at the outlet or inlet of one type of fan construction under specific conditions of size, tip speed, and total pressure, noise levels at other values of tip speed, total pressure, and size may be approximated by the relationships:

1. For constant size and point of rating, the noise level of a fan will increase with increasing speed.

$$db \text{ (change)} = 55 \log_{10} \left(\frac{RPM_2}{RPM_1} \right) \quad (1)$$

2. For constant pressure and tip speed, the noise level of a given type of fan will increase with increasing fan size.

$$db \text{ (change)} = 20 \log_{10} \left(\frac{\text{Size}_2}{\text{Size}_1} \right) \quad (2)$$

Fan size refers to wheel diameter, housing height or some dimension that is directly proportional to lineal units. Fan sizes based on arbitrary systems or systems of preferred numbers have no significance.

The noise of a given fan is not constant at constant speed if the air delivery changes due to change of resistance. In general, a backward curved blade fan is lowest in noise at or near the point of maximum efficiency; a forward curved blade fan at or between the point of maximum efficiency and shut-off; an axial flow fan at or between the point of maximum efficiency and free delivery. The noise level of a double width fan

TABLE 2. ATTENUATION IN STRAIGHT SHEET METAL DUCT RUNS

DUCT	SIZE, IN.	ATTENUATION PER FT, db
Small	6 x 6	0.10
Medium	24 x 24	0.05
Large	72 x 72	0.01

TABLE 3. ATTENUATION OF ELBOWS[a]

ELBOW	SIZE, IN.[b]	ATTENUATION PER ELBOW, db
Very small	2 wide	3
Small	3 to 15	2
Medium	15 to 36	1.5
Large	36 plus	1

[a]The attenuation in vaned elbows should be considered the same as in elbows having the same dimensions as the radius of curvature of the vanes. If the vanes are lined for the purpose of damping any vibrations in them, one third may be added to the attenuation values listed.

[b]These attenuation values are based on elbows having a center line radius 1.5 to 2 times the diameter or width of the duct. The attenuation will be greater if the ratio is less than 1.5 and less when the ratio is greater than 2.

may be taken as 3 db higher than a similar single width fan operating under the same conditions of speed and pressure.

NATURAL ATTENUATION OF DUCT SYSTEM

Straight Sheet Metal Ducts. The attenuation of sound in straight sheet metal ducts is a function of the length, shape, and size of the duct[4]. Attenuation values are given in Table 2. In general this attenuation is so negligible except for long runs that it may be disregarded for all practical purposes.

Elbows and Transformations. Due to reflective interference, attenuation will take place at elbows and transformations. The magnitude of the attenuation will depend on the size and abruptness of the elbow or transformation as shown in Table 3.

When the area of a duct increases abruptly, an attenuation of noise level takes place in the duct. In duct design practice the total area of the branch ducts is greater than the supply duct. Similarly with outlets, the area of the outlet plus the area of the duct after the outlet is greater than the duct area before the outlet. Therefore in an outlet run, attenuation occurs in the duct as it passes each outlet. Table 4 gives the *db* reduction for various ratios of total branch duct and outlet area to supply duct area.

Grilles to Room. The large abrupt change in area between the grilles and the surfaces within a room results in an appreciable noise attenuation. This attenuation is a function of the total grille area (supply and return) and the total sound absorption of the room in *sabines*. (The sound absorption of a room in *sabines* is the summation of the products of each surface of the room measured in square feet multiplied by its corresponding absorption coefficient). The attenuation is given in Equation 3 as:

TABLE 4. ATTENUATION AT DUCT BRANCHES OR OUTLETS

RATIO: BRANCH DUCT + OUTLET AREA / SUPPLY DUCT AREA OR SUM OF BRANCH AREAS / SUPPLY DUCT AREA	ATTENUATION PER TRANSFORMATION, db
1.00	0.0
1.20	0.8
1.35	1.3
1.50	1.8
1.75	2.5
2.00	3.0

$$db\left(\begin{matrix}\text{Attenuation between}\\ \text{grilles and room}\end{matrix}\right) = 10\log_{10}\frac{\text{Total Room Absorption in Sabines}}{\text{Total Grille Area}} \quad (3)$$

Values in Table 5 approximate the attenuation for various rates of air change, and general types of room surfaces.

DUCT SOUND ABSORBERS

The difference between the required sound attenuation and the natural attenuation is that which must be supplied by the proper sound treatment of the ducts.

Selection of the Absorptive Material

When a sound wave impinges on the surface of a porous material, a vibrating motion is set up within the small pores of the material by the

[d]Dead room-average absorption coefficient 0.25. Heavy carpeted floor. Walls and ceiling acoustically treated. Upholstered furniture.

alternating sound waves. As the ratio of the cross-sectional area of the pores to their interior surface is small, the resistance to the movement of air in the pores is large. This viscous resistance within the pores of the material converts a portion of the sound energy into heat. The decimal fraction representing the absorbed portion of the incident sound wave is called the absorption coefficient. Considerable absorption may also result, particularly in the low frequency range, from the flexural vibrations of the duct. In the selection and application of the absorptive material, several points should be considered.

1. For the absorption of the low frequencies below 500 cycles per second the material should be at least 1 to 2 in. thick. Thin materials, particularly when mounted on hard solid surfaces, will absorb the high frequencies and reflect the low.

2. In order to provide as much low frequency noise absorption as possible by means

of flexural vibration, it is desirable to fasten the absorptive panels discontinuously. This result may be attained to some extent by spot cementing, but better results are obtained when it is possible to fasten the absorptive panels to furring strips, leaving an air space behind. However, the exact resonance characteristics of the panels, and thus their absorption, are so unpredictable that flexural vibration cannot be relied upon for a specific value of attenuation.

Requirements for a good sound absorption material are: (1) high absorption at low frequencies[5], (2) adequate strength to avoid breakage, (3) fire resistance and compliance with national and local code requirements, (4) low moisture absorption, (5) freedom from attack by bacteria and algae, (6) low surface coefficient of friction, (7) particles should not fray off at the higher design velocities, and (8) freedom from odor when either dry or wet.

With every application the use of sound absorptive material should be considered in the dual function of insulation and sound absorption. It has been shown theoretically[6] that the reduction, in decibels per linear foot, of sound transmitted through a duct lined with sound absorbing material is related in a rather complicated manner to the size and shape of the duct, to the frequency of the sound, and to the sound absorbing char-

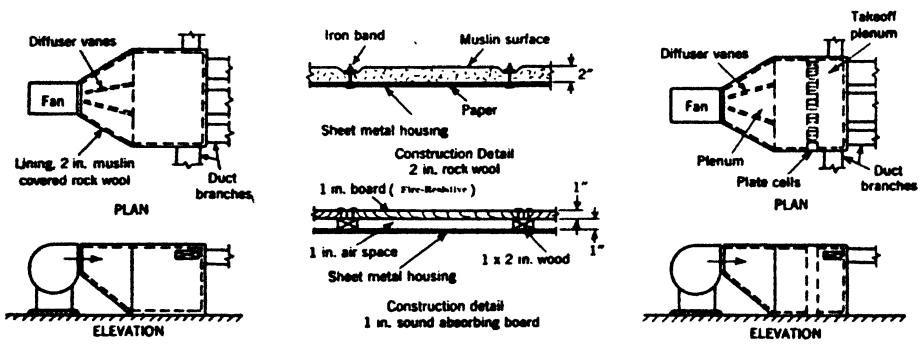

FIG. 1. ABSORPTION PLENUMS WITH AND WITHOUT SOUND CELLS

acteristics of the lining. Experimental evidence likewise indicates that there is no simple formula involving the variables which will apply accurately to all cases. However, it may be stated generally that the attenuation in decibels at a given frequency is directly proportional to the length of lined duct. It decreases as the cross-sectional area increases, and increases as the aspect ratio is increased.

The noise reduction varies to a considerable extent with the frequency of the sound. In calculating noise reduction, consideration should be given both to the comparative efficiency of the duct lining material at different frequencies, and to the frequency distribution of the noise to be quieted. In the case of fan noise, it is recommended that calculations be based on the frequency 256 cycles, since most of the noise energy is in the region of this frequency. In quieting noise due to air turbulence and eddy currents, in which the high frequencies predominate, the frequency 1024 cycles should be used.

Since ventilating system noise contains many frequencies, an exception should be noted to the statement above that attenuation in decibels is directly proportional to length of duct. Most sound absorbent materials are more efficient at high frequencies than at low frequencies. In consequence, the attenuation in the first five or ten feet of lined duct will be greater because the high frequencies are being absorbed. Thereafter,

since low frequencies will be predominant, the over-all noise attenuation per foot will gradually be less.

Acoustic Impedance of Absorptive Materials

In the past five years considerable literature has collected describing methods of determining the acoustic impedance of sound absorbent materials and methods of utilizing this quantity for predicting the acoustics of rooms [7] and the attenuation of sound in ventilating ducts[8]. Acoustic impedance as a concept is derived from electrical circuit theory. The effect of the sound absorbent material upon incident sound waves is described in terms of a resistive and a reactive component which may be determined by specifically devised apparatus[9].

Generally speaking, however, the use of acoustic impedance theory involves rather elaborate mathematical calculations, and the improved accuracy obtained is largely off-set by variations in the materials themselves and in their methods of mounting. It has been difficult to measure the acoustic impedance of large areas of material mounted in a manner typical of standard construction. P. E. Sabine [7] concludes that the assumptions required by acoustic impedance theory make this method of calculation of no immediate practical advantage in the measurement of sound absorption coefficients.

Beranek [8] compares results of sound attenuation observed for rectangular ducts lined with absorbent material computed by acoustic impedance theory with data reported by H. J. Sabine[10], using the methods of this chapter. Beranek concludes that the conventional P/A relation is valid for rectangular ducts not too far from square. His analysis indicates that other cases require more exact theory. However, it seems questionable whether the improvement in accuracy offered by the impedance method overbalances the additional computation time required and out-weighs other sources of error such as variations between samples of material.

Plenum Absorption

In systems, where individual ducts are directed to a number of rooms and sound treatment is required in every duct, a sound absorption plenum on the fan discharge as shown in Fig. 1 will often prove the most economical arrangement. The absorption in the plenum may be approximated by Equation 4.

$$db \text{ (Attenuation)} = 10 \log_{10} \frac{\text{Plenum Absorption in Sabines}}{\text{Area Fan Discharge}} \qquad (4)$$

The area of the plenum should be at least ten times as great as the fan discharge area. The plenum should be lined with 2 in. of muslin covered rock wool blanket or 1 in. sound absorbing board preferably nailed to wood strips on the inside of the plenum. With such a lining the plenum

TABLE 6. END REFLECTION OF PLATE ABSORBERS

50	1
40	2
30	4
25	5
20	6

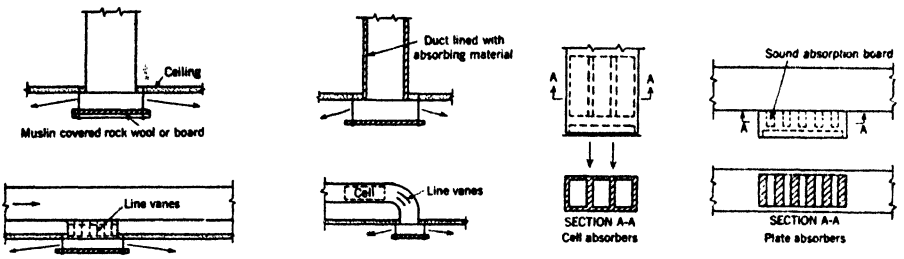

FIG. 2. OUTLET CELLS FOR PAN OUTLETS OR GRILLES

is particularly effective in reducing low frequency fan noise. The absorption of the plenum in sabines is the sum of the products of each interior area of the plenum measured in square feet multiplied by its corresponding absorption coefficient.

Plate Cells

One of the most economical methods of applying sound absorbent material from the standpoint of both labor and material is the plate cell. The plate cell consists of ½ or 1 in. sound absorbent board, spaced on 2, 3 or 4 in. centers. The attenuation due to the plate cell may be divided into two parts. There is reflection at each end due to the change in area and the absorption at the ends. Values for this attenuation are given in Table 6 which depend on the spacing. There is also attenuation due to absorption of sound within the passages of the cell, which depends on the length and the spacing. The attenuation within the cell for 1 in. board neglecting the end effect is given approximately by Equation 5.

$$R = \frac{10La^{1.4}}{S} \qquad (5)$$

where

R = attenuation, decibels.
L = linear length of duct, feet.
S = spacing in inches between plates up to 3 in.
a = absorption coefficient for the full thickness of the cell material. For typical value of a see Table 7.

An important objection to the plate cell is the increase in duct cross-sectional area required. Often on the fan discharge, particularly with unitary equipment, where a number of branch ducts take off, the plate cell may be installed with little or no difficulty.

Outlet Sound Absorbers

Outlet sound absorbers are rectangular or plate cells installed directly behind an outlet or they may be the lining of a pan or plaque outlet. They are particularly effective in the elimination of high frequency

TABLE 7. ATTENUATION FORMULAE FOR 1 IN. THICK TYPICAL DUCT LINING BOARD

FREQUENCY	ABSORPTION COEFFICIENT	ATTENUATION REDUCTION, db
256	0.37	3.0 L P/A
512	0.69	7.5 L P/A
1024	0.78	9.5 L P/A
2048	0.78	9.5 L P/A

whistles which are generated by air flow in the ducts. They are also employed in large systems with long runs where only a few outlets near the fan require treatment. Frequently outlet cells are the only means of correcting existing noisy installations, as the duct sections directly behind the outlets may be the only sections accessible for treatment. (See Fig. 2.)

Duct Lining or Rectangular Cells

One series of experiments[10] made on a commonly used type of duct lining material (1 in. rock wool sheet) has shown that, subject to certain restrictions, the attenuation of single-frequency sounds may be expressed by the approximate Equation 6. This equation is accurate within plus or minus 10 per cent for duct sizes ranging from 9 x 9 in. to 18 x 18 in., for

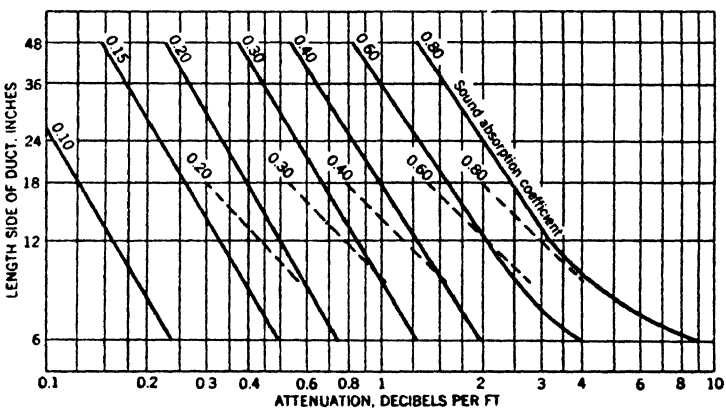

FIG. 3. SOUND ATTENUATION FOR VARIOUS ABSORBING DUCT LINERS

cross-sectional dimension ratios of 1:1 to 2:1, for frequencies between 256 and 2048 cycles, and for absorption coefficients between 0.20 and 0.80.

$$R = 12.6\, L \frac{P}{A}\, a^{1.4} \qquad (6)$$

where

R = attenuation, decibels.
L = length of lined duct, feet.
P = perimeter of duct, inches.
A = cross-sectional area of duct, square inches.
a = absorption coefficient of lining.

In Table 7, the absorption coefficients at different frequencies of a material of the previously mentioned type are listed, together with the corresponding values for Equation 6.

Results of other experiments indicate, however, that Equation 6 may be in error when applied to other types of duct lining material and to duct sizes and shapes outside of the range specified. An empirically derived chart[11] representing the *average* experimental data on a number of different types of materials including the rock wool sheet mentioned as applicable to Equation 6 is shown in Fig. 3. Since individual materials vary, the curves in Fig. 3 are given only as representing the best available averages for duct sizes of square cross-sections from 6 x 6 in. to 48 x 48 in. As an illustration, the dotted lines in the chart show values calculated from Equation 6 which indicate that the slope for this particular material is somewhat different than from the average curves. The curves in Fig. 3,

as well as Equation 6, show that the attenuation in decibels is directly proportional to the length of duct lined, and that the larger the duct the greater will be the length which must be lined in order to obtain a given noise reduction.

If the length of duct from the main duct to a grille is shorter than the length of lining indicated by the calculations, this duct may be subdivided into smaller ducts, as shown in Fig. 4. The increase in noise reduction thus obtained may be calculated from Equation 7, provided the splitters are installed parallel to the long side of the duct:

$$R_s = R_o \frac{a + bn}{a + b} \tag{7}$$

where

R_s = reduction with splitters, decibels.
R_o = reduction in same length of duct, without splitters, decibels.
a = dimension of short side of duct, inches or feet.
b = dimension of long side of duct, inches or feet.
n = number of channels formed by splitters.

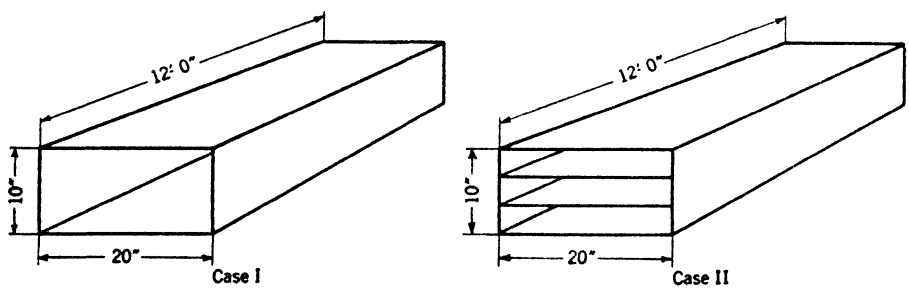

FIG. 4. DIAGRAM OF BRANCH DUCT TREATMENT WHERE LENGTH IS INSUFFICIENT FOR ADEQUATE ABSORPTION

Example 1. An air conditioning installation is to be installed in a small theater. Determine the necessary sound treatment for the air distribution system to provide a satisfactory noise level in the theater utilizing these conditions:

Fan tip speed 4000 fpm, total pressure 1.25 in.	77 db
Acceptable room noise level (Table 1)	40 db
Required attenuation	37 db

Solution: Natural attenuation of supply duct.

Sheet metal duct 50 ft long 48 in. x 36 in. (Table 2) 50 x 0.01	0.5 db
Elbows, two size 48 in. x 36 in. (Table 3) 2 x 1	2.0 db
Attenuation grilles to theater air change 10 min (Table 5) outlet velocity 1000 fpm	22.0 db
Total natural attenuation	24.5 db

Difference between required and natural attenuation, 37 minus 24.5, is 12.5 db. This attenuation must be supplied by sound treatment in the duct, either in the form of duct lining or plate cells.

A similar analysis of the return duct system shows that 15 db attenuation is to be furnished by absorptive material. An inspection of the installation shows that the lining of the plenum on the suction side of the fan would prove the most economical, where it would secure the dual function of heat insulation and sound absorption.

Example 2. A 10 x 20 in. duct is connected to a private office space in a quiet location. Determine the length of lining necessary to attenuate average fan noise satisfactorily, using a lining material of a type to which Equation 6 applies, and having an absorption coefficient of 0.40 at 256 cycles. Assume that the duct is only 12 ft long as shown in Fig. 4, and that a 30 db reduction is required in this length.

Solution:

Case 1. (No splitters), From Equation 6,

$$R_o = 12.6 \times 12 \times \frac{60}{200} \times 0.40^{1.4} = 12.6 \text{ db}$$

Case 2. (Two splitters, three channels), From Equation 7,

$$R_s = 12.6 \times \frac{10 + (20 \times 3)}{10 + 20} = 29.6 \text{ db}$$

AIR SUPPLY OPENING NOISES

When air is introduced into a room through a grille or register at a constant velocity, sound energy is being introduced into the enclosure at a constant rate [12]. Due to partial reflection at the boundaries of the enclosure, the intensity of sound at any point in the space builds up to some maximum value. In a large room at a point remote from the source of sound (the supply opening) the intensity can be shown to be substantially

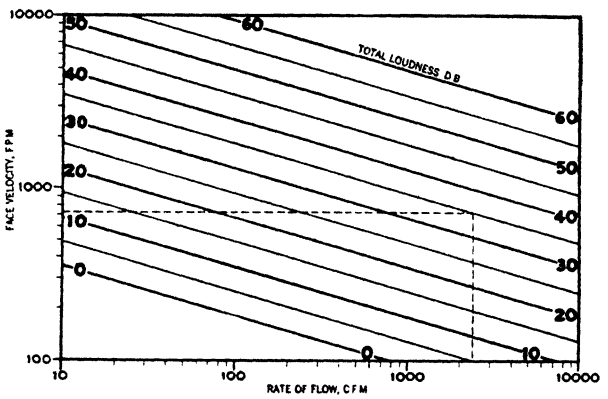

FIG. 5. AIR FLOW AND LOUDNESS CHART

proportional to the rate at which sound energy is generated and inversely proportional to the number of sound absorption units (sabines) in the room. It would thus appear that doubling the sound absorption of the room would halve the intensity and result in a noise level decrease of 3 db.

Grille noise is similar in character to fan vortex noise. Knowing the noise level at the face of a grille for a given grille blade setting, the noise will vary as given in Equation 8 where V is the velocity of the air through the grille.

$$db \text{ (change)} = 55 \log_{10} \left(\frac{V_2}{V} \right) \tag{8}$$

For a change in blade setting Equation 9 applies and in this case the total pressure is measured directly behind the face of the grille. For a typical air conditioning grille the noise level at the grille face may be approximately 48 db with a total pressure behind the grille of 0.1 in.

$$db \text{ (change)} = 27.5 \log_{10} \left[\frac{(\text{Total Pressure})_2}{(\text{Total Pressure})_1} \right] \tag{9}$$

The resultant room noise level can be approximated by Equation 10.

$$\text{Room Level} = \left[\begin{matrix} \text{Noise Level at Face} \\ \text{of Grille} \end{matrix} \right] - 10 \log_{10} \frac{\text{Total Room Absorption in Sabines}}{\text{Total Grille Area}} \tag{10}$$

Grille Selection

In practice the allowable total sound and the required air flow are usually known, and it is desired to determine the maximum allowable velocity. In comparing sound ratings of various grilles several factors must be known if the information is to be properly applied:

1. The threshold intensity on which the decibel ratings are based.
2. The distance from the grille at which data were taken.
3. If stated as loudness level versus velocity for a given grille, the *core area* (not nominal area) must be known.
4. The sound absorbing characteristics of the test room.
5. Whether or not corrected for test room loudness level: if not, the room level (without grille noise) must be known.
6. Methods used for recording data. (Characteristics of sound meter).

Since total loudness and air flow are both functions of velocity and area, the solution of the problem implies a trial and error method. It has been found possible to present these data with sufficient practical accuracy as a family of uniform curves, as illustrated in Fig. 5, which are based on these assumptions:

1. Threshold intensity = 10^{-16} watts per square centimeter [1].
2. Microphone location 5 ft from lower edge of supply opening on a line downward at 45 deg and in a plane bisecting the supply opening perpendicularly.
3. Where data are given as loudness level versus velocity, the rating is per square foot of core area.
4. The room is assumed to have 100 sabines absorption.
5. Plotted data are loudness levels of *supply openings only*, correction having been made for test room level.
6. Data taken with a direct reading sound-level meter with frequency weighing network intended to approximate the response of the human ear.

If the published ratings are in terms of decibels per square foot, correction must be made for area to secure the total sound level of supply openings of more or less than one square foot area from Equation 11.

$$\text{Decibel Addition} = 10 \log_{10} A \tag{11}$$

where

A = core area, square feet.

With Fig. 5 it is possible to find directly the velocity in feet per minute which will give a predetermined total loudness at a predetermined rate of flow expressed in cubic feet per minute. The values used are arbitrarily chosen for the purpose of discussion and do not necessarily represent data referring to any particular design of air supply opening. A correction chart is shown in Fig. 6 for a room having a sound absorption other than 100 sabines.

Example 3. Determine the core area (see Chapter 40) of an air supply grille which will maintain a noise level of not more than 40 db in a room having 100 sabines of sound absorption, if an air volume of 2400 cfm is required to maintain the proper air conditioning.

Solution. Assuming a grille noise rating of at least 5 db below the noise level of the room, Fig. 5 shows that the limiting grille velocity for a total loudness of 35 db is about 725 fpm and the core area becomes fixed at 2400 ÷ 725 or 3.31 sq ft.

If the room absorption had been greater, the previously selected velocity of 725 fpm would be safe, since the loudness reduces. If the room absorption had been 200 sabines a correction of plus 1.3 should be made by reference to Fig. 6, and the permissible velocity becomes that corresponding to a total loudness of 36.3 or approximately 800 fpm.

If the room had been highly reflective with an absorption of less than 100, the cor-

rection would be much more important. For instance, for a room of 35 sabines a correction of minus 3 db should be made and the maximum velocity corresponding to the 32 db total loudness would be approximately 600 fpm.

Where more than one supply opening must be considered, the problem is more complicated. If a similar supply opening is added in a far corner of a highly absorbent room, the change in noise level at the 5 ft station at the first supply opening is small; however, if the room is small, or highly reverberant or both, the intensity at the 5 ft station may be almost doubled and the noise level increased nearly 3 db thereby. The simplest method of handling this problem is to treat the room as though all the air were being supplied by one supply opening. Thus, if two outlets, each supplying 1000 cfm are used, the value 2000 cfm should be used with

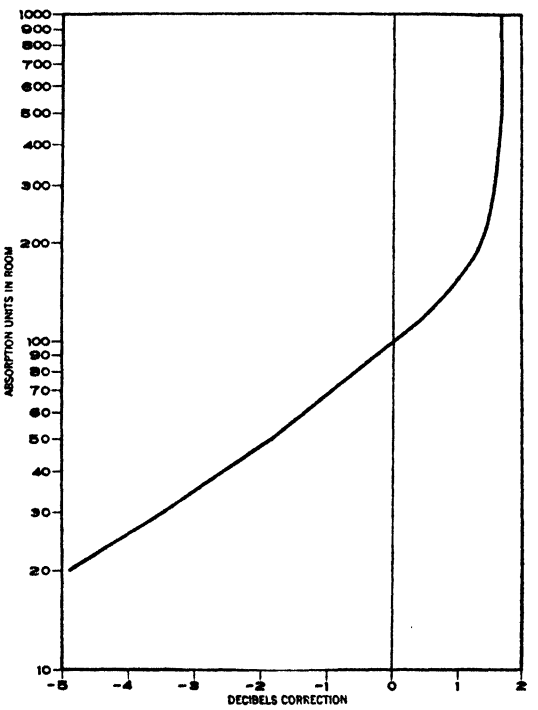

FIG. 6. ROOM ABSORPTION CORRECTION CHART

Fig. 5. Although this method may place an unwarranted limit on velocity when used in a large room, it is seldom that such a room has a noise level low enough to justify a more complicated though more exact procedure.

In general, return grilles are selected for velocities about half the supply velocity, and when this is done, they may be neglected in sound computations. However, if supply and return grilles are the same size, resulting in the same face velocity, they must be treated as two supply openings. That is, if 1000 cfm are supplied and exhausted through grilles of the same area, 2000 cfm must be used in the solution with Fig. 5.

CROSS TRANSMISSION BETWEEN ROOMS

Ducts serving more than one room permit cross talk between the rooms and should be lined with acoustical material. Where the rooms are close together and the ducts short, the ducts should be sub-divided to provide

ample acoustical treatment. Lagging material similar in character to acoustical board, when placed on the outside of ducts, serves to prevent noise originating outside the ducts being carried inside the ducts and into the air stream.

A case where outside lagging is desirable occurs when ducts originate at the fan in the equipment room and pass through this room on the way to the room being conditioned or ventilated. Unless the ducts are lined some of the mechanical noise from the equipment room air may be transmitted through the wall of the duct into the air stream and thereby carried into the room. In such cases, that portion of the duct which is exposed to the sounds in the equipment room should be lagged with material such as cork, pipe covering or other sound damping material to prevent the sound from entering the duct at this point. Numerical data are not available to permit a simple and practical calculating procedure to determine thickness of covering which should be used for this purpose.

Laboratory measurements have shown that the loss through a sheet of No. 22 gage metal is 24 db. When a sheet of rock wool insulation 1 in. thick and weighing 1.4 lb per square foot is added to this, the insulation value is increased to 29 db. In general, however, adding a layer of insulation or pipe covering does not materially increase the sound insulation value unless the material is dense, or unless it is surfaced with another sound impervious layer such as metal or board. Standard reference books should be consulted for sound insulating properties of various materials. Inside lining material used in the case previously mentioned would serve as an absorber of the sound transmitted through the duct walls, and thus act as a means of preventing the transfer of noise into the air stream. Inside lining may also be used in ducts to absorb noise which reaches the air stream from equipment such as fans, sprays and coils; noise due to eddying currents set up by elbows, dampers and similar obstructions; and noise transmitted from room to room where there is a common duct system.

CONTROLLING VIBRATION FROM MACHINE MOUNTINGS

It is impossible to select equipment which will operate without producing some mechanical noise and, since the equipment must be mounted in a building, it is probable that a part of this noise will be transmitted to the building to such a degree as to make noisy conditions in the rooms which are to be air conditioned.

Much of this noise may be transmitted by the duct if it is rigidly connected to the fan outlet. It is common practice to make the connection between the fan and the duct with a canvas sleeve which effectively restricts noise at this point. Noise may also enter the building through the mounting of the motor and the fan. Flexible mountings should be provided in all installations but these mountings must be carefully designed so that they will actually reduce the energy transmitted between the machinery and the supporting floor. If a flexible material is used, it is desirable to investigate the installation so that it is not short-circuited by through bolts which are improperly insulated and by electrical conduit which is not properly broken and is attached both to the equipment and to the building. The flexible mounting, if improperly engineered, may actually increase the energy transmitted between the equipment and the floor upon which it is supported.

In the proper isolation of vibration, which is usually in the lower range of frequencies and does not include the *airborne* vibrations known as

sound, there is one basic formula which is important in the solution of the problem. It is the formula of transmissibility as governed by the equation:

$$T = \frac{1}{1 - \left(\frac{f}{f_n}\right)^2} \tag{12}$$

where

T = transmissibility of the support.

f = frequency of the vibratory force.

f_n = natural frequency of the machine unit on its support (Damping = 0).

Equation 12 shows that the transmissibility approaches unity for disturbing frequencies considerably lower than the natural frequency of the mounting. As the disturbing frequency is increased the transmissibility is also increased until at the resonant frequency, where $f = f_n$ the transmissibility becomes infinite. This is not true in practice because all materials have some internal damping effect. However, operating at or very close to the resonant frequency is always serious as forces and stresses may be multiplied 10 to 100 times. As the disturbing frequency becomes greater than the natural frequency the transmissibility becomes a smaller quantity and at the value of $f/f_n = \sqrt{2}$ it again has the value of unity. Beyond this point true isolation is first accomplished. At a ratio of 3 to 1 for f to f_n the isolation is effective enough for practical application, and experience and economical design have shown that a ratio of 5 to 1 is good. For high speeds, higher ratios for f to f_n are easily attained and give better results for effective vibration control, but for the lower speeds as experienced with compressor work the higher ratios become uneconomical.

For a given installation the speed of the compressor is fixed by the specifications, therefore the value of f is fixed. That leaves only f_n to be determined and that is accomplished by the choice of mounting material and design for the support of the machine. It is well to keep in mind that when trying to isolate vibration, no attempt should be made to isolate the driving and driven piece of equipment separately. The two should be mounted on a rigid frame and then the entire assembly isolated according to the rules presented in this chapter.

The value of f_n can be controlled by the flexibility of the machine support, and when the deflection of the machine support is proportional to the load applied (such as with springs or nearly so with rubber in shear) the value of f_n can be determined by Equation 13.

$$f_n = \frac{1}{2\pi}\sqrt{\frac{g}{d}} \tag{13}$$

where

g = gravitational constant.

d = static deflection of supporting material.

f = frequency of the vibratory force.

f_n = natural frequency of the machine unit on its support (damping = 0).

By the use of Equation 13 a set of curves may be plotted as shown in Fig. 7. The first line AB, plotted as the critical frequencies for the various

static deflections, is a curve showing the worst possible conditions or resonant conditions.

Plotting another curve *CD*, which is $\sqrt{2}$ times curve *AB*, shows the area *MCDN* in which the resilient material or mounting does more harm than good. Plotting two more curves *EF*, 3 times curve *AB*, and *GH*, 5 times curve *AB*, shows area *EGHF* which represents efficient and economical isolation. Area *GPOH* is excellent isolation, but for all except the highest speeds becomes rather uneconomical because of the large deflections required.

Example 4. An electric motor driven compressor unit is to be isolated. The compressor is partially balanced and operates at a speed of 360 rpm. The speed of the motor is 1160 rpm and is belt connected to the compressor. Total weight of the compressor and motor is 4500 lb.

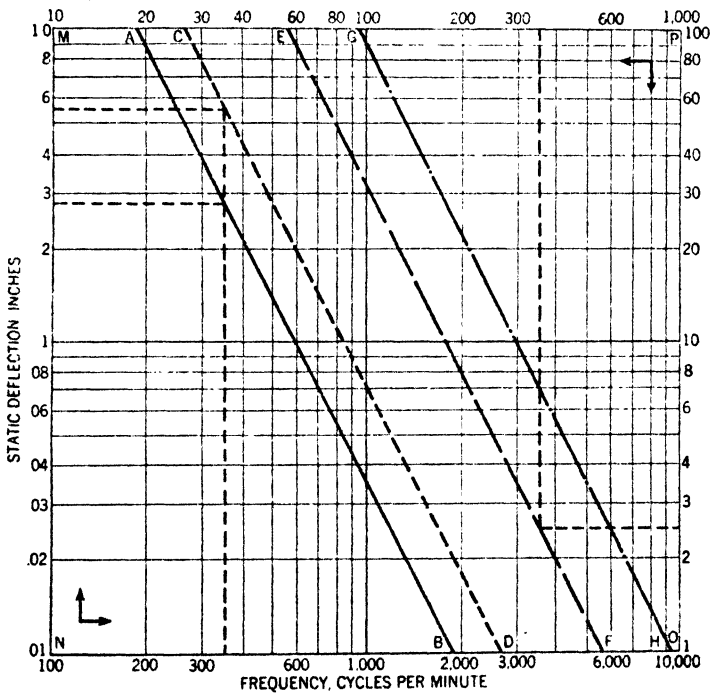

FIG. 7. STATIC DEFLECTION FOR VARIOUS FREQUENCIES

Solution: The minimum disturbing frequency to be isolated is 360 cycles per minute. Assume that the desired ratio of forced to natural frequency is 3 as a minimum and that 5 is desired. The desired natural frequency of the mounting is 360 ÷ 5 = 72 cycles per minute.

From Fig. 7 a deflection of 7 in. is required to attain a natural frequency of 72 cycles per minute. This value may be obtained from critical curve *AB* for 72 cycles or from curve *GH* (5 times critical) for 360 cycles. For the minimum ratio of 3 the deflection would be 2.5 in.

The next step is to determine the total weight to be supported by the springs. For low speed partially balanced compressors, it has been found necessary to add a foundation weighing 2 to 3 times the weight of the motor and compressor, in order to maintain the machine movement below 0.03 in.

Compressor and motor	4,500 lb
Concrete foundation	9,000 lb
Total	13,500 lb

Practical application dictates the number of springs to be used, which is based on the design of the machine foundation and the supporting floor structure. However, it is desirable to design for at least 8 springs and one or two spares for cases of unknown weights. As many as 50 springs have been used on one installation. The distribution of the springs must be balanced against the masses to be supported, otherwise the foundation design and supporting structure determine the location of the springs.

The choice of the material used in the design of the resilient mounting is also important. For the slow-speed type compressor a common speed found in practice is 360 rpm. For speeds below this, isolation should not be attempted except under careful supervision. Referring to Fig. 7, it is found that for 360 rpm the static deflection required for a ratio of f/f_n of 3 to 1 (line EF) is 2.5 in. and for a ratio of 5 to 1 (line GH) it is 7 in. For these values of deflection the only choice of material is the coil spring. This is also true for speeds up to about 700 rpm. In consideration of the transverse spring constant (so as to maintain good ratios among the various degrees of freedom) experience has shown that the spring should be designed with a *working height* equal to 1.0 to 1.5 times the outside diameter. A long spring of small outside diameter has very low transverse rigidity and therefore requires some additional means of preventing side drift of the unit and on very sensitive applications this may tend to destroy the isolation efficiency. For speeds of 700 to 1200 rpm the required deflections range from 0.22 in. to 1.75 in. For these conditions rubber in shear serves as a rather satisfactory material if protected from oil. For speeds higher than 1200 rpm cork specially made for vibration damping can be applied with good results. These limitations are by no means absolute, because certain liberties may be taken without impairing the result if all possible degrees of freedom have been taken into account in the design of the installation.

When a machine unit is properly isolated it will have a definite amount of movement which is determined by the ratio of the unbalanced forces to the total mass of the machine. If this resultant machine movement is too great for the necessary connections or the satisfaction of the customer it can be reduced only in two ways without destroying the quality of the isolation; first, adding mass or dead weight to the machine (such as concrete) common in the application of low speed, partially balanced machinery; second, accurately balancing (both statically and dynamically) all moving parts so as to eliminate the vibration at the source. This latter method is the best engineering practice and is the modern trend. However, even with well balanced machinery, installed in the vicinity of quiet offices it is usually necessary to properly isolate the equipment to prevent the transmission of vibration likely to cause complaints.

Where limitation of machine movement is desired during the starting and stopping periods, the application of friction or hydraulic damping will serve without seriously interfering with the efficiency of the isolation.

CENTRAL SYSTEMS FOR AIR CONDITIONING

Features of Systems, Zoning, Apparatus Dew-Point, Cooling Load, Heating Load, Air Quantity and Effective Temperature Difference, Low and High Pressure Induction Convectors, Evaporative Cooling, Precooling, Sensible Cooling with Unwetted Coils, Run-Around System; Selection of Type of System, Location of Apparatus

---

THE term central applied to an air conditioning system implies that the equipment such as fans, coils, filters and their encasement are designed for assembly in the field rather than in a factory as a unit. As a central system usually serves several different rooms, individual controls are required for each room.

FEATURES OF CENTRAL SYSTEMS

One advantage of a central air supply system is that one apparatus serving many rooms may involve a lower investment cost than that for a number of self-contained plants, each serving a single room. A central system may occupy basement or attic space that is relatively unimportant, whereas individual factory-assembled apparatus placed in each room may occupy otherwise valuable space. Another advantage of a central system is accessibility for servicing, since it is possible to provide doors in the encasement for cleaning and inspecting all of the component parts in a manner usually superior to that practicable with compact factory-assembled equipment.

Central air conditioning systems usually are connected by ducts with the various rooms served, and preferably have exhaust fans that may effect complete removal and disposal of any desired proportion of the air. The exhaust fan may return air to the supply system for recirculation, as a measure of economy of fuel or refrigeration.

Central air conditioning systems are served by heating and refrigerating equipment which may be located at some distance from the air supply apparatus and which may serve one or more central air supply systems.

Year-Round Air Supply System

Fig. 1 is a plan of a year-round air supply system. Outside air may enter from the left at A, desirably from an intake on the side of the building least exposed to solar heat and not close to the ground or to a sun-heated or dust-gathering roof. A damper B for proportioning the volume of outside air, is interlocked with the return air damper C in such manner that as the outside air volume increases the return air volume decreases. The return air duct D, shown diagrammatically, comes from the exhaust fan. All the air, it will be observed, must pass through the filters E and there is ample room on both the inlet and outlet sides of the filters for servicing them. The filters may be of mechanically cleaned type, of replaceable cell type, or may be electronic, as described in more detail in Chapter 33.

The cleaned air passes to the equipment that changes its temperature and humidity. Except in very warm climates, a heating or tempering

coil F is required to warm the air to a temperature above freezing. Usually, the heat is supplied by means of hot water or steam. During many hours of most days it is practicable to recirculate enough of the air so that the air drawn from outside, after mixing with the relatively warm return air, will not be cold enough to freeze the water in the humidifier.

Upon leaving the tempering coil, the air enters the humidifier G. This may be a spray of warmed water, circulated by a small pump from a water tank under the spray chamber, or may be other means of supplying water vapor. The supply of moisture must be under automatic and very reliable control. Following the humidifier a heater I is required, for controlling the temperature of the air entering the supply fan.

The second group of heat transfer devices in a year-round system includes an air cooling component H, for use in warm weather. Its surface may be chilled by direct expansion of an approved refrigerant

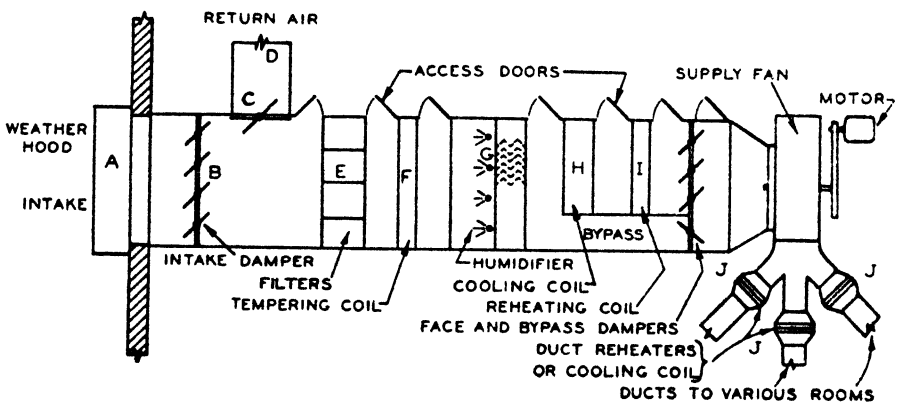

FIG. 1. ARRANGEMENT OF EQUIPMENT FOR YEAR-ROUND AIR SUPPLY SYSTEM

within its tubes, or the surface may be cooled by a pump-circulated liquid such as water or brine. This device must be sufficiently cold to cool the summer air to a temperature below the existing dew-point, and may be expected to be wetted constantly by the moisture condensed from the air. A water-tight drainage tank must be installed under the cooling coil and should extend for a distance toward the fan. Water should be drained by means of a trapped waste through a vented air-break. The second group of heat transfer devices also includes an air-heating component (reheater) similar to the tempering coil and capable of warming the chilled, saturated air leaving the cooling surface, to a temperature sufficiently high to prevent complaint of drafts, when the air is delivered into the rooms.

ZONING AND ZONE CONTROL

It is apparent that while an apparatus like that of Fig. 1 would be very desirable for any single room, since in that case the air could be delivered at optimum conditions, the cost of a complete individual system for each room and the space required for the equipment generally would be prohibitive. Economy is favored if the varying requirements of numerous

rooms or zones can be simultaneously satisfied by air from a single central supply system.

Various methods are practicable for controlling the temperature, humidity and air movement in various rooms or zones. A measure of control is attainable merely by proportioning the flow of air to each room, though usually such control by throttling dampers is difficult to maintain and should be avoided when possible.

Another scheme is to install a properly proportioned coil in the branch air supply duct serving each room to warm the air to suit the individual need. The air, for example, leaving the fan that serves several rooms, may be cooled before entering the fan, to the condition favorable for one room, and the air for each other room may be reheated by the branch duct coil to the required temperature. It is also possible to circulate a heat absorbing medium in the branch duct coils to reduce the temperature of the air passing to rooms that would be overheated if they received air at the condition leaving the central air supply system. In Fig. 1 such coils J are indicated in the three branch ducts leaving the supply fan.

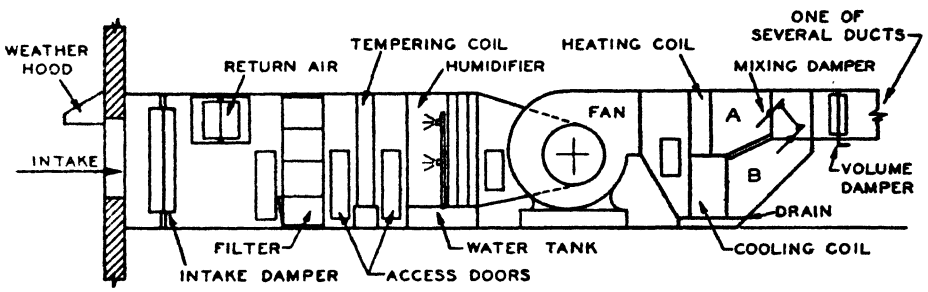

FIG. 2. ALTERNATE ARRANGEMENT OF EQUIPMENT FOR CONTROLLING AIR CONDITION IN CENTRAL AIR SUPPLY SYSTEM

When heat transfer devices are placed in branch ducts for improved temperature control, mechanically circulated water gives excellent results as a heat carrier. The water usually is warmer than the air but it is possible to use water colder than the air.

It is practicable also to use single central air conditioning equipment similar to that shown in Fig. 1, in conjunction with several fans; one for each room or zone. In such cases there may be a separate reheater on the suction side of each relatively small supply fan.

The designer must remember that the various supply fans will compete with each other for air, against the resistance interposed by the filters, coils, etc., that are used in common under such circumstances, and that, therefore, unless the fans are of backward-curved blade, non-overloading type, they may alternate in carrying more than their share of the air, and thereby cause the air distribution to be chaotic and unsatisfactory.

Another method of controlling temperature in various rooms served by a central air supply system is shown in the sectional elevation, Fig. 2. The supply fan is placed immediately after the humidifier. When cooling the air in hot weather, the humidifier is not operated. The fan will deliver the air through the heating coil and through the cooling coil to

the two air pressure chambers A and B at the right of these coils. From these chambers many separate ducts, one of which is shown, each with a double-blade mixing damper, may convey the air to the various rooms. The mixing dampers, one of which is shown, are interlocked so that as the upper one closes the lower one opens; selecting between them, air in the required quantity from either the warmer chamber A or the cooler one B. In cold weather no refrigerant is required in the cooling coil and in hot weather no heating medium is circulated in the heating coil. With this scheme, the control of relative humidity in warm weather is not always sufficiently precise to meet requirements, since the untreated air delivered through the upper coil may be so high in relative humidity that it cannot sufficiently compensate for the nearly saturated air leaving the lower coil. A reheater could be placed if desired, to the right of the lower coil to bring the air in the lower chamber to the desired relative humidity. The

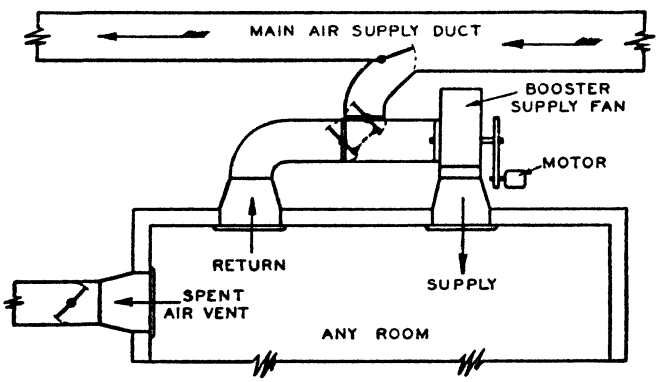

FIG. 3. ARRANGEMENT FOR INDIVIDUAL ROOM TEMPERATURE CONTROL WITH CENTRAL AIR SUPPLY SYSTEM

simple arrangement of Fig. 2 is admirable in winter and, except where close control of relative humidity is important, may be acceptable in summer.

Another method of attaining temperature control in individual rooms with a year-round central air supply system is to install a booster fan between the main air supply duct and the air delivery opening to each zone or room, as shown in Fig. 3. Air can then be delivered from the central supply fan through the main duct at some desired condition, for instance, 60 F, 45 per cent relative humidity. A double mixing damper near the intake opening of the booster fan, controlled by a thermostat in the room or zone that is served by the fan is interlocked with an outlet exhaust damper in the spent air opening, so that as more of the room air is recirculated, and as less new air from the main air supply duct is delivered into the room, the spent air outlet is throttled in proportion. In many large installations this principle is applied successfully for zoning different stories in multi-story office buildings, the main supply fan being on the roof, and each booster fan used for supplying the rooms of one orientation of each story. In other cases the booster fans serve only single offices and therefore are small enough to be concealed above ceilings alongside the main supply duct.

There may be installations in which the use of recirculated air for mixing with new refrigerated and nearly saturated air to control temperature and relative humidity is objectionable. In such cases the general recirculation arrangements of Fig. 1 may be omitted, and the heat transfer coils located in the ducts may be used. In some cases where general recirculation is not acceptable, as for all the rooms in an entire building, use of the local circulation of Fig. 3 may solve the problem.

APPARATUS DEW-POINT

In ordinary practice, with commercial apparatus, complete saturation of the air is seldom obtained. Four-row finned cooling coils contact approximately 80 per cent of the air, whereas six-row finned coils contact approximately 95 per cent of the air. In spray type dehumidifiers of good design the air leaves the dehumidifier at 1 to 2 deg higher wet-bulb temperature than the spray water leaving the dehumidifier, and the difference between the dry-bulb and wet-bulb temperatures leaving the dehumidifier may be as low as 1 deg. A spray type dehumidifier having sufficient length of spray chamber and density of spray, together with proper arrangement of nozzles, may approach saturation very closely.

As explained in Chapter 3, the slope of the line on the psychrometric chart connecting the room condition with the apparatus dew-point on the saturation line, determines the ratio of sensible heat absorbing capacity to the moisture absorbing capacity of the supply air. Therefore the room condition can be maintained as long as the supply air temperature lies on this line, but a greater volume of supply air must be used to satisfy the room load if the cooling coil does not contact 100 per cent of the air. For a given room load, the same apparatus dew-point will be required whether the cooling appliance contacts all the air or only part of the air.

From the point of view of satisfying the given cooling load requirements, the air passing through the apparatus without being cooled below the dew-point temperature produces two effects:

1. The air quantity which must be passed through the dehumidifier must be increased. Thus, if 20 per cent of the air passing is contacted, then 25 per cent ($0.20 \div 0.80 \times 100$) more air must be used than would be necessary if all of it were contacted.

2. Passing untreated air may change the room cooling load, which in turn may change the sensible heat factor. If return air only is passed through the dehumidifier or if room air only is by-passed, the room load would not change, but if some outside air is passed through, the room sensible heat gain and room latent heat gain will be changed due to the addition of untreated outside air, which changes the sensible heat factor. When a load calculation is made, it is necessary to know the percentage of air affected in the dehumidifier and calculation must be made accordingly.

If the ventilation air is drawn through the dehumidifier before it goes into the room, only that portion of the air not saturated must be included in the room load for the purpose of determining the apparatus dew-point and supply air quantity. It should be noted when evaluating the load added by untreated outside air that the temperature difference between room air and outside air and the moisture content difference between room air and outside air should be used, rather than the difference between outside air and apparatus dew-point, since the rise from the apparatus dew-point to room condition is charged against the dehumidifier as the cooling and dehumidifying load.

In winter, room relative humidities in excess of 30 per cent are seldom required in a system designed for comfort conditioning only, and a low

saturating efficiency may be desirable, or even necessary, especially if the same volume of air is handled as in summer. With a spray type dehumidifier the main sprays may be shut off and only the eliminators need be flooded; which may give sufficient moisture. In other cases, such as those in which cooling coils are sprayed, the spray water supply may be throttled. If the saturation efficiency of the sprays is too low, the spray water may be heated. The amount of heat put into the spray water by open or closed water heaters will be equal to that required to bring the dew-point temperature of the air entering the sprays up to that required before entering the preheater. It is possible, where clean steam is available, to introduce steam directly into the air stream to produce the desired dew-point temperature of supply air. However, the steam must be exceptionally clean, or objectionable odors will result.

It should be noted that the quantity of outdoor air to be introduced is affected by infiltration and leakage. Infiltration will reduce the quantity to be introduced by the system, while leakage may have to be offset by an increase in the quantity of outdoor air.

COOLING LOAD

The method of determining the cooling load for a conditioned space or spaces is outlined in Chapter 15. As pointed out therein, many of the items of heat gain are variable and do not reach their maximum values simultaneously. Proper consideration of these peaks and the avoidance of pyramiding these peaks in the cooling load calculations are stressed. Maximum solar heat gain on an east exposure is seldom coincident with the maximum outdoor wet-bulb.

A large difference in the time-incidence of the peaks between various spaces or parts of the same space indicates the necessity for zoning. In a building having an east and west exposure where solar heat gain forms a fair share of the cooling load, the times of their individual peaks are apt to be some hours apart, and the peak load of one plus the off-peak load of the other will be substantially less than their combined peak loads. Proper zoning will permit operation to take full advantage of this condition or of similar conditions of non-simultaneous peaks and will result in a lower total load and in savings in equipment.

A factor, similar in effect and closely related to the non-simultaneous occurrence of peak loads, is diversity. Typical of this is the case of a large department store where the air handling equipment serving a certain space must be sufficient to handle the load created by the throngs of people attending sales in that space. Under such a condition the number of people in other spaces is usually normal or below. While this means that the air handling equipment for certain departments must be large enough to cope with the situation, the refrigeration equipment need be only large enough to handle the average maximum. If a system employing zone recirculating fans and a single central fan and dehumidifier were used, the saving would be reflected in the capacity of the central fan and dehumidifier. Another example of this diversity is found in an office building having restaurants and stores of certain types in the first story and basement. At noon, when the restaurants and stores are crowded, the offices are below normal occupancy.

Heat lag should be carefully considered in the cooling load calculations. In certain types of buildings the effect of solar radiation is still apparent several hours after the sun has shifted from that exposure. In other

types having a much lighter construction, the heat gain due to solar radiation decreases markedly with the passing of the sun. Some walls, having been warmed by the sun, may radiate heat long after the passing of the sun, thus requiring lower inside temperatures to offset the radiant energy.

Buildings have considerable heat storage capacity which can often be utilized to great advantage and which has more than once provided an unexpected safety factor. If a space is kept below the design inside temperature for some time, the interior walls, floors, furniture and fixtures begin to assume the temperature of the space. Where the time is sufficient, the entire mass rather than merely its surface may reach the room temperature. Thus, when a space has been precooled below the design maximum temperature for a period of time prior to the advent of the peak load, and the heat gain begins to increase to peak conditions, some of the increase is used in raising the temperature of the furniture, fixtures, etc., to the design conditions and the cooling load can be reduced accordingly. However, unless very accurate data with regard to the mass, surface, specific heat, etc., of the items within the space are available, due caution must be used in discounting the cooling load for this storage effect. In the absence of reliable data this allowance is often a matter of experience rather than calculation.

Where air conditioning supply and return ducts pass through unconditioned spaces, there will be a transfer of heat from these spaces to the air in the ducts, even though these ducts are well insulated. An allowance should be made for this heat gain and included in the heat estimate so that air can be supplied at a temperature low enough to offset the rise caused by this heat gain (see Chapter 41). There will also be some heat gain to the air in ducts passing through conditioned spaces, but since a cooling effect is produced in the space through which the duct passes, this is not a loss and usually can be compensated for by adjustment of air quantities between the various spaces.

HEATING LOAD

Methods of calculating the heating load are shown in Chapter 14. Many of the factors outlined previously under Cooling Load, such as zoning, non-simultaneous peaks, and diversity, apply in the reverse manner due to the heating requirements instead of the cooling requirements. However, these factors affect the heating load from the standpoint of control of inside conditions, over-all performance, and economy of operation more than from a capacity of equipment standpoint. It is not only necessary to heat a building or space to its design conditions when there is but the merest fraction of normal occupancy, and when there are practically no lights, internal heat, or solar radiation, but it is also necessary to provide capacity to heat the building quickly when sudden cold follows relatively warm weather, as may occur after a week-end or holiday shut-down. However, in normal operation during week-ends and holidays, buildings are usually kept at a holding temperature to prevent the freezing of services. In many cases, less fuel is required to continue operation of the heating plant at a near-normal rate and maintain the building or space at a temperature of 50 to 65 F for some time than to shut the system down and then bring the temperature back to normal through forced operation of the heat generating equipment with a consequent loss in efficiency.

AIR QUANTITY AND EFFECTIVE TEMPERATURE DIFFERENCE

The difference between the room air temperature and the supply air temperature at the outlet to the room is known as the effective temperature difference. In the theoretical case of a dehumidifier having 100 per cent saturating efficiency and where this air is delivered directly to the room without temperature increases due to heat gain, then the effective temperature difference is the difference between room temperature and apparatus dew-point temperature. If duct heat gains are considered a part of the room load, this still holds true. The apparatus dew-point, as outlined previously, is fixed by the latent and sensible loads of the space, but in many cases, it is desirable to deliver more air to the spaces than is indicated by the difference between the room temperature and the apparatus dew-point.

It has been indicated that where a percentage of air is passed through the dehumidifier without being treated, the relationship is modified in direct proportion, and that if room air is passed through untreated, no effect on the heat balance results. Similarly, if room air is passed around the dehumidifier and mixed with the treated air the heat balance is not adversely affected. Therefore, if the quantity of air passed through the dehumidifier is determined by the usual methods, room air can be passed around the dehumidifier and mixed with the dehumidified air, increasing the supply air quantity and temperature and decreasing the effective temperature difference. Thus if the difference between the room temperature and the apparatus dew-point indicates that 10,000 cfm at 30 deg below room temperature will be required to hold conditions, that quantity can be passed through the dehumidifier and cooled to 30 deg below the room temperature, then mixed with 10,000 cfm of room air; resulting in a supply air quantity of 20,000 cfm and an effective temperature difference of 15 deg instead of 30 deg. Air supply outlets and grilles that have a high induction ratio are available and cause a large amount of room air to be mixed with the air leaving the outlet within a short distance of the outlet through the induction effect of the air stream. A proper selection of outlets may make it possible to introduce air at low temperatures and high velocities without causing objectionable drafts or cold spots, but care must be used to see that too little air motion is not a result. Low effective temperature differences may be required for this reason. While the use of a high effective temperature difference results in a saving in initial cost of fans and ducts and in the operating cost of fans, this difference should be carefully considered. If the sensible heat load of a space is subjected to substantial variations, low effective temperature differences should be considered, since systems employing low effective temperature differences require less precision in controls.

Reduction of air quantity by slowing down the fans for the winter season and increasing the temperature difference often is feasible. A saving in fan power can thus be effected, provided the air distribution remains adequate.

Extremes should be avoided in all cases. For summer air conditioning, low supply air temperatures result in larger heat gains to the air passing through the ducts, as well as in poor control. Too high a supply air temperature may result in excessive initial and operating costs. Suggested limits for the effective temperature difference are from 12 to 20 deg; the actual selection being based on the requirements of the particular case. For winter air conditioning, too high supply air temperatures result in

excessive heat losses from the ducts and stratification within the room unless thorough mixing is assured, while too low supply air temperatures may cause drafts, high operating costs, etc. Suggested limits are from 15 to 35 deg. There can be no set rule and each case should be judged according to its particular requirements.

Reference may be made to Chapter 40 for further discussion of the most satisfactory design difference between the entering air temperature and volume in relation to the desired room condition.

INDUCTION CONVECTORS—LOW PRESSURE TYPE

Induction convectors, located in the room that is to be served, utilize a jet of conditioned air (or primary air) to induce a flow of room or secondary air which mixes with the primary air Fig. 4. The mixture is discharged

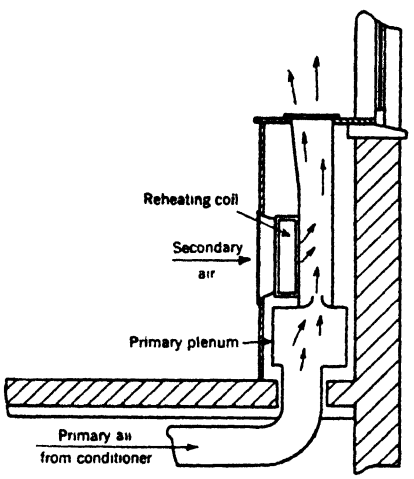

FIG. 4. INDUCTION UNIT (LOW PRESSURE TYPE)

into the room through a grille at the top of the convector. Heating coils are located in the secondary air stream. The output is controlled either by manually or automatically throttling the air jet. Heat may be supplied to the coil in summer as well as in winter. These induction convectors present several advantages. Since the secondary air stream is thoroughly mixed with the high velocity low temperature air stream before leaving the discharge outlet of the device, the resultant temperature of the mixture is satisfactory even though the primary air is introduced at a temperature too low for ordinary methods of distribution. One of these devices usually is provided under each window in place of the customary direct radiator, and combines the air distribution system with the heating system. With a conventional system it may be necessary to provide supplementary heating in the form of direct radiation. Induction convectors may be selected with heating coils having sufficient capacity under gravity conditions (that is, with the fan system shut off and no primary air entering the device) to maintain the room at a reasonable temperature in winter. The use of low temperature, dehumidified air which has not been reheated or mixed with room air before

delivery to the room may permit a reduction in fan capacity and the use of smaller ducts. In some cases a by-pass may be desirable in order to maintain the primary air volume and to provide additional control. This system can provide a degree of zoning that is usually difficult with conventional design since the air delivered by each unit can be controlled individually. Selection of induction convectors should be made with due regard to noise level. The inductive capacity of the device increases with the jet velocity, but high jet velocities may result in objectionable noise.

INDUCTION CONVECTORS—HIGH PRESSURE TYPE

Another type of induction convector Fig. 5 employs nozzles which produce a high velocity air jet without objectionable noise. The term,

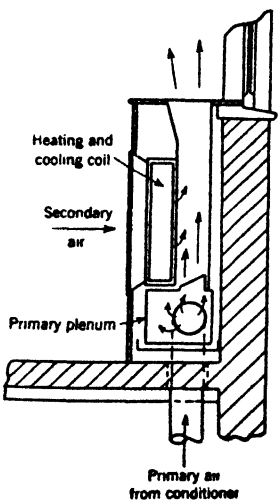

FIG. 5. INDUCTION UNIT (HIGH PRESSURE TYPE)

high pressure, is to some extent inaccurate, since the air pressure at the nozzles, while several times that used with a low pressure induction convector, is still less than the total resistance pressure of a conventional central system. The high velocity jet of primary air induces a flow of air from the room through coils located in the secondary air stream and supplied with chilled water in summer and with hot water in winter. The chilled water removes a large portion of the sensible heat in summer and the hot water supplies the sensible heat loss in winter. The primary air is delivered at a sufficiently low dew-point to compensate for the latent heat gain in summer. In winter the primary air is supplied at a sufficiently high dew-point to take care of latent heat losses. Control of temperature is obtained by throttling the water quantity supplied to the secondary coil. The required flow of primary air is greatly reduced due to the fact that a portion of the sensible heat load is carried by the secondary air stream. Since the primary quantity is small, very high velocities can be maintained in the supply ducts without requiring fan power in excess of that for a conventional system. This means that the supply ducts or pipes can be very small and can be run in chases, or

furred in at columns along with the water pipes. The primary air is treated in the usual manner to reach the required dew-point and a surface or spray dehumidifier or a dehydrator may be used. The primary air quantity is sufficient for ventilation purposes and frequently consists entirely of outdoor air. The water piping for the coils can be so valved that hot water will be supplied to one zone that may require heating while cold water may be supplied at the same time to a zone that requires cooling.

This system usually is limited in application to hotels, apartments, office buildings and other multi-room installations having a large perimeter with relation to the floor area. The units usually are installed beneath the windows, replacing direct radiation or thermally-circulating enclosed convectors. Where the spaces to be conditioned extend a considerable distance from the outer wall into the interior of the building, a separate system or zone for the conditioning of the interior portions may be required.

EVAPORATIVE COOLING

In climates where, on the hottest days, the outdoor wet-bulb depression is relatively great, it may be possible to dispense with refrigeration or other cooling sources by use of the evaporative cooling effect. A well designed air washer using recirculating sprays will reduce the entering dry-bulb temperature to within a degree or two of the entering wet-bulb condition. Thus, it may be possible that, with air entering at 100 F dry-bulb, 60 F wet-bulb, a leaving condition of 62 F dry-bulb, nearly saturated, can be obtained. Under some conditions of latent and sensible heat load, evaporative cooling may be adequate.

At times when the outdoor wet-bulb temperature is not quite low enough to permit the use of straight evaporative cooling it is possible to use precooling convectors with refrigeration, well water or a cooling tower as the basic source of sensible heat removal to reduce the wet-bulb temperature of the air before it enters the spray chamber. Where internal heat loads are high, this scheme may be more economical than one using return air. Where the required supply air dew-point is too low to permit straight evaporative cooling and where the sensible heat load is not too great, intentional partial saturation may be employed. That is, the low dew-point of the outdoor air is utilized by permitting some of this air to pass through the humidifying sprays untreated, or to by-pass the humidifier. All of these remarks with regard to evaporative cooling are based on the assumption that all of the supply air will be taken from outside. Provision should be made in most cases for the return of some air from the conditioned spaces for control purposes as well as for economy of fuel in winter.

PRECOOLING

Where sufficiently cold water from wells or streams is available, a saving in refrigeration may be obtained by the use, in location ahead of the dehumidifier, of precooling coils through which the cold water is circulated. The resultant cooling of the air decreases the load to be carried by the dehumidifier and refrigeration plant. In normal practice the water, after passing through the precooling coils may be further utilized in the refrigeration plant condenser. The economic advantages of this scheme are apparent and it is frequently used.

SENSIBLE COOLING WITH UNWETTED COILS

Under favorable atmospheric conditions where a large wet-bulb depression exists and the dew-point of the outdoor air is sufficiently low at all times, acceptable cooling may be obtained by removing only the sensible heat from the outdoor air delivered to the rooms. Under this condition of a great wet-bulb depression, a temperature-reducing coil may be located in the air stream and supplied with water from a cooling tower. When humidity control is desired, sprays to saturate or partially saturate the air may be used down-stream from the unwetted coil. Saturation or partial saturation after the coil will reduce further the dry-bulb temperature and the air quantity required. This system has very definite application in hot dry climates.

RUN-AROUND SYSTEM

An interesting method of control is found in the use of combined reheating and precooling usually termed the run-around system. Typically three coils are placed in series in the air stream. The primary one receives liquid that has been cooled in the third coil. The center coil is maintained at a temperature colder than the dew-point of the air. The primary coil thus pre-cools the air and the third coil reheats the saturated air from the center coil. The third coil is heated by the relatively warm water coming to it from the primary coil. The run-around scheme has the advantage of permitting a higher supply air dew-point temperature than would be possible otherwise. This is due to the fact that continual reheating is available, which is not a large penalty on the refrigeration plant since it provides precooling at the same time. This reheating at peak load creates an artificial sensible heat gain which increases the ratio of sensible heat to total heat and for a given room temperature results in a higher apparatus dew-point. Thus, while the volume of supply air is increased, the low-side temperature level of the refrigeration plant is raised and this may effect savings in initial and operating costs. The run-around system has the disadvantage of providing a decreasing amount of heat for reheating as the demand for reheating increases.

SELECTION OF TYPE OF SYSTEM

If the perimeter of the building is large with regard to the area, and if there are many rooms, induction convectors of either the low or high pressure type may be employed. Occasionally a dual system, one duct carrying air at a warmer temperature than the other, may be considered.

Low buildings with large floor areas may be divided into sections or zones with separate central air supply systems to facilitate temperature control. In the case of large department stores it may be possible to provide a single conditioner with a fan delivering the conditioned air to local mixing fans which supply the various departments or spaces. This application is limited by the practicability of running the large conditioned air ducts to the various recirculating fans. Each vertical section of the building also may be supplied by a separate fan delivering conditioned air to local mixing fans. In many cases the most economical and satisfactory scheme may be to employ a hot water or steam reheater in each branch duct to each room. Where vertical sectionalizing is not indicated, the building may be divided into horizontal groups, each handled by a central system and adequately zoned. In some large

buildings, apparatus rooms for the systems may be located in the basement and in the attic and on intermediate floors.

In high buildings the necessity for horizontal sectionalizing may be suggested by the size of air supply and return risers and by the extent to which they encroach upon usable space. Each story should be cut off by doors from other stories as otherwise the cool air tends to collect in the lower story and the warm air is forced to the upper story.

Balconies and large lobbies in theatres and similar high rooms frequently justify the use of separate zoning fans, to counteract the tendency of the heavier, cooler air to collect at the lower levels.

Fans operate at full capacity continuously in many systems and therefore should be selected for good efficiencies. In winter when higher temperature differentials are used, it is sometimes practicable to deliver smaller air quantities than when cooling.

In climates where winter temperatures fall below freezing, the tempering coils should be of the steam-distributing type; or if they are heated by a liquid, this liquid should contain some anti-freezing substance such as ethylene glycol. If hot water is employed in cold climates, the temperature control of the air should be obtained through use of face and by-pass dampers rather than by throttling the valves, to prevent damage due to freezing.

If zone reheaters placed in supply duct branches are employed, they should be of such type as to be heated over the entire surface so that no temperature-stratification can occur in the delivered air. Steam distributing-tube coils or mechanically circulated water coils are serviceable in such cases and throttling valves may be used.

Refrigeration equipment must be carefully selected to satisfy the particular requirements of each installation. For some small plants the evaporator may be placed in the air stream, when type of refrigerant and nature of occupancy permit. In many cases, chilled water coils are required by considerations of safety. Where low temperature and relative humidity are necessary, brine, often of calcium chloride, may be indicated.

Condensing requirements must have economic analysis. Wells, public water service, cooling towers and evaporative condensers present possibilities for consideration. Condenser water may have a secondary use for roof sprays in hot weather, and is usually suitable for lawn sprinkling. Most health department rules in cities prohibit any connection from refrigerant condensers that might permit the water to be used for drinking or lavatory purposes.

Practically without exception, air cleaners should be provided for both outside and recirculated air.

Control of temperature and of relative humidity by automatic means is vital, if comfort and economical operation of air conditioning equipment are to be attained.

The insulation of ductwork is not merely a matter of economics but sometimes is a necessity from the standpoint of limiting the temperature change of the air between the conditioning apparatus and the point of final delivery. Such temperature change of the air should be taken into account when apportioning the air and sizing the ducts. When computing heating or cooling loads, due allowance must be made for the effect of any hot or cold ducts or pipes contained in the space under consideration and insulation must be incorporated where necessary or justified. Con-

sideration must also be given to the possibilities of condensation of moisture on either the inside or outside surfaces of pipes, ducts, housings, fan encasements, etc., and insulation should be applied to prevent corrosion and water damage and to conserve refrigeration.

The location of the apparatus room often is determined by building construction or available space. The closer the apparatus room is to the conditioned space, the less expensive are the ducts. If the equipment is noisy, it should be located at some distance from the occupied spaces or be provided with adequate sound and vibration treatment. The scattering of wet apparatus throughout a building is to be avoided unless suitable precautions are taken. It must be remembered that encroachment on spaces that are otherwise usable can be charged against the system as an operating cost.

In general the apparatus should be arranged to have straight line air flow. Each change in direction is the cause of air resistance, and in addition elbows and offsets may cause eddy currents resulting in stratification. The usual order of equipment, beginning at the outside air intake is: weather hood or louvers, outside air dampers, return air connection, filters, tempering coils, cooling coils or sprays, by-pass connection with or without reheaters, reheaters, fan and distributing ducts.

Screens at the intake prevent the entry of large foreign matter, birds, etc. A hood or louver at the outside air intake prevents the entry of rain and snow. Since in most climates there are many days during which use of 100 per cent outside air unheated or uncooled may be economical, the areas of all air-passing and treating apparatus should be large enough for such a volume, and the exhaust or spent air equipment should be capable of discharging out of doors, all of the air admitted.

The by-pass connection normally connects the return air duct system with the apparatus casing between the conditioner and the supply fan. Usually the by-pass opening is sized to handle about 50 per cent of the fan capacity where a variable by-pass is used, though extreme load variations may require a larger size. It is at times good design to locate a reheating coil in the by-pass connection to permit using some by-pass air when heating is required. Since the relatively high resistance of the cooling coil or spray is to be balanced by the heating coil and by-pass connection, enough heating surface can be provided to raise the temperature of the by-pass air to the point where the mixture of by-passed air and conditioned air will have the required temperature. When a variable by-pass is used, a damper working in opposition to the by-pass damper should be placed across the face of the dehumidifier, for unless the resistances of the two are carefully balanced at all operating points, the proper mixtures of air will not be obtained. Outside air that has not been dehumidified should not be by-passed around a cooling coil or spray dehumidifier if accurate control of the delivered relative humidity is desired. Where the by-pass is made a part of the dehumidifier or conditioner and is located on the top or side of it, the return air connection should be arranged so that stratification of return air is insured, baffles being provided to accomplish this purpose if necessary. Where return air and by-pass air connections are taken off a return duct system, it may be necessary to install a back-draft damper between the return air connection and the by-pass connection. When the by-pass damper is at maximum opening it may be much easier for outside air to pass through the return damper, into the return duct connection and through the by-pass than for return air to pass through the by-pass connection into the

fan. Air tends to take the path of least resistance and, if the dehumidifier resistance is high, and if the return duct resistances are low, this situation is apt to occur. A recirculating air fan instead of a back-draft damper may be required for this case if the failure of return air to reach the dehumidifier or conditioner is a serious matter under reduced load conditions.

LOCATION OF APPARATUS

In general, the outside air intake, preheaters, and return air connections precede the conditioner, while the by-pass, reheaters and fan follow it. In the case of a blow-through system, where the fan is located ahead of the conditioner, the leakage of air at the conditioner is outward instead of inward and may be accompanied by water leakage.

The location of the complete apparatus assembly including the dehumidifier will be dependent on the type of building, spaces available, structural characteristics, etc. The type of conditioner used may limit the location under certain conditions. Where cooling coils employing chilled water or brine as the cooling agent are used, there are few limitations with regard to location other than those of pumping power, working pressures, piping costs, etc. Where spray dehumidifiers are used, very definite limitations present themselves, and these may require certain extraneous equipment to make the system workable. If several spray type dehumidifiers are located on different levels, thus involving different water pressures, a surge or storage tank to which the return water from each dehumidifier can be taken is required. Should the water level in the pan of the dehumidifiers be low in relation to that of the surge tank, return water pumps will be required, and these pumps will have to be operated until the water supply lines are drained in order to prevent flooding of the lower dehumidifiers. Where spray dehumidifiers are on the same level, equalizing lines between the pans may be required if a storage tank is not provided. It is exceedingly important that water-tight drained floors shall be provided under all overhead cooling systems, since water condensed out of the air generally will be present and may damage the interior finish of the rooms below the apparatus.

All of the various pieces of equipment from the outdoor air intake through the fan usually are connected together by sheet metal casings. Frequently the building structure or specially constructed walls or partitions may be used to form a portion of the casing. In any case the casing or connection must be sufficiently sturdy for the required duty. Sheet metal work must be well braced not only to prevent vibration under pulsations in air flow but also to withstand the abuse of normal usage. Casings should be braced wherever access doors are installed and all large panels should be adequately reinforced by structural steel.

Accessibility for Service

Each apparatus layout is to be made with accessibility in mind. Where cooling convectors are used, space for removing and repairing or replacing them should be provided. Adequate space is to be provided for the servicing and replacement of eliminators. Whether these accompany sprays or wetted coils, filters must be so located that the proper cleaning, replacement or routine servicing can be accomplished without difficulty. Free access to the bearings of all moving machinery is a necessity. Provision should be made for the complete removal and replacement of

any parts of the apparatus that are subject to wear, deterioration or damage, whether it may be filter, fanwheel, motor, pump, impeller or heat transfer surface.

DESIGN PROCEDURE

The customary design procedure is outlined herewith. For simplification the procedure is set up on the basis of a year-round system. For systems designed only for winter or summer, the unrelated parts may be omitted.

1. Selection of design conditions (inside and outside).
   a. Summer.
   b. Winter.
2. Determination of outside air requirements.
3. Determination of cooling load.
   a. Room sensible heat gain.
   b. Room latent heat gain.
   c. Room total heat gain.
   d. Grand total heat gain.
4. Determination of heating load.
   a. Room sensible heat loss.
   b. Room moisture loss.
   c. Humidification requirement.
   d. Total heating requirement.
5. Determination of apparatus dew-point and dehumidified or humidified air quantity.
   a. Summer (full load and part load).
   b. Winter.
6. Supply air temperature difference and quantity.
   a. Summer.
   b. Winter.
7. Equipment selection.
8. Equipment layout.

The foregoing steps are merely typical. Many applications will require at least a preliminary investigation of some of the latter steps before proceeding with the earlier steps. A permanent record of all design assumptions and computations should be made and preserved for comparison with the performance of the installation.

Chapter 44

OWNING AND OPERATING COSTS

Fixed Charges: Amortization, Interest, Taxes, Insurance, Rent; Maintenance Costs, Service Costs: Operating Refrigeration Equipment, Condenser Water, Heating

---

THE purpose of this chapter is to discuss the owning and operating costs of heating, ventilating, air conditioning and refrigeration systems for buildings from an economic standpoint so that owners or prospective purchasers may compare the operating economics of one system with another and evaluate properly the over-all costs of the systems instead of considering only the first cost.

There are cases in which it may be desirable to study the possibilities of installing a system for the purpose of obtaining a substantial increase in income or a better return on the investment due to: increased patronage in theaters, stores, or hospitals; increased occupancy in office buildings; improved efficiency of employees in offices or factories; or improvement in a manufactured product or a decrease in its cost of production.

Owning and Operating Costs may be grouped under three headings: (1) *Fixed Charges*, (2) *Maintenance Costs*, and (3) *Service Costs*.

FIXED CHARGES

Fixed Charges, which are the costs of owning the system, include: (1) Amortization, (2) Interest, (3) Taxes, (4) Insurance, and (5) Rent.

Amortization

Amortization cost will depend on: (1) the total first cost, and (2) the amortization period.

The *total first cost* of an installation is the actual dollar outlay or capital expenditure required to buy and install the air conditioning, or heating and ventilating system ready for operation. It can be divided into two parts: (*a*) The first cost of the air conditioning or heating and ventilating system itself, and (*b*), other first costs incurred because of the installation of the air conditioning or heating and ventilating system.

The *first cost* of air conditioning or heating and ventilating systems includes the following:

1. Heat producing equipment including boilers, burners, etc.
2. Heat distributing equipment including direct radiation, piping, etc.
3. Air handling equipment including fans, air heaters, air conditioners, filters, controls, etc.
4. Air distributing equipment including ducts, outlets, grilles, etc.
5. Refrigerating equipment including piping, pumps, etc.
6. Water conservation devices including towers, evaporative condensers, etc.

The best procedure for establishing the first cost of any system is to select the various parts after thorough engineering study, and then to estimate the installed costs of same. When such detailed work is not warranted or when only rough comparisons are desired between several types, approximate unit costs are of value as time savers.

Approximate installed prices of the various parts are shown in Tables 1, 2, and 3 and, as indicated, vary with the size or capacity of the equip-

ment. The apparatus and items included in each group are stated in the footnotes beneath the tables. By use of these three tables it is possible to obtain a reasonable approximation of the cost of heating or air conditioning a given space or building. In order to use the approximate values indicated in Tables 1, 2 and 3, a rough estimate of the load is required. If time does not permit a determination of the load and if extremely rough figures will suffice, Table 4 may be used as an indication of the price of various types of air conditioning applications.

Other first costs, incurred because of the installation of the air conditioning or heating and ventilating system, include costs of electrical work, plumbing, miscellaneous piping, building alterations, cutting, patching, remodeling, or redecorating after installation, consulting engineer's fees, licenses, permits, etc. These vary so widely that no approximations are possible and each case must be considered alone.

The length of the amortization period to be used depends upon: the type and remaining life of the building or space for which the system is to be used; the type of equipment to be employed as a part of the system; the character of the business; and the lease or ownership conditions. For small shops in rented quarters on short term leases, a period of 5 years or less may be proper, whereas for larger installations in buildings that are owned outright a period of 10 or 20 years or more may be used.

Depreciation due to deterioration and obsolescence must also be considered in arriving at the amortization period. Deterioration and

[a]Columns 1 and 2 include hand fired boiler erected, with shaking grates and standard trimmings. Column 1 includes brickwork and rotating soot blowers. Foundations and piping are not included.

Columns 3 and 4 include direct radiation, piping, valves, specialties, and insulation. Boilers, condensate and circulating pumps, boiler connections, and all building construction or alterations are not included.

[b]The approximate figures given above may vary as much as 30 per cent due to job conditions, labor rates, and locality. These figures represent the selling prices of the individual items indicated above based on costs encountered in the year 1940. It is suggested that correction be made according to the particular locality for increases in labor and material costs since that year.

[a] *Air conditioning equipment* includes fans and drives, filters, heaters, spray dehumidifiers or cooling coils, automatic controls, apparatus casings and insulation, and recirculating pumps.

[b] *Heating and ventilating equipment* includes fans and drives, filters, heaters, automatic controls and apparatus casings.

[c] Includes ducts, grilles, outlets, insulation where required and specialties.

[d] The approximate figure given above may vary as much as 35 per cent due to job conditions, labor rates and locality. Figures are based on conventional systems. Building alterations, piping, plumbing and wiring are not included. These figures represent the selling prices of the individual items indicated above based on costs encountered in the year 1940. It is suggested that correction be made according to the particular locality for increases in labor and material costs since that year.

TABLE 3. AVERAGE INSTALLED COSTS OF REFRIGERATION SYSTEMS AND WATER SAVING DEVICES

Tons Refrigeration	Cost—Dollars Per Ton[e]					
	1	2	3	4	5	6
	Reciprocating (Water Cooling)[a]	Centrifugal (Water Cooling)[a]	Reciprocating Direct Expansion[b]	Evaporative Condenser[c]	Cooling Tower Steel[d]	Cooling Tower Wood[d]
25	147		106	47		
50	132		86	40		
75	125		77	35		
100	120		72	32	47	40
150	115	137	68	30	45	38
200	113	124			44	36
250	110	115			42	35
300		107			40	33
400		97			38	31
500		93			36	29

[a] Columns 1 and 2 include compressors, evaporators, and water-cooled condensers; auxiliaries; electric motor, starter and drive; refrigeration piping, refrigerant and insulation of cooler and suction lines. Turbine driven centrifugal equipment may cost about 4 to 6 per cent more than motor driven, if condensing turbine and steam condenser, with supplementary equipment, are used.

[b] Column 3 includes same items as Column 2 except evaporator and auxiliaries are omitted.

[c] Column 4—These values are additive to Columns 1 and 3.

[d] Columns 5 and 6 include towers erected and a reasonable allowance for condenser water piping and pumps.

[e] The approximate figures given above may vary as much as 25 per cent due to job conditions, labor rates and locality. Building alterations, supply water and plumbing connections, wiring, chilled water piping and pumps are not included in these figures and may vary widely. Chilled water piping and pump costs may vary between $10 and $50 per ton of refrigeration effect. These figures represent the selling prices of the individual items indicated above based on costs encountered in the year 1940. It is suggested that correction be made according to the particular locality for increases in labor and material costs since that year.

[a]Modern Air Conditioning, Heating and Ventilating, by W. H. Carrier, R. E. Cherne and W. A. Grant (*Pitman Publishing Corp.* 1940, p. 64).

[b]There is a wide variation in unit prices such as shown above, due to differences in load concentration and in complexity of physical layout. Prices cover air-conditioning work only, for year-round use (except the *low* column, which in general includes summer cooling only). Net area (square feet) includes corridors, but excludes elevators and service spaces. ***Excluded*** are the cost of plumbing and steam connections, electrical wiring, painting and redecorating, building construction and alterations, and boilers or burners. Low figures in general are simply direct expansion systems using city water for condensing. High figures are usually chilled water systems with cooling towers or evaporative condensers, and may be considered high quality systems as well.

[c]Price per room.

[d]Price per seat.

maintenance generally go hand in hand. If a long depreciation period is to be used, then the item for maintenance, repair and replacement of wearing parts must be greater than for a short depreciation period.

Obsolescence depends mainly on time required for the equipment to become out-moded. Air conditioning, particularly, would probably

suffer more from obsolescence in small plants than in large establishments. In addition the obsolescence of the building or property in which the equipment is installed may have a similar effect upon the equipment.

An approximation of the useful life of various items of equipment and parts of systems is shown in Table 5. It should be noted that if an appropriate maintenance item is not established, the rate of equipment deterioration may be substantially increased.

Interest

The interest chargeable may not represent the existing money rates. It may include an item to cover the diversion of capital or other items depending on existing tax laws which may make it necessary to charge interest due to diversion of capital as a cost item. It should be noted that interest may be based on an unamortized balance. As an example, a 15 year amortization period with a 4 per cent interest rate will approximate a 2.1 per cent average annual interest rate.

TABLE 6. OWNING AND OPERATING COST

FIRST COST		ANNUAL SERVICE COST	
Cost of mechanical system		Electric Power Costs

Refrigerant			
Wages of engineer or operator		SUMMARY	
Annual Maintenance Cost—TOTAL		Annual Fixed Charges	
		Annual Service Costs	
		Annual Maintenance Costs	
		Annual Owning and Operating Costs—TOTAL	

Insurance

The rate for insurance may vary considerably depending on the type of structure in which the equipment is located and upon other governing factors. A rate of about $0.60 per $1,000 may be considered as being representative for normal installations.

Rent

If the equipment under consideration is to be located in rented or leased quarters it may be necessary to include an item for space rental.

An orderly arrangement of the various components of owning and operating costs, which will also serve as a check list to forestall inadvertent omissions, is illustrated in Table 6. The formulae for computing amortization and interest are given in the table. Interest should be computed on the undepreciated portion of investment only.

MAINTENANCE COSTS

Maintenance costs include replacement parts and the labor required for making repairs, replacing parts, cleaning, painting, etc. It should be noted that major overhauling or complete replacement may restore the capital value of certain items of equipment, and in such cases the costs incurred may not necessarily be charged as maintenance costs. Generally, routine labor requirements will be the function of an operating engineer or staff and the responsibility of this group may extend beyond the equipment being discussed here; hence, it is important to include only an equitable share of the time of this group. Extraordinary repairs involving special machinery will usually be covered by contract with equipment service divisions and should be accounted for on that basis.

Many of the items included in maintenance costs are highly variable and depend on the type and quality of the purchased equipment. For large air conditioning installations, using high quality equipment, some approximate costs per ton are given in Table 7.

In addition to the costs listed in Table 7, consideration should possibly be given to other items such as: water treatment for boilers; other boiler and heating plant cleaning and repairs; repair and replacement of heating plant valves, traps, and vents; water treatment for cooling tower or chilled spray water; drive belts, possible damage due to freezing weather; cleaning of air ducts; and repairs to insulation.

SERVICE COSTS

Service costs include the costs for power, water, steam, coal, oil, etc., consumed to operate the system.

From the selected equipment and type of installation, it is possible to segregate the relatively constant power loads and the total brake horsepower. Annual power cost can then be figured from the following formula:

$$\text{Annual power cost} = \frac{0.746\ (\text{bhp})\ H\ R}{\eta} \qquad (1)$$

where

bhp = Brake horsepower.
H = Annual operating hours.
R = Power rate, dollars per/kwhr.
η = Motor efficiency (decimal).

In using Equation 1 it must be pointed out that the electric rate, R must reflect the proper combination of energy and demand rates. These vary widely between the utility companies, and sometimes the rate structure is such that it is largely the demand charge which determines the proper value of R to use in Equation 1.

Refrigerating Equipment Operating Cost

In an air conditioning system, the refrigerating equipment is usually the largest power-consuming item to be considered. Also, the prediction

TABLE 7. APPROXIMATE MAINTENANCE COST FOR LARGE AIR CONDITIONING INSTALLATIONS, USING HIGH QUALITY EQUIPMENT

	DOLLARS PER TON PER YEAR
Repairs for refrigeration machinery	0.60
Refrigerant	0.25
Oil and grease	0.07
Painting (Water boxes and dehumidifiers)	0.25
Filters, clean and recoil 4 times per year	0.85
Controls, outside service	0.15
Cleaning air conditioners	1.15

of operating cost is more complex, since the power required for summer cooling is affected by many factors which are of a variable nature. Among these are solar radiation, temperature difference between outside and inside, sensible and latent heat brought in with outside air, sensible and latent heat from people, heat released by electric lights, and, in some cases motor-driven equipment, cooking devices, and other equipment used in the conditioned spaces. Some of these factors vary with the weather while others are substantially independent of it. The relative proportion of each factor varies widely even among installations of the same application, depending on building layout and location, the size and quality of the establishment, the personal idiosyncracies of the owner, and other items.

In a strict sense, it is necessary to evaluate the effect of all such factors in order to predict the operating cost of a refrigeration plant. In most cases this procedure will prove to be too tedious, or it may not be possible because the exact breakdown of load data is unknown. The use of a simplified semi-rational formula, Equation 2, which takes into account for each application the number of hours open for business and the geographical location, will provide a value of H which may be used in Equation 3 to determine the *Season Power Cost.*

$$H_e = m\,(b + cf) \tag{2}$$

where

H_e = Equivalent full load operating hours of refrigeration equipment used for summer cooling during period May 15 to October 15.

m = Total hours during period May 15 to October 15 that the establishment is open for business.

b = Fraction of maximum load from internal heat under average operating conditions.

c = Fraction of maximum load which is due to external sources at maximum design conditions.

f = Ratio of the number of hours for a particular city, when the outside wet-bulb exceeds 65 F, during the period June 1 to October 1 to the total number of hours during that same period. Total hours are assumed as 8 hr per day period for barber shops, department stores, funeral parlors, offices, short hour restaurants, and specialty shops and 12 hr per day period for drug stores, long hour restaurants, and theaters.

Table 8 was calculated from Equation 2. It should be pointed out that certain southern cities may have seasons longer than the 5-month period indicated in Table 8. If it is desired to consider a longer season of operation, the ratio of full load operating hours to hours open for business is smaller; in other words, the *refrigeration load factor* is lower. This is true because the extra increment of days added will be at relatively light load, since the table already includes the more severe part of the season.

TABLE 8. EQUIVALENT FULL LOAD OPERATING HOURS OF REFRIGERATION EQUIPMENT USED FOR SUMMER COOLING MAY 15 TO OCT. 15[a]

[a]Modern Air Conditioning, Heating and Ventilating, by W. H. Carrier, R. E. Cherne and W. A. Grant (*Pitman Publishing Corp.* 1940, p. 73).

The season electrical power cost for refrigerating equipment is then given by the following equation:

$$\text{Season power cost} = \frac{0.746\,(\text{bhp}_t)\,T\,H_e\,R}{\eta} \qquad (3)$$

where

bhp_t = Brake horsepower per ton (see Fig. 1) for *average* load during period. (Due allowance should be made for poorer compressor efficiency at light load).

T = Tons of refrigeration at maximum design load.

H_e = Equivalent full load refrigeration operating hours (Table 8).

R = Power cost, dollars per kwhr, including demand and energy charges.

η = Motor efficiency at average load (decimal).

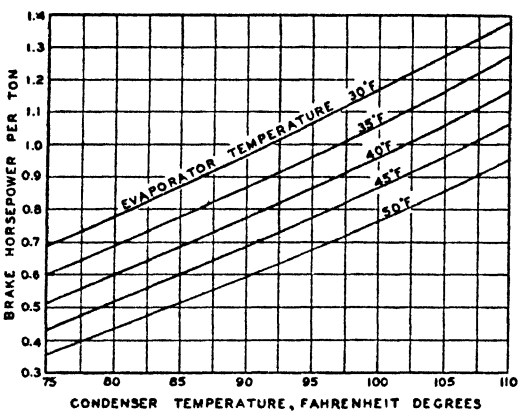

FIG. 1. TYPICAL BRAKE HORSE POWER REQUIREMENTS FOR REFRIGERATION[a]

[a]Values given are representative of "F-12" reciprocating machines of about 25 tons capacity in air conditioning applications. Requirements of smaller machines are usually higher, and for larger machines may be lower. Values shown are for liquid refrigerant at condenser temperature (no subcooling). Subcooling of the liquid may decrease these values approximately 0.3 per cent to 0.5 per cent for each Fahrenheit degree the liquid temperature is lowered.

Table 9 will be useful in estimating the design load in the absence of detailed load estimates.

In considering refrigeration power consumption, it should be noted that the use of weather records for a specific year may lead to large inaccuracies in estimating operating costs, since there may be wide variations from year to year, and therefore, average yearly weather records should be used rather than those for any individual year.

If the refrigeration compressor is steam turbine driven, the same general method can be followed, taking into account average water rate per bhp-hr and the cost of steam.

Condenser Water

Condenser water cost estimates can also be based on equivalent full load operating hours of the refrigeration equipment. The varying temperature of the water at its source, as well as the temperature of the discarded water, must however be taken into account. In general, when water is purchased, control is provided to hold the leaving water temperature (or condensing temperature) constant; and in such case the entering water temperature becomes the major variable and the gpm per ton can readily be calculated for any water temperature rise.

The following equation for cost of condenser water is useful:

$$B = 0.060\, a\, T\, H_e\, C \quad (4)$$

where

B = Cost of water for refrigeration during period, dollars.
a = Average gallons per minute (ton).
T = Tons of refrigeration at maximum design load.
H_e = equivalent full load refrigeration operating hours (Table 8).
C = Water cost, dollars per 1000 gal.

The average gpm per ton must take into account the variable water temperature. When well water is used as a source, and entering and leaving temperatures are considered constant, the average gpm per ton obviously is equal to the design gpm per ton. However, when the source is river or lake water, its maximum seasonal temperature will generally be reached at the same time that the refrigeration load factor is highest.

TABLE 9. REPRESENTATIVE TONS PER 100 SQ FT FOR VARIOUS APPLICATIONS

	LOW	AVG	HIGH
Department Store (Main Floor)	0.50	0.58	0.67
Department Store (Upper Floors)	0.29	0.46	0.54
Dress Shop	0.29	0.50	0.71
Drug Store	0.33	0.54	0.83
Lunch Room	0.83	1.08	1.33
Office Bldg	0.21	0.25	0.38
Restaurant	0.58	0.75	1.00
Shoe Shop	0.29	0.42	0.63
Theater (Tons per Seat)	0.064	0.078	0.093

The average gpm per ton should be calculated from known or estimated water temperatures because they vary through the season. Maximum water main temperatures are given in Chapter 37 but should always be verified locally. In lieu of this tedious work, the average gpm per ton may be taken as 80 per cent of design gpm per ton with reasonable accuracy, for the condition of variable temperature of entering water obtained from rivers and lakes.

When cooling towers or evaporative condensers are used, the windage and evaporation losses are usually between 3 per cent and 5 per cent of the water circulated.

Heating

The method of estimating fuel consumption to balance the building heat loss is given in Chapter 20. It is important to include the fuel required to heat ventilation air as used in ventilating and air conditioning systems. In estimating fuel consumption for ventilation air, the tendency of the conventional control systems to use less than the estimated quantity of outside air in cold weather should be considered in its effect in lowering fuel consumption. In addition, the heat required to accomplish winter humidifying must not be neglected, when this feature is included in the equipment.

Chapter 45

INDUSTRIAL AIR CONDITIONING

General Requirements; Typical Applications in Storage and Processing: Air Quality Control, Control of Moisture Content and Regain, Conditioning and Drying, Control of Rate of Chemical and Biochemical Reactions, Control of Rate of Crystallization, Elimination of Static Electricity.

INDUSTRIAL air conditioning is as much concerned with the atmospheric conditions required for maintaining the health, safety and efficiency of workers as with those required for the manufacture, processing, and preservation of material, equipment and commodities.

GENERAL REQUIREMENTS

Specialists in the field of industrial hygiene should be consulted in case of doubt concerning the presence of airborne industrial hazards to health. Chapter 10, Air Contaminants, Chapter 12, Physiological Principles, and Chapter 13, Air Conditioning in the Prevention and Treatment of Disease, will be of help in determining the atmospheric conditions which should be maintained around the worker. Comfortable conditions are desirable because they are likely to increase the efficiency of workers.

Table 1 lists the temperatures and relative humidities required for storage of certain commodities and for manufacturing and processing of others. The desirable relative humidity may range from a low of 5 per cent in certain industrial applications, such as insulation winding processes, up to a condition approaching saturation, as in processes relating to textile, tobacco and baking industries. Relative humidities of 50 per cent or less are on the dry side and are conductive to low regains in hygroscopic materials, drying out, increased brittleness of fibrous materials, increased static electricity, and tendencies toward increased dust liberation from the product. Relative humidities higher than 50 per cent are considered to be on the damp side. These conditions are conducive to high regain, promote softness and pliability in materials, decrease static electricity and tend to reduce the generation of product dust.

The most favorable temperature will vary according to the specific material and particular process. In some cases the temperatures listed in Table 1 have no direct influence upon the product itself but do affect the efficiency of employees, which in turn affect workmanship, uniformity and the cost of production. Frequently a compromise between the known optimum condition for processing and that required for worker comfort is unavoidable.

In many processes, the optimum air conditions are variable according to the stage and progress of the processing cycle from the raw material to the finished product. Some materials, such as cotton textiles, begin with a low relative humidity in the carding and picking rooms, and after passing through the various intermediate steps with a gradual increase of relative humidity, are subjected to relative humidities of from 75 to 85 per cent in the final stage of weaving. Other processes are encountered that require the reverse of this procedure, starting with a high relative humidity and finishing with a low relative humidity, as in the manufacture of glue and gelatinous materials and making gelatine capsules.

Safeguarding the health, safety and efficiency of workers requires control of dusts, fumes, smokes, mists, fogs, vapors, and gases, and control of the effective temperature, which includes temperature, humidity and motion of air about the worker.

General ventilation may be relied upon in some cases to control air contaminants. Chapter 9 gives information on natural ventilation. If mechanical ventilation is to be used, Chapter 32, Fans; Chapter 40, Air Distribution; Chapter 41, Air Duct Design; Chapter 33, Air Cleaning Devices; and Chapter 37, Spray Apparatus, furnish information on a broad range of industrial design conditions. If ventilation is to be provided for isolated areas using booths or enclosures, or if local exhaust ventilation is to be employed using hoods, exhaust slots or flexible tubes, fundamental design information will be found in Chapter 46 Exhausting and Conveying Systems.

In controlling effective temperature, or in providing appropriate air conditions for storage and for processing, it may be necessary to humidify or dehumidify, to heat or cool, to clean and to transport the air. These subjects are treated in other chapters in the Guide. When exhaust ventilation is used, care should be taken to properly admit a supply of air into the building to replace that removed; otherwise the exhaust system may fail to perform its intended function. Chance infiltration should not be depended upon for this supply. Optimum results are most probable if the industrial process or project and its air conditioning system are designed together.

TYPICAL APPLICATIONS IN STORAGE AND PROCESSING

Air conditioning in storage and processing may have one or more of the following objectives: (1) air quality control, (2) control of moisture regain, (3) control of rate of chemical reactions, (4) control of rate of biochemical reactions, (5) control of rate of crystallization, and (6) elimination of static electricity.

Air Quality Control

The control of humidity has proved to be useful in blast furnace operations; better uniformity of product and increased rate of production are the result. Very low humidity, with or without control of air flow and temperature, is essential in preserving stored machinery and instruments against corrosion. Control of temperature is necessary in high precision manufacturing. If, in addition to temperature, humidity is controlled and air cleanliness maintained, good conditions for gaging laboratories, for optical goods production, and for such processes as photographic film and pharmaceutical manufacturing may be provided. In libraries and museums, control of humidity and temperature is important to the preservation of the materials stored there; air cleanliness is of almost equal importance in minimizing damage during use or when cleaning the materials. In drafting rooms, control of temperature and humidity to eliminate sweating of workers reduces damage to drawings and tracings, improves accuracy of work that is to be used in direct transfer processes, and improves worker efficiency.

Moisture Content And Regain

In the manufacture or processing of hygroscopic materials such as textiles, paper, wood, leather, tobacco and foodstuffs, the temperature and relative humidity of the air have a marked influence upon the rate of

TABLE 1. TEMPERATURES AND HUMIDITIES APPLICABLE TO INDUSTRIAL AIR CONDITIONING

production and upon the weight, strength, appearance and general quality of the product. The moisture content of materials having a vegetable or animal origin, and to a lesser extent minerals in certain forms, comes to equilibrium with the moisture of the surrounding air. This is the fundamental basis for the control of certain physical qualities of the material during manufacture. With increase in moisture content, hygroscopic materials ordinarily become softer and more pliable. Standards of regain are fixed in the trade.

Manufacturing economy therefore requires that the moisture content be maintained at a percentage favorable to rapid and satisfactory manipulation and to a minimum loss of material through breakage. A uniform condition is desirable in order that high speed machinery may be adjusted permanently for the desired production with a minimum loss from delays, wastage of raw material and defective product.

In the processing of hygroscopic materials, it is usually necessary to secure a final specified moisture content suitable for the goods as shipped. *Moisture content* refers to free moisture (as in a sponge) and to hygroscopic moisture (which varies with atmospheric conditions). It is usually expressed as a percentage of the total weight of material. *Regain* is more specific and refers only to hygroscopic moisture. It is expressed as a percentage of the *bone-dry* weight of material. For example, if a sample of cloth weighing 100.0 grains is dried to a bone-dry weight of 93.0 grains, the loss in weight, or 7.0 grains, represents the weight of moisture originally contained. This expressed as a percentage of the total weight (100.0 grains) gives the moisture content or 7 per cent. The regain, which is expressed as a percentage of the bone-dry weight, is $\frac{7.0}{93.0}$ or 7.5 per cent.

The use of the term *regain* does not imply that the material as a whole has been completely dried out and has re-absorbed moisture.

A basis for calculating the regain of textiles is obtained by drying, under standard conditions, a sample from the lot and the dry weight thus obtained is used in the calculations to determine the regain.

Table 2 shows the regain or hygroscopic moisture content of several organic and inorganic materials when in equilibrium at a dry-bulb temperature of 75 F and various relative humidities. The effect of relative humidity on regain of hygroscopic substances is clearly indicated. The effect of temperature is comparatively unimportant. Changes in temperature do, however, affect the rate of absorption or drying. Sudden changes in temperature cause temporary fluctuations in regain even when the relative humidity remains stationary. The rate of absorption or drying varies with the nature of the material, its thickness and density.

During the preparation processes in a cotton mill, the cotton fibers should be in a condition to be easily carded. These preliminary processes are carried out best in a relative humidity of 50 to 55 per cent. As the cotton fiber comes to the spinning operation, more flexibility is needed and the relative humidity is increased in this department. Winding, warping and weaving are all processes calling for great flexibility and a consequent need for higher humidity.

Rayons, like cotton, require different humidities and temperatures at different steps in manufacture, but on account of great loss of strength with the higher regains, should be finished in a relative humidity of 55 to 70 percent.

TABLE 2. REGAIN OF HYGROSCOPIC MATERIALS

Moisture Content Expressed in Per Cent of Dry Weight of the Substance at Various Relative Humidities—Temperature, 75 F

Other textile fibers, due to their different natural characteristics, are processed under relative humidities and temperatures applicable to each.

When hygroscopic materials absorb moisture from the surrounding air they deliver to the air sensible heat equivalent to the latent heat released by the moisture to the material. This may account for a small part of the total heat load of the conditioned space.

Conditioning and Drying

In general, the exposure of materials to desirable humidities for treatment may be coincidental with the manufacture or processing of the materials, or they may be treated separately in special enclosures. This latter treatment may be classified as conditioning or drying. The purpose of conditioning or drying is usually to establish a desired condition of moisture content and to regulate the physical properties of the material. When the final moisture content is lower than the initial one, the term *drying* is applied (See Chapter 47). If the final moisture content is to be higher, the process is termed *conditioning*. In the case of some textile products and tobacco, for example, drying and conditioning may be combined in one process for the dual purpose of removing undesirable moisture and accurately regulating the final moisture content. Frequently conditioning or drying is made a continuous process in which the material is conveyed through an elongated compartment by suitable means and subjected to controlled atmospheric conditions.

Control of Rate of Chemical Reactions

A typical example of control of the rate of chemical reactions occurs in the manufacture of rayon. The pulp sheets are conditioned, cut to size, and passed through a mercerizing process. It is essential that during this process close control of both temperature and relative humidity should be maintained. The temperature controls the rate of reaction directly, while the relative humidity maintains a constant rate of evaporation from the surface of the solution and obtains a solution of known strength throughout the mercerizing period.

Another well-known example in this class is the *drying* of varnish which is an oxidizing process dependent upon temperature. High relative humidities have a retarding effect on the rate of oxidization at the surface and allow the internal gases to escape freely as the chemical oxidizers *cure* the varnish from within. This produces a surface free from bubbles and a film homogeneous throughout. Desirable temperatures for *drying* varnish vary with the quality. A relative humidity of 65 per cent is beneficial for obtaining the best processing results.

Control of Rate of Biochemical Reactions

In the field of biochemical control, industrial air conditioning has been applied to many different and well-known products. All problems involving fermentation are classed under this heading. As biochemistry is a subdivision of chemistry, subject to the same laws, the rate of reaction may be controlled by temperature. An example of this is the dough room of the modern bakery. Yeast develops best at a temperature of 80 F. A relative humidity of 65 per cent is maintained to hold the surface of the dough open to allow the carbon dioxide gases formed by the fermentation to pass through and produce a loaf of bread, when baked, of even, fine texture without large voids.

The curing of fruits, such as bananas and lemons, also comes under this classification. Bananas require a cycle of temperatures and relative humidities for ripening. The starches in the pulp of the fruit must be changed and the skin cured and colored, after which the fruit is cooled to maintain as low a rate of metabolism as possible. Ideal storage conditions range between 56 and 60 F with about 75 per cent relative humidity and ventilation at the rate of three or four air changes per hour.

The curing of lemons is an entirely different problem. Bananas are cured for a quick market, while lemons are held for a future market. The process, therefore, varies in the temperature used. Temperatures from 54 to 59 F have been found to be best suited for this process. A high relative humidity of 88 to 90 per cent is necessary to hold shrinkage to a minimum and, at the same time, develop the rind so it will be sufficiently tough to permit handling.

Tobacco from the field to the finished cigar, cigarette, plug or pipe tobacco, offers another interesting example of what may be done by industrial air conditioning in the control of color, texture and flavor. In the processing of tobacco, control of regain, of chemical and biochemical reactions is involved, and only through close atmospheric control can the best quality of leaf be developed.

Control of Rate of Crystallization

The rate of cooling of a saturated solution determines the size of the crystals formed. Both dry- and wet-bulb temperatures are of importance, as the one controls the rate of cooling, while the other, through evaporation, changes the density of the solution.

In the coating pans for pills, gum and nuts, a heavy sugar solution is added to the tumbling mass. As the water evaporates, each separate piece is covered with crystals of sugar. A smooth, opaque coating is only accomplished by blowing into the kettle the proper amount of air at the right dry- and wet-bulb temperatures. The wet-bulb depression determines the rate of moisture pick-up or drying by the air and may be termed the *drying head*. Of equal importance is the uniformity at which the wet-bulb is maintained. If this is allowed to vary, poor results will follow due to checking and cracking of the unfinished coating.

Elimination of Static Electricity

The presence of static electricity is very detrimental to the staisfactory and economical processing of many light materials, such as textile fibers, paper, etc. It is also extremely dangerous where explosive atmospheres or materials are present. Fortunately, this hazard is minimized by increasing the relative humidity if the material being processed is not damaged thereby.

In attempting to eliminate static electricity, it must be borne in mind that for successful elimination the air that actually comes in contact with the material in the machine must be at a relative humidity of 50 per cent or more. As some machines consume a great deal of power which is converted directly into heat, the temperature in the machine may be considerably higher than the temperature adjacent to the machine where the relative humidity is normally measured. In such cases, the relative humidity in the machine will be appreciably lower than that elsewhere in the room, and it may be necessary to maintain a room relative humidity of 65 per cent, or even more, before the desired results can be obtained inside the equipment.

CALCULATIONS

The methods for determining the heating and cooling loads for the various industrial processes are similar to those outlined in Chapters 14 and 15. The several other chapters previously cited call attention to additional phases of calculation which may be needed. Because of the

large number of motors and heat producing units usual in an industrial application, it is particularly important that operating allowances for the latent and sensible heat loads be definitely ascertained and used in the calculations to determine the total design load.

EXHAUSTING AND CONVEYING SYSTEMS

Classification of Systems, Hood Design Principles, Hood Suction and Indraft Velocities, Duct System Design, Air Cleaning Equipment, Resistance of Systems, Air Flow Producing Equipment, Protection Against Corrosion

---

IN many industrial plants some type of exhaust system designed to collect and remove dusts, fumes, mists, vapors and gases is essential in order to promote efficiency, economy, and safety of operation. Definitions of these various contaminants are included in Chapter 10, Air Contaminants.

The theory of air flow in an exhaust system in the following paragraphs *A* to *D* will be found in a publication [1] of the *American Foundrymen's Association.*

A. When the air flow producing equipment of an exhaust system is properly operated it will produce a negative pressure (below atmospheric) in the exhaust side of the system sufficient to overcome all resistance and to sustain the desired air velocity; and, further, will overcome all resistances on the discharge or positive pressure side of the system so that the air drawn through exhaust inlets will be discharged against atmospheric pressure.

B. An exhaust system is entirely dependent on a *sufficient volume* of air flowing into the exhaust inlets to catch the matter to be exhausted before such matter has an opportunity to diffuse into the general atmosphere of the work place or room.

C. The velocity of the air flowing into an exhaust inlet is usually of secondary importance and becomes an essential factor only when a certain velocity is required to overcome some force acting on the matter to be caught. The velocity within an exhaust system is only important to the extent that it shall be sufficient to convey the entrained matter and prevent it from settling or dropping out in the piping system. Velocity in terms of velocity pressure is most essential in designing a system because it is the basis upon which all calculations are made. In testing and checking a system the velocity as determined from the velocity pressure reading obtained by means of a Pitot tube is the only true indication of the exact air flow in a pipe or system.

D. The total pressure within an exhaust system is only of importance in determining the power required to operate the system. Total pressure tests do not indicate the proper functioning of an exhaust system as related to the volume and velocity of the air flowing into an exhaust inlet.

General design information is included in this chapter which is intended to relate primarily to industrial exhaust systems.

CLASSIFICATION OF SYSTEMS

In general there are two basic layouts of exhaust systems, the central and the multiple unit system. In the central system a fan is located near the center of operations with a piping system radiating to the various machines to be served. In the multiple unit system, which is sometimes employed where the machines to be served are widely scattered, or where the operations are apt to be independent or intermittent, small individual exhaust fans are located at the center of the machine groups or at each machine. The unit arrangement has the advantage of flexibility.

Exhaust systems may be classified with respect to the nature of the material to be handled by them as (*a*) those handling dust and (*b*) those handling fumes, mists, vapors and gases. There is a marked difference in design details of systems serving dust producing operations and those exhausting the more vapor-like matter even though the same basic

theories govern both classes. The type of hood and exhauster, the adaption of general ventilation, the conveying velocities and duct construction differ substantially.

Exhaust systems are also classified by the means employed to collect the material. The dust or refuse may be collected and controlled by enclosed hoods or open hoods with positive inward air movement or by diluting or exhausting the general air of the room. With some classes of machinery it is not feasible to hood the machines closely and in these cases open hoods over or adjacent to the machines are provided to collect as much as possible of the dust and fumes. This class includes such machines as rubber mills, package filling machinery, sand blast, crushers, forges, pickling tanks, melting furnaces, and the unloading points of various types of conveyors.

Open hoods should be placed as close to the source of dust or fumes as possible, with due regard to the movements of the operator, and should be placed so that the operator is in no case in the path of the exhausted material. When the hood must be placed at some distance above the machine it should be large enough to cover a large area as diffusion is usually quite rapid.

Some consideration should be given to the natural movement of the fumes. For those that are lighter than air, the hood may be over or above the machine; and where a heavy vapor, or dust-laden air at ordinary temperature is to be removed, horizontal or floor connections are sometimes preferable. In many cases there are convection currents and other atmospheric disturbances in the work room which should be given consideration. These disturbances diminish the tendency of dust and fumes to settle from the room air because of their density.

In another class of operation the main objective is to prevent the escape of dust into the surrounding atmosphere, and the removal of some dust from the machine or enclosure may be merely incidental. The dust-creating apparatus is enclosed within a housing which is made as tight as practicable, and sufficient suction is applied to the enclosure to maintain an inward air leakage, thus preventing escape of the dust. While the exhaust system is required to handle only the air which leaks in through the crevices and openings in the enclosure, yet in many installations leakages are very high and great care is required to obtain satisfactory results with a system of this kind. The inward-leakage principle is utilized for controlling dust in the operating of tumbling barrels, grinding, screening, elevating, and similar processes.

Certain dust and fume producing operations are best carried on by isolating the process in a separate compartment or room and then applying general ventilation to this space. The compartment or room in which the work is performed should be as small as is consistent with convenience in handling the work. The ventilating system should be designed so that a current of clean air is drawn across the work in such a manner as to carry the dust or fume away from the operator and out of the work space. Another method of accomplishing the control of this type of installation, and one usually applied in the case of gases and fumes, is the dilution method. In this case sufficient clean air is introduced generally into the work space to dilute the contamination to a safe level.

HOOD DESIGN PRINCIPLES [2, 3]

The first step in the design of an exhaust system is to determine the number and size of the hoods and their connections. No general rules,

however, can be given since hood and duct dimensions are determined by the characteristics of the operations to which they are applied. When a tentative decision regarding the set-up has been made, it is then necessary to obtain the suction and air velocities required to effect control. At this point the designer must rely upon the prevailing practice and on such physical data relating to hoods, duct systems and collectors as are available. The fan speed must be sufficient to maintain the estimated suction and air velocities in the system. In general, the most important requirements[4] of an efficient exhaust and collecting system are:

1. Hoods, ducts, fans, motors and collectors should be of adequate size and type.
2. The air velocities should be sufficient to control and convey the materials collected.
3. The hoods and ducts should be placed so as not to interfere with the operation of a machine or any working part.
4. The system should do the required work with a minimum power consumption.
5. When inflammable dusts and fumes are conveyed, the piping should be provided with an automatic damper in passing through a fire-wall.
6. Ducts and all metal parts should be grounded to reduce the danger of dust explosions by static electricity.
7. The exhaust system should be readily accessible for inspection and care.

HOOD SUCTION AND INDRAFT VELOCITIES

The removal of dust or waste by means of an exhaust hood requires a movement of air at the point of origin sufficient to carry it into a collecting system. The air velocities necessary to accomplish this depend upon the physical properties of the material to be eliminated and the direction and speed with which it is thrown off. If the dust to be removed is already in motion, as is the case with high-speed grinding wheels, the hood must be installed in the path of the particles so that a minimum air volume may be used effectively. It is always desirable to design and locate a hood so that the volume of air necessary to produce results is as small as possible. This will reduce the size of equipment, the power required by the system, and also the heating load requirements in winter.

Air Flow from Static Readings

The static suction at the throat of a hood is frequently used in practice as a measure of the effectiveness of control. Where the hood coefficient is known the volume of air flow through any hood may be determined from the equation:

$$Q = 4005 f A \sqrt{h_t} \qquad (1)$$

where

Q = volume of air flow, cubic feet per minute.
A = area of connecting duct, square feet.
h_t = static suction measured 3 diameters from throat of hood, inches of water.
= orifice or restriction coefficient which varies from 0.6 to 0.9 depending on the shape of the hood.

An average value of f is 0.71, although for a well-shaped opening a value of 0.8 may be used. The factor f is determined from the equation:

$$f = \sqrt{\frac{h_v}{h_t}} \qquad (2)$$

where h_v is the velocity head in the connecting duct.

The *static suction* is not a good measure of the effectiveness of a hood unless the area of the opening and the location of the operation with

respect to the hood are known. This is clearly indicated by Equation 3 which shows that the velocity at any point along the axis varies approximately inversely as the square of the distance. This formula coupled with Equation 1 should serve to indicate the velocity conditions to be expected when operations are conducted externally to the hood opening.

Design Based on Total Air Flow

Where the foregoing factors are not known, the usual method of designing an exhaust system is to base the air flow through the system on rates of flow through each hood which have been found by experience to provide adequate control. For woodworking systems the rates of flow given in Table 1, calculated on the basis of a branch velocity of 4000 fpm, are adequate for control. Using these air flow rates, Table 2 gives the size of pipe connections to be used with the more common woodworking machines. Properly designed grinding and buffing wheel hoods have been found to be adequately controlled when the rates of air flow given in Table 3, calculated on the basis of a branch velocity of 4500 fpm, are used. Table 4 gives the minimum branch pipe sizes to be used on the more common sizes of grinding and buffing wheels.

In some states grinding, polishing and buffing wheels are subject to regulation by codes. The static suction requirements, which range from 1½ to 5 in. water displacement in a *U*-tube, must be followed in such states although in several instances they appear to be excessive. Frequently, in these operations, a large part of the wheel must be exposed and the dust-laden air within the hood is thrown outward by the centrifugal action of the wheel, thus counteracting useful inward draft. This tendency may be diminished by locating the connecting duct so as to create an air flow of not less than 200 fpm past the lower edge of the wheel.

Controlling Air Velocities

Exact determinations of hood control velocities are not available, but it is safe to assume that for most dusty operations velocities should not be less than 200 fpm at the point of origin. Recommended air velocities through hood openings for various processes are given in Table 5. For granite dust generated by pneumatic devices, velocities from 150 to 200 fpm, depending on the type of hood used, are recommended as sufficient for safe control [5]. Considering the character of the industry, air velocities of this order may be extended to similar dusty operations. The method for approximately determining these velocities in terms of the velocity at the hood opening is given in Equation 3.

No set rule can be given regarding the shape of a hood for a particular operation, but it is well to remember that its essential function is to create an adequate velocity distribution. The fact that the zone of greatest effectiveness does not extend laterally from the edges of the opening may frequently be utilized in estimating the size of hood required. Where complete enclosure of a dusty operation is contemplated, it is desirable to leave enough free space to equal the area of the connecting duct. Hoods for grinding, polishing and buffing should fit closely, but at the same time should provide an easy means for changing the wheels. It is advisable to design these hoods with a removable hopper at the base to capture the heavy dust and articles dropped by the operator. Such provisions are of assistance in keeping the ducts clear. Air volumes used to control many dust discharges may often be reduced by effective baffling or partial

TABLE 1. RATES OF FLOW THROUGH BRANCH PIPES OF WOODWORKING MACHINES

enclosure of an operation. This procedure is strongly urged where dusts are directed beyond the zone of influence of the hood.

Axial Velocity Formula for Hoods

When the normal flow of air into a hood is unobstructed, Equation 3 may be used to determine the air velocity at any point along the axis[6]:

$$V = \frac{0.1\,Q}{x^2 + 0.1\,A} \tag{3}$$

where V = velocity at point, feet per minute.
Q = volume of air handled, cubic feet per minute.
x = distance along axis, feet.
A = area of opening, square feet.

Velocity Contours

It is possible by use of a specially constructed Pitot tube[7] to map contours of equal velocity in any axial plane located in the field of influence. It has been found that the positions of these contours for any hood can be expressed as percentages of the velocity at the hood opening and are purely functions of the shape of the hood[8].

TABLE 5. RECOMMENDED AIR VELOCITIES THROUGH OPENINGS IN HOODS ENCLOSING OPERATIONS OR LOCATED OVER ZONES OF GENERATION OF DUSTS, FUMES, VAPORS AND GASES RELEASED IN CERTAIN MANUFACTURING PROCESSES

CONDITION OF GENERATION OF CONTAMINANT	MINIMUM AIR VELOCITY, FPM	PROCESS
Released without noticeable movement	50–100	Evaporation of vapors, exhaust from pickling, washing, degreasing, plating, welding, etc.
Released with low velocity	100–200	Paint spraying in booth; inspection, sorting, weighing, packaging, low speed conveyor transfer points, rotating mixtures, barrel filling.
Active generation	200–500	Foundry shakeout, high speed conveyor transfer points, crushers, screens.
Released with great force	500–2000	Grinding, tumbling mills, abrasive cleaning.

Further, the velocity contours are identical for similar hood shapes when the hoods are reduced to the same basis of comparison. These facts are applicable to all hood problems so that when the velocity contour distribution is known, the air flow required can be determined. Fig. 1 shows the contour distribution in two axial planes perpendicular to the sides of a rectangular hood with a side ratio of one-half. The distribution shown is identical for all openings with a similar side ratio provided the mapping is as shown in the figure. The contours, of course, are expressed as percentages of the velocity at the opening.

Low Velocity Systems

On multiple installations of the same operation it is often possible to institute a great saving in power cost by designing an exhaust system

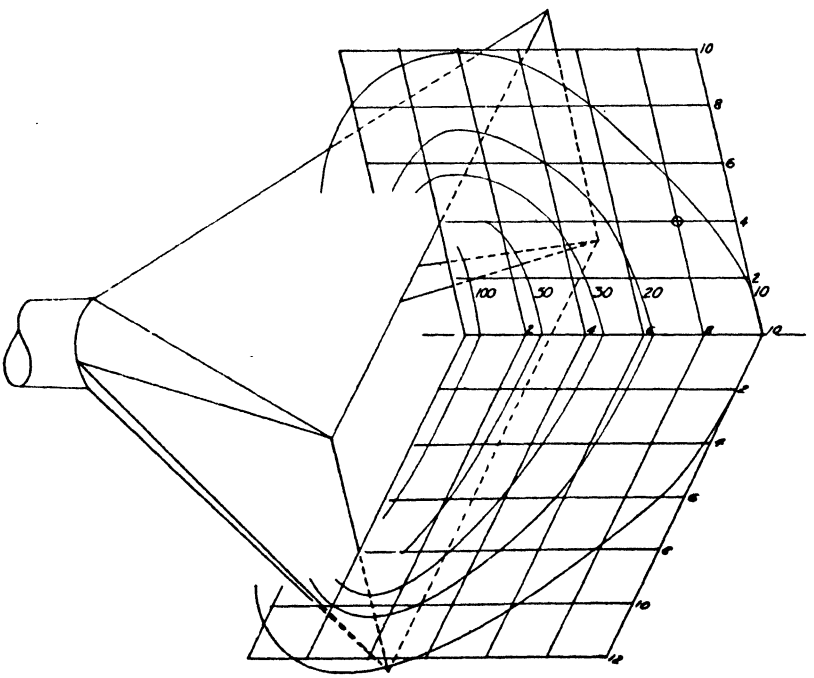

FIG. 1. VELOCITY CONTOURS FOR A RECTANGULAR OPENING WITH A SIDE RATIO OF ONE-HALF. CONTOURS ARE EXPRESSED AS PERCENTAGES OF THE VELOCITY AT THE OPENING

using low velocities in the main ducts. Such a system for use in grinding and shaping porcelain has been described[9]. In these operations, the separate machines are grouped around a central plenum chamber and exhausted by means of a low pressure fan connected to the plenum. In this case a power saving of over 90 per cent was obtained. A similar design technique[10] has been described for use in ventilating plating tanks.

Large Open Hoods

Large hoods, such as may be used for electroplating and pickling tanks, should be sub-divided so the area of the connecting duct is not less than one-fifteenth of the open area of the hood. Frequently, it will be found necessary to branch the main duct in order to obtain a uniform distri-

bution of flow. *Canopy hoods* should extend 6 in. laterally from the tank for every 12 in. elevation, and wherever possible they should have side and rear aprons so as to prevent short circuiting of air from spaces not directly over the vats or tanks. In most cases, hoods of this type take advantage of the natural tendency of the vapors to rise, and air velocities may be kept low. Cross drafts from open doors or windows disturb the rise of the vapors and therefore provision must be made for them. The air velocities required also depend upon the character of the vapors given off, cyanide fumes, for example, requiring an air velocity of approximately 75 fpm on the surface of the tank and acid and steam vapors requiring velocities as low as 25 to 50 fpm. The total volume of air flow necessary to obtain these velocities may be approximately determined from the equation:

$$Q = 1.4\,PDV \tag{4}$$

where

Q = total volume of air handled by hood, cubic feet per minute.
P = perimeter of the tank, feet.
D = distance between tank and hood opening, feet.
V = air velocity desired along edges and surface of tank, feet per minute.

Lateral Exhaust Systems

The lateral exhaust method, as developed for chromium plating [11], is applicable in many instances in preference to the canopy type hoods. The method makes use of drawing air and fumes laterally across the top of vats or tanks into slotted ducts at the top and extending fully along one or more sides of the tanks. The slots are 1 in. wide and for effective ventilation a 2000 fpm exhaust air velocity at the slot face is advisable. In addition, the duct should not be required to draw the air laterally for a distance of more than 18 in. and the level of the solution should be kept 6 to 8 in. below the top of the tanks. If width of tank is over 18 in. a double lateral exhaust may be used with slots on both sides.

It has also been determined that a similar control may be used for tanks wider than 3 ft when the same velocity (2000 fpm) is maintained through a slot which is increased ¼ in. for every foot of width greater than 3 ft. When these slots must be extended more than 6 ft in length, some method of spreading the flow is necessary to provide even air flow distribution through the entire slot length. This can be accomplished by tapering the slot, which incidentally will add to the resistance of the system. A more economical approach is to place properly spaced vanes in the side ducts, or to branch the side ducts [12].

The flexible exhaust tube method may be advantageously used for removing dust or fumes. Flexible tubes having one end connected to an exhaust system and a slotted hood attached to the other end may be shaped at will to fit in with industrial processes without affecting the ease of operation. Efficient dust or fume removal may be had with use of relatively small exhaust volumes. This type of system may be used on swing grinders, portable grinding wheels, soldering operations, stone cutting, rock drilling, etc.

Spray Booths

In the design of an efficient spray booth, it is essential to maintain an even distribution of air flow through the opening and about the object being sprayed. While in many instances spraying operations can be

performed mechanically in wholly enclosed booths, the volatile vapors may reach injurious or explosive concentrations. At all times the concentrations of these vapors, and particularly those containing benzol, should be kept well below 100 parts per million in the breathing zone of the worker. Spray booth vapors are dangerous to the health of the worker and care should be taken to minimize exposure to them.

It is recommended in the design of spray booths that the exhaust duct be located at the end of the booth opposite the opening. In front of this duct should be placed baffle plates which will cause a uniform air velocity distribution across the frontal area. The air volume should be sufficient to maintain a velocity of not less than 100 fpm over the open area of the booth (150 fpm is preferable where benzol or lead is present in the paint) and the vapors should be discharged through a suitable stack to permit dilution. It is good practice to pass the fumes or vapors through baffle type washers or scrubbers designed for efficient spray removal.

Hoods for Chemical Laboratories

Hoods used in chemical laboratories are generally provided with sliding windows which permit positive control of the fumes and vapors evolved by the apparatus. Their design should offer easy access for the installation of chemical equipment and should be well lighted. Air velocities should exceed 50 fpm when the window is fully open.

Kitchen Hoods

The length and width of kitchen hoods should be such as to extend beyond the extreme projection of the ranges, broilers, etc., over which they are installed. The minimum projection or overlap should be 12 in. Where space conditions permit, range hoods should be about 2 ft high so as to provide a reservoir to confine momentary bursts of smoke and steam until the exhaust system can evacuate the hood. Range hoods should be located as low as possible to increase their effectiveness.

A steel plate placed horizontally within a kitchen hood and located sufficiently high above the level of the bottom of the hood to permit use of a row of lights within the hood along the edge has been found effective in improving the operation. The area between the edges of the plate and the edges of the hood should be selected according to the exhaust volume and velocity required.

In general the amount of air to be exhausted from restaurant range hoods is at the rate of 100 fpm per square foot of face area. Thus, a hood 4.5 ft wide by 30 ft long has a face area of 135 sq ft, which multiplied by 100 fpm velocity results in a total air quantity to be exhausted of 13,500 cfm. In some cases, where the application is principally frying and where it is not practical to install a hood 2 ft high, it is recommended that the face velocity be increased from 100 to 150 fpm, depending on peak load conditions in the kitchen. Exhaust connections to range hoods should always be made at the top and back of hoods, and should be spaced preferably not more than 6 ft apart and be rectangular in shape with the long side parallel to the back of the hood. Exhaust openings into range hoods should be designed to maintain a velocity of 1500 to 1800 fpm.

An approved fire damper with fusible link should be (and is required by code in many states) installed in the main exhaust duct or branch adjacent to the range hood. Should there be more than one hood connected to a common duct, then the branch duct to each hood should be provided with a fire damper. Access doors should be provided at the fire

damper for purpose of inspection, cleaning, or for renewal of fusible link. All exhaust piping to range hoods, commonly called grease ducts, should be provided with tight fitting cleanout doors of adequate size to permit easy removal of grease. Some engineers use filters to advantage in hoods which are subject to grease conditions.

Hoods over steam tables should be of similar construction to range hoods. It is good practice to design such hoods with a face velocity of 60 to 70 fpm. Hoods over dishwashing machines are usually relatively small and generally 1500 to 2000 cfm per hood is allowed, which is equivalent to a velocity of approximately 100 fpm per square foot of face area. Range hoods in diet kitchens are constructed the same as restaurant range hoods but with less exhaust air per square foot of face area, depending upon the nature of the food cooked.

Hoods are not often used in private residences unless they are quite large and the consideration of expense is not important. For such residences the hoods should be designed on the same basis as diet kitchens. Most all residence kitchens can be effectively and economically ventilated by the installation of a built-in kitchen ventilator, which should be located in an outside wall and in close proximity to the kitchen range. It has been found that the capacity of the built-in kitchen ventilator should be at least 350 cfm regardless of the size of kitchen. This can be justified on the basis that the smaller the kitchen the more concentrated the heat will be thus requiring a more rapid rate of air change. Standard size built-in kitchen ventilators are generally available in three sizes, namely 350, 500 and 800 cfm. The proper size to use will depend on design conditions and available wall space.

DUCT SYSTEM DESIGN

In designing a duct system it is necessary to recognize a few fundamental principles (see also Chapter 41). Knowing the quantity of air required, the size of the duct may be computed from Equation 5:

$$A = \frac{Q}{V} \tag{5}$$

where

A = cross-section area of duct, square feet.
Q = air quantity to be handled by the duct, cubic feet per minute.
V = velocity of air, feet per minute.

Air Velocities in Ducts

Where it is necessary to transport the particulate material collected in an exhaust system, minimum carrying velocities must be maintained in the ducts preceding the collector. It has been found that good results are obtained when design air velocities in horizontal runs are not less than 2000 fpm or not greater than 5000 fpm. When the dust being carried is organic and other than wood flour, or similar material, a velocity of 2500 fpm is adequate. Approximate required conveying velocities are given in Table 6.

For duct systems wherein the air has no dust or solid load, a lower velocity is desirable, which may range from 1200 to 2000 fpm. In view of the fact that the horsepower required by a system depends directly on the resistance and the resistance is a function of the velocity, economical design requires velocities of this magnitude.

The equal friction method is generally used for designing a duct system as this insures equal resistance to air flow in all branches throughout the system (see Chapter 41). Long main ducts do not generally provide the most economical layout. Where it is necessary to ventilate a large number of machines, or machines which are widely separated, it is desirable to locate the fan at approximately the center of the system. With this arrangement it is possible to choose a fan which will deliver the required air quantity against a lower resistance pressure, and this will generally result in a horsepower saving.

When a system carrying dust is designed with an oversize main duct to allow for future extension, the air velocity may be found to be too low to carry the dust, and serious plugging may occur. In this case it is desirable to install an orifice in the end of the pipe to allow for the lower air quantity.

Construction

The interior of all ducts should be smooth and free from obstructions at joints and soldered air-tight. Other sealing mediums are permissible where soldering is impracticable.

Ducts should be constructed of galvanized sheet metal except when the presence of corrosive fumes or gases, temperatures above 400 F, or other factors would make galvanized material impractical. For the usual exhaust systems the metal thicknesses shown on Table 7 are recommended. Elbows and angles should be a minimum of two gages heavier than straight lengths of equal diameter. Hoods should be a minimum of two gages heavier than straight sections of a connecting branch.

Longitudinal joints of ducts should be lapped and riveted or spot-welded on 3-in. centers maximum. Girth joints or ducts should be made with lap in direction of air flow, with 1 in. lap for duct diameters through 19 in. and 1¼ in. lap for diameters over 19 in. Elbows and angles should have an inside or throat radius of two pipe diameters whenever possible. Large radii are recommended for heavy concentrations of highly abrasive dusts. Elbows 6 in. or less in diameter should be constructed of at least 5 sections and, if over 6 in. in diameter, of 7 sections, with angles pieced proportionally. Hoods should be free of sharp edges or burrs and reinforced to provide necessary stiffness. Transitions in mains and submains should be tapered with a taper 5 in. long for each 1 in. change in diameter whenever possible. All branches should enter the main at the large end of the transition at an angle not to exceed 45 deg or preferably 30 deg. Branches should be connected only to the top or sides of mains, with no two branches entering diametrically opposite to each other. Dead end caps should be provided within 6 in. from last branch of all mains and sub-mains. Cleanouts should be provided every 10 ft and near each elbow, angle, or duct junction in horizontal sections. Ducts should be supported sufficiently to place no loads on connected equipment and to carry weight of a system plugged with material. The

TABLE 6. APPROXIMATE CONVEYING VELOCITIES

MATERIAL CONVEYED	DESIGN VELOCITY FPM
Vapors, gases, fumes, very fine dust	2,000
Fine dry dusts	3,000
Average industrial dusts	3,500
Coarse particles	3,500–4,500
Large particles, heavy loads, moist materials	4,500 and over

maximum distance between supports should be 12 ft for 8 in. or smaller ducts and 20 ft for larger ducts. Six inches minimum clearance should be provided between ducts and the ceiling, wall or floor. Blast gates for adjustment of the system should be placed near the connection of a branch to the main and means of locking gates after the adjustments have been made should be included. Rectangular ducts should be used only when clearances prevent the use of round construction. Rectangular ducts should be as nearly square as possible. The weight of metal and the lap, and other construction details, should be the equal of round duct construction having a diameter equal to the longest side. All pipes passing through roofs should be equipped with collars so arranged as to prevent water from leaking into the building.

The main trunks and branch pipes should be as short and straight as possible.

Cleanout openings having suitable covers should be placed in the main and branch pipes so that every part of the system can be easily reached in case the system clogs. Either a large cleanout door should be placed in the main suction pipe near the fan inlet, or a detachable section of pipe, held in place by lug bands, may be provided.

Every pipe should be kept open and unobstructed throughout its entire length, and no fixed screen should be placed in it, although the use of a trap at the junction of the hood and branch pipe is permissible, provided it is not allowed to fill up completely. The passing of pipes through fire-walls should be avoided wherever possible, and floor sweep connections should be so arranged that foreign material cannot be easily introduced into them.

At the point of entrance of a branch pipe with the main duct, there should be an increase in the latter equal to their sum. Some state codes specify that the combined area be increased by 25 per cent. While this is not always good practice and is frequently done at the expense of a reduced air velocity, it is often done where future expansion of the exhaust system is contemplated.

Duct Resistance

The resistance to flow in round galvanized duct riveted and soldered at the joints may be obtained from Fig. 2, Chapter 41. The pressure drop through elbows depends upon the radius of the bend. For elbows whose centerline radii vary from 100 to 300 per cent of pipe diameter, the loss may be estimated from Table 8. It is sometimes convenient to express the resistance of an elbow in terms of an equivalent length of duct of the same diameter. Thus with a center line radius equal to the pipe diameter the resistance is equivalent to a section of straight pipe approximately

TABLE 7. GAGES OF METALS FOR EXHAUST SYSTEMS[a]

DIAMETER OF ROUND PIPE OR GREATEST DIMENSION OF RECTANGULAR PIPE, INCHES	THICKNESS OF DUCT MATERIAL U. S. GAGE NUMBER	
	For Highly Abrasive Matter	For Other Matter
Up to 8 inclusive	20	22
Over 8 to 18 inclusive	18	20
Over 18 to 30 inclusive	16	18
Over 30	14	16

10 diameters long, while with a center line radius 1½ times the diameter, the resistance is apparently the same as that of seven diameters of straight pipe.

AIR CLEANING EQUIPMENT

Primary dust separators depend for their air cleaning action on centrifuging out the dust particles or on imparting to the transporting air stream a quick change in direction, accompanied by a sudden reduction in velocity. They may be applied to exhaust systems from polishing and buffing wheels and, in some cases, as a preliminary separator ahead of a final dust arrester.

Dust particles which cannot be caught in inertia type separators are usually removed by one of the following methods:

1. *Filtration.* Of the filter arresters the cloth type, either of the screen, envelope, or bag construction, is most generally used for industrial exhaust systems. Cloth arresters properly engineered for this job and handling dust for which they are suited operate at a good efficiency.

2. *Wet Collectors.* Wet collectors have been in use for many years, but only recently have been introduced for collection of industrial dust from exhaust systems. They are particularly applicable where moisture is present in the air being exhausted. The resistance is relatively low in wet collectors suitable for dust removal and remains constant for a given exhaust system.

3. *High-tension Electrical Precipitation.* High-tension electrical precipitation has been applied to removal of dust, fumes, and mists from air and other gases. (See section on Electric Precipitators in Chapter 33.)

4. *Dynamic Precipitators.* This equipment effects removal of entrained dusts by means of a specially designed fan in which the rotating element imparts a centrifugal force to the dust particles. Originally these precipitators were intended for the collection of dry dust, but recently the construction has been modified to permit the introduction of water into the dirty air intake, thus increasing its application to more kinds of dust. Consideration must be given to the type of dust handled [13].

For additional information on dust and cinders, see Chapter 33, Air Cleaning Devices.

RESISTANCE OF SYSTEM

The maintained resistance of the exhaust system is composed of three factors: (1) loss through the hoods, (2) collector drop, and (3) friction drop in the duct system.

The loss through the hoods is usually assumed to be equal to the suction maintained at the hoods. Where possible the resistance of the particular collector to be used should be obtained from the manufacturer.

[c] Stainless steel of (24 *Cr*—10 *Ni*) fairly resistant at low temperature for HCl and H_3PO_4.
[d] Under most conditions.
[e] At room temperatures.

Friction drop in the pipes must be computed for each section where there is a change in area or in velocity. The velocities should be found in each section of pipe starting with the branch most remote from the fan. The friction drop for these sections can be determined by reference to Table 8 in this chapter and Fig. 2, Chapter 41. Total friction loss in the piping system is the friction drop in the most remote branch plus the drop in the various sections of the main, plus the drop in the discharge pipe.

EFFICIENCY OF EXHAUST SYSTEMS

The efficiency of an exhaust system depends upon its effectiveness in reducing the concentration of dusts, fumes, vapors and gases below the safe or threshold limits [14].

Too much emphasis cannot be placed on the necessity of testing exhaust systems frequently by determining the concentration of atmospheric contamination at the worker's breathing level [15]. Commonly accepted values of threshold limits for usual atmospheric contaminants will be found in Tables 3, 4 and 5, Chapter 10.

AIR FLOW PRODUCING EQUIPMENT

In any type of exhaust system some form of air flow producing equipment should be required to create the pressure necessary to cause the air

to flow through the system to the discharge stack. Natural draft should not be depended on to remove harmful or dangerous gases, fumes, mists, dusts, or other matter when it is imperative that such matter be removed from the work place or room atmosphere.

The principal types of air moving equipment are chimney exhausts, venturi ejectors, centrifugal exhaust fans, disc or propeller fans, and axial flow fans [16].

Manufacturers generally provide special fans for the collection of various industrial wastes. These are available for the collection of coal dust, wood shavings, wool, cotton and many other substances. When substances having an abrasive character are conveyed, the fan blades and housing should be protected from wear. This may be accomplished by placing a collector on the negative side of the fan or by lining the housing and blades with rubber.

PROTECTION AGAINST CORROSION

The removal of gases and fumes in many chemical plants requires that metals used in the construction of the exhaust system be resistant to chemical corrosion. A list of the materials which may be used to resist the action of certain fumes is given in Table 9. Hoods and ducts, when short, may frequently be constructed of wood and be quite effective. Rubberized paints are available and may be applied as protective coatings in handling such gases and fumes as chlorine and hydrochloric acid.

DRYING SYSTEMS

Mechanism of Drying, Omissions in Drying Cycle, Factors Influencing Drying Rates, Drying Methods and Equipment, Radiant Drying, Conduction Drying, Convection Drying, Calculation and Design, Estimating Methods

---

THE term drying in a broad sense encompasses the removal of water, and occasionally other liquids, from gases, liquids, or solids. However, the common usage of the word confines the meaning principally to the removal of water or solvent from solids. Dehumidification is the term that is commonly assigned to the drying of gases. This is usually accomplished by condensation or adsorption by various drying agents and is treated in Chapter 38. Distillation and more particularly fractional distillation is associated with the drying of liquids.

It is usually more economical to employ, whenever possible, mechanical means of separating as much water as is practicable from the solid materials before undertaking drying or dehydration steps. These mechanical methods such as filtration, screening, pressing, centrifuging, or settling usually require much less power and frequently less capital outlay, thereby making the operation cheaper in terms of cost per pound of water removed.

MECHANISM OF DRYING

The course of drying of any substance under constant conditions of temperature, humidity, and air velocity and distribution, follows a definite pattern which can be represented by a graph such as Fig. 1, which is that for a slab of whiting, wherein the rate of drying is plotted against the moisture content. The drying cycle may then be divided into three components: (1) Constant rate period. (2) Uniform falling rate period. (3) Varying falling rate period.

One or more of these components may be missing for a substance under a particular set of conditions.

During the *constant rate* period, water is being evaporated from the surface of the material at a rate comparable to that of a free water surface and moisture is being supplied by diffusion or capillarity to the surface at a rate equal to or greater than the evaporative rate. However, a point is reached at which the moisture reaches the surface at a rate less than the potential evaporative rate. The moisture content of the substance at which this occurs is known as the *critical moisture.* Up to this point the material is generally considered to assume the wet bulb temperature of the air. This is not strictly true as in many cases radiant heat is absorbed or some heat is supplied by conduction.

During the *uniform falling rate* period, moisture is still evaporating from the surface, but the area of wet surface is constantly diminishing.

During the *varying falling rate* period the water is vaporized beneath the surface and escapes as the vapor. As the thickness of the dried material increases, it becomes more difficult for the vapors to escape.

Finally all drying stops at the *equilibrium moisture content,* where the vapor pressure of water in the air is equal to the vapor pressure of water in the material. The *equilibrium moisture content* varies with the humidity

of the air and the hygroscopic properties of the material as explained in Chapter 45.

Omissions in Drying Cycle

Many solids, such as lumber, are so dry at the beginning of the drying operation that the constant rate period of free surface evaporation does not occur. Frequently the surface of the material is dry enough so that no surface drying can take place, in which case only the final stage of sub-surface drying is involved. In other instances, the critical moisture content of a wet solid is sufficiently low that sub-surface drying starts almost immediately after the conclusion of the constant rate period. Thus the intermediate state of unsaturated surface drying does not occur and the drying is of the sub-surface type during practically the whole of the falling rate period. With other kinds of material, particularly thin sheets, such as newsprint paper, sub-surface drying may occur at such a low moisture content that it is not encountered in commercial work, the falling rate period being confined in practice to unsaturated surface drying.

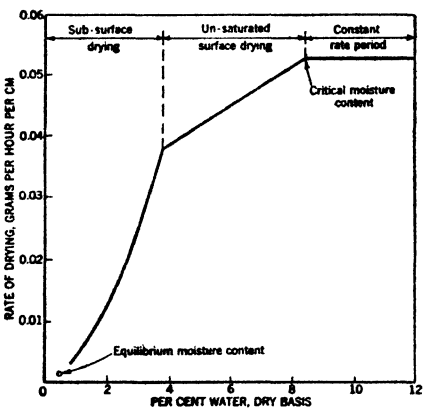

FIG. 1. RATE OF DRYING OF WHITING SLAB

FACTORS INFLUENCING DRYING RATES

Temperature

The driving force for evaporation is directly proportional to the difference between the absolute humidity of the air being used and the absolute humidity of saturated air at this temperature. It may be seen from the psychrometric chart, Fig. 2, that as the temperature increases the humidity of saturated air corresponding to that temperature increases immensely. For example, at 100 F one pound of dry air will carry about 0.04 pounds of water, while at 120 F this figure has become 0.08 pounds. Thus during the constant rate and uniform falling rate periods an increase in temperature will increase the drying rate. During the varying falling rate period, i.e., sub-surface drying where diffusion is the controlling factor, an increase in temperature will lower the viscosity permitting a more rapid drying. Temperature and thickness of the material are the only external variables which affect the drying rate during the variable falling rate period. The drying rate varies inversely with the square of the thickness of the material.

In general, then, it is preferable to use as high a temperature as possible for any drying operation because of the faster rate of drying and the greater capacity of the air to remove water. During the constant rate

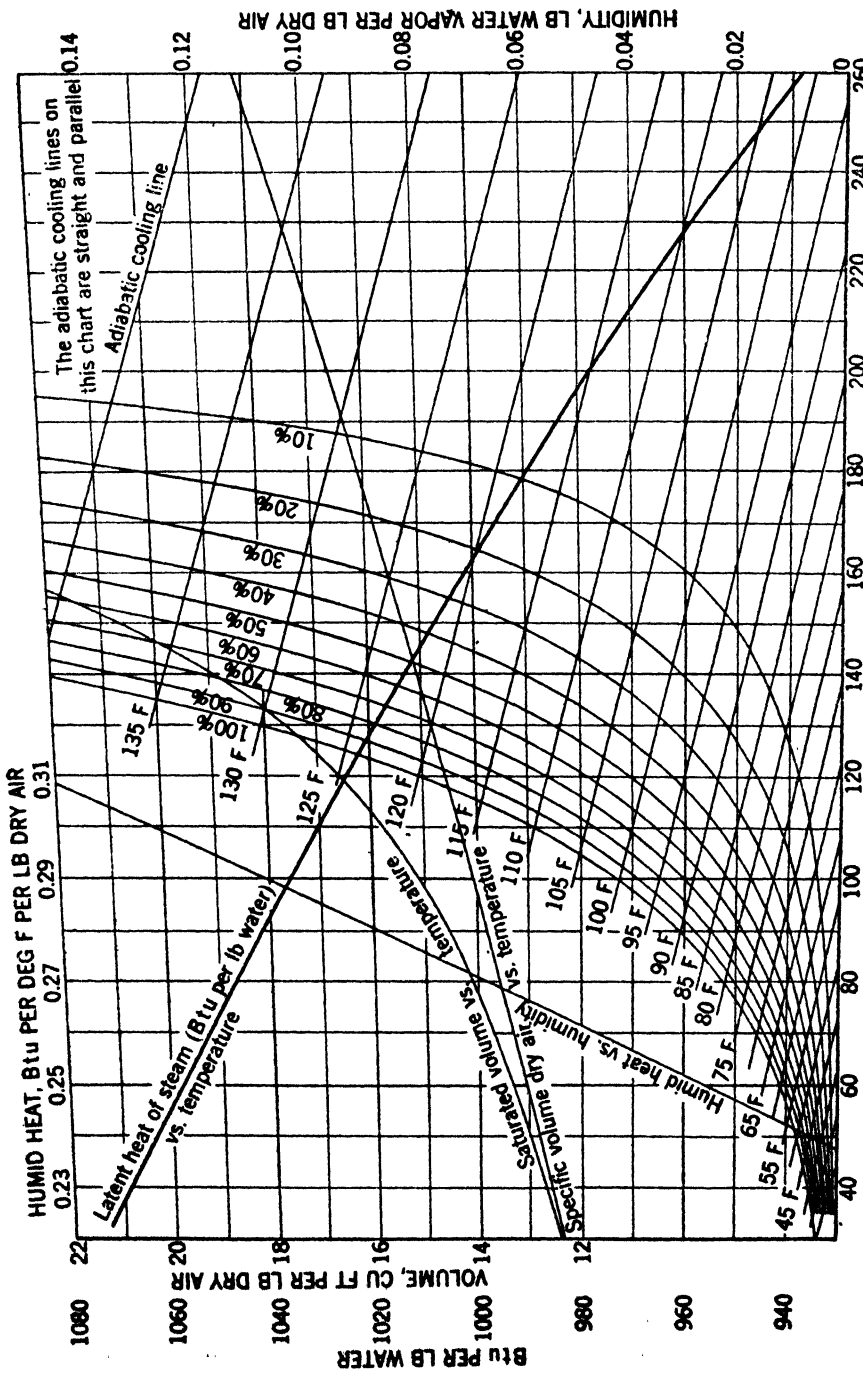

FIG. 2. PSYCHROMETRIC CHART

period of drying, the temperature of the material approximates the wet bulb temperature of the air. Therefore, high dry-bulb temperatures may be employed.

The nature of the material and its characteristics often determine the temperatures that can be employed with safety. For example, chemically combined water may be lost, cells may be steam exploded, charring may take place or exothermic reactions initiated if the product temperature exceeds a critical value.

Humidity

As previously pointed out, absolute humidity is the driving force for evaporation, therefore, a low humidity increases the drying rates. However, certain materials if dried too rapidly may case harden, i.e., form a nearly impermeable skin which greatly reduces the drying rate. Also, certain undesirable physical changes may take place such as the cracking and warping of lumber. In such instances, it may even be necessary to increase artificially the humidity to assure satisfactory drying by the recirculation of moist air or the use of water or steam jets.

In the case of substances that must be dried at relatively low temperatures (120-140 F) it is often necessary to dehumidify the air to secure satisfactory drying rates. In such instances, a closed system using the adsorptive methods described in Chapter 38, is frequently applicable.

Air Circulation

Air velocity and distribution are important factors only in the first two periods of drying when surface evaporation is taking place. During the varying falling rate period of gaseous diffusion enough ventilation must be provided to prevent stagnation. The velocity of the air passing over the surface to be dried determines the rate at which the moisture-laden air is swept away. The more rapidly this moist air can be removed the more rapidly can evaporation occur. It has been demonstrated that this drying rate is a function of the 0.8 power of the velocity. Air directed perpendicularly to the drying surface exhibits the greatest efficiency in dispersing the *dead air* film. The limiting factors in air velocity are the power requirements to remove the air and the danger of blowing away the lighter particles of material.

DRYING METHODS AND EQUIPMENT

Drying systems are sometimes classified according to the method of heat transfer that is employed since the entire problem of drying resolves itself into individual problems of heat transfer and the thermodynamics of air and water vapor. The methods of heat transfer are radiation, conduction and convection. Many types of dryers have been built on these principles for different purposes.

Radiant Drying

Sun drying, the oldest form known to man, is still practiced where the material is amenable to such treatment, where the necessary time can be allowed, and where there is little danger of rain or atmospheric pollution.

In artificial systems radiating surfaces, heated by steam, electricity or other means, afford a good method of heat distribution and control. Radiant heating sets up convection currents, and in low-temperature dryers only about one-third to one-half of the total heat for evaporation

is actually sypplied to the material by radiation. At high temperatures the radiation output increases rapidly, according to the *fourth-power law.* The total radiation may be computed by the equations and tables given in Chapter 5. In general, fins and irregular surfaces do not increase radiation, hence the area to be used in calculations is the area of a smooth-surface envelope enclosing the radiating elements.

A certain amount of air circulation is required through a radiant dryer, in order to carry off the vapor.

Radiant heat from infra-red lamps has been accepted by certain industries as practicable for their specific problems. An example of successful application is found in the drying of lacquers.

Another highly specialized field coming under this heading is electronic drying in which ultra short waves are broadcast into the material and, by interference and adsorption, create heat internally. Some systems have a rather critical optimum frequency. Similarly a high frequency induction field may be employed (See Chapter 30).

Conduction Drying

Drying rolls or drums, flat surfaces, open kettles and immersion heaters are examples of the direct-contact method. Intimate contact of the material with the heating surface is important, and in some cases agitation is desirable to increase the uniformity of heating or to prevent overheating.

Greatest resistance to heat transfer occurs on the air side of the material being dried. The rate of heat transfer from the surface of the heated material to the air, and hence the rate of drying, may be increased by: (a) forced convection or air circulation and (b) vacuum operation to lower the boiling point of the liquid being evaporated.

A rather interesting method of conduction drying was put into practical use during the war for the drying of blood plasma and has since been expanded to other fields such as the preservation of bacteria and other micro-organisms. This has come to be known as freeze drying or drying by sublimation. The material to be dried is first frozen and then placed in a high vacuum chamber connected to extremely low temperature condensers. The water is removed by vaporizing from the solid directly to the gas without ever becoming liquid.

Convection Drying

A limited amount of convection drying takes place in almost any dryer such as those described in the preceding paragraphs. However, to be classified as a convection dryer the principal source of heat is the heated air or other gases circulated in the dryer. There are a number of mechanical means of accomplishing this circulation of air or gases, each of which has some particular virtue. Brief descriptions of some important types of convection dryers follow:

Rotary Dryers. These dryers are cylindrical drums usually having internal flights, as shown in Fig. 3, which cascade the material being dried through the air stream. The driers may be heated directly or indirectly and the air circulation may be parallel or counter flow. A variation is the roto-louvre type dryer, which introduces the air beneath the flights thus securing very intimate contact.

Cabinet and Compartment Dryers. These are generally considered batch dryers wherein each charge is dried to completion before removal. A wide range includes types from the heated loft with only natural con-

vection, and usually poor and non-uniform drying, to the self contained units with forced draft and properly designed baffles which give positive results. It is also possible to evacuate some of the systems for low temperature drying of delicate or hygroscopic materials. These dryers are usually loaded with material spread in trays to increase the exposed surface. The trays are loaded directly into the dryer or may be stacked on trucks which are wheeled in.

Tunnel Dryers. Tunnel dryers are a modification of the compartment dryer and as a rule are continuous or semi-continuous in operation. Heated air or combustion gas is usually circulated by means of fans although a few natural draft units are still in use. The material is handled on trays or racks on trucks and move through the dryer either intermittently or continuously. The air flow may be parallel, counter flow or a combination of the two, obtained by center exhaust. Further, the air flow may be across the surface of the trays or up or down through the bed

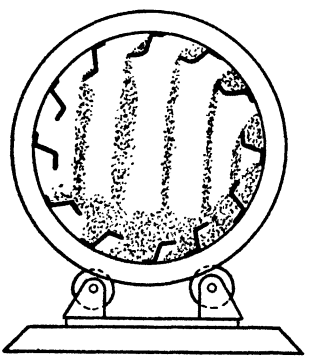

FIG. 3. SECTION OF ROTARY DRYER

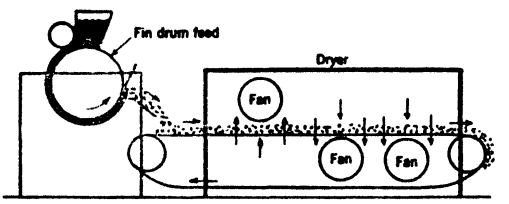

FIG. 4. SECTION OF CONTINUOUS DRYER, BLOW-THROUGH TYPE

or in any combination of directions. By reheating the air in this type of dryer or recirculating it a high degree of saturation is achieved before exhusting the air. This reduces the waste of sensible heat.

A variation on this type dryer is the strictly continuous type having one or more mesh belts which travel through the dryer carrying the product, such as Fig. 4. Innumerable combinations of temperature, humidity and air direction and velocity are possible. The labor requirement is low on such a dryer as it can be loaded and unloaded mechanically. There is the disadvantage of hot air leaks at the entrance and exit although these can be minimized by means of baffles or inclined ends where the material enters and leaves from the bottom.

Spray Dryers. In recent years the spray dryer has become important for the drying of liquids in many fields, especially in the food industry.

The liquid is atomized by means of pressure nozzles, air jets or centrifugal bowls into the air stream of a tower or chamber. Inlet air temperatures may run from 250-300 F up as high as 1200 F. Drying is almost instantaneous because of the minute particle size. The dry powder is separated from the air by cyclone separators which are sometimes followed by cloth bags or scrubbing towers.

Because of the high inlet temperatures and the relatively large volume of air required the efficiency of the spray dryer is not too good and consequently is seldom used for dilute solutions (less than 30 per cent solids).

CALCULATION AND DESIGN

Calculation of the factors involved in drying systems is very complex and frequently inaccurate. For typical examples of the calculations involved the reader is referred to the literature references. Under ideal conditions, however, the following relations hold for convection dryers during the constant rate period.

Constant-Rate Period

The rate of drying by air passing over a wet surface is directly proportional to the vapor pressure difference, and also proportional to the 0.8 power of the air velocity. For practical calculations the wet surface is assumed to attain the wet-bulb temperature of the air passing over it, and evaporation takes place at constant rate under equilibrium conditions. The equation may then be expressed in three forms:

$$R = C\,A\,V^{0.8}\,(\Delta P) \tag{1}$$

$$R = C'\,A\,V^{0.8}\,(\Delta H) \tag{2}$$

$$R = C''\,A\,V^{0.8}\,(\Delta T) \tag{3}$$

where

R = rate of drying during constant-rate period, pounds of moisture per hour.

A = area of bed or material in contact with air, square feet.

V = air velocity over material, feet per minute.

ΔP = difference between vapor pressure at wet-bulb (surface) temperature and at dew-point of air.

ΔH = difference between humidity ratio of saturated air, at the surface temperature, and the actual humidity ratio of the air stream, pounds of water per pound of dry air.

ΔT = difference between dry-bulb and wet-bulb temperatures of air, *i.e.*, the wet-bulb depression.

C, C', C'' = proportionality constants (for numerical values consult references).

These equations are useful mainly for computing the effects of changes in operating conditions, such as changes in air velocity, air temperature, humidity and surface area. The equations assume that the material is in equilibrium at the wet-bulb temperature of the air. If equilibrium has not been reached, or if heat is being added to the charge by radiation or conduction, such conditions must be taken into account. For large tray dryers or continuous surfaces, the logarithmic mean difference should be substituted for the simple difference in ΔP, ΔH and ΔT.

Calculations other than these are probably best left in the hands of experts since considerable data with respect to time, temperature, humidity, air velocity and direction, bed load, pressure drop, recirculation, etc., must be obtained. These data may be based on past experience but are preferably obtained from experiments employing the conditions which are expected in commercial large-scale practice.

Calculations involving the falling rate period are seldom satisfactory because of the number of variables involved but approximations may be made from empirical data obtained by experimentation.

ESTIMATING METHODS

Values based on practical experience are available for rough estimating of drying problems. The temperature will drop approximately 8.5 F deg per (grain of water evaporated) (cubic foot of air, measured at 70 F deg)

or approximately 0.62 F deg per pound of air at any temperature. Air will drop 55 F deg per cubic foot for each Btu extracted. Generally, air will absorb from 2 grains to 5 grains per cubic foot of air in one passage through an air dryer, depending on the temperature and the degree of contact with the material. The amount of steam required to evaporate a pound of water will vary from 1.5 lb to a more usual figure of from 2.5 to 3 lb of steam per pound of water evaporated.

TRANSPORTATION AIR CONDITIONING

Railway Passenger Car Ventilation, Method of Air Distribution, Air Cleaning, Winter and Summer Air Conditioning, Humidity and Temperature Control, Summer Air Conditioning for Buses and Automobiles, Airplane Air Conditioning

---

THE principles of air conditioning applying to stores, restaurants, hospitals, theaters, and homes are in general applicable to railway passenger cars, buses, automobiles, and ships. However, the equipment used for mobile applications must meet additional requirements. Especially important are features of lightness, compactness, and accessibility for quick inspection and servicing. Freedom from vibration which could be transmitted to the passengers is essential. (For Air Conditioning of Ships see Chapter 49.)

RAILWAY PASSENGER CAR VENTILATION

In non-air-conditioned cars, ventilation is accomplished by exhaust fans, roof ventilators, and by opening doors and windows. This practice provides an ample supply of outside air but does not prevent the entrance of smoke, cinders, and other dirt.

An average passenger car contains approximately 5000 cu ft of air and may seat 80 passengers, who are continually liberating heat, carbon dioxide, moisture, odors, and some organic matter from their breath, skin and clothing. The heat and moisture can be removed by cooling and dehumidification, but the other constituents can be successfully handled only by proper ventilation and air cleansing. In the average car, from 2000 to 2500 cfm should be circulated by the air conditioning unit. Some of this air may be recirculated, but a portion of it should always be brought in from the outside. The amount of outside air will vary from 15 to 90 per cent of the total air circulated depending upon the type of car, number of passengers, air temperature, humidity, odors, and smoking.

Careful attention must be exercised in specifying the rate of outside air taken in so as to fit the type of service adequately and yet not to supply more ventilation than is necessary. Conditioning this outside air is a major factor in determining the size of summer and winter equipment. With present average ventilation requirements, about 30 per cent of the cooling capacity and sometimes as high as 50 per cent of the heating capacity are necessary to handle the outside air load.

For normal conditions, 10 cfm of outside air per passenger is sufficient. When smoking is permitted, at least 15 cfm should be admitted. In some of the dining cars and de luxe sleeping cars, outside air rates as high as 20 and 30 cfm per occupant are used.

Method of Air Distribution

Railway cars present critical problems in air distribution because the air space per passenger is small and the sun load is great. Three principal methods are used to distribute the air to the interior by fans or blowers:

1. A ceiling duct lengthwise along the center of the car.

2. One or two side ducts built on the outside of monitor-roofed cars, or on the inside of turtle-backed or arch-roofed cars.

3. A perforated ceiling supplied by an overhead duct. From one-half to the full area of the ceiling is used for distribution of air although practical considerations generally limit the available area to about two-thirds.

Delivery grilles and plaques designed to give considerable entrainment and mixing are often used to prevent cool drafts.

Smoking rooms present a special problem. The cloud of smoke that usually hangs near the ceiling can be broken up by directing the incoming air along the ceiling at a velocity somewhat higher than that used for the rest of the car. The air should be exhausted through the washroom or lavatory. For compartments an adjustable supply grille of suitable size and design should be provided and provision should be made in the door or partition for the removal of used air.

Lower berths should be provided with an adjustable air outlet which will discharge air at low velocity in any desired direction.

Recirculating air grilles are usually of the straight flow type. Outside air intakes are usually located in the vestibule, on the side of the car, or on the roof, depending upon location of cooling coils. On many of the recently air-conditioned cars, there are no dampers or shutters at the outside air intakes; the percentage of outside air is controlled by adjusting the flow through the recirculating grille.

A considerable number of coach cars is now being equipped with return air ducts fitted in the structure of the baggage racks. Part of the air circulated is returned to the blower unit through these ducts and part through the car body. This arrangement reduces the velocity of air returning through the car body and removes smoke fumes at the source.

Air Cleaning

All air circulated by the blower is filtered before passing over the cooling coils. In some cars the outside and recirculated air is filtered separately before mixing, while in others the air from the two sources is mixed before passing through a common filter. Filters in use are made of metal, wool, cloth, spun glass, hemp, paper, hair, and wire screen. Most filters have a viscous coating of oil for greater cleaning efficiency. Some types may be cleaned, retreated, and re-used while other types are discarded when dirty.

Activated carbon units sometimes are used in addition to the regular filters for adsorbing odors and other impurities, thus reducing the amount of outside air necessary for ventilation.

Trials are also being made of electric precipitation for air cleaning. In this system the coarser particles are removed from the air by mechanical separation, the finer materials being precipitated by electro-static action.

RAILWAY PASSENGER CAR WINTER AIR CONDITIONING

The majority of cars in service use steam from the locomotive or from an oil-fired boiler for winter heating. In some instances electrical energy from a generating set or motive power supply is utilized for heating. In still other cases electrical energy and waste heat from individual car engine-generator sets are employed. The peak heating loads may vary from 150,000 to 250,000 Btu per hour, depending largely upon the amount of insulation used in the car, the type of windows (whether single or double glazed), and the ventilation rate.

From 30 to 50 per cent of the total heat required is supplied by means of finned tempering coils or resistance heaters located in the outside air

duct. The remainder is usually supplied by finned tubing located along the sides of the car near the floor to prevent drafts about the feet.

RAILWAY PASSENGER CAR SUMMER AIR CONDITIONING

Three general types of refrigerating equipment are being used in conditioned railway cars and rail motor cars in the United States. Of these approximately 23 per cent use ice, 19 per cent use steam jet systems, and 58 per cent employ mechanical compression refrigeration systems. The systems were modified somewhat to meet the requirements of mobile service.

Air cooled or evaporative condensers are always used, with the result that mobile cooling equipment operates at higher temperature, pressure, and power requirement levels than stationary equipment.

The maximum cooling and dehumidifying load may vary from 60,000 to 96,000 Btu per hour per car. An average ice-activated system for such capacities uses about 500 lb of ice and 1.2 kw per hour. The increase in car weight due to such a system is approximately 8500 lb.

A steam jet system will require 180 lb of steam and 3.3 kw per hour, and will add weight per car of 8000 lb.

With mechanical compression systems, all of which use dichlorodifluoromethane as a refrigerant, the problem of driving the compressor (approximately 10 hp) is complicated by the necessity of having motive power available at all times whether the car is in motion or standing still on the right-of-way or in a terminal where auxiliary power plug-ins are available. Where compressors are driven from car axles, additional refinements in the drive are necessary in order to obtain the required cooling capacity from a variable speed power source. Numerous schemes for generating sufficient electrical energy from the car axle for lighting, ventilation, and summer air conditioning are in use, and their operation is closely interlocked with compressor demands, battery charging, etc. It is difficult therefore to estimate the weight of a compression air conditioning system, but it is probably in the vicinity of 6000 to 8000 lb. The power required by such systems is from 5 to 10 per cent of the total locomotive power.

Several schemes for relieving the locomotive of this compression load are used. Some of the articulated trains, which run as unit equipment—the same cars always in the same train—employ a head-end, engine-generator unit for supplying power to compressor motors. In other cases, especially in many of the new streamlined trains, propane fueled engine-driven generators on individual cars are used to supply power to motors, and power for car lighting and accessories. Gas engine compressor combinations on individual cars provide attractive low weight equipment where automatic engine operation is permissible under all circumstances. Diesel-powered generator units have been used experimentally on individual cars for supplying electrical energy and in some cases waste engine heat has been used either for modulating refrigeration with a reheat cycle or for car heating purposes.

RAILWAY PASSENGER CAR HUMIDITY AND TEMPERATURE CONTROL

Little humidity control has been attempted on cars up to the present time. A certain degree of automatic humidity control is secured with cooling, but the relative humidity obtained depends largely upon the

temperature of the evaporator, which should be below the dew-point temperature of the air. With certain outside atmospheric conditions it may not be possible to operate conventional equipment with a sufficiently low evaporator temperature to reduce the humidity without dropping the temperature too low.

There is at present a trend toward the reheat system in which the evaporator temperature is carried sufficiently below the dew point to obtain proper dehumidification; the dehumidified air is then heated to the proper dry-bulb temperature for comfort by passing it over a steam coil, or a coil heated by high temperature liquid from the condenser. Where an internal combustion engine is used as a power source the waste engine heat can be used to good advantage for reheating the dehumidified air.

During the heating season a steam or water spray controlled by a humidistat can provide moisture for humidification, but unless properly controlled, condensation will appear on the windows. There are several cars using this feature.

Temperature control, by thermostats and relays capable of withstanding vibrations, is usual equipment. Manual zone control for varying outdoor conditions, as well as controls which regulate the car temperature automatically in accordance with outdoor conditions, are employed.

A system coming into extended use has a thermostat controlling the dry-bulb temperature, and reset by the wet-bulb temperature, in order to approximate best comfort conditions.

Simplified controls from the standpoint of operation by train crews and especially from the servicing viewpoint are very desirable. The control of summer temperatures is accomplished mainly by cycling the complete cooling system; however, modulation is being effected by using multiple evaporators in which a fixed portion may automatically be cut out of operation to suit the cooling capacity requirements and to keep the equipment in operation for longer periods. With motor or engine driven compression equipment modulation of compressor capacity to suit the reduced evaporator capacity is accomplished by changing motor or engine speed, or by varying the number of compressor cylinders in operation.

For further information on controls, see Chapter 34.

PASSENGER BUS SUMMER AIR CONDITIONING AND VENTILATION

The highways in the United States are now traveled by thousands of air-conditioned passenger buses. Many of the facts stressed in connection with the design and installation of summer conditioning equipment in railway cars are even more important in these newer vehicles. Weight and space limitations are more stringent, and the problem of circulating from 900 to 1200 cfm of air in coaches carrying from 25 to 40 passengers with about 35 cu ft of space per passenger without drafts is not easy to solve.

Some bulkhead delivery systems have been used and, while the overhead package racks have served to break up drafts to some extent, these installations are not gaining in popularity. Longitudinal ducts in the corners above the package racks are sometimes used to carry conditioned air to a series of outlet louvers along the top of the windows. Other designs provide for false spaces below the package racks which serve as ducts to distribute air to entrainment grilles in the bottom of the racks

or to distributing slots at the edges of the package racks. Some coaches employ a false ceiling to provide a duct, with delivery taking place from numerous perforations in the ceiling.

Return air grilles and filters are usually located near the rear ceiling where the evaporator is placed. Outside air intakes and filters are located preferably near the front of the vehicle so as not to contaminate this supply with exhaust fumes and road dust. Of the 30 cfm circulated per person, about 8 to 10 cfm are outside air. Power for the motor driving the centrifugal fans is obtained from the bus battery.

More recently a coach design has been brought out which provides for a number of return air outlets below the seats; these permit return air to enter a longitudinal duct below the floor. The filters and evaporator are located in this duct near the front of the vehicle. A central heating coil utilizing waste heat from the coach engine is also located in this duct. Conditioned air is delivered through a pair of vertical ducts to a package rack distribution scheme.

Summer conditioning systems for these vehicles range in cooling capacity from 36,000 to 48,000 Btu per hour. Mechanical compression systems using dichlorodifluoromethane are used, and are powered by water cooled, gasoline engines of approximately 14 hp.

Complete systems add from 800 to 1300 lb to the weight of a coach. Sometimes an auxiliary generator driven by the air conditioning engine is used and serves to help charge the bus battery, thereby offsetting the power drain imposed by the ventilating blower. Belted reciprocating compressors and direct driven V-type and rotary compressors are used, with engine speeds up to about 1800 rpm. Air cooled condensers for this service require about 5000 cfm of outdoor air, and this is provided by either centrifugal or propeller type fans belted or direct driven by the air conditioning engine. Preventing noise and vibration from affecting passengers is of vital importance. Installations must be made so that quick daily servicing of the engine is possible. In all cases fuel is obtained from the main bus tanks, and in some cases the main engine water cooling system is used to cool the air conditioning engine.

In the de luxe equipment, after the driver has started the air conditioning engine by means of its own cranking motor, the engine speed is modulated automatically as the refrigeration demand is partially met, and if this demand is then fully met, the engine is stopped thermostatically. Restarting when the cooling thermostat is no longer satisfied is accomplished either automatically or manually. The various protective and automatic devices on the refrigerant and engine systems make some of the bus air conditioning control systems quite complicated.

AUTOMOBILE SUMMER AIR CONDITIONING

Recently summer cooling has been applied to automobiles. The average present day automobile with little insulation, large, single glazed window areas, and high infiltration and exfiltration losses, requires about 15,000 Btu per hour of cooling capacity. One system utilizes a reciprocating compressor belted from the main engine fan shaft thus operating at varying speeds up to 3000 rpm. The resulting refrigeration capacity varies from about 6000 Btu per hour at idling speed to 24,000 Btu per hour at maximum car speed.

A dry air condenser is placed in front of the engine radiator, and the liquid and suction refrigerant lines run back under the car floor to the

evaporator which is located in back of the rear seat. Conditioned air is delivered into the car just above the shelf near the back of the rear seat. A return grille is provided under the rear seat, and the recirculated air is filtered. Outdoor air is provided by infiltration. Power for the air circulating blowers is obtained from the car storage battery. Equipment of this nature increases the car weight approximately 200 lb.

AIRPLANE AIR CONDITIONING

Complete air conditioning of planes in flight has received little attention probably because of added weight of equipment necessary. Under ordinary conditions heating and temperature control become the chief considerations. Passenger and military planes even at low level flying require no cooling and at extreme altitudes the design temperature of the atmosphere is as low as 60 deg below zero.

In the operation of internal combustion engines the heating value of fuel appears approximately one-third as power, one-third transferred to cooling fluid, and one-third in the exhaust gases.

Ordinarily, the heat in the exhaust gases is ample for all heating needs, despite the excessive transmission loss due to high speed, low temperatures, and light wall construction. The maximum coefficient of heat transmission without insulation is found to be 2.3. The minimum coefficient with insulation is 0.3. For present day construction a value of 0.6 may be assumed for speeds not exceeding 300 mph. Naturally, the waste heat in the exhaust gases offers an attractive source for designers of heating equipment, who have followed closely the development of heating as applied to land structures. In first attempts heat was obtained from an annular space surrounding the exhaust pipe, from which branches conducted the heated air to grilles or to seats of passengers. The speed of the plane eliminates the need for a fan or pump. In present practice danger of carbon monoxide contamination is reduced by the use of both primary and secondary heat exchangers.

Heating systems using hot air are in use for passenger and military planes. Steam systems have been used with boilers located in the path of exhaust gases but difficulty experienced in preventing freezing of the water has apparently rendered this system unattractive. A similar system using glycol is in use and requires special care because of the peculiar qualities of glycol. Thermostatic control, mixing dampers and air distribution vary little from standard practice. Controlling devices are built to withstand the extensive vibrations experienced. Planes requiring air conditioning when on the ground are satisfactorily serviced by portable air conditioning machines. High flying airplanes—above an elevation of 14,000 ft—require oxygen supply or pressurized cabins. The compression of the outside air by the supercharger raises the temperature of the cabin air from an extremely low to a comfortable high. The compression of the air also increases the humidity. Cleanliness at flying altitude is not a consideration, except under special conditions such as above deserts or upon encountering dust storms. In small planes carrying several passengers or crew, localized heating and ventilation are provided. Electrically heated clothing and oxygen masks often are required in combat aircraft. At high altitudes pressurized cabins require no special oxygen supply.

Medium bombers at one time were equipped with separately fired heating units, but larger bombers, to meet the heating load imposed by

crew and equipment, demand too much heat to be supplied in this manner. The recovery of heat from waste gases is therefore imperative. In airplane operations light weight is a more important requirement than in any other type of transportation. Noise should be reduced to a minimum and combined use may be made of material for insulating and noise reduction.

Chapter 49

MARINE HEATING, VENTILATION, AIR CONDITIONING

General Considerations, Ship Construction Features, Factors Affecting Design, Ventilation Requirement for Various Types of Space, Air Conditioning Space Treatment, Typical Air Conditioning Systems, Types of Refrigerating Systems, Dehumidification, Ship Insulation

---

THE importance of adequate shipboard heating, ventilation, and air conditioning arrangements cannot be overemphasized. Installations must be designed to keep the passengers comfortable and the operating personnel physically and mentally fit. The provision of satisfactory living and working conditions is one of the most economical means of keeping a high morale.

GENERAL CONSIDERATIONS

A ship must be self-sufficient and provide for all human needs. Facilities must be limited to the minimum space and weight practicable to conserve dead weight and to increase the pay load. The pay load may be expressed in terms of cargo carrying ability, passenger carrying capacity, fighting strength, or towing ability.

Conditions in living spaces must permit adequate rest and comfort. Passenger accommodations must be treated to provide service and living conditions similar to those afforded by the various classes of hotels. Many of the expedients used ashore for this purpose are not applicable afloat. For instance, all living quarters aboard ship cannot be located at a distance from the power plant, but must often have boundaries in common with heat producing spaces. The thermal conductivity of shipbuilding materials such as steel, copper, brass, etc., is many times the value for building materials used ashore, and this, together with concentrated arrangement of equipment, produces a difficult heat transfer and insulation problem. Furthermore, the use of portholes, windows, skylights, and similar openings is greatly restricted in marine applications because of the necessity for strength, water-tightness and protection from the sea in foul weather. During wartime, the utility of portholes, windows, and skylights is greatly restricted because they must be fitted with light-excluding devices.

Mechanical ventilation is absolutely necessary for most shipboard spaces to enable the crew to operate the vessel, to prevent the accumulation of objectionable combustible and toxic gases, and to preserve stores and cargo. Shipboard equipment must also be reliable inasmuch as specialized servicing facilities are not available at sea and failure during an emergency may jeopardize the vessel's safety. Adequate spare parts form an integral part of all equipment furnished. Experience has demonstrated that *simple* and *foolproof* heating, ventilating, and air conditioning arrangements are essential for satisfactory service. The only variation between ship and shore applications is that emphasis is placed on different practical aspects of the design.

SHIP CONSTRUCTION FEATURES

The seaworthiness of a vessel is increased by subdividing the main hull space into a number of watertight compartments, so arranged that the vessel

will not sink even when the hull is pierced in one or more places, by collision, torpedoing, or other causes. Every effort is made to avoid penetration of watertight subdivisions and, where openings must be cut, special closures are fitted.

The ship's interior is fitted with decks and flats (partial decks). The deck heights (floor heights) in cargo spaces generally vary from 9 to 30 ft and in living quarters from 7½ to 9 ft. Usually in main machinery spaces, the entire depth is subdivided only by a few flats, with gratings provided where necessary to service equipment.

There is very little unassigned space on a ship, and many studies must be made to ascertain the arrangement of equipment which will best suit the conditions. Cuts in structural members must be limited in number and size. Lack of headroom and floor space often causes unsatisfactory drainage, inaccessibility, and other undesirable conditions. Air conditioning equipment must be located where it will interfere least with basic arrangements of major equipment and construction, and with ship stability.

FACTORS AFFECTING DESIGN

A ship is a self-contained structure capable of operating in a wide range of climates. The ventilation of most ships is designed on the basis of an 88 F outside dry-bulb temperature. Heating facilities on merchant vessels are invariably selected for an outside temperature of 0 F dry-bulb, although ships encountering only moderately cold weather in normal service are designed for higher outside temperatures. Designers of naval vessels commonly use 10 F outside dry-bulb temperature for estimating heating loads.

Cooling loads for most comfort systems are based on 95 F dry-bulb and 80 F wet-bulb temperatures. Inside conditions equivalent to from 73 to 75 effective temperature are used. An 81 F dry-bulb temperature and 50 per cent relative humidity are generally used for the design of comfort systems, except those serving public spaces having relatively large latent loads. These are designed for 80 F dry-bulb and approximately 55 per cent relative humidity. Bracket fans are supplied in many instances. Systems on naval vessels are designed for higher effective temperatures, and outside design temperatures of 88 F dry-bulb and 80 F wet-bulb are used.

Preliminary design is simplified by the uniformity of the conditions which apply to most ships. Among such conditions are (1) the necessity for the vessel to supply its own power, (2) the availability of an unlimited supply of cooling water, (3) the all-year-round supply of low cost steam at suitable pressure, (4) the drastic restriction of shipbuilding materials because of strength requirements, corrosion resistance, and fire hazard, and (5) the limitation of available space and permissible weight. These limitations require precise layouts, with minimum design safety factor, and unusual attention to design details and to means for balancing systems.

The relation between supply and exhaust ventilation depends on the type of space, and the relation of the space to the weather. Positive means for supply and exhaust must be provided. Ventilation through doors, windows, hatches, etc., should not be considered in the basic design.

It is usually most economical to heat spaces served by mechanical supply systems with steam duct heaters, in order to save weight and space. Spaces which do not have mechanical supply or do not require

ventilation in cold weather are heated by steam convectors, or unit heaters where the load is large. Ventilation air, except that supplied to auxiliary and main machinery spaces, is usually preheated (50 to 70 deg). In addition, where blast heating is used, zone reheaters are provided. No recirculation is used on combined ventilation and heating systems, but manual speed reduction (25 to 50 per cent) is provided during the heating cycle. All heaters are automatically controlled, and preheaters are designed and installed to minimize the possibility of freezing of condensate.

The usual combinations or variations of duct type and convection or radiant heaters are used, depending on basic design requirements, such as weight and space limitations, and economic justification for refinements.

VENTILATION REQUIREMENT FOR VARIOUS TYPES OF SPACE

In the paragraphs which follow the most important considerations are given for the treatment of the various spaces, but the resulting quantities of air should in all cases be checked with those shown in Table 1.

Machinery Spaces

The prime purpose of machinery space ventilation is to maintain a habitable temperature for the operating personnel. Of secondary importance is the necessity for maintaining temperature conditions satisfactory for the successful operation of machinery. It is more practicable to use *spot cooling* of personnel at working areas than to attempt to obtain uniform ambient temperature. The permissible temperature rise at working stations is usually about 15 deg while the over-all temperature rise is usually between 30 and 50 deg.

These spaces must be exhausted adequately, preferably by mechanical means. Every attempt should be made to remove air at or close to heat sources. The capacity of the mechanical exhaust systems should take into consideration the expansion of the supply air, and should be sufficient to insure an indraft through access openings to the space.

Normally, heat is not required for machinery spaces except for those fitted with electrically operated equipment, which may remain inactive during periods while in port. Such spaces should be equipped so as to be heated to about 50 F during such periods.

Living Spaces

The minimum quantity of air required for any space which is fitted for sleeping or office work, including hospital space, should be that which will limit the temperature rise over the outside air conditions to not more than 10 deg (a rise of 7 deg is more satisfactory if practicable), or a minimum of 30 cfm per person, whichever is the greater. For spaces fitted for eating, recreation, or manual work the rise may be taken at 10 deg with not less than 20 cfm per person. The same requirement applies to mechanical exhaust, although natural exhaust may be used where only a short run of duct exists.

Heat should be furnished to maintain the following temperatures:

Staterooms, Berthing, Messing and Office Spaces	70 F
Working Spaces and Shops	60 F
Hospital Spaces	75 to 78 F

[a]H. B.—Hot Blast System.
[b]D. R.—Direct Radiation.
[c]T. A.—Tempered Air.

Toilets, Washrooms, Showers and Baths

Spaces for these purposes should be fitted with mechanical exhaust ventilation for odor and steam removal. Generally, the surrounding living or working spaces are exhausted through them. Air requirements on merchant vessels are commonly estimated on the basis of a 4 min rate of change. Where the amount of available air is limited by outside air requirements of air conditioning systems, rates of change as high as one change

in 6 min are used for private bathrooms. On naval vessels, the minimum total quantity of exhaust is that which changes the air within the compartment in 6 min, plus 25 cfm for each toilet fixture, plus 50 cfm for each shower head.

Heat is obtained by use of convector radiators which should maintain a temperature of 70 F.

Galleys, Bakeries, Laundries, and Food Handling Spaces

The problem of the ventilation of spaces fitted for cooking and food preparation is primarily one of heat and smoke or fume removal. Complete mechanical exhaust is always provided, and the mechanical supply is made equivalent to at least 50 per cent of the exhaust. Sufficient natural supply to provide an indraft is required. The exhaust quantities should be predicated on restricting the ambient temperature rise to about 15 deg above the outside summer design air conditions. The resulting quantity will change the air in these spaces in about $\frac{3}{8}$ to 1 min. All of the exhaust should be arranged to remove air from the space through hoods fitted over the heat producing equipment. The mechanical supply should blow air directly on the personnel, but away from the equipment and so as not to interfere with the flow of exhaust air to the hoods.

The problem of ventilating laundries is somewhat similar to that for galleys. Experience indicates that the quantity of mechanical supply ventilation should be sufficient to change the air in the spaces in 1 to 4 min. The total exhaust (including tumbler dryers) should be equivalent to at least one air change per minute and at least equal to 120 per cent of the supply so as to insure an indraft of air. Generally, no heat is required for these spaces in winter, but preheaters are provided to temper the supply to between 45 and 60 F.

Storerooms and Cargo Spaces

The ventilation provided for these spaces depends on the type of vessel, location of space, and nature of cargo.

On merchant vessels ventilation is required for all closed spaces. Even if ventilation is not necessary to preserve the stores or cargo, it is required to prevent the accumulation of toxic or combustible gases and putrid odors. One air change in 15 to 30 min is common practice, except where inflammable liquids or proximity to hot spaces requires additional ventilation. Mechanical supply and natural exhaust are usually used. However, where inflammable gases may exist, natural supply and mechanical exhaust are provided.

It is the practice on naval vessels to omit ventilation where it is not necessary to preserve the stores, except for those spaces which hold inflammable liquids. The latter are provided with mechanical exhaust systems and natural supply. As spaces below the waterline are frequently damp, those which are unventilated may require chemical desiccants for removing moisture.

Refrigerated stores and cargo spaces requiring constant temperature and humidity control require special treatment.

AIR CONDITIONING SPACE TREATMENT

The extent of the application of air conditioning to new American passenger ships is fairly well established. All passenger staterooms, except steerage and third class, are usually air conditioned. This includes state-

rooms for ship's personnel and offices within conditioned passenger areas. Third class staterooms are air conditioned on some ships, depending on the particular trade. Theaters, lounges, smoking rooms, beauty shops, barber shops and similar closed public spaces are usually air conditioned.

All messrooms, recreation rooms, captain's and chief engineer's staterooms and offices, crew's inboard rooms and those having fixed portlights are usually air conditioned on passenger vessels. Other living spaces are air conditioned on some ships and only ventilated and heated on

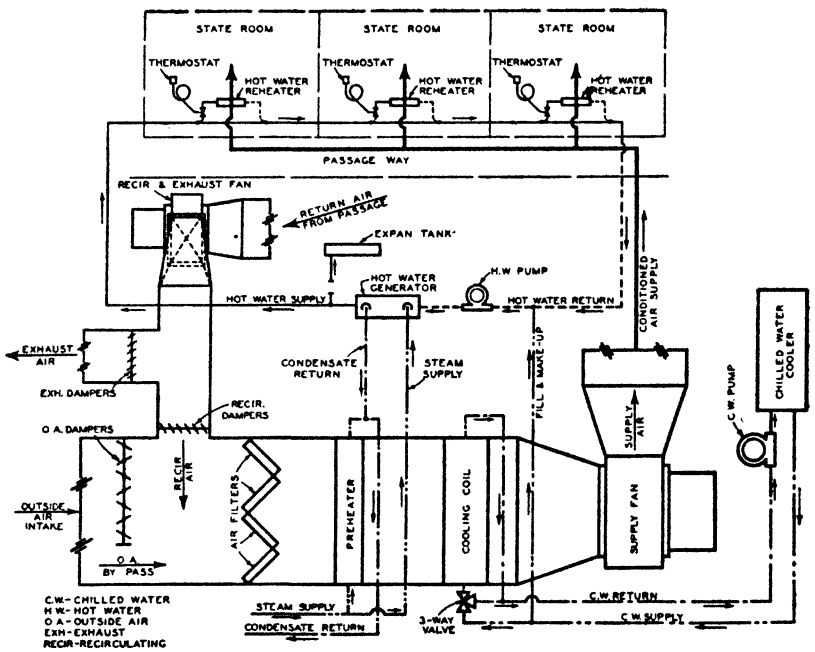

FIG. 1. ARRANGEMENT OF AIR CONDITIONING SYSTEM WITH CENTRAL SUPPLY EQUIPMENT AND INDIVIDUAL HOT WATER ROOM REHEATERS

others. The treatment depends on the requirements of the operator and the proposed itinerary of the vessel.

TYPICAL SYSTEMS OF COMFORT AIR CONDITIONING

The various types of comfort conditioning systems used to date generally have followed conventional lines, except for those serving staterooms, offices, and similar small spaces. Large public spaces are fitted with individual systems which supply dehumidified and cooled air during the cooling cycle and warm air during the heating cycle. In many cases these rooms are fitted with large glass windows and doors, and require direct radiation to offset the downdraft which would occur in cold weather. Finned-tube radiation running the full length of the glass area is commonly used for this purpose.

Systems serving most public spaces are designed to provide all outside air as long as the refrigeration load is less than the capacity of the cooling equipment. Many central systems are simplified by using 100 per cent outside air all-year-round.

An important problem in ship air conditioning concerns the treatment of the small spaces such as passenger staterooms, offices, and crew quarters. Low headroom, congested quarters, double berths, and unsymmetric arrangements make each space a problem in air distribution and treatment.

The simplest system used for small spaces consists of a central filter bank, supply fan, preheater, and cooling and dehumidifying coil. Zone

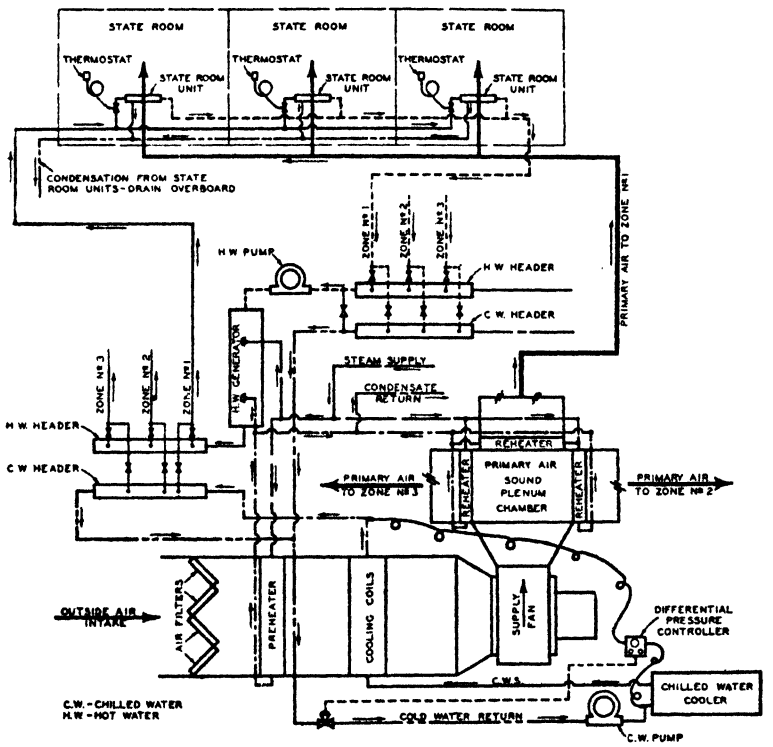

FIG. 2. ARRANGEMENT OF AIR CONDITIONING SYSTEM WITH CENTRAL SUPPLY EQUIPMENT AND INDIVIDUAL ROOM INDUCTION UNITS

reheaters are provided to take care of variations in heating loads. Control of room temperature is achieved by manual dampers in the air supply to the space. A recirculation-exhaust fan is provided, which operates in conjunction with automatic dampers to utilize the maximum quantity of outside air consistent with the capacity of the cooling coils. Manual speed reduction, without recirculation, is normally provided during the heating cycle. This system is used principally for third class, crew, and officer's accommodations. The average total air per person is about 45 cfm, and average outside air about 15 cfm.

A more popular system utilizes the same central supply equipment and recirculation-exhaust system as the one just described, except that the zone reheaters are omitted. Each space is provided with a small hot water reheater, automatically controlled by a room thermostat. Heat is provided through a forced circulation, single pipe, hot water system in most cases. Fig. 1 shows a diagrammatic arrangement of this system. It

should be noted that reheat is used to eliminate overcooling of the individual spaces during mild cooling conditions. This system is generally used for staterooms and small spaces devoted to first and second class passengers. The average total air per person is about 60 cfm and average outside air per person is about 18 cfm.

A third, less common, arrangement is a primary air system consisting of central filters, preheaters, cooling and dehumidifying coil, supply fan, and zone reheaters. In addition, each room is provided with an induction unit (floor type where possible) which reheats or recools the primary air supply. Automatic regulation of chilled or hot water flow, achieved by a room thermostat, controls the space temperature. The unit is provided with a drip pan and drain piping is required to remove condensation. Fig. 2 shows a diagram of this system, which is generally confined to passenger accommodations. The average primary (outside) air is about 35 cfm per person. No recirculation is used. The amount of induced air varies with the unit design.

Another system, which may be used to a limited extent, is similar to the third system, except that the room induction unit is used only to reheat the primary air, as all cooling and dehumidifying is done centrally. This simplifies the system and eliminates the unit drainage facilities. However, as no recirculation is used, the primary (outside) air requirements are somewhat larger, averaging about 40 cfm per person.

The duct work for all of the above systems may be designed for conventional velocities. However, if power is available, high velocity systems may be used providing suitably strong duct construction and adequate sound absorbing facilities are provided.

TYPES OF REFRIGERATION SYSTEMS

The kind of refrigeration equipment chosen for a particular vessel depends on the same factors which would govern selection on land.

Small tonnages use reciprocating or radial (Freon) compressors. Ships requiring in excess of approximately 125 tons of refrigeration generally use centrifugal compressors. Steam jet refrigeration has proven satisfactory on several large foreign liners and is being seriously considered in this country for similar applications. The two essential prerequisites of the steam jet—low-cost steam and condenser cooling water—are available. Also, the simplicity of principle and operation are very desirable features even for small installations.

Many ships have considerable refrigerated cargo space. The type of equipment used for this application should be kept in mind when selecting equipment to be used for air conditioning. This consideration can reduce materially the over-all cost, because a stand-by unit is always provided for cargo refrigeration. Also, most cargo systems are designed for cooling hot cargoes, and thus a large part of the capacity is available for comfort air conditioning most of the time.

DEHUMIDIFICATION

Merchant Vessels

Many merchant ships are fitted with dehumidification facilities for eliminating damage to the dry cargo by preventing condensation and dampness. The dehumidification load consists of moisture removed from the ventilation air passed through the dehumidifier, and also the

moisture on, or given off by, the cargo, packaging, dunnage, battens, and other materials in the ship's holds. The most severe outside condition requires a moisture removal of 90 grains (140-50) per pound of dry air, with 88 F cooling water. The largest cargo ships are provided with equipment for removing about 250 lb of water per hour.

The dehumidification systems generally utilize silica gel or lithium chloride with inhibitor (see Chapter 38). In most cases central drying equipment is provided and a simple duct system distributes the dry air to the hold supply ventilation system. These ventilation systems use outside air when weather conditions are favorable. Recirculation and dehumidification are used only when necessary; *i.e.* when the weather dew-point approaches or exceeds the temperature in the hold. On large passenger ships consideration is given to the use of two dehumidifying units, because the cargo carrying spaces are usually concentrated at the extreme ends of the vessel. With this arrangement, almost all of the dry air distributing system may be eliminated.

Naval Vessels

The end of the war terminated the current need for a great number of naval vessels and presented the problem of their economical preservation and readiness for speedy return to active service. This problem has been solved by making the ship a warehouse for its own non-perishable stores and supplies, painting the exterior, applying polar type rust preventives (requiring no later removal) to corrodible exposed metal, and sealing and dehumidifying the interior. Such ships can be returned to service in 10 to 30 days.

The dehumidifiers developed for this purpose are dual bed, electric heat reactivating types and represent improvements for their special application over commercially available equipment, with respect to compactness, weight, reliability, performance, and economy. On most ships dry air from the machine is delivered to the remote portions of the vessel through the fire mains, which provide the most extensive piping system available. The air returns to the machine via accesses and passageways. Humidity is maintained constant at a prescribed value, usually 30 per cent, by a recorder-controller developed especially for the preservation program. This device continuously checks, records, and averages humidity readings of 8 *sensing* stations, located throughout the vessel, and starts or stops the dehumidifier accordingly.

SHIP INSULATION

In order to limit one of the major ventilation heat loads which is that made necessary by heat transmission, and to prevent condensation, it is necessary to use insulation judiciously. The principal sources of heat in a ship are the power plant and sun load. The confinement or exclusion of this heat in the structure of a ship is not easy, principally because of the complex structural nature of the beams, stiffeners, bulkheads, decks, and hull. The continuous metal paths offer easy means of heat flow throughout the structure.

Insulation cannot be used indiscriminately because of weight and space limitations. Therefore higher heat transmission coefficients are accepted for insulated structures of certain classes of vessels, than would be considered satisfactory ashore. Particular care must be taken to prevent metal to metal contact, which greatly reduces the effectiveness of the insulation.

Hull insulation must be of high quality with particular attention given to fireproofness, low density, low thermal conductivity, ruggedness, vermin resistant ability, and ease of application. Board or blanket types are most common.

Duct insulation must have the same characteristics as hull insulation. Semi-rigid board is most common, and the blanket type is used only for curved surfaces. Corrugated asbestos is not used because the presence of moisture tends to disintegrate it.

Preheaters are frequently located close to the outside air intake in order to conserve insulation, and for the same reason zone reheaters are located as close as possible to the zone. Where a reheater serves only one space, the heater is commonly located in the space.

WATER SERVICES

Estimate of Demand Load, Estimate of Pipe Capacity, Sizing of Cold Water Supply Piping, Hot Water Supply Piping, Storage Capacity and Heating Load, Methods of Heating Water, Computing Area of Heat Transmitting Surface, Control of Service Water Temperature, Solar Water Heaters

---

PROPER design of the water distributing system in a building is necessary in order that the various fixtures may adequately perform their function. The amount of either hot or cold water used in any building is variable, depending on the type of structure, usage, occupancy, and time of day. It is necessary to provide piping, water heating, and storage facilities of sufficient capacity to meet the peak demand without wasteful excess in either piping or equivalent cost. Most of the following data on the sizing of water supply pipes have been taken from various publications of the National Bureau of Standards [1].

ESTIMATE OF DEMAND LOAD

The demand load in building water supply systems is based on the number and kind of fixtures installed and on the probable simultaneous use of these fixtures. The essentials for making these estimates consist principally of Table 1 giving demand weights in terms of fixture units for different plumbing fixtures under different conditions of service and Fig. 1 giving estimated demand in gallons per minute corresponding to any total number of fixture units. Fig. 2 shows an enlargement of Fig. 1 for a range up to 250 fixture units.

The estimated demand load for fixtures used intermittently on any supply pipe will be obtained by multiplying the number of each kind of fixture supplied through that pipe by its weight from Table 1, adding the products, and then referring to the appropriate curve of Figs. 1 or 2 with this sum. In using this method it should be noted that the demand for fixture or supply outlets other than those listed in the table of fixture units is not yet included in the estimate. The demands for outlets—such as hose connections, air conditioning apparatus, etc.—which are likely to impose continuous demand during times of heavy use of the weighted fixtures should be estimated separately and added to the demand for fixtures used intermittently, in order to estimate the total demand.

ESTIMATE OF PIPE CAPACITY

The size of iron pipe required to carry a given rate of flow with a given pressure drop may be determined from Fig. 3 for *Fairly Rough*, or Fig. 4 for *Rough* Pipe, respectively [2].

Ferrous pipe, after a few years of water supply service even with the best of waters in respect to corrosion and caking, will have become sufficiently roughened so that it may be considered as fairly rough pipe and, hence, Fig. 3 may be used to estimate the capacity of ferrous pipe which will carry such water. With badly corrosive or badly caking water, the flow chart in Fig. 4 should be used to estimate capacities of ferrous pipe and no pipe should be smaller than ¾ inch.

As copper tubing is not likely to retain interior incrustration to any

Registration. The registration on the meter dial shall indicate the quantity recorded to be not less than 98 per cent nor more than 102 per cent of the water actually passed through the meter while it is being tested at rates of flow within the specified limits herein under normal test flow limits: There shall be not less than 90 per cent of the actual flow recorded when a test is made at the rate of flow set forth under minimum test flow.

serious extent, Fig. 5 may be used safely to estimate carrying capacity of copper tubing[2].

SIZING OF COLD WATER SUPPLY PIPING

In order to apply the foregoing principles to the sizing of the supply pipes in the usual up-feed system, it is necessary to ascertain the minimum pressure in the street main, and from this should be subtracted the minimum pressure required for the operation of the topmost fixture. (A pressure of 15 psi is ample for flush valves but reference should be made to the manufacturers' requirements. A minimum of 8 psi should be allowed for other fixtures.) The pressure differential thus obtained will be available for overcoming pressure losses in the distributing system and in overcoming the difference in elevation between the water main and the highest fixture.

The pressure losses in the distributing system will consist of the pressure losses in the piping itself, the pressure losses in the pipe fittings, and the pressure losses in the water meter, if any. Estimated pressure losses for disc-type meters for various rates of flow are given in Fig. 6. Flow limits for disc-type meters, which may be regarded as the limits of recommended ranges in capacities, are given in Table 2. For information on other types of meters the manufacturers should be consulted.

TABLE 3. ALLOWANCE IN EQUIVALENT LENGTH OF PIPE FOR FRICTION LOSS IN VALVES AND THREADED FITTINGS

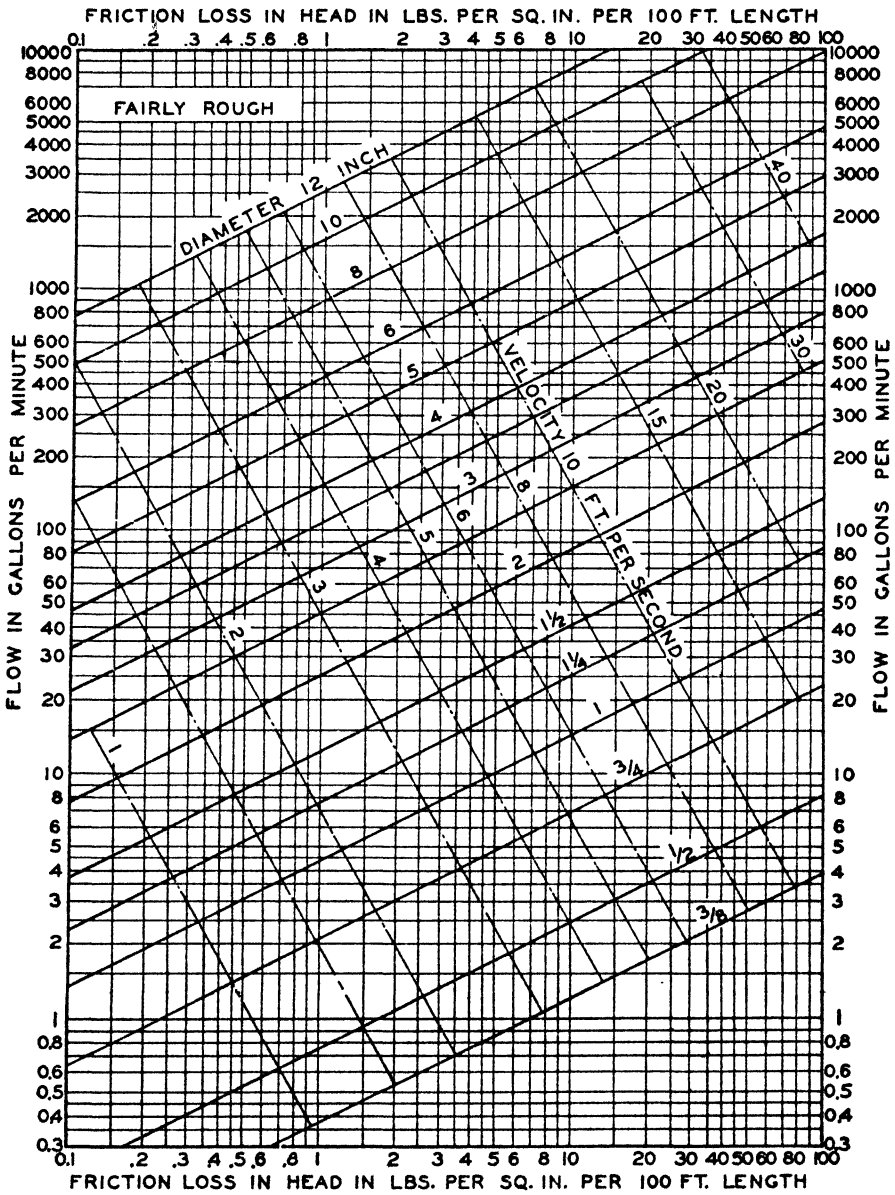

FIG. 3. FLOW CHART FOR FAIRLY ROUGH PIPE

Estimated pressure losses for pipe fittings and valves in terms of equivalent pipe length are shown in Table 3.

The pressure loss, in pounds per square inch, caused by the difference in elevation between the street main and the highest fixture may be obtained by multiplying the difference in elevation in feet by 0.43.

Example 1. Assume: a minimum street main pressure of 55 psi; a height of topmost fixture above street main of 50 ft; a developed pipe length from water main to highest fixture of 100 ft; a total load on the system 50 fixture units; and that the water closets are flush-valve operated. Find the required size of supply main.

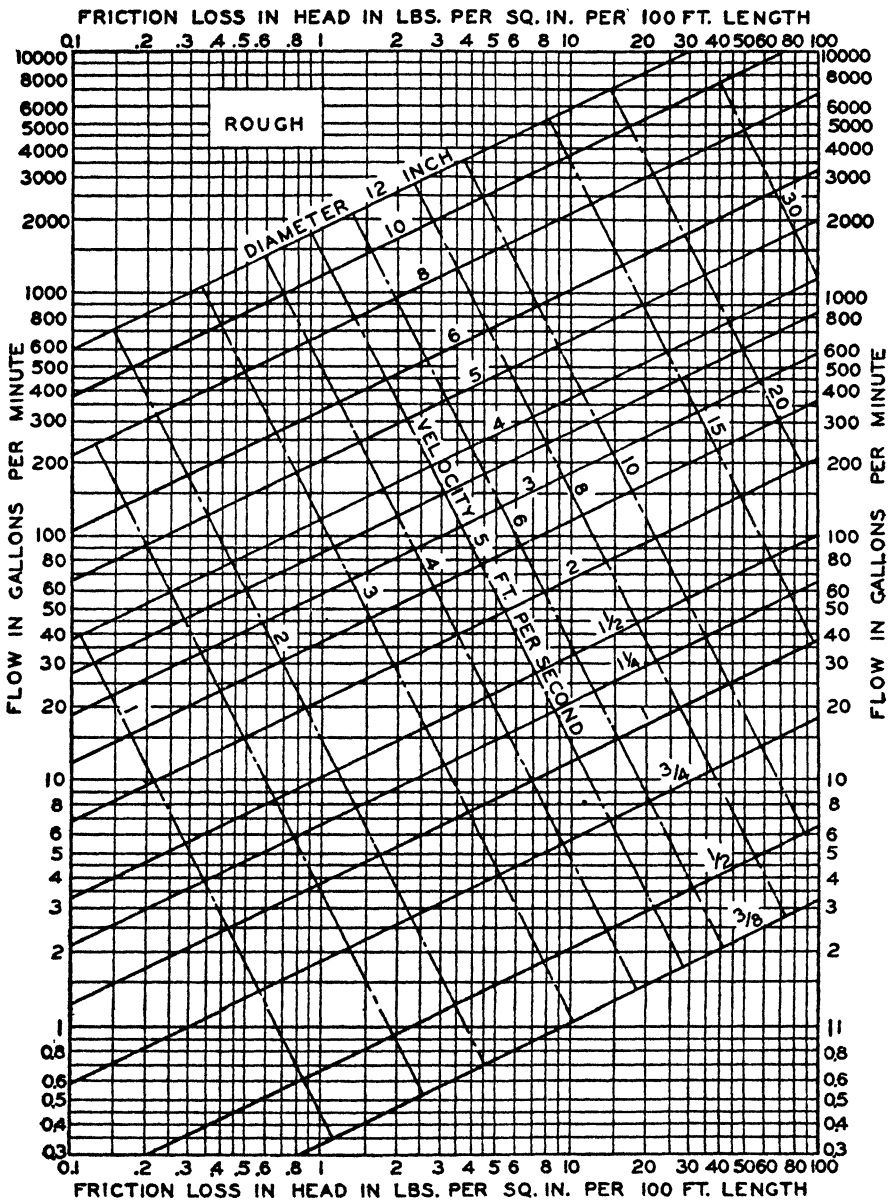

FIG. 4. FLOW CHART FOR ROUGH PIPE

From Fig. 2 the estimated peak demand is found to be 51 gpm. From Table 2 it is evident that several sizes of meters would adequately measure this flow. For a trial computation choose the 1½ in. meter. From Fig. 6 the pressure drop through a 1½ in. disc-type meter for a flow of 51 gpm is found to be 6.5 psi.

Then the pressure drop available for overcoming friction in pipes and fittings is $55 - (15 + 50 \times 0.43 + 6.5) = 12$ psi.

At this point it is necessary to make some estimate of the equivalent pipe length of the fittings on the direct line from the street main to the highest fixture. The exact equivalent length of the various fittings cannot now be determined since the pipe sizes of the building main, riser, and branch leading to the highest fixture are not known as yet, but a first approximation is necessary in order to make a tentative selection of pipe sizes.

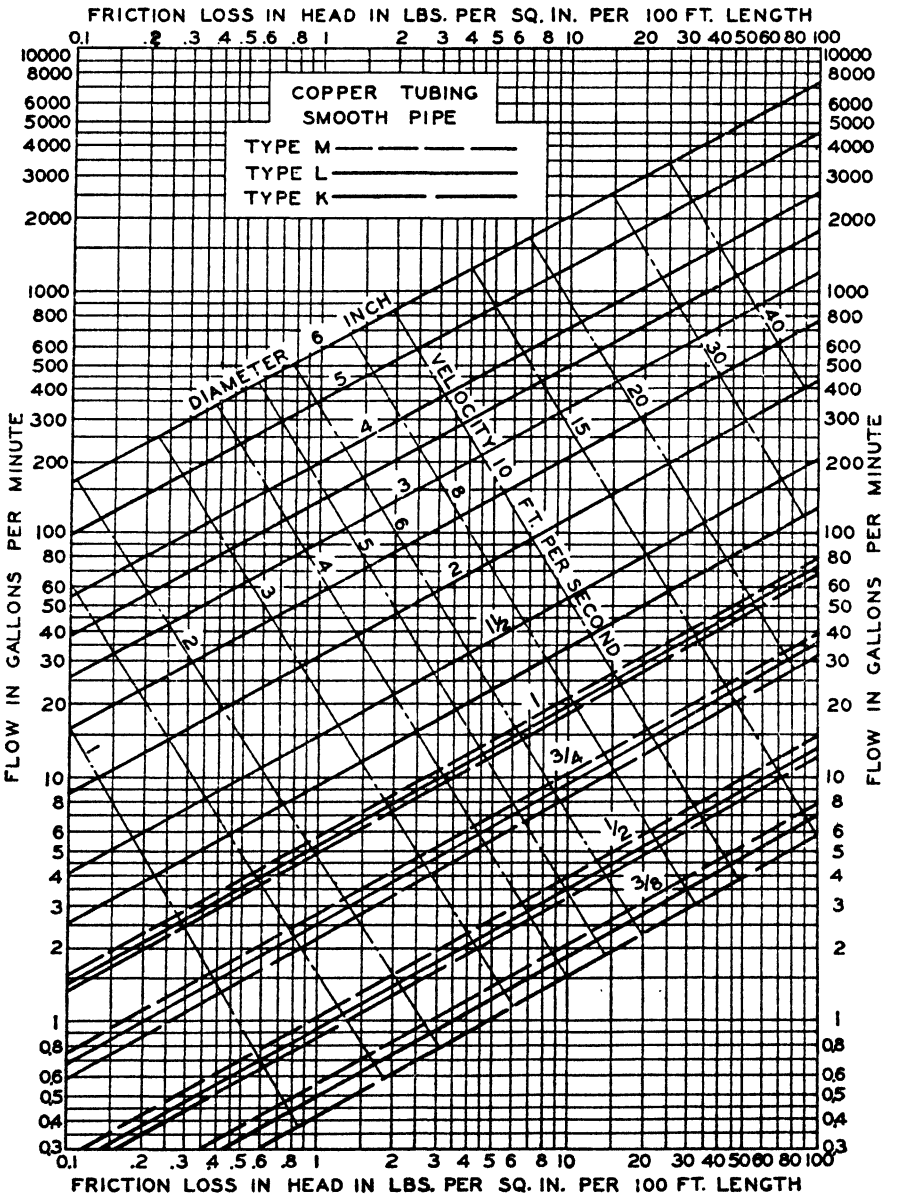

FIG. 5. FLOW CHART FOR COPPER TUBING

If the computed pipe sizes differ from those used in determining the equivalent length of pipe fittings, a recalculation will be necessary, using the computed pipe sizes for the fittings. For the purposes of this example assume that the total equivalent length of the pipe fittings is 50 ft.

Then the permissible pressure loss per 100 ft of equivalent pipe is $12 \times 100/(100 + 50) = 8$ psi.

Assuming that the corrosive and caking properties of the water are such that Fig. 3 for fairly rough pipe is applicable, a 2 in. building main is found adequate.

The sizing of the *branches* of the building main, the *risers*, and *fixture branches* follow the principles outlined. For example, assume that one of the branches of the building main carries the cold water supply for 3 water closets, 2 bath tubs, and 3 lavatories. Using

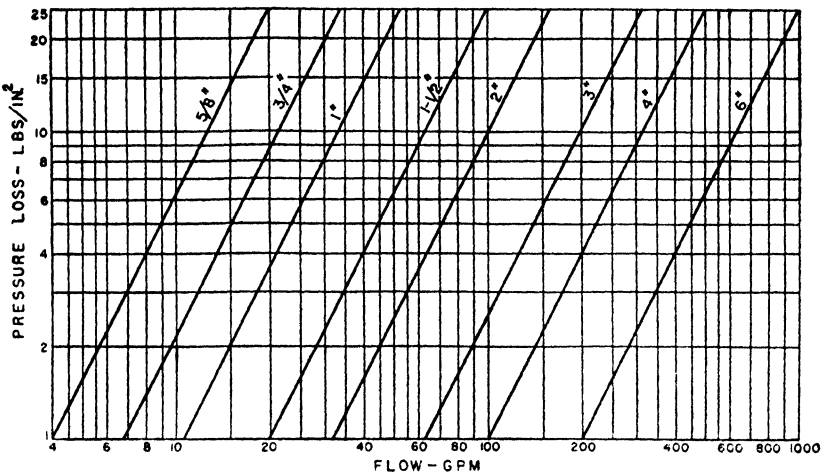

FIG. 6. PRESSURE LOSSES IN WATER METERS

the permissible pressure loss of 8 psi per 100 ft, the size of branch determined from Table 1 and Figs. 1 and 3 is found to be 1½ in. Items entering the computation of pipe size are given in Table 4.

The principles involved in sizing either up-feed or down-feed systems are the same. The principal difference in procedure is that in the down-feed system the difference in elevation between the house tank and the fixtures provides the pressure required to overcome pipe friction.

The water demand for hose bibbs or other large demand fixtures taken off the building main is frequently the cause of inadequate water supply to the upper floor of a building. This robbing of upper floor fixtures of water may be prevented by sizing the distribution system so that the pressure drops from the street main to all fixtures are the same. It is good practice to maintain the building main of ample size (not less than 1 in. where possible) until all branches to hose bibbs have been connected. Where the street main pressure is excessive and a pressure reducing valve is used to prevent water hammer or excessive pressure at the fixtures, it is frequently desirable to connect hose bibbs ahead of the pressure reducing valve.

HOT WATER SUPPLY PIPING

It is common practice to provide circulating piping in all hot water supply systems in which it is desirable to have hot water available continuously at the fixtures. In average sized and small residences and systems, in which the piping from the heater to the fixtures is short, return circulating piping is generally omitted in order to reduce installation cost and to reduce heat loss from the piping, particularly during periods of no water demand.

TABLE 4. COMPUTATION OF BRANCH SIZE IN EXAMPLE 1

FIXTURES NO. AND KIND	FIXTURE UNITS (FROM TABLE 1 AND NOTE C)	DEMAND (FROM FIG. 2) GPM	PIPE SIZE (FROM FIG. 3) IN.
3 flush valves	3 x 6 = 18		
2 bath tubs	¾ (2 x 2) = 3		
3 lavatories	¾ (3 x 1) = 2.25		
Total	23.25	38	1½

The hot water supply may be distributed by either an up-feed or down-feed piping system. Three common methods of arranging the circulating lines are shown in Fig. 7. Although the diagrams apply to multi-story buildings the arrangements (*a*) and (*b*) are sometimes used in residential designs.

A check valve should be provided in the run-out from each return riser to prevent temporary reversal of flow in the piping when a faucet is open. Proper air venting of a circulating system is extremely important, particularly if gravity circulation is employed. In Fig. 7 (*a*) and (*b*) this is accomplished by connecting the circulating line below the top fixture supply. With this arrangement, air is eliminated from the system each time the top fixture is opened.

Where an overhead supply main is located above the highest fixture as in Fig. 7 (*c*), an automatic float type air vent is installed at the highest

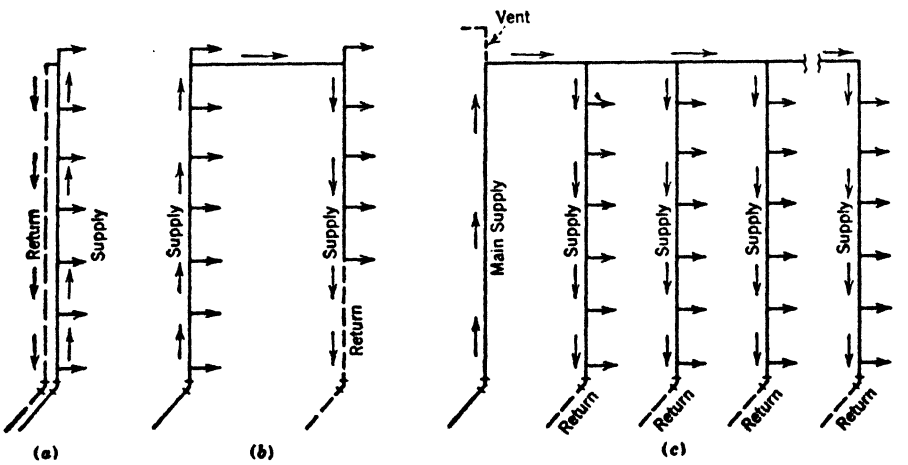

FIG. 7. METHODS OF ARRANGING HOT WATER CIRCULATION LINES

point of the system or a fixture branch is connected to the top of the main where air venting is desired and then dropped to the fixture outlet.

It is sometimes necessary to make an allowance for pressure drop through the heater when sizing hot water lines, particularly where instantaneous hot water heaters are used and the available pressure is low.

The principles involved in the sizing of the hot water supply pipes are the same as those for the sizing of cold water supply lines. For small and medium sized installations a ¾-in. hot water return will be ample. For larger installations the size of the hot water return may be computed from considerations of the heat losses in the hot water piping[8]. A throttling valve should be placed in the hot water return pipe so that the rate of circulation may be adjusted.

Where the hot water piping system is exceedingly long, a water circulator is frequently installed and controlled from an immersion thermostat, in the return line, set to start and stop the pump over approximately a 20 F deg temperature range.

STORAGE CAPACITY AND HEATING LOAD

In estimating the size of hot water storage tank required and the heating capacity to be provided either from the boiler or from an inde-

pendent domestic hot water heater, it is necessary to know the total quantity of water to be heated per day, and the maximum amount which will be used in any one hour, as well as the duration of the peak load.

In cases where the requirements for hot water are reasonably uniform, as in residences, apartment buildings, hotels, and the like, smaller storage capacity is required than in the case of factories, schools, office buildings, etc., where practically the entire day's usage of hot water occurs during a very short period. Correspondingly, the heating capacity must be proportionately greater with uniform usage of hot water than with intermittent usage where there may be several hours between peak demands during which the water in the storage tank can be brought up to temperature. As a general rule it is desirable to have a large storage capacity in order that the heating capacity, and consequently the size of the heater, or the load on the heating boiler, may be as small as possible.

TABLE 5. ESTIMATED HOT WATER DEMAND PER PERSON FOR VARIOUS TYPES OF BUILDINGS

TYPE OF BUILDING	HOT WATER REQUIRED AT 140 F	MAX. HOURLY DEMAND IN RELATION TO DAY'S USE	DURATION OF PEAK LOAD HOURS	STORAGE CAPACITY IN RELATION TO DAY'S USE	HEATING CAPACITY IN RELATION TO DAY'S USE
Residences, apartments, hotels, etc.	40 gal per person per day	1/7	4	1/5	1/7
Office buildings	2 gal per person per day	1/5	2	1/5	1/6
Factory buildings	5 gal per person per day	1/3	1	2/5	1/8
Restaurants $0.50 meals $1.00 meals $1.50 meals	1.5 gal per meal 2.5 gal per meal 4.5 gal per meal			1/10	1/10
Restaurants 3 meals per day		1/10	8	1/5	1/10
Restaurants 1 meal per day		1/5	2	2/5	1/6

In estimating the hot water which can be drawn from a storage tank it should be borne in mind that only about 75 per cent of the volume of the tank is available, as by the time this quantity has been drawn off the incoming cold water has cooled the remainder down to a point where it can no longer be considered hot water.

Where steam from the heating boiler is used to heat domestic hot water, the computed load on the boiler should be increased by 4 sq ft EDR (equivalent direct radiation) for every gallon of water per hour heated through a 100 F rise. The actual requirement is $(100 \times 8.33)/240 = 3.48$ sq ft per gallon of water heated 100 F. The value of 4 allows for transmission losses, etc.

There are two ways in common use of estimating the hot water requirements of a building; first, by the number of people and second, by the number of plumbing fixtures installed. Where the number of people to be served is known or can be reasonably estimated, the data in Table 5 may be used.

Example 2. From Table 5, a residence housing five people would have a daily requirement of $5 \times 40 = 200$ gal per day, and a maximum hourly demand of $200 \times 1/7 = 28.5$ gal. The heater should have a storage capacity of $200 \times 1/5 = 40$ gal and a heating capacity of $200 \times 1/7 = 28.5$ gal per hour.

The conditions given in Example 2 may be cited as average. It is possible to vary the storage and heating capacity by increasing and decreasing one over the other. Such a condition is illustrated in Example 3.

Example 3. Assume an apartment house housing 200 people. From the data in Table 5: Daily requirements = 200 × 40 = 8000 gal. Maximum hours demand = 8000 × ¼ = 1140 gal. Duration of peak load = 4 hr. Water required for 4-hr peak = 4 × 1140 = 4560.

If a 1000 gal storage tank is used, hot water available from the tank = 1000 × 0.75 = 750. Water to be heated in 4 hr = 4560 − 750 = 3710 gal. Heating capacity per hour = 3710/4 = 930 gal.

If instead of a 1000 gal tank, a 2500 gal tank had been installed, the required heating capacity per hour would be $\frac{4560 - (2500 \times 0.75)}{4}$ = 671 gal.

Table 6 may be used to determine the size of water heating equipment from the number of fixtures. To obtain the *probable maximum demand* multiply the total quantity for the fixtures by the Demand Factor in line 11. The heater or coil should have a water heating capacity equal to this *probable maximum demand.* The storage tank should have a capacity equal to the *probable maximum demand* multiplied by the storage capacity factor in line 12. Example 4 will illustrate the procedure.

Example 4. Determination of heater and storage tank size for an apartment building from number of fixtures.

60 lavatories	× 2	=	120 gal per hour
30 bath tubs	× 20	=	600 gal per hour
30 showers	× 75	=	2250 gal per hour
60 kitchen sinks	× 10	=	600 gal per hour
15 laundry tubs	× 20	=	300 gal per hour
Possible maximum demand		=	3870 gal per hour
Probable maximum demand	= 3870 × 0.30	=	1161 gal per hour
Heater or coil capacity		=	1161 gal per hour
Storage tank capacity	= 1161 × 1.25	=	1450 gal

METHODS OF HEATING WATER

Hot water may be heated either by the direct combustion of fuel, by an intermediate carrier such as steam or hot water, or by electrically heated surfaces. The simplest method is to have the fire on one side of a metal barrier and water on the other. In such a method if the water surfaces of heat transfer are small, and if the water carries a heavy proportion of precipitable salts, the water passages may soon clog and then burn out. A familiar example of such trouble is the water back of the firebox in the kitchen stove or the pipe coil inserted into the firebox of a warm air furnace or small boiler. The critical water temperature, at which the lime, magnesia, etc. collect on hot surfaces, varies with the character and proportions of the solids, but generally such deposits are not a serious trouble with water temperatures lower than 140 F.

Coal-burning direct-fired water heaters may be constructed of cored cast-iron sections or of steel. In some cases the external appearance of the cast-iron sections is the same as in heating boilers, but internally the cores are changed to enable the sections to withstand the city water pressure. In small capacity water heaters, efficiency is not considered so

important as low first cost and ability to maintain a fire at a low rate of combustion, and consequently such heaters are generally built with a *dry* section or fire-brick lining at the base of the fire-pot to prevent too much chilling of the fuel. While mud and scale will eventually clog the water ways of any direct-fired heater, increased life may be obtained by providing a three-way cock in the return line between the heater and the bottom of the storage tank, so that water can be blown through the heater or the tank separately at full line pressure to clean out loose sediment. Clean-out openings in the bottom of the heater are advantageous if used by operators of water heaters for periodic cleaning out of sediment.

Oil-burning direct-fired water heaters usually are of steel and operate with higher flame temperature and better efficiency than commensurate sized coal-burning heaters. They have the same tendency as coal boilers

to *lime up*, and the water passages should be large in cross-section and accessible for periodic cleaning.

Gas-burning direct-fired water heaters may be of the instantaneous or storage type. Instantaneous heaters are generally constructed of spiral water tubes of copper around which the products of combustion circulate upward from high capacity burners. Storage-type heaters may include in one unit an insulated storage tank, a combustion chamber, flues, burner equipment, and controls, or may consist of a separate storage tank and external direct-fired water heater, which may be a so-called *side-arm* heater for small capacity or a gas-fired boiler for larger capacity. Gas boilers used for direct hot water supply must be able to withstand the city water operating pressure. While direct-fired gas heaters are used generally for residences and small installations of 100 gal storage capacity or less, indirect heaters are recommended for larger installations.

Electric water heaters for domestic hot water supply are described in the section Heating Domestic Water by Electricity in Chapter 30.

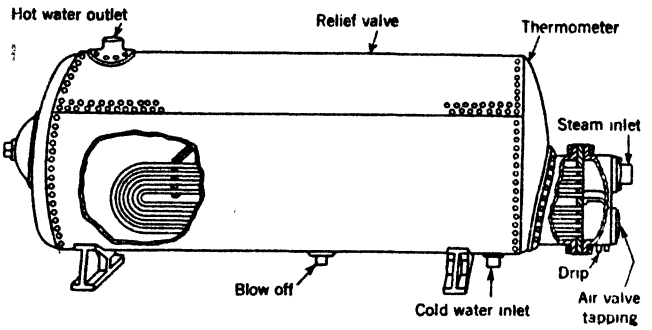

FIG. 8. INDIRECT WATER HEATER

In the indirect method either steam or hot water is used for heating the water. With steam the water to be heated is preferably circulated around the outside of the steam tubes which are submerged within a tank. A typical indirect heater using steam is shown in Fig. 8. The coils usually are of copper and are *U*-shaped to permit expansion and contraction. The shell may be of steel, copper, or with a special inside protective lining. Where straight heating tubes are used, one end of the tube is usually expanded into a *floating* head to take care of expansion. The coils should be capable of easy withdrawal for inspection and for removal of scale. Instead of steam the heating medium may also be hot water inside the tubes.

Another method of transferring heat from a heating boiler to the domestic water is illustrated in Fig. 9. The water heater is generally a cast-iron shell within which there is located a spiral copper coil. Hot water from the boiler circulates inside the shell and around the coil and returns to the boiler, while domestic water from the storage tank circulates inside the coil. The storage tank should be installed with the bottom of the tank as far above the boiler as possible. Horizontal storage tanks smaller than 18 or 20 in. diameter are not recommended because of the difficulty of preventing the hot and cold water from mixing, and especially is this an important consideration when large quantities of water are withdrawn. In Fig. 10 the heat transfer surface is placed inside the boiler instead of in a separate vessel, but otherwise the operation is

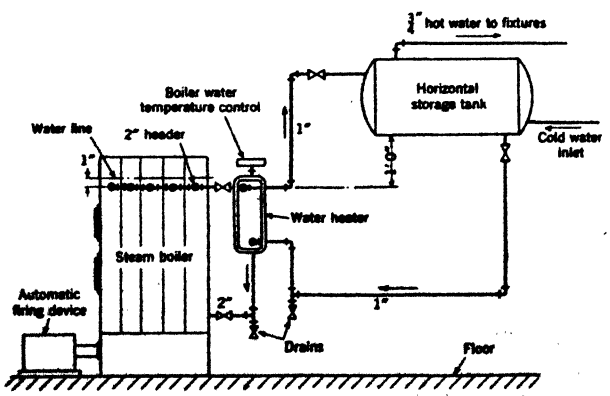

FIG. 9. INDIRECT WATER HEATER MOUNTED ON SIDE OF BOILER

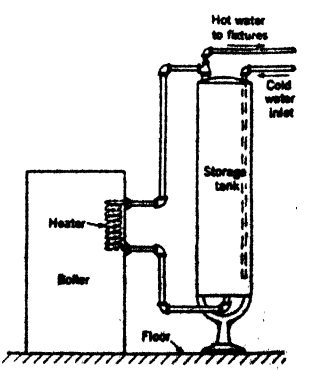

FIG. 10. INDIRECT WATER HEATER PLACED IN BOILER

similar to that of Fig. 9. This arrangement with vertical tank is commonly used for small domestic installations.

Sometimes the heating element is located inside of the larger type fire tube boilers and small residential boilers. In this case the heat transfer surface is in the form of a number of straight copper tubes with rear U bends or a floating head, inserted through a special opening in the boiler. While the coil may be located in the steam space above the water line of a steam boiler, it operates more satisfactorily when below the water line since clogging of the water tubes may thereby be delayed. This method is widely used without storage tanks since the intimate contact and efficient circulation of the water in this arrangement permit the utilization of the heat stored in the water of the boiler. A thermostatic three-way mixing valve is frequently used to maintain a uniform temperature of the hot water supply to the plumbing fixtures.

In order to reduce clogging by precipitated solids, water heating plants sometimes develop steam in a closed circuit, transferring the heat through a tubular heater to the domestic water. The water in the primary heater, exposed to the high temperature of the fire, is repeatedly used and hence has no appreciable tendency to deposit scale, while the domestic water, heated by steam at a much lower temperature than that of the fire, also exhibits a much reduced tendency to precipitate dissolved salts.

COMPUTING AREA OF HEAT TRANSMITTING SURFACE

The area of the inside surface of a heating coil may be determined from Equation 1.

$$A = \frac{Q \times 8.33\ (t_2 - t_1)}{U \times t_m} \qquad (1)$$

where

A = surface area of coil, square feet.

Q = quantity of water heated, gallons per hour.

t_2 = hot water outlet temperature, degrees Fahrenheit.

t_1 = cold water inlet temperature, degrees Fahrenheit.

U = coefficient of heat transmission, Btu per (hour) (square foot) (degree Fahrenheit logarithmic mean temperature difference).
For copper or brass coils $U = 240$ (steam) and 100 (hot water).
For iron coils $U = 160$ (steam) and 67 (hot water).

t_m = logarithmic mean of the difference between the temperature of the heating medium and the average water temperature and is *approximately*:

$$t_s - \left[\frac{(t_2 + t_1)}{2}\right]$$

t_s = temperature of the heating medium, degrees Fahrenheit.

Equation 1 may be used to check the heating coil ratings under temperatures other than those stated in the manufacturer's published ratings.

Example 5. What area of copper transfer surface will be required to heat 70 gal of water per hour from 40 to 180 F with boiler water at 220 F?

$$t_m = \left[220 - \frac{(180 + 40)}{2}\right] = 110 \qquad A = \frac{70 \times 8.33\ (180 - 40)}{100 \times 110} = 7.42 \text{ sq ft.}$$

For instantaneous submerged heaters the surface required will depend upon (1) the velocity of water in the tubes, (2) the boiler water temperature, (3) the inlet water temperature, (4) the outlet water temperature, (5) the cleanliness of the coil surface, and (6) the condition of the boiler

TABLE 7. COEFFICIENT OF HEAT TRANSFER OF INSTANTANEOUS WATER HEATERS
U = Btu per (hr) (sq ft) (Fahrenheit degree logarithmic mean temperature difference)

Boiler Water Temperature	210	200	180
U	225	175	150

water surrounding the coil. If the heater is located in the water of an actively steaming part of a boiler the heat transfer may be twice as great as would be obtained if the water surrounding the coil were circulating slowly. Ratings of instantaneous water heating coils will therefore vary greatly depending upon the assumptions made regarding the conditions of operation. The values of the coefficient of heat transmission for instantaneous heaters shown in Table 7 are conservative.

For a coil in which heat is transferred from steam to water the value of $U = 300\sqrt{v}$ may safely be used (v = velocity of water in feet per second).

The rate of heat transfer between steam or water as the carrier and the domestic water is influenced by the rate of movement of both the carrier and the water which receives the heat. For this reason, where the transfer occurs from heating system water to domestic water, it is good practice to install a circulating pump to insure rapid movement of the boiler water.

In view of the high condensation rates obtained when steam is used with gravity circulation from the boiler, as when there is a sudden demand followed by an inflow of cold water, the bottom of a steam heating transfer element always should be at least 30 in. above the boiler water line, and the steam and condensate return pipes should be of liberal size. Otherwise water hammer and reduced capacity may result due to imperfect drainage of condensate.

When connecting a transfer-type hot water heater below the water line of a cast-iron steam boiler having vertical sections, there should be a separate tapping for water circulation into every section of the boiler, as shown in Fig. 9, unless the boiler has large top nipple ports providing inter-sectional circulation. If the top nipples are entirely within the boiler steam space, no internal circulation occurs between sections and steaming may occur in sections not connected to the heater and further the unconnected sections will not deliver any heat to the heater.

CONTROL OF SERVICE WATER TEMPERATURE

Coal-fired boilers are usually controlled by an immersion thermostat located in the heated water, which opens or closes draft dampers at the boiler to adjust the rate of fuel combustion. With oil or gas-fired boilers the immersion thermostat controls the oil burner or the automatic gas valve. The gas pilot flame usually burns continuously. With electric heaters the immersion thermostat operates a switch on the source of energy.

When steam or hot water is the medium for heating the water in the tank, an immersion thermostat is used to control a valve in the steam or hot water supply line. In small residence installations, using water as the carrier, a combined immersion thermostat and butterfly valve in one simple fitting may be installed in the transmitting circuit to prevent overheating of the service water.

In residences heated by pump circulated hot water, the house temperature is controlled by operating the circulating pump intermittently, while domestic hot water is warmed by transfer from the house boiler,

independent of the pump operation. The domestic water is heated from the heating boiler the year 'round. Under such an arrangement, to prevent overheating the house by thermal circulation when the pump is not running, it is usual to insert a weighted check-valve in the house heating main, so that no circulation to the house heating system can occur unless the pump operates. In summer the fire may be controlled to maintain a boiler water temperature lower than when heating and generally about 20 F warmer than that desired in the domestic hot water system.

In buildings which have restaurants it is generally desirable to install two separate service hot water systems so that water at about 180 F minimum may be available for dish washing, while water at 140 F maximum may be used for lavatory and bath purposes.

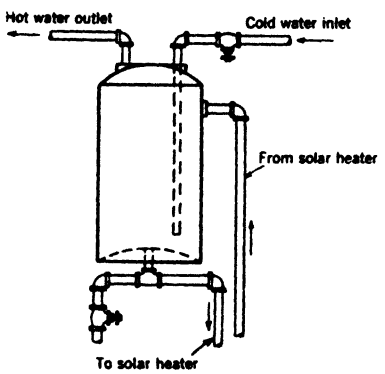

FIG. 11. SOLAR HEATER TANK CONNECTIONS

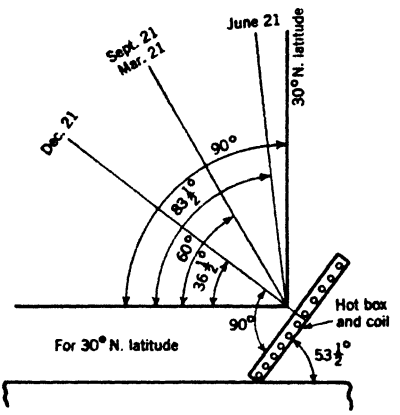

FIG. 12. SOLAR HEATING COIL INCLINATION

The immersion thermostat in a hot water storage tank should be located no higher than the center of the tank, and possibly should be even closer to the bottom since water in a tank stratifies proportionally to the temperature. When hot water is removed, the cold water entering to replace it quickly reduces the temperature in the lower parts of the tank.

SOLAR WATER HEATERS

Solar heaters utilize the energy of the sun for heating hot water. The successful operation of such heaters requires the availability of sunshine practically every day in the year, which has limited their use to Florida and the southern portions of California. When supplemented with some other means of gas, coal or, oil water heating, solar heaters may be used in climates where sunshine may be more or less intermittent. They have been used in summer homes as far north as Chicago. When properly installed and proportioned, solar water heaters render satisfactory service especially in climates where the outside temperatures are high and extremely hot water is not necessarily desirable. Such installations consist essentially of a storage tank, heating coil, and hot box. The coil is installed in the hot box and is arranged to circulate water to and from the storage tank. The advantage in the use of this type of heater is the fact that it requires no fuel. The same materials should be used for the coil,

[a] Sun Effect and the Design of Solar Heaters, by H. L. Alt (A.S.H.V.E. TRANSACTIONS, Vol. 41, 1935, p. 131).

circulation lines, and tank. A copper coil is more efficient in absorbing heat in the box but galvanized iron or steel may be substituted depending on the local water conditions, cost, and other considerations.

The storage tank must be able to store sufficient heated water for the night period of about 16 hours when the coil is not functioning or is operating under such poor sun conditions as to make its heating effect negligible. Due to the fact that the *no sun* period includes the night period when little or no hot water is used, an available storage of 50 per cent of the average daily usage is considered adequate. Since about 25 per cent of stored hot water cannot be drawn out of a storage tank before the incoming cold water reduces the temperature of all of the water in the tank to an unsatisfactory point for usage, the equation for calculating the storage capacity of the tank becomes:

$$S = \frac{Q \times 0.50}{0.75} = 0.666Q \qquad (4)$$

where

S = storage capacity of tank, gallons. Q = average daily usage, gallons.

Thus for a family of four persons using an average of 40 gal of hot water per person per day the size of the tank would be 4 persons x 40 gal x 0.666 or 106 gal, and the nearest standard size of tank to this theoretical capacity would be used. The tank should be well insulated to prevent undue loss of heat during the 16-hour period when the coil is inoperative, and it should be located as high as possible in the building (under the peak of the roof if such exists) so as to secure a maximum circulation head from the coil. The hot water supply to the house, as shown in Fig. 11, is located at the top of the tank, which serves to vent the air from the tank through the hot water faucets as fast as it accumulates.

The coil should be of the return-bend type, square or slightly rectangular in form, and should have the pipes running east and west, with the coil on the south side of the building where it can receive the full sun

effect all day long without shadows from the building itself or from adjacent obstructions such as trees or other structures. The coil should be placed as low as possible in relation to the storage tank level, such as on a porch roof, the roof of a one-story extension or, if necessary, even on the ground. Both the coil and the circulation lines should be designed to facilitate the circulation flow as much as possible, using long radius copper fittings or recessed galvanized iron fittings to match the materials of the coil, circulation lines, and tank. The coil should be inclined as shown in Fig. 12 so that the north end is raised above the south end to secure an angle with the horizontal of about 53 deg. This will result in the inlet end of the coil being on the south side (or bottom) and the outlet end being on the north side (or top). This will satisfy conditions along the 30 deg N latitude which includes the portions of Florida and Southern California where these heaters are most frequently used.

The hot box is usually constructed of wood on the four sides and bottom, and is insulated. Over the top of the box glass sash are placed and the box should be constructed as near air-tight as possible. The interior surfaces should be painted white to reflect the heat, while the coil should be painted black to absorb the heat. The box need not be deeper than necessary to house the coil and to protect it from the weather.

The addition of a light gage copper plate on the bottom of the box to which the pipe of the coil is soldered, for good metallic contact, will add to the amount of heat received by the coil due to the fact that this plate will receive all of the sun rays which fail to directly strike the coil. The heat from this source is transmitted to the coil through the plate instead of by heating the air surrounding the coil and from which only part of the heat enters the coil, the balance being transmitted through the glass sash.

Design data given in Table 8 may be used with some judgment in selecting the size of solar heater coil and box for a particular application. These data are based on consumptions of 30 and 40 gal of hot water per day per person.

Chapter 51

CORROSION AND WATER FORMED DEPOSITS CAUSES AND PREVENTION

Definitions, Classification and Characteristics of Water, Causes and Prevention of Scales and Sludges, Causes and Prevention of Slimes, Under-Water Corrosion, Atmospheric Corrosion, Buried Pipe Lines, Handling Water Treating Chemicals, Legal Regulations

---

THE surfaces of heating and ventilating equipment that are in intimate contact with water sometimes are affected by the chemical characteristics of the contacting waters to such extent that prohibitive amounts of insoluble materials are formed or corrosion ensues at an insufferable rate. To avoid or to correct such troubles, it is desirable that heating and ventilating engineers have a general appreciation of industrial water chemistry. The principal purpose of this chapter is to provide those criteria by which the average engineer may judge whether a problem is one that will yield to rather simple remedies or will require the skill of an experienced water technologist.

DEFINITIONS

The following definitions for water-formed deposits, corrosion, and closely allied terms have been proposed:

Water-Formed Deposits. A water-formed deposit [1] is any accumulation of insoluble material derived from water or formed by the reaction of water upon surfaces in contact with water.

Deposits formed from or by water in all of its phases may be further classified as scale, sludge, corrosion products, or biological deposits.

Scale. Scale [1] is a deposit formed from solution directly in place upon a confining surface. It is a deposit which will retain its physical shape when mechanical means are used to remove it from the surface on which it is deposited. Scale, which may or may not adhere to the underlying surface, is usually crystalline and dense, frequently laminated, and occasionally columnar in structure.

Sludge. Sludge [1] is a water-formed sedimentary deposit. It usually does not cohere sufficiently to retain its physical shape when mechanical means are used to remove it from the surface upon which it deposits. Sludge is not always found at the place where it is formed. It may be hard and adherent and baked to the surface on which it has been deposited.

Biological Deposits. Biological deposits [1] are water-formed deposits of biological organisms or the products of their life processes. Biological deposits may be microscopic in nature, such as slimes, or macroscopic, such as barnacles or mussels. Slimes are usually composed of deposits of a gelatinous or filamentous nature.

Corrosion. Corrosion [2] is destruction of a metal by chemical or electrochemical reaction with its environment. In the corrosion process, the reaction products formed may be soluble or insoluble in the contacting environment. Insoluble corrosion products may deposit at or near the attacked area or be carried along and deposited at considerable distance from the attacked area.

Corrosivity. Corrosivity [3] is the capacity of an environment to bring about destruction of a metal by the process of corrosion. Corrosivity is a property of the environment, but it has no significance until the metal in question is specified.

CLASSIFICATION AND CHARACTERISTICS OF WATER

For industrial use there is no accepted conventional classification of water. Rather, each industry usually develops a body of ideas applicable to its own water problems [4]. For heating and ventilating engineers, it is

perhaps most convenient to distinguish between mineralized waters and condensates.

Mineralized Waters

All the waters found in streams, wells, lakes, and the ocean are mineralized. The same is true of all municipal supplies even though they may have been *treated*. For a given area ground waters are likely to be more highly mineralized than are surface waters. Conversely, surface waters are more likely to be contaminated with municipal sewage and trade wastes. Virtually all mineralized waters also contain biological organisms.

Mineralogical Characteristics. The character and amount of extraneous inorganic materials—including deleterious gases—dissolved and sus-

(8) Well Water—Rosewell, N. Mexico
(9) Ocean Water—Average

pended therein describe the mineralogical charateristics of any water. Revealing such information is the function of a mineralogical chemical analysis.

The analyses in Table 1 disclose the composition of the public water supplies used by about 45 per cent of the total population of the cities, in the United States, having more than 20,000 inhabitants[5].

All values recorded are in terms of parts per million *. This is the approved standard terminology for reporting the results of mineral analyses[6]. Values reported in the other terms commonly used may be converted into the standard form by using the conversion factors listed in Table 2.

Data for dissolved gases or pH values have been omitted in Table 1 because even waters of the same mineral contents may vary widely in these respects. Unpolluted natural waters usually have pH values within the range 5 to 8, depending upon their *free* CO_2 contents. Polluted

* Parts per million are hereinafter abbreviated ppm. A part per million signifies a unit weight of material per million unit weights of the solution.

waters, which include those derived from wells or swamps in marshy ground, may have pH values well below 5.

Biological Characteristics. The slime-forming organisms are mostly lower plants, grouped by botanists into the Phylum Thallophyta. This group is distinguished by the absence of leaves, roots, or stems from the mosses, ferns, and seed plants which comprise the three other phyla of the plant kingdom.

The Thallophyta (see Table 3) are divided into algae, which can synthesize chlorophyll for the production of sugar, and the fungi which lack chlorophyll and must therefore secure already synthesized carbohydrates.

All Thallophyta are of universal distribution and many of them are slime forming. Of the five divisions of algae, only three (the green, the blue-green, and the diatoms) are found in fresh water. Of the five divisions of fungi, all may occur in fresh water, the principal slime formers being indicated in Table 3.

The methods of analysis commonly used in the sanitary examination of a water have, as their principal object, to identify and count pathogens.

Most slime-forming organisms are not pathogens. When a water is subjected to a biochemical analysis for the purpose of evaluating its slime producing characteristics, tests, widely different from sanitary bacteriological tests, must be made. Tests upon the water itself are seldom satisfactory, and true indications of the sliming characteristics of a water can only be determined for the analysis of deposits on surfaces having the temperature close to the temperature of the final design equipment. The results of such a test are commonly reported in the manner illustrated in Table 4.

Condensates

All condensates result from the chilling of water vapor. Such chilling may result from natural causes, thus producing *dews, sweats, rain, and*

TABLE 3. PRINCIPAL SLIME FORMERS

PHYLA	ROUGH DIVISION OF PHYLA
Algae	Single celled, sometimes forming slimy sheets. Many celled in either sheets or fronds.
Fungi	*Bacteria* (Schizomycetes) frequently forming slimy surface coatings. *Slime Molds* (Myxomycetes) forming slimy sheets as one stage of their life history. *Sac fungi* (Ascomycetes) of which one division, the yeasts, occasionally form slimy aggregates. The alga-like fungi (*Phycomyceles*) and the stalked fungi (Basidomycetes) rarely form slimes but their filaments may hold together the slimes of other organisms.

TABLE 4. PLANT WATER SUPPLY EXAMINATION

WATER SUPPLY—	200 ft deep well—average water temperature 53 F—water is producing a brown stain in plumbing fixtures.
SAMPLE—	The sample was scraped from the surface of the shell and tube condenser of #2 Freon Compressor on the meat chilling room. The sterile sample bottle was filled one-half with deposit and the balance with circulating water. No preservative was added—pH at time of collection was 7.4.

ANALYSIS REQUIRED—

MACROSCOPIC	[√]	MICROSCOPIC	[√]
BACTERIOLOGICAL	[√]	ORGANIC CONTENT	[√]

PROBLEM—	A 25-ton Freon—12 Compressor has head pressure about 10# higher than during initial operation, without change in water temperature. Deposits have been observed on heat exchanger surfaces. It is desired to know the nature of these deposits and if they are the cause of this increased head pressure.
MACROSCOPIC EXAMINATION—	Heavy brown flocculent material settles rapidly in clear water. pH—7.3 Odor—woody, mouldy.
MICROSCOPIC EXAMINATION—	INORGANIC MATERIAL—small amount white crystals. AMORPHOUS MATERIAL—small amount—brown. IRON BACTERIA—profuse growth of crenothrix—(Photo usually included).
CULTURAL EXAMINATION—	SABOURAUD'S AGAR 1. Aerobic gram positive spore-forming rod with mucoid sheaths (Photo usually included). 2. Short gram negative coccibacilli (Photo usually included).
TOTAL COUNT	100,000 organism/cc.

ORGANIC CONTENT (by WEIGHT, DRY BASIS)—60%

DISCUSSION—	The presence of common slime-forming organisms in the deposit combined with high organic content indicates that the deposit is bacterial in origin. Heat transfer reductions would be caused by such a deposit. These deposits, combined with crenothrix, can cause corrosion of both ferrous and non-ferrous metals.
RECOM-MENDATIONS—	It is recommended that the water be treated at the suction side of the deep well pump with chlorine in quantities sufficient to maintain a free chlorine residual of 1.0 ppm at the discharge of the shell and tube cooler. This treatment can be scheduled on an intermittent basis.

snow, or from artificial causes, as in steam condensing equipment, producing condensate or return water.

In the heating and ventilating field, the biological characteristics of condensates are likely to be of concern *only* where the condensate is used as cooling water in recirculating systems. The deleterious gas contents of condensates, however, very often create serious corrosion troubles.

The data in Table 5 typify the chemical composition of the atmosphere in rural and metroplitan areas, and of stack gases when various types of common fuels are used. The curves in Fig. 1 disclose the solubility of the major deleterious gases present in such atmospheres in otherwise pure water, when the partial pressure of the gas is one pound per square inch absolute.

The most common deleterious gases entrained by steam are oxygen and

carbon dioxide. In rare instances, hydrogen sulphide, sulphur dioxide, or ammonia are present.

In most steam condensing equipment[7, 8], the non-condensable gases entrained with steam accumulate so that the amount present in the vapor space is several hundred times higher than in the incoming steam and, the amount dissolved in the condensate may therefore approach, or even exceed for short periods, the amount entrained by the steam.

CAUSES AND PREVENTION OF SCALES AND SLUDGES

Scales may be formed on surfaces of equipment in contact with water, and sludges in the body of the water, by the separation from the water of dissolved or suspended solids. According to the nature of a particular piece of equipment and the method of its operation such separation may be promoted by one or more than one, of several factors:

a. The concentration of solids may be increased by the evaporation of water.

b. The dissolved solids may be rendered less soluble in the water by changes in temperature.

c. Conditions may favor the decomposition of unstable compounds with the formation of less soluble compounds.

TABLE 5. DATA TYPIFYING THE DELETERIOUS GAS CONTENT OF DIFFERENT ATMOSPHERES

Name of Gas	Chemical Formula	Air				Flue Gases					
		Rural		Metropolitan		Bitum. Coal		Fuel Oils		Natural Gas	
		% by Volume	Partial Pressure psia	% by Volume	Partial Pressure psia	% by Volume	Partial Pressure psia	% by Volume	Partial Pressure psia	% by Volume	Partial Pressure psia
Oxygen	O_2	21	3.143	21	3.143	2	0.299	7	1.048	10	1.497
Carbon Dioxide	CO_2	0.03	0.004	0.06	0.009	15	2.245	13	1.946	10	1.497
Sulphur Dioxide	SO_2	None	None	0.003	0.004	0.07	0.010	0.03	0.004	0.0001	0.0015

Figs. 2 and 3 show that the solubilities of both calcium carbonate and calcium sulphate decrease with the rising temperature within a moderate range of temperatures. Surfaces transferring heat into water, such as condensers and coolers, are more susceptible to scale and sludge formation than are the cold parts of the same system using the same water.

The most common of the unstable soluble salts are the bicarbonates of calcium, magnesium, and occasionally iron. Under conditions favoring the removal of carbon dioxide, as when the water is strongly aerated or when it is boiled, the bicarbonates are readily converted to the relatively insoluble carbonates (or, in the case of iron in the presence of oxygen, ferric hydroxide or oxide may be formed). Conversely, carbonates are readily converted to the more soluble bicarbonate by the addition of carbon dioxide or other acidic materials. This explains the increase in the apparent solubility of calcium carbonate at decreasing pH values (increasing concentration of hydrogen ion) shown in Fig. 2, the carbonate really going into solution largely as bicarbonate.

It is sometimes desired to evaluate the tendency in a particular water toward the separation of calcium carbonate, which may be desirable as a means of establishing a corrosion-resistant film on metal surfaces, or in

other circumstances may be undesirable because of the impedance of the calcium carbonate film to heat transfer. This tendency is indicated approximately by the Langelier Index [9], which is obtained by subtracting the actual pH of a particular water from the pH at which it is estimated precipitation of calcium carbonate would just begin. This estimate may be made by the use of Fig. 4.

There are various expedients which may be employed for avoiding or mitigating difficulties due to scales:

a. The water may be treated before use to remove elements such as calcium, magnesium, and iron, which form relatively insoluble compounds. In the various softening processes this removal of these elements is accompanied by the addition of other elements, particularly sodium, the compounds of which are relatively soluble.

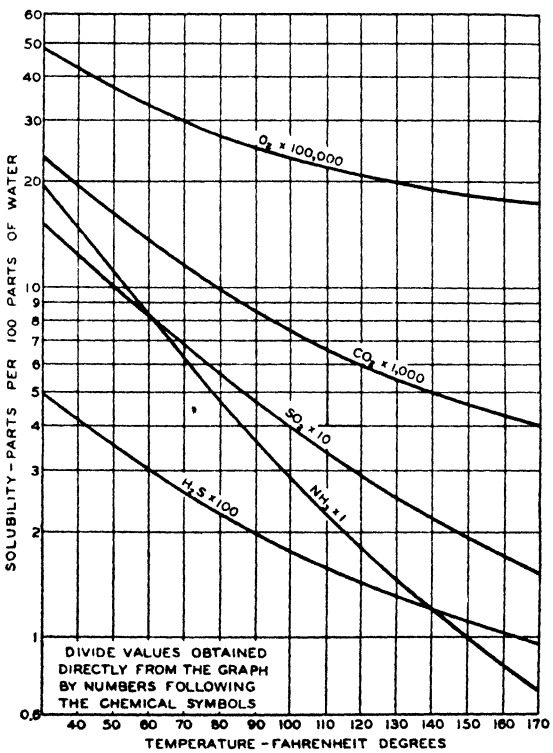

FIG. 1. SOLUBILITY OF GASES AT PARTIAL PRESSURE OF 1 PSI

b. The water may be treated within the equipment to promote the separation of dissolved solids as sludges, rather than as scale which is in most cases more objectionable.

c. The increase in total solids due to the evaporation of water may be controlled by the displacement, continuously or intermittently, of some of the used water by fresh supply.

d. Substances, such as the polyphosphates, having the property of inhibiting the precipitation of calcium carbonate from solutions supersaturated with it, may be added.

e. The pH of the water may be lowered (hydrogen ion concentration raised) to reduce the tendency for precipitation of carbonate. This is permissible only to such an extent as will not cause a serious increase in rate of corrosion.

The choice of the best expedient must be made for each type of equipment and will be affected by local considerations.

Once-Through Equipment and Closed Recirculating Systems

Where abundant supplies of water are available at low cost, the cooling water may pass through the equipment once, undergoing a slight rise in temperature. Little difficulty from scale should be experienced in this case unless the carbonate hardness is more than 200 ppm, or the water has been treated to induce incipient calcium carbonate precipitation. Closed recirculating systems in which the water is cooled indirectly, as in radiators, and returned to the equipment, should usually be little troubled with scale. However, in both once-through and closed recirculating systems, slimes may cause trouble.

If there is some tendency for scaling, it may usually be prevented by the addition of small amounts, about 5 ppm or less, of polyphosphate [10]. Alternately, a minor lowering of pH by the addition of carbon dioxide or sulphuric acid may be effective if this is permissible from the standpoint of corrosion.

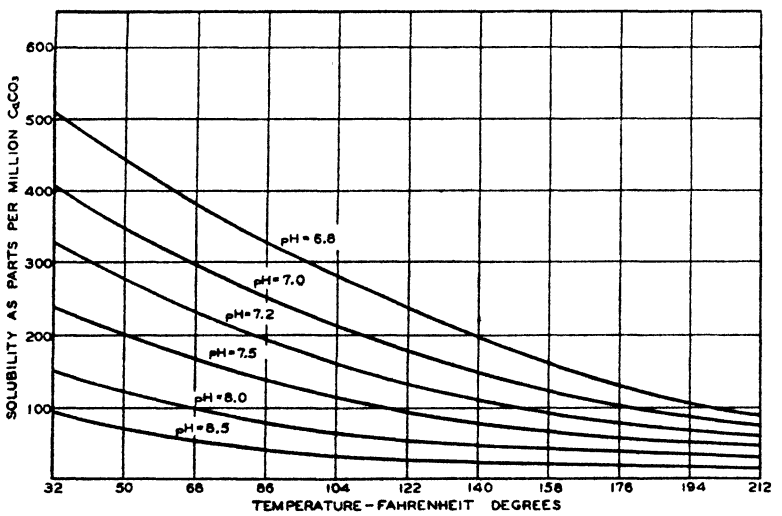

FIG. 2. SOLUBILITY OF CALCIUM CARBONATE IN DISTILLED WATER CONTAINING CARBON DIOXIDE

(*pH Values at Approximately 78 F*)

Fig. 2 Adapted from (1) Ind. & Eng. Chem., 20 (1928) 1197—by Baylis. (2) J.A.C.S. 50 (1929) 2086—Frear & Johnson.

Open Recirculating Systems

Where water from condensers and similar equipment is passed through a spray pond or cooling tower and then returned to the equipment, there is an increase in the concentration of solids because of the evaporation of some of the water into the cooling air, and, moreover, the aeration removes carbon dioxide. Both factors promote the tendency to deposit scale. If the conditions are particularly adverse, it may be necessary to subject the water to a softening treatment before use, this being the more feasible because of the reduced water requirement in such a recirculating system. When this is not practicable, or when the tendency to scale formation is only moderate, a considerable improvement may be effected by the addition to the water of organic compounds such as gelatine, glucosates, dextrine, and tannin which tend to prevent precipitated material from

forming adherent scales. In systems of this kind, the loss of liquid as spray from the cooling towers or spray ponds may limit adequately the final concentration of solids in the cooling water. If not, provision must be made for sufficient purging of used water.

Heating Systems

In hot water heating systems or in steam heating boilers where all condensate is returned, troubles from scaling should not be severe. If necessary, sodium phosphate or sodium carbonate may be added to the water to prevent the formation of adherent calcium sulphate scale.

Boilers and High Temperature Equipment

Where temperature exceeds 250 F, complete softening of the water is the only practical method for minimizing sludge formation. This is

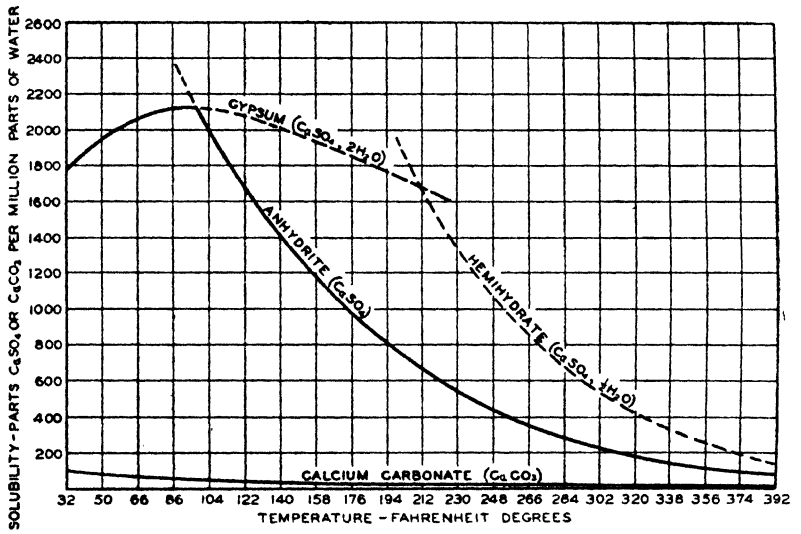

FIG. 3. SOLUBILITY OF CALCIUM SULFATE AND OF CALCIUM CARBONATE FOR COMPARISON

(*$CaCO_3$ in Equilibrium with Normal CO_2 Content of the Atmosphere*)

Fig. 3 Adapted from Bul. No. 15, Univ. of Mich. "Formation and Properties of Boiler Scales" by E. P. Partridge.

usually accomplished by artificial or natural zeolites (called also ion-exchange materials) or by hot-process precipitation softeners.

In boilers operating at pressures above 100 psi virtually all the calcium, magnesium, silica, iron, and manganese salts entering with the feed water are potential scale or sludge formers.

In low pressure boilers (100-250 psig), the formation of adherent calcium sulphate (anhydrite) scales is most to be feared. Such deposits form on the *hottest* evaporative surfaces. It is a material of low heat conductivity. Even a layer of egg shell thickness may so impede the rate of heat transfer as to bring about over-heating of the metal.

The ortho-phosphates of sodium are most frequently used to prevent sulphate scales. The concentration of phosphate required is such as to cause the precipitation of calcium phosphate as sludge, thus keeping the boiling water under-saturated with respect to calcium sulphate. To a

FIG. 4. GRAPH AND NOMOGRAM FOR DETERMINATION OF pH SATURATION BY LANGELIER'S FORMULA

(Applicable within pH Range 7.0—9.5)

[a]Based on article in Oct. 1936 issue of American Water Works Association Journal and later corrections for Tables 2 and 4. Prepared for Charles P. Hoover of the Columbus, Ohio, Water Softening and Purification Plant by M. L. Riehl.

Instructions for Using Chart:

1. **Knowing temperature and total dissolved solids, find temperature and total solids constant on Col. 1.**
2. **Align this constant with given value of calcium on Col. 3 of Chart, then locate point on Col. 2 of Chart (Pivot Line).**
3. Align this point on Pivot Line with given alkalinity on Col. 5; read pH saturation on Col. 4.

Saturation index is pH actual minus pH saturation.

E. G.—pH actual. pH saturation. Saturation index.

7.6	8.1	−0.5 (corrosive)
8.4	7.8	+0.6 (scale forming)

lesser extent, sodium carbonate (called also soda ash and sal soda) is also used. Most of the effective boiler compounds contain either phosphates or soda ash, or both. Certain organic materials and colloids are sometimes found to minimize scale formation. Where chemicals are introduced directly into the boiler in amounts adequate to prevent scale, sludge is formed in amounts proportionate to the calcium and magnesium salts entering with the feed water. To prevent troublesome accumulation of this sludge, as well as soluble salts, as evaporation occurs some *blowdown* of boiler water is necessary.

CAUSES AND PREVENTION OF SLIMES

A water containing slime-producing organisms will produce prohibitive amounts of slime *only* when the conditions of use are such as to propagate their life processes. Whenever sufficient food material from normal water or from air-borne dust combines with optimum temperature conditions such as exist on cooling surfaces and air washers, serious quantities of slime will be produced.

TABLE 6. COMMON CHEMICALS USED FOR SLIME CONTROL

CHEMICAL	TRADE NAME	PHYSICAL STATE*
Chlorine	Chlorine	Gas
Hypochlorites	Calcium Hypochlorites Sodium Hypochlorites	Crystalline
Chlorinated Phenols Sodium -	Chlorophenylphenate Tetrachlorophenate Pentachlorophenate	Briquettes Briquettes Briquettes
Potassium Permanganate	Permanganate of Potash	Crystalline
Copper Sulphate	Blue Vitriol	Crystalline

*As shipped.

Some natural well waters do not contain sufficient foods to support luxuriant slime growths. Algae which require light for carrying on their life processes are likely to cause difficulty in cooling towers and other areas where sunlight is abundant. The ordinary slime-forming bacteria are capable of using a wide variety of nitrogenous and cellulose material as food sources. These bacteria thrive best under dark conditions such as exist in condensers and other heat transfer surfaces. Other organisms capable of causing similar difficulties use such a wide variety of food material as algae [11], iron compounds [12], and inorganic sulphates [13].

At present, the use of toxic chemicals and irradiation are the two general means employed in slime control. The value of ultra violet light, used so broadly in the beverage industry, is somewhat in dispute.

Anti-fouling paints have been developed and are fairly satisfactory for the prevention of the growth of micro-organisms such as *barnacles* and *mussels*, but these paints must be renewed at frequent intervals and are not applicable to inaccessible areas such as the inside of pipe lines and cooling towers. Satisfactory *anti-sliming* paints have *not* been found.

Names and other pertinent data relating to some of the more common chemicals used in slime control, are shown in Table 6.

Chlorine is the only chemical to which is attributed the ability to de-

stroy slime-forming organisms. The others are presumed to poison marine organisms, most of which *recover* when the chemical is not used regularly.

While chlorine is the most generally used chemical, others may occasionally prove to be more practicable. Choice of the chemical is conditioned largely by the design and operation of the system.

Open Recirculating Systems

In spray ponds and cooling towers of the open type, light-loving algae growths are likely to cause blocking of the distribution piping and troughs. These organisms are most troublesome in areas accessible to sunlight. Algae slimes are usually stringy in character.

In open recirculating systems, continuous use of small quantities of chlorine is generally most satsifactory. In once-through systems, where large quantities of water are used, intermittent treatment a few times each day will usually result in satisfactory slime removal and chemical economies.

Neither the phenols nor copper sulphate may be used for the removal of slime already formed. For this purpose, chlorine gas is used. After being cleaned, the other chemicals may be used to prevent the reestablishment of slime in the system. The removal of green algae from a cooling tower should never be used as an indication that the true slime-forming organisms on heat exchanger surfaces have been removed. The more resistant slime formers, which so materially reduce heat transfer efficiency, will often be unaffected by treatment which completely eliminates algae.

Closed Once-Through Systems

In equipment where light is excluded, slime formations are due to fungi. Usually, they predominate on the heat exchange surfaces. Bacteria form thick, soft slime. Yeasts and molds form tough rubbery slimes. Chlorine and hypochlorite solutions, fed intermittently, are used to prevent such slimes.

UNDER-WATER CORROSION

When deleterious substances are present in water, the corrosivity of the solution is increased in proportion to the amount of deleterious substances present, the temperature, and usually the rate of flow of the solution over the metal surfaces. There are other relevant factors, but their influence in general is subordinate to those mentioned. Dissolved oxygen, acid gases, and chloride salts are the corrosion accelerators most frequently encountered.

Neutral and slightly alkaline waters saturated with air, corrode iron at a rate about triple that for the same water free of air. Hot water containing oxygen will corrode iron at a rate three to four times that for the same water when cold.

Corrosion of iron decreases as the pH of water solutions increases and practically ceases at a pH of 11. If the metal contains film forming agents, such as chromium, nickel, and silicon or if the water contains inhibitors such as silicates and chromates, corrosion may in some instances be minimized.

Cold Water Services

Where water from municipal supplies is used industrially in a closed system with little or no increase in temperature, it is seldom necessary or

feasible to treat the water to reduce its corrosivity. When it is mandatory, the addition of caustic soda to *maintain* a pH over 11 *plus* the addition of sufficient sodium sulphite to maintain a residual of over 100 ppm (as Na_2SO_3) usually suffices to prevent serious troubles. However, in some cases the cost may be prohibitive.

When the use of sodium sulphite or a comparable chemical for oxygen removal is prohibited, as in potable waters, the addition of small amounts of lime to maintain a Langelier Index (See Fig. 4) of 0.5 or more may prove helpful.

In systems exposed to the atmosphere, as for example air washers or storage tanks, both laboratory [14] and field tests [15] have shown that the addition of alkalies to maintain a pH greater than 8.5, plus the addition of other chemicals that produce protective films on the metal surface, will measureably decrease corrosion. Sodium dichromate, sodium silicate, and tri-sodium orthophosphate have been shown to be effective film formers in the order mentioned.

Caustic soda is usually used to raise the pH value, and sodium dichromate is most often employed as a film former in industrial waters. In old systems, not previously inhibited, about 500 ppm of sodium dichromate are usually maintained at the start. After two or three months and in new systems, a residual of about 300 ppm of dichromate usually proves effective. When insufficient dichromate is employed, pitting is sometimes accelerated. Aeration does not impair the efficiency of dichromates, but does deplete the caustic soda concentration.

In large industrial systems, the use of vacuum deaeration has been shown to be effective [16]. In small systems, the equipment required can seldom be justified, economically.

Soft water, as for example the effluent from zeolite softeners, is likely to be several times more corrosive to iron than hard waters. In small installations, the use of copper or brass pipe usually is a practical expedient. Cement lined pipe and tanks suitably resist attack.

Where the water contains slime-forming organisms, especially those bacteria that thrive on iron, chlorination of the water is imperative to inhibit tuberculation and subsequent pitting.

Bitumastic paints, applied at *regular* intervals upon *well cleaned* surfaces, will measurably prolong the life of equipment handling cold waters.

Hot Water Services

As a usual thing, corrosion does not create important troubles when temperatures are maintained below 140 F.

In closed systems where little fresh water is introduced, such as in a hot water space heating system, corrosion is usually negligible because the oxygen released in heating the water is purged through the vents.

Where large amounts of fresh water are constantly entering and are being heated, the use of mechanical deaeration is the most universally satisfactory expedient to employ. Where the use of such equipment cannot be justified economically, anti-corrosive chemicals, and the use of corrosion resistant metals, are the more practical expedients to be used.

Treating Chemicals. Alkalies, such as lime and caustic soda, silicates of soda (water glass), the poly-phosphates of soda, sodium sulphite, and sodium dichromate are usually used. Organic compounds, such as the glucosates, dextrines, and tannins are sometimes used, but their value is

still a controversial matter. When any chemical is used, so many relevant factors are involved that it is always advisable to seek adequate technical counsel in inaugurating the treatment. Very often, where such precaution is not taken, new troubles are created that are more aggravating than the original difficulty [17].

Silicate of soda is used to protect iron, lead, and brass water pipe [18]. For most waters, a solution of $Na_2O;3SiO_2$ is recommended. Sodium silicate equivalent to about 10 ppm added silica, should be fed to the water for the first month after which it may be reduced to give 5 or 6 ppm added silica. Where careful control of the silicate feed is exercised, the water is not injured for domestic use by this treatment. The rate of corrosion of iron pipe has been reduced by 70 per cent and dezincification of brass pipe practically stopped by this simple treatment. The amount required and the effect are not the same in all waters.

Pipe Materials. Brasses with 60 to 67 per cent copper are dezincified in some corrosive waters and in certain localities are not much more service-

TABLE 7. QUANTITIES OF SODIUM DICHROMATE TO BE ADDED TO MAINTAIN INITIAL CONCENTRATION

SPECIFIC GRAVITY OF BRINE TO BE STRENGTHENED	LB SODIUM DICHROMATE PER 100 LB $CaCl_2$ ADDED
1.16	0.695

1.14	1.47
1.16	1.32
1.175	1.18

able than galvanized iron or steel pipe. The zinc in brass pipes is leached out locally, leaving a plug of porous copper. The weakening of such pipe is especially noticeable under the threads. Dezincification is retarded by the use of silicate of soda (8 ppm added silica) [19].

In salt or fresh water, there is no material difference in rate of pitting of wrought iron, steel, low metalloid steels, or copper bearing steels. This is contrary to the relative performance of these metals in atmosphere.

Refrigerating Systems

Corrosion in refrigerating systems is confined to surfaces in contact with brines and/or those in contact with the refrigerant.

Brines. Refrigerating brines usually are comprised of sodium chloride, calcium chloride, or calcium and magnesium chlorides. The corrosivity of dilute brines is higher than their more concentrated solutions. The corrosivity of sodium brines, other conditions being fixed, is about 1.5 times greater than brines of the alkaline earth metals.

Brines are excellent electrolytes. Contact of dissimilar metals of wide potential differences when in contact with brines results in rapid corrosion by galvanic action.

The leakage of air, acid refrigerants, or both, accelerates the corrosivity of brines. Ammonia precipitates calcium and magnesium salts thus clogging the system at restricted points.

The addition of caustic soda and sodium dichromate to brine solutions to inhibit corrosion of iron is a more or less general practice. Sodium silicate and sodim phosphate are also used at times, but tests indicate they are not as effective as is sodium dichromate. It has been suggested [20] that 125 lb of sodium bichromate per 1000 cubic feet of calcium chloride brine, and 200 lb per 1000 cubic feet of sodium chloride brine be added to inhibit brines; that when salt or calcium chloride is added to "strengthen" brine, sodium dichromate also be added in the amounts shown in Table 7.

Refrigerants. The common refrigerants, except those of the hydrocarbon type, will attack the common metals and alloys if *moisture is present.* Even a very small amount of water may cause severe corrosion with certain refrigerants. The amount required need only be sufficient to produce a water film on the metal surface.

With the halogenated hydrocarbons, complete elimination of water is much to be desired. Where ammonia is used, copper and its alloys, aluminum and zinc, are attacked especially at elevated temperatures. When sulphur dioxide is used more than 50 ppm (0.005 per cent) of water will cause appreciable corrosion of virtually all the common materials.

Minimizing Condensate Corrosiveness

There are four expedients that may be utilized to minimize corrosion in steam condensate systems: (1) treatment of the boiler feedwater so as to eliminate deleterious gases entrained with the steam, (2) design of the condensing equipment to minimize dissolution in the condensate of the deleterious gases entrained with the steam, (3) chemical treatment of the condensate, (4) use of resistant metals.

Boiler Feedwater Treatment. Elimination of oxygen from boiler feedwater and, therefore, from the steam developed, can be accomplished either mechanically or chemically. In some steam generating stations, both expedients are employed.

Tests [21] have indicated that in small low-pressure heating boilers, where the boiler input contains less than about 50 ppm of carbonate hardness, the CO_2 in the steam can be controlled by adding calcium hydroxide to the boiler. In Fig. 5 are shown the equilibria conditions proposed for boilers operating at pressures up to about 5 psi gage. This expedient may *not* be used in higher pressure boilers, because of the possibilities of scale and sludge formations. In the latter, the only method used to date for treating the feedwater consists (a) in removing the alkaline earth salts, *i.e.*, softening (b) in subsequent acidulation followed by deaeration at temperatures near the atmospheric boiling point of water [22].

Design of Condensing Equipment. In the design of water heaters and comparable types of condensing equipment [23], it is possible to shift the accumulation of non-condensible gases to a location away from the condensate level and, subsequently, vent these gases to the atmosphere. Venting an amount of steam equal to about one-half per cent of the total steam entering the condenser is the optimum vent rate.

Venting, is of little practical value, when the CO_2 content of the incoming steam is below about 5 ppm. When the steam contains more than 5 ppm, venting provides a means of producing a condensate containing a

minimum of about 3 ppm. However, even as little as 3 ppm of dissolved CO_2 can produce active corrosion if large amounts of condensate are flowing.

Chemical Treatment of Condensate. Condensates containing comparatively large amounts of oil, are practically non-corrosive, due to the protective film provided by the oil. When oil is intentionally added to condensate[24], inadequate quantities may accelerate rather than decelerate corrosion on those surfaces not covered by the oil. Sodium silicate added to CO_2-bearing condensate has been shown to decrease, but not entirely prevent, corrosive action. It is not definite whether the protection afforded by silicate solutions is due to the establishment of a protective film on the metal surface or to neutralization of the CO_2 by the alkali in the silicate solution.

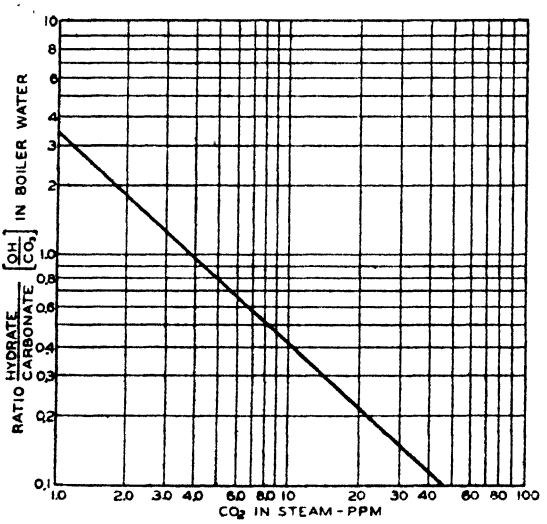

FIG. 5. RELATION OF HYDRATE/CARBONATE CONTENT IN *Hard* BOILER WATER AND CO_2 IN STEAM AT ABOUT 5 PSI OPERATING PRESSURE

(All analytical values are ppm by weight)

It has been postulated that ammonia[25], cyclohexylamine[26], ethylene diamine, and morpholine[27] will retard corrosion of condensate lines. Tests with benzylomine have also been reported[28]. Where copper and its alloys are involved, the use of alkaline inhibitors is believed inadvisable. The use of small amounts of sodium hexametaphosphate has been suggested too, but tests[29] indicate that this salt accelerates rather than decelerates, the rate of attack of steel by condensate containing CO_2 and oxygen. Whether chemical treatment of steam or condensate is feasible, must be determined not only upon the basis of the acuteness of corrosion troubles, but also upon the uses to which the steam or condensate are put.

Use of Resistant Metals. For economic reasons, the metals known to resist corrosion can seldom be used exclusively for condensate lines in any sizeable enterprise. Nevertheless, there may be instances where the use of a limited amount of the more costly, but resistant, materials can be justified. The data in Fig. 6 are the results of tests[30] designed to reflect the corrosion resistance of the more commonly used metals to attack by condensate containing oxygen and CO_2.

In contemplating the use of a resistant metal, as a section of a condensate line, it should be remembered that, if other conditions are *right*, corrosive attack will merely be transferred down stream in the system. Galvanic corrosion resulting from the contact of dissimilar metals in a condensate line seldom occurs. No paint or similar protective coating have thus far proven satisfactory. Tests of cement lined and vitreous lined pipe have shown the linings to be readily dissolved by hot condensates.

ATMOSPHERIC CORROSION

Most of the problems originated by atmospheric corrosion occur in connection with the fire-side of boilers and furnaces (including their flues and stacks), sewer vents, air ducts, coal and ash handling equipment. Usually such equipment is fabricated from common types of ferrous metals.

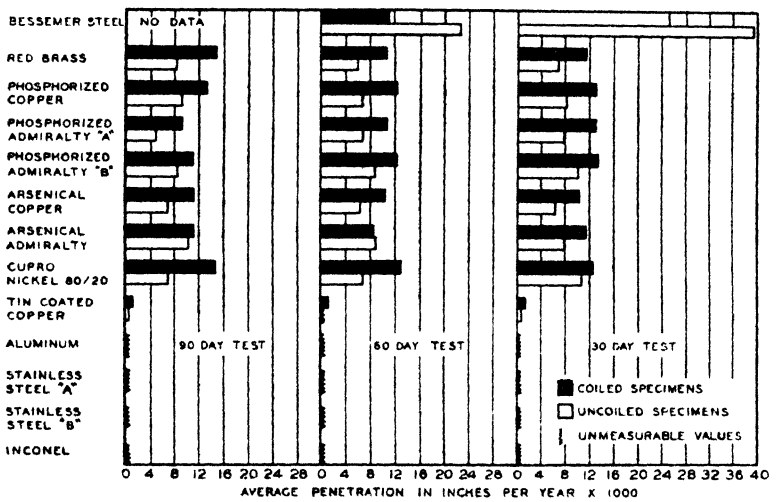

FIG. 6. COMPARATIVE CORROSION RESISTIVITY OF 10 MATERIALS EXPOSED TO CONDENSATE

Generally little or no atmospheric corrosion occurs at temperatures higher than the boiling point of water, because at such temperatures little or no condensate is formed. If it does form at the higher temperatures, only negligible amounts of carbon dioxide and oxygen, present in the atmosphere, will dissolve in the hot liquid but sulphur gases may dissolve and cause rapid attack. Oxygen, sulphur dioxide, sulphur trioxide, and carbon dioxide are the deleterious gases most frequently accountable for corrosion in moist atmospheres.

Coal Storage and Handling Equipment

Virtually all coals contain sulphur in the form of pyrite, and some moisture. In storage, the pyrite is likely to be decomposed by oxidization. Moisture dissolves the products of decomposition forming sulphurous and sulphuric acid. The acid solutions vigorously attack the supporting metal.

Rubber linings have been developed for coal chutes and bins that effectively resist corrosion and the abrasive action of the coal, but they are expensive[31]. Concrete linings for steel bunkers have also been effectively employed[32].

The use of high chromium steels is not always a sure cure, especially with coals treated with dust allaying agents high in chlorides.

Flues, Stacks, and Fire-side of Boilers

The surfaces of flues and boilers contacting the products of combustion, seldom experience corrosive attack when the equipment is in operation. Breechings, smoke hoods and canopies in contact with flue gas may, however, be subject to attack during the warming-up period of an appliance or when the rate of operation is so low that the temperature of the flue gas is below the dew-point. It is common practice to use cast-iron or acid resistant vitreous enameled steel in flue gas connections to appliances to prolong the life of these parts. The shut-down period when condensation of moisture occurs on the metal surfaces is usually the time when most damage is done [33]. In those sections of the stacks where flue gas temperature drops below the dew-point, corrosion is inevitable during operation.

It is clear that where long shut-down periods are anticipated, a practical method for mitigating corrosion is to clean the surface thoroughly and to provide adequate clean, dry air circulation to prevent condensation (See also Care of Idle Heating Boilers, p. 357, Chapter 18).

Protective coatings with organic binders are destroyed rather rapidly above 400 F because of the decomposition of the organic materials. The surfaces of metals whose temperature does not exceed 400 F, may be protected by periodically applying paints such as those specified in the following paragraphs entitled Air Ducts.

Air Ducts

The most practical method for protecting air duct surfaces made of steel from atmospheric corrosion is to apply protective paints. One of the most effective protective coatings is red lead paint.

Three coats of paint should be applied, of which the first two coats should be rust inhibitive paint such as red lead paint with the second coat tinted to a light brown color with carbon black, and the finishing coat may be red lead paint tinted to a black or brown color, black paint made according to Federal Specification TT-P-61, red iron oxide paint conforming to Federal Specification TT-P-31, or white or light tinted paint made according to Federal Specification TT-P-40.

Another paint which has had some use for priming iron and steel is zinc chromate paint.

Under some conditions, a chlorinated rubber base paint made according to Federal Specification TT-P-91 may be used for the finishing coat, particularly where the presence of highly corrosive gases or contact with strong alkaline water would injure the standard paints. Rubber base paints should be used only for the finishing coat over regular priming and second coats.

BURIED PIPE LINES

Lines that are cold and in intimate contact with the earth are corroded from the same causes as in mineral waters, but pitting is usually more intense due to variations in concentration of salts and oxygen in solution and presence of solid materials, such as cinder in contact with metal pipe. Galvanic currents induced by contact of certain dissolved constituents in the soil often act over a large area, and accelerate corrosion where they leave the pipe line.

Certain bacteria that thrive in the absence of oxygen have the power to obtain hydrogen and dissociate sulphates in the soil with a resultant production of hydrogen sulfide which attacks the iron to form iron sulphide. Other bacteria have preference for cathodic hydrogen and by removing it keep natural corrosion going on at a rapid rate.

Stray electric currents from electric power generating stations sometimes find their way into buried steel structures and do damage in proportion to the current density where the current leaves the metal to enter the ground.

Pipe Materials

Under many conditions where steel would be corroded, the use of corrosion-resistant metals other than steel may be desirable even if greater in first cost. Stainless steel, copper, red brass, and bronze will resist corrosion and may, at times, be used to advantage. Sheet lead linings are excellent to prevent corrosion, and lead pipe will resist corrosion both on the exterior and interior when used for buried pipe lines as well as for pipe for general purposes. Galvanized iron pipe will resist corrosion for various periods of time depending on the soil and how long the galvanized coating lasts. The zinc used for the galvanized coating is on the electrochemical protective side of the iron and the zinc is corroded and changed to zinc compounds before the iron is attacked. This accounts for the protection afforded by galvanized iron. Even if some protection is obtained, eventually the galvanized coatings are destroyed by chemical action and the corrosion of the steel begins.

Protective Coating

Protective coatings for buried pipe lines are in a class by themselves because of the unusual service conditions and because it is not possible to maintain them by recoating when necessary. Buried steel pipe lines have been protected against corrosion with considerable success by the use of very thick bituminous coatings applied in molten condition. The best results are obtained by applying the bituminous coatings over a standard priming coat such as red lead or a bituminous paint, and for long service it has been found that after the bituminous coatings are applied, a wrapping of asbestos fabric saturated with bitumens will prevent movement and displacement of the bituminous coatings and add greatly to the length of time.satisfactory protection will be maintained.

Cathodic Protection

Protection is obtained by rendering the structure cathodic to the surrounding water or soil by means of a controlled difference of potential. This method, which has proved satisfactory and economical on a number of gas and oil pipe lines underground, has also been applied with some success to the protection of the inside of water storage tanks and other structures that are in contact continuously with water. Protective coatings that insulate a large portion of the metal surface will reduce very materially the total amount of protective current that it is necessary to impress on bare anodic areas to arrest corrosion.

For each structure, it is necessary to determine or estimate the minimum current density required and design the anode or anodes so that the necessary protection can be obtained most economically. In water having relatively high electrical conductivity such as in sea water, this is comparatively easy compared with fresh water. In the latter, the composition

of the water is a major factor. It is therefore desirable to obtain an accurate estimate of the minimum current density required. The current is then controlled by the potential between the anode and the structure to be protected.

Rectifiers have generally proved to be the most practical means for supplying the necessary current for protection of surfaces in contact with neutral waters[34].

HANDLING WATER TREATING CHEMICALS

Virtually all the chemicals used in water conditioning are injurious if taken internally in large doses. Many also cause severe skin irritation. Thus, they should be handled with caution.

Caustic soda, lime, and concentrated sulphuric acid will burn the flesh. In addition, if mixed with small amounts of water, sufficient heat may be generated so that spattering occurs or the container becomes too hot to handle.

The chlorophenol compounds, even in the low concentrations used in water conditioning, have been reported[35] to produce dermatitis. Chromitch is not uncommon among workers handling chromates. The amines are said to be absorbed through the skin[36]. Morpholine is said to cause kidney and lung trouble when so absorbed.

Chlorine gas irritates the skin, eyes, and mucous membranes. Concentrations as low as 0.004 per cent by volume in air cause dangerous illness in 0.5 to 1 hour.

When relatively large amounts of the non-gaseous chemicals are to be handled, protective clothing, including goggles, should always be provided, and a shower head or its equivalent provided at or very near the point where the chemicals are mixed. *Chemicals should always be washed from the skin with large volumes of water.*

For the handling of chlorine and chlorinators, the U. S. Public Health Service[37] stipulates the following safety requirements:

1. Suitable gas masks and a small bottle of ammonia for testing for leaks should be kept at convenient points immediately outside the room or enclosure in which chlorine is being stored or is in use. Gas masks should be inspected at regular intervals and kept in serviceable condition. Note:—All purpose masks offer adequate protection only when the concentration of acid gases does not exceed two per cent—See "Safe Practises Pamphlet #64 National Safety Council".

2. Chlorinating equipment and cylinders of chlorine should be housed preferably in separate buildings above the ground level.

3. The room or building housing chlorinators in service should be maintained at a temperature above 60 F, but never in excess of the normal summer temperature. The cyclinders of chlorine should be shielded, where necessary, from excessive heat or cold. Direct heat should not be applied to cylinders of chlorine nor should hot water be poured over them or come in contact with the cylinder valve.

4. Adequate ventilation should be provided for all enclosures in which chlorine is being fed or stored.

5. All joints of tubing connecting chlorine cylinder and chlorinators should be kept absolutely tight and inspected frequently to insure tightness. Tubing should slope upward from the cylinder.

LEGAL REGULATIONS

In a number of states, the water used for humidification, even in industrial plants, is required to meet drinking water standards insofar as bacteriological quality is concerned. A ruling of the U. S. Department of

Agriculture, Meat Inspection Division prohibits the use of chromate in water used for air washing when the air later contacts foodstuffs[38].

There is an ever growing consciousness on the part of public health officials of the necessity for regulations to *protect* potable water supplies. Attesting this is an ordinance[39] now in effect in Detroit, Michigan, which stipulates in part:

"No physical connection shall be maintained between lines carrying city water and pipes, pumps, or tanks supplied from any other source. Where dual supplies are necessary or desired, lines carrying city water must be protected against back flow of polluted water by an *atmospheric gap*—Secondary supplies and emergency sources shall include: surface waters from rivers, lakes, ponds, lagoons, and reservoirs; well waters both deep and shallow; any supply of water which has been stored, held, or reserved after being used for industrial purposes; cooling water, or water which has in any way been treated, processed, or has been subjected or exposed to any contamination of a bacteriological or chemical nature; and water from any other source than the city supply."

The U. S. Public Health Service stipulates:

"Salts of barium, hexavalent chromium, heavy metal glucosides, or other substances with deleterious physiological effects, shall not be allowed in the water supply system."

The same agency recommends that the concentration of the substance hereinafter listed be held below the values cited:

Substance	Max. Concentration, ppm
Copper	3.0
Iron & Manganese (Total)	0.3
Magnesium	125.0
Zinc	15.0
Lead	0.1
Fluorine	1.0
Arsenic	0.05
Selenium	0.05
Phenols (Total)	0.001
Poly-phosphate of Sodium	10.0
pH Value @ 25C	10.6

The Board of Directors of the American Water Works Association has accepted these values as standard for *all* public water supplies in the United States[40]. While their action is not binding, prudence dictates that no form of treatment should be used that will result in raising the concentration of the substances listed above the value cited.

Since virtually all of the permissible chemicals used for scale slime, and corrosion control have deleterious, physiological effects if taken internally in *relatively large doses*, they should always be carefully *proportioned*. To insure this, the Detroit Ordinance stipulates that the chemical feeding device must have the following major characteristics:

"1. There shall be a visible means of checking the quantity of material being applied by the feeding device.

2. A water metering device, sealed to prevent tampering, shall be installed to measure the flow of water being treated.

3. The device shall be constructed so that in the event of back-flow or vacuums, the maximum amount of material that may be possibly back-siphoned from the device or any of its attachments or parts shall not exceed one fluid ounce.

4. Should there be a failure of the water metering device or the water supply, the feeding device shall automatically cease operating."

Chapter 52

CODES AND STANDARDS

THE Codes and Standards listed in Table 1 represent accepted practice, methods, or standards prepared and accepted by the organizations indicated. They are valuable guides for the practicing engineer in determining test methods, ratings, performance requirements, and limits applying to equipment used in heating, ventilating, and air conditioning. Copies can usually be obtained from the organization listed in the reference column.

Boilers	A.S.H.V.E. Standard Code for Testing Steam Heating Boilers Burning Oil Fuel (1932).	A.S.H.V.E.	A.S.H.V.E.
Boilers	A.S.H.V.E. Standard Code for Rating Steam Heating Solid Fuel Hand Fired Boilers (Revised April 1930).	A.S.H.V.E.	A.S.H.V.E.
Boilers	A.S.H.V.E. Standard Code for Testing Stoker-Fired Steam-Heating Boilers (1938).	A.S.H.V.E	A.S.H.V.E
Boilers	*A.S.M.E.* Boiler Construction Code for Low Pressure Heating Boilers.	*A.S.M.E.*	*A.S.M.E.*
Boilers (Miniature)	*A.S.M.E.* Miniature Boiler Code (1946).	*A.S.M.E.*	*A.S.M.E.*
Boilers	*A.S.M.E.* Boiler Construction Code (Combined Edition) (1946 with 1947 Addenda).	*A.S.M.E.*	*A.S.M.E.*
Boilers (Power)	*A.S.M.E.* Power Boiler Code, Including Rules for Inspection (1946 with 1947 Addenda).	*A.S.M.E.*	*A.S.M.E.*
Boilers (Power)	Suggested Rules for Care of Power Boilers (1946).	*A.S.M.E.*	*A.S.M.E.*
Boilers (Steel)	Steel Boiler Institute Rating Code for Commercial Steel Boilers and Residential Steel Boilers (1945).	*S.B.I.*	*S.B.I.*
Boilers (Steel)	Simplified Practice Recommendation for Steel Firebox Heating Boilers (1937).	*B. S. S.B.I.*	*B.S.* R157-37

TABLE 1. CODES AND STANDARDS—(Continued)

SUBJECT	TITLE	SPONSOR	REFERENCE
Building Requirements	American Standard Building Requirements (1946)	*N.H.A.* *U.S.P.H.S.*	*A.S.A.* A53.1-1946
Burners (Gas)	American Standard Testing Requirements for Gas Conversion Burners (1941).	*A.G.A.*	*A.S.A.* Z21.17-1940
Burners (Gas)	American Standard Requirements for Installation of Gas Burning Equipment in Power Boilers (1942).	*A.G.A.*	*A.S.A.* Z21.33-1942
Burners (Anthracite)	Commercial Standard for Domestic Burners for Pennsylvania Anthracite (Underfeed Type) (1940).	*B.S.* *A.I.L.*	*B.S.* CS48-40
Burners (Oil)	Commercial Standard for Mechanical-Draft Oil Burners Designed for Domestic Installations (1942).	*B.S.* *O.B.I.*	*B.S.* CS75-42
Cleaners (Air)	A.S.H.V.E. Standard Code for Testing and Rating Air Cleaning Devices Used in General Ventilation Work (1934).	A.S.H.V.E.	See A.S.H.V.E. TRANSACTIONS, Vol. 39, 1933, p. 225
Color Scheme (Piping)	Scheme for Identification of Piping Systems (1945).	*H.P. & A.C.C.N.A.*	*H.P. & A.C.C.N.A* Engrg. Stds., Sec. 2. Part V
Color Scheme (Piping)	Scheme for Identification of Piping Systems (1928).	*A.S.M.E.*	*A.S.A.* A13-1928
Coils	Proposed Commercial Standard for Rating and Testing Air Cooling Coils Using Non-Volatile Refrigerants (1945).	*B.C.M.I.* *B.S.*	*B.S.* T.S. 4044
Compressors	Tentative *A.S.R.E.* Standard Methods of Rating and Testing Refrigerant Compressors.	*A.S.R.E.* A.S.H.V.E. *A.C.R.M.A.*	*A.S.R.E.* Circular No. 23
Condensers	*A.S.R.E.* Standard Methods of Rating and Testing Evaporative Condensers.	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 20
Condensers	Tentative *A.S.R.E.* Standard Methods of Rating Water-Cooled Refrigerant Condensers.	*A.S.R.E.* A.S.H.V.E *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 22
Condensing Units	*A.S.R.E.* Standard Methods of Rating and Testing Mechanical Condensing Units (1940).	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 14-41
Condensing Units	Commercial Standard for Commercial Electric Refrigeration Condensing Units (1945).	*B.S.* *S.R.C.A.*	*B.S.* CS107-45
Conductivity	Standard Method of Test for Thermal Conductivity of Materials by Means of the Guarded Hot Plate (Tentative) (1942).	A.S.H.V.E. *A.S.R.E.* *A.S.T.M.* *N.R.C.*	A.S.H.V.E.
Control Equipment (Industrial)	Underwriter's Laboratories, Inc., Standard for Industrial Control Equipment (July 1938, reprinted Sept. 1945).	*U.L.*	*U.L* Subject 508
Controls	Underwriter's Laboratories, Inc., Standard for Temperature Indicating and Regulating Equipment (Jan. 1947).	*U.L.*	*U.L.* Subject 873
Convector	A.S.H.V.E. Standard Code for Testing and Rating Concealed Gravity Type Radiation (Steam Code) (1931).	A.S.H.V.E.	A.S.H.V.E. TRANSACTIONS, Vol. 37, 1931, p. 367
Convector	A.S.H.V.E. Standard Code for Testing and Rating Concealed Gravity Type Radiation (Hot Water Section) (1933).	A.S.H.V.E.	A.S.H.V.E. TRANSACTIONS, Vol. 39, 1933, p. 237
Convector	Recommended Commercial Standard for Testing and Rating Convectors (1946).	*B.S.* *C.M.A.* *I.B.R.*	*B.S.* TS-4169
Coolers (Air)	Proposed *A.S.R.E.* Standard Methods of Rating and Testing Forced Circulation and Natural Convection Air Coolers for Refrigeration (1945).	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.* *R.E.M.A.*	*A.S.R.E.* Circular No. 25-44
Coolers	Tentative *A.S.R.E.* Standard Methods of Rating and Testing Water and Brine Coolers.	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 24
Cooling Units	Standard Methods of Rating and Testing Self Contained Air Conditioning Units for Comfort Cooling (1940).	*A.S.R.E.* A.S.H.V.E. *R.M.A.* *N.E.M.A.* *A.C.M.A.*	*A.S.R.E.* Circular No. 16

TABLE 1. CODES AND STANDARDS—(Continued)

SUBJECT	TITLE	SPONSOR	REFERENCE
Ducts and Fittings	Simplified Practice Recommendation for Pipes, Ducts and Fittings for Warm Air Heating and Air Conditioning (1945).	*Mfrs.* *B.S.*	*B.S.* R207-45
Exchangers (Heat)	Standards of *Tubular Exchanger Manufacturers Association* (1941).	*T.E.M.A.*	*T.E.M.A*
Exhaust Systems	American Standard for Grinding, Polishing, and Buffing Equipment Sanitation (1941).	*A.F.A.*	*A.S.A.* Z43-1941
Exhaust Systems	Tentative Code of Recommended Practices for Testing and Measuring Air Flow in Exhaust Systems (1937).	*A.F.A.*	*A.F.A.* Preprint 36-27
Exhaust Systems	Tentative Recommended Good Practice Code and Handbook on the Fundamentals of Design, Construction. Operation and Maintenance of Exhaust Systems.	*A.F.A.*	*A F.A.*
Fans	Definitions and Terms in Use by the Blower Industry (1940).	*N.A.F.M.*	*N.A.F.M.* Bulletin No. 105
Fans	Standard Test Code for Centrifugal and Axial Fans (1938).	*N.A.F.M.*[a] A.S.H.V.E.	*N.A.F.M.* Bulletin No. 103
Fans	*N.E.M.A.* Fan Standards (1944).	*N.E.M.A*	*N.A.F.M.* Publ. 44-95
Fire Prevention	Building Code Recommended by the *National Board of Fire Underwriters* (1943).	*N.B.F.U.*	*N.B.F.U.*
Fire Prevention	National Fire Codes (1944).	*N.F.P.A.*	*N.F.P.A.*
Fire Prevention	National Fire Code for the Prevention of Dust Explosions (1943)	*N.F.P.A.*	*N.F.P.A.*
Furnaces (Duct)	American Standard Approval Requirements for Gas-Fired Duct Furnaces (1942).	*A.G.A.*	*A.S.A.* Z21.34-1942
Furnaces (Gas, Floor)	Commercial Standard for Gas Floor Furnaces—Gravity Circulating Type (1942).	*B.S.* *A.G.A.E.M.*	*B.S.* CS99-42
Furnaces (Gas)	American Standard Approval Requirements for Central Heating Gas Appliances (1943).	*A.G.A.*	*A.S.A.* Z21.13-1943
Furnaces (Forced Air, Solid-Fuel)	Commercial Standard for Solid-Fuel-Burning Forced Air Furnaces (1944).	*F.H.A.* *N.W.A.H. & A.C.A* *A.I.L.*	*B.S.* CS109-44
Furnaces (Oil-Fired)	Commercial Standard for Warm Air Furnaces Equipped with Vaporizing Pot Type Oil Burners (1943).	*Mfrs.* *B.S.*	*B.S* CS(E)104-43
Furnaces (Oil)	A Tentative Code for Testing Oil-Fired Furnaces	*N.W.A.H. & A.C.A.*	*N.W.A H. & A.C.A*
Furnaces (Oil)	Commercial Standard for Oil Burning Floor Furnaces Equipped with Vaporizing Pot-Type Burners (1944).	*B.S.* *O.P.A.*	*B.S.* CS113-44
Garages	Code of Minimum Requirements for Heating and Ventilating Garages (1935).	A.S.H.V.E.	A.S.H.V.E.
Gases (Toxic) and Dust	American Standard Allowable Concentration of Harmful Gases:	*A.S.A.*	*A.S.A.*
	Carbon Monoxide		Z37.1-1941
	Hydrogen Sulfide		Z37.2-1941
	Carbon Di-sulfide		Z37.3-1941
	Benzene		Z37.4-1941
	Cadmium		Z37.5-1941
	Manganese		Z37.6-1942
	Chromic Acid and Chromates		Z37.7-1943
	Mercury		Z37.8-1943
	Metallic Arsenic and Arsenic Trioxide		Z37.9-1943
	Xylene		Z37.10-1943
	Lead and Certain Inorganic Lead Compounds		Z37.11-1943
	Toluene		Z37.12-1943
	Oxides of Nitrogen		Z37.13-1944
	Methanol		Z37.14-1944
	Styrene-Monomer		Z37.15-1944
	Formaldehyde		Z37.16-1944
Heat Transfer (Walls)	A.S.H.V.E. Standard Test Code for Heat Transmission Through Walls (1928)	A.S.H.V.E.	A.S.H.V.E.

[a]Also endorsed by *P.F.M.A.*

TABLE 1. CODES AND STANDARDS—(Continued)

SUBJECT	TITLE	SPONSOR	REFERENCE
Mineral Wool	Commercial Standard for Mineral Wool: Blankets, Blocks, Insulating Cement, and Pipe Insulation for Heated Industrial Equipment (1944).	*B.S.* *I.M.W.I.*	*B.S.* CS117-44
Mineral Wool	Commercial Standard for Mineral Wool: Loose, Granulated or Felted Form, in Low Temperature Installations (1943).	*B.S.* *I.W.M.I.*	*B.S.* CS105-43
Mineral Wool	Recommended Commercial Standard for Industrial Mineral Wool Products—All Types—Testing and Reporting (1946).	*I.M.W.A.* *B.S.*	*B.S.* CS131-46
Motors	Nema Motor and Generator Standards (June 1945).	*N.E.M.A.*	*N.E.M.A.* 45-102

MANUFACTURERS'

CATALOG DATA

PAGES 917-1278

On pages 947-1278 will be found the Catalog Date of 230 manufacturers whose products are described and illustrated.

For the convenience of the user of THE GUIDE 1948 there are eight main divisions:

Air Conditioning	947-1006
Air Conditioning and Heating Piping	1007-1013
Air System Equipment	1014-1115
Bends, Coils, Fittings	1116-1121
Controls and Instruments	1122-1144
Heating Systems	1145-1237
Insulation	1238-1271
Publications	1272-1278

On pages 915-944, under each of the index headings—Air Cleaning Equipment, Fans, Humidifiers, Ventilators, etc., will be found a list of manufacturers of any desired products, fully cross-indexed, and the page numbers in the Catalog Data Section where the products are described.

By reference to these indices, the manufacturers names and the page numbers, any item of equipment or materials, and the producers address, may be located quickly.

Air & Refrigeration Corporation

475 Fifth Avenue, **New York 17, N. Y.**

Atlanta, Ga. **Detroit, Mich.**

Air Conditioning, Humidifying, Dehumidifying, Cooling, Scrubbing, Air Washing and Purification Apparatus

Air & Refrigeration Corporation specializes in the design and manufacture of industrial and comfort-conditioning apparatus where maintenance of suitable humidity and temperature within closely controllable limits is essential. This specialization is based on technical knowledge and ingenuity born of extensive experience in the solution of the more difficult problems of air conditioning. A complete line of air conditioning equipment is available to contractors and owners for all phases of humidifying, dehumidifying, cooling and washing.

Capillary Air Washers provide a superior type humidifying, dehumidifying, air washing, cleaning and cooling unit for central station apparatus. For most purposes the Capillary Washer requires 1/3 the volume of water at 1/3 the pressure used by conventional spray equipment. They are available with factory insulated casings and tank for central station applications. *For complete data, see Bulletin G-3.*

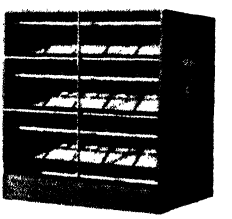
Capillary Unit Conditions are factory insulated and assembled, ready for use. They include fan, motor, drive, heating coils, Capillary Cells with suitable sprays, spray pump and mixing dampers. Units are designed for floor mounting or for ceiling suspension, and can be arranged for the reception of cooling coils, if required. *Complete description and engineering data will be found in Bulletin G-3.*

Spray Type Air Washers for washing, humidifying and dehumidifying air are all basically the same. A & R Spray Washers include special features of design developed to insure more efficient and dependable operation, lower maintenance costs, and, in many cases, lower installation costs. Such features relate especially to eliminators, collecting tanks, flooded baffles, nozzle arrangement, etc. Spray Washers can be supplied with factory insulated casings and tank for central stations applications. *For details, see Bulletin AW-1.*

Sprayed Coil Dehumidifiers for year-round treatment of air are complete with heating coils, sprays, circulating pump and glass mat eliminators. Sprayed coil dehumidifiers are factory insulated and complete, ready for assembly in the field. Special features in design insure continuous washing and cleaning of finned surfaces and easy accessibility to all parts. *For engineering information and detailed description, see Bulletin SC-1.*

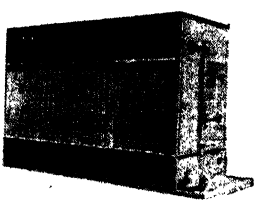
A & R Insulated Panels consist of insulation between metal sheet on one side and hard fiber board on the other, the three laminated and cemented together under pressure. This unique panel design includes the structural frame to form units which require *only bolting together* to make enclosures of any required shape for plenum chambers and many other purposes. Panels are available in widths from 3 in. to 48 in., and in lengths to 12 ft. Their use insures tremendous economies in field labor. *For details, see Bulletin P-1.*

Submit design and capacity for special recommendations; write for catalog and engineering data.

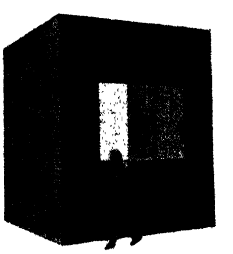


Factory Insulated Class 1 Capillary Air Washer—Capacity 33,000 cfm.

Factory Insulated Size #3-4 Capillary Unit Conditioner—Capacity 16,000 cfm.



Factory Insulated Prewasher for Lint Removal—Capacity 12,000 cfm.



Factory Insulated Plenum Chamber—Size 18 ft Long, 12 ft Wide x 15 ft High.

American Blower Corporation

Detroit 32, Michigan

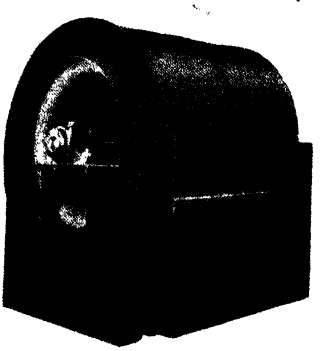
CANADIAN SIROCCO COMPANY, LTD.

310 Ellis Street, Windsor, Ontario

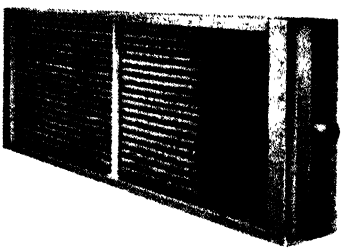
Branch Offices in Principal Cities

Division of AMERICAN RADIATOR & Standard Sanitary CORPORATION

AIR CONDITIONING — HUMIDIFYING — DEHUMIDIFYING — COOLING — VENTILATING — HEATING — VAPOR-ABSORPTION — DRYING — AIR WASHING AND PURIFICATION — EXHAUSTING EQUIPMENT AND MECHANICAL DRAFT APPARATUS



Double Inlet "ABC" Multi-blade Fan—above, is a heavy duty ventilating fan. The wheel has narrow, forward pitched blades. Low tip speeds assure quiet operation. Request Bulletin A-801. Bulletin A-603 describes backwardly inclined, non-overloading HS Fan.



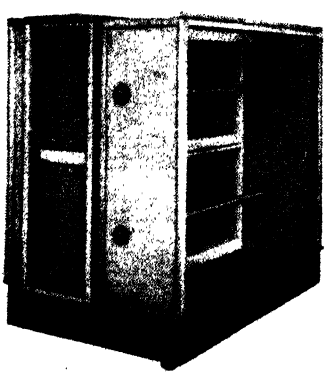
Heating and Cooling Coils—above, American Blower heating and cooling coils offer a number of improvements in design and construction. Available in a complete range of sizes and types, including:

Bulletin B-1218 { Type S steam coils; Type D double tube coils; Type U return blend coils; Type B booster coils

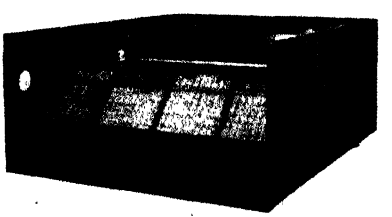
Bulletin 1521 { Type W water coils; Type C cleanable water coils; Type X direct expansion coils

Bulletin B-1318 Type H heavy duty coils

"ABC" Utility Sets—complete packaged units, direct connected or V-Belt short coupled drive for duct applications. Sizes for wide variety of ventilating problems. Quiet, compact. Bulletin 2814.



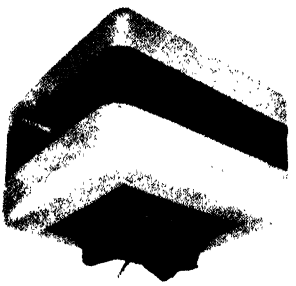
American Blower Air Washer—above, cleans, purifies and freshens air, removes dust, odors and bacteria, cools if desired and provides an effective method of controlling humidity. Bulletin 3623.



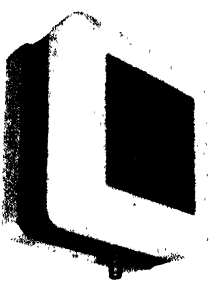
Capillary Air Washers—above, for high efficiency in cleaning, humidification, cooling and dehumidification of air. Air is forced at low resistance through long, irregular passages of small size formed by a large amount of thoroughly wetted glass surface. Write for Bulletin 3723.

TYPES OF AMERICAN BLOWER CORPORATION AIR HANDLING AND CONDITIONING EQUIPMENT

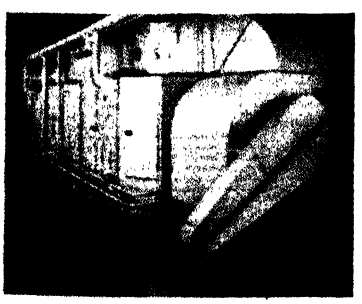
All types of air handling and air conditioning equipment for industrial applications, process work, drying, cooling; also equipment for stores, offices, shops, public buildings, power plants, etc., and attic and kitchen ventilation for homes.



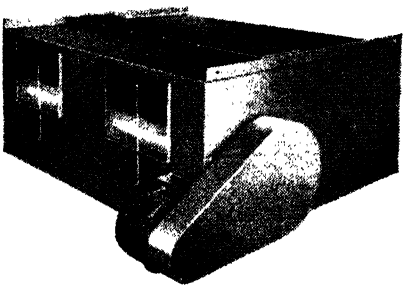
"ABC" Vertical Unit Heaters—for ceiling applications, give an even, wide floor area distribution of heat. For either steam or hot water heating systems. Variable speed, 2-speed and constant speed models. Write for Bulletin 6417.



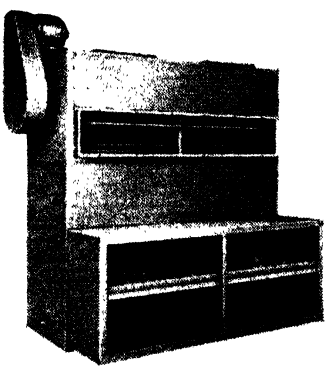
Venturafin Unit Heaters—for many general purpose heating jobs. Wall or ceiling mounted. Streamline construction. rugged heating elements. Steam or hot water. Request Bulletin 6317.



Air Conditioning Central Systems—provide an effective way of cooling, heating, humidifying, dehumidifying and purifying air in all classes of business and public buildings where a duct system is desirable. Write for special data.



Heating and Ventilating Units—with air filters and Aileron control. Ideal wherever attractive, quiet and economical heating and ventilating units are required. Wall, floor or ceiling mounting. Offer great flexibility of design and arrangement to meet specific needs. Bulletin 6017.



American Blower Air Conditioning Units—*Type A* for all normal unitary type commercial and industrial applications. Cooling, heating, humidifying. Capacities 1000 cfm—13,600 cfm. *Type S* for commercial and industrial applications desiring washed air or high relative humidities. Capacities 1000 cfm—13,600 cfm. *Type M*, large capacity for central system installation with separately mounted fan. Cooling, dehumidification, heating, humidifying. Capacities 1000 cfm—41,000 cfm. Bulletin 6527.

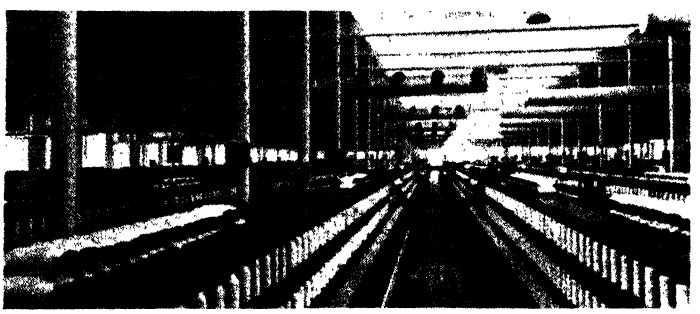
HUMIDUCT

AIR CONDITIONING SYSTEM



The Bahnson Humiduct is a unit system of air conditioning for humidifying, ventilating, evaporative or refrigerative cooling, heating, filtering, electrostatic air cleaning, and dehumidifying, in any desired combination. Through the application of delivering saturated air plus entrained moisture, wherein part of the evaporation may take place in the room, supplementary evaporation is not required with the Humiduct. The use of this principle allows a more accurate control of humidity with a lower volume of air than is required with saturated air types of systems.

BAHNSON CENTRAL STATION AIR CONDITIONING

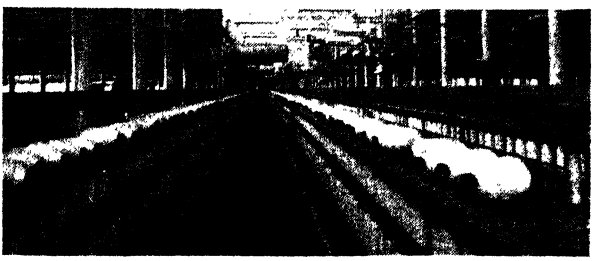
Air washers and other components for evaporative cooling or refrigerative cooling systems are designed, manufactured, and installed by Bahnson for applications requiring central station air conditioning. Conventional air washers of single or double bank sprays and the Bahnson Centrispray which utilizes the principle of centrifugal atomization of water are manufactured in required sizes.

Bahnson Central Station with Refrigeration

Bahnson System
AIR CONDITIONING ENGINEERS

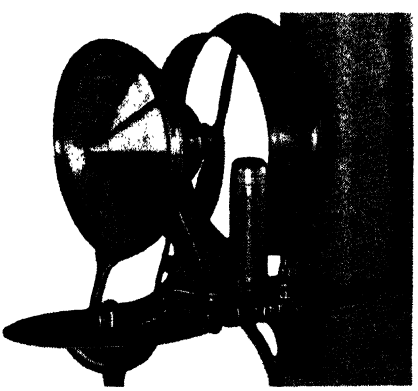
AIR-VITALIZER

The Bahnson Air Vitalizer air conditioning system employs a dry duct unit distribution system combined with the Bahnson Centrifugal Humidifier or the Bahnson Economizer Atomizer to obtain evaporation. Ventilation, humidification, evaporative cooling, heating and air filtering are combined with the flexibility of the Air Vitalizer system to permit any air handling or evaporative capacity. Positive circulation affords even distribution with additional sensible Cooling.



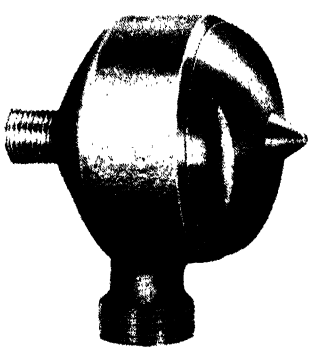
CENTRIFUGAL HUMIDIFIER

The Bahnson Centrifugal Humidifier is a completely self-contained unit humidifier requiring only water supply, drain, and electrical connection for installation. Evaporative capacity ranges up to 12 gal of water per hour dependent upon the size of the Humidifier and conditions under which it must operate. The Centrifugal Humidifier may be equipped with the Type J individual humidity control, or the highly sensitive Bahnson Master B control may be used to actuate an electric motor valve on the feed water line to a group of humidifiers.



Type H with J Control

1. **Atomizes water into a fine mist.**
2. **Diffuses the mist with room air until absorbed.**
3. **Distributes the humidified air uniformly.**
4. **Automatically controls evaporation for constant relative humidity.**



Type ESC
Pat. Pending

Economizer ATOMIZER

The Type ESC Bahnson Economizer is a pneumatic Atomizer employing air and water under pressure to produce a fine spray for humidification purposes. The Type ESC Atomizer is very simple in construction and dependable in operation. It includes a self-cleaning pin operating in conjunction with the water pressure to remove any dirt from the water line. The capacity of this Atomizer may be adjusted for amount of evaporation and quality of spray by regulating the pressure of the air and water supplying the unit. When operating at from 20 lb to 25 lb air pressure, the unit uses as little as one-half the amount of compressed air required for aspirating type Atomizers for comparable spray quality and evaporative capacity.

Carrier AIR CONDITIONING

Room Air Conditioners—compact units in attractive cabinets; two sizes in window type models and two sizes in floor or console models. Built to provide summer comfort air conditioning, year round ventilation and air circulation for individual rooms, private offices and other similar small enclosures.

Self-Contained Air Conditioners—completely enclosed in neat cabinets, these units provide summer comfort for residences, retail shops, general offices, beauty salons, and other commercial spaces of medium size.

Assembled Air Conditioners—fully enclosed, compact units designed for installation outside the space to be air conditioned, and using ducts to distribute the air. Ideal for year round air conditioning of laboratories, offices, stores, and similar interiors.

Unitary and Central Station Air Conditioners—for groups of rooms such as offices and laboratories, and for large spaces such as stores, factories, theaters, industrial plants, and other interiors requiring year round air conditioning. Units available in floor or suspension models. Supplemented by refrigeration where cooling and dehumidifying is required.

"Weathermaster" Systems—for air conditioning of multi-story, multi-room buildings such as apartments, hospitals, hotels and office buildings. System consists of room units in decorative cabinets or for furring in under windows, each with individual control of temperature, and a central station apparatus. In one system the air is distributed through conduits requiring but little space—practical for new or old buildings. A special development of Carrier Corporation.

Blast Freezers and Cold Diffusers—for food freezing and storage, meat packing operations, and other industries requiring low temperatures. Units are available in suspension or floor models and can be used within the space to be refrigerated or remotely located and connected by ducts.

Write for descriptive literature on any of the above equipment

Carrier REFRIGERATION

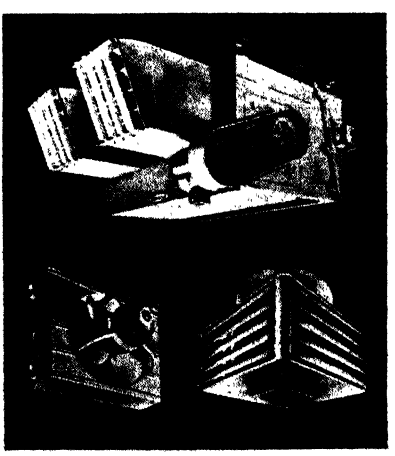
Centrifugal Refrigerating Machine—for large comfort and industrial air conditioning applications and for cooling processes down to below −100 F. These efficient machines operate with any standard drive, are simple in operation and require little maintenance. Uses safe refrigerant. Available in capacities from 100 to 1200 tons cooling

Reciprocating Refrigerating Machines—to provide refrigeration for industrial and comfort air conditioning of moderate size and for process cooling. These new 5 Series machines are available in direct connected or belt drive, water or evaporative cooled types and are job-assembled to give widest variety of capacities. Sizes from 5 to 100 hp.

Commercial Refrigerating Machines—for storage refrigerators, display cases, milk coolers, ice makers, farm and home food freezers in a wide range of capacities and temperatures. Units use "Freon" or Methyl Chloride refrigerants and are complete with compressor, drive, air or water cooled condenser, and controls mounted on a one-piece base.

Evaporative Condensers—for condensing refrigerants and cooling liquids by a process of blowing air over wetted coils. The evaporation of the water from the surface of the coils removes a maximum amount of heat with a minimum of water consumption. Can be used in place of a cooling tower. Afford savings wherever water costs are high. May be placed outdoors without protection. Capacities range from 6 to 75 tons condensing.

Carrier INDUSTRIAL HEATING



Unit Heaters—for commercial and industrial heating uses. Available in two suspended types: one horizontal discharge model for small space heating and one vertical 4-way discharge model for larger areas. Both models have adjustable louvres for directional control. Units consist of propellor type fan, coils for steam or hot water, and drive, all neatly encased. Available with manual or thermostatic controls. Capacities range from 15,600 to 502,000 Btu per hour at 2 lb steam pressure.

Heat Diffusing Units—for commercial and industrial buildings. Suspended or floor models with centrifugal type fan, coils for steam or hot water, and selective air distribution, all factory assembled for easy installation. Capacities are from 115,000 to 1,570,000 Btu per hour at 2 lb steam pressure.

Write for descriptive literature on any of the above equipment.

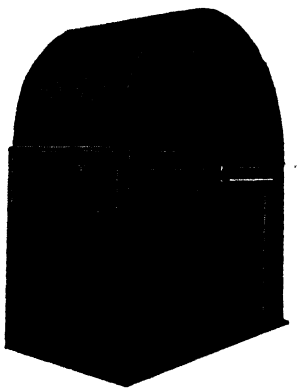
Clarage Fan Company

Kalamazoo, Michigan

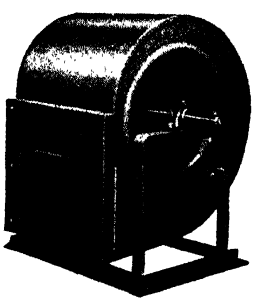
Application Engineering Offices — In Principal American Cities

(Consult Telephone Directory)

Clarage Air-Handling and Conditioning Equipment



Fans for ventilating and air conditioning. Capacities; 200 to 200,000 cfm.



Fans for warm air furnaces, oil burners, stokers, etc. 200 to 9000 cfm.

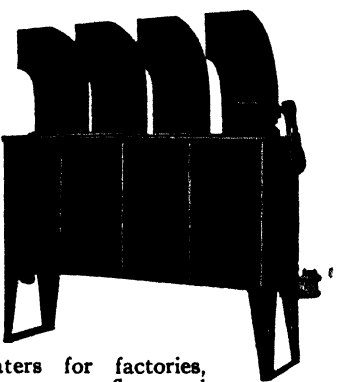
Fans for exhaust systems, pressure blowing, etc. 100 to 50,000 cfm.; built for a wide range of pressures.

Air Conditioning central systems and units to solve any temperature and humidity control problem.

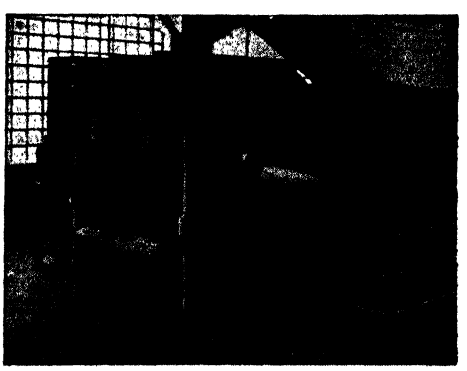
Fans • Blowers • Air Washers Air Conditioning Systems and Units • Unit Heaters & Coolers

For over thirty-five years Clarage has been a leading manufacturer of equipment for ventilating, heating, cooling, drying, air cleaning, humidifying, dehumidifying, complete air conditioning, exhausting, pneumatic conveying and mechanical draft. Clarage equipment is designed to meet all types of industrial, commercial, public building and power plant requirements. Whatever your air-handling or conditioning problem, Clarage is an excellent source of supply.

We build many other types of fans and allied equipment. Write for a Clarage catalog covering our complete line.



Unit Heaters for factories, stores, offices, etc.—floor and suspended type units. Offered in 19 standard sizes.



GENERAL REFRIGERATION

YATES-AMERICAN MACHINE CO., Beloit, Wisconsin

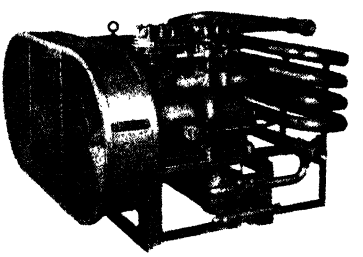
TWO GOOD NAMES TO REMEMBER

Lipman AUTOMATIC REFRIGERATION

GR AIR CONDITIONING

LIPMAN FOR REFRIGERATION

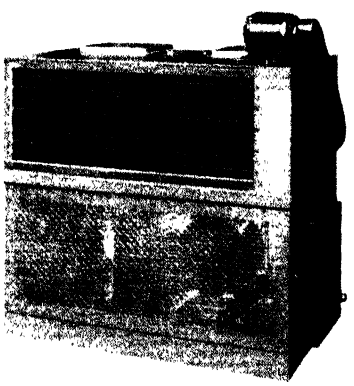
You can choose from a wide range of LIPMAN automatic refrigeration units —¼ thru 40-hp capacity—air or water-cooled - with ammonia, freon or methyl chloride refrigerant. Every unit is backed by more than a quarter century of LIPMAN service in every field of commercial refrigeration—your guarantee of dependable, economical performance.



MODEL F1509 WATER COOLED FREON—12 CONDENSING UNIT

A compact, self-contained 15-hp Freon-12 condensing unit.

GENERAL REFRIGERATION FOR AIR CONDITIONING



During its thirty years in the field, General Refrigeration has developed an outstanding line of air conditioning equipment, with a size and type for every requirement in theaters, hotels, factories, offices, shops, laboratories, etc.

MODEL 10-4000 DUCT-TYPE SELF-CONTAINED AIR CONDITIONER

Equipped with 10-hp condensing unit. Requires relatively small operating charge of refrigerant.

Let experienced GR-LIPMAN engineers study your refrigeration or air conditioning needs and recommend the correct unit for the job. No obligation. Write General Refrigeration Division, Yates-American Machine Company, Beloit, Wis., for descriptive literature and nearest distributor.

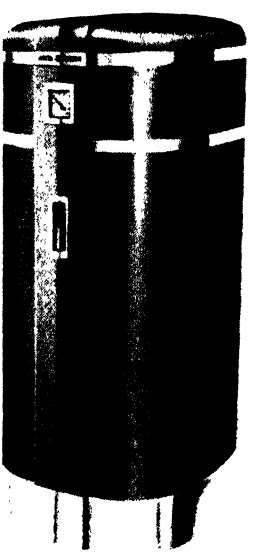
G-E AUTOMATIC HEATING EQUIPMENT

A COMPLETE LINE



G-E OIL-FIRED BOILER. Available in 7 sizes, from 75,000 to 450,000 Btu. Shipped with controls and jacket dismounted, to permit easy handling of the boiler. Assembly and installation on the site is a quick, simple job. Listed by Underwriters' laboratories.

G-E CONVERSION OIL BURNER. Attachment type. Comes in 2 sizes, 3 capacities (1 to 3 gal) with an input Btu range from 141,000 to 423,000 Btu. Listed by Underwriters' laboratories.

G-E WARM AIR OIL FURNACE. Small, packaged units, easily and economically installed. Two sizes, 60,000 and 85,000 Btu. Listed by Underwriters' Laboratories for 2 in. clearance on both sides and back.

G-E GAS-FIRED BOILER. Comes in 8 sizes, with Btu output ranging from 76,800 to 345,600. *A. G. A.* approved, Underwriters' Laboratory listed.

G-E GAS-FIRED WARM AIR FURNACE. Compact, packaged, easily and economically installed units in 5 sizes. Btu outputs ranging from 48,000 to 168,000. Listed by Underwriters' Laboratories for 2 in. clearance on both sides and back.

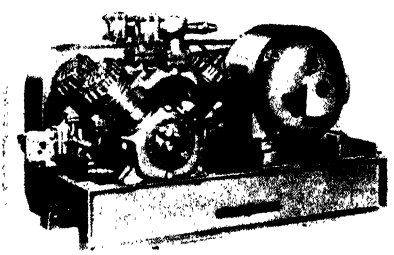
PACKAGED AIR CONDITIONING EQUIPMENT

G-E SELF-CONTAINED AIR CONDITIONERS to provide air conditioning directly in the space or remotely installed with simple ductwork, for stores, beauty shops, restaurants, large offices, office suites, or apartments. All parts accessible for service through easily removable front and side panels. Two new attractively styled models available, with 3-hp and 5-hp compressor motors, respectively.

WATER COOLERS

G-E WATER COOLERS—bottle type—designed to hold either 3 or 5 gallon water bottles and to cool 2.5 gal per hour, *A.S.R.E.* standard capacity rating. Extensively used in offices and small shops. G-E PRESSURE BUBBLER WATER COOLERS—FOOT PEDAL OPERATED—range in cooling capacity from 5.3 to 20.5 gph, *A.S.R.E.* standard capacity ratings. Wide variety of applications.

CENTRAL PLANT AIR CONDITIONING AND REFRIGERATION EQUIPMENT



REFRIGERATING CONDENSING UNITS 1/6 to 125-hp—A complete line of reciprocating type condensing units for use with "Freon" refrigerants. Air-cooled models available from 1/6-hp to 3-hp. Water cooled models available from 1/2-hp to 125-hp. Motor-compressor units for use with evaporative condensers or cooling towers available from 3-hp to 125-hp.

UNIT COOLERS—G-E "Conditioned Air" Unit Coolers can be applied to provide the essential, balanced combination of proper high humidity, gentle positive air circulation, and the correct temperature to maintain the quality, appearance, and weight of perishable foods.

CENTRAL PLANT AIR CONDITIONERS—for summer, winter, or year round air conditioning. Extra large, dynamically balanced multivane fans spring mounted for smooth operation. Panels on both sides, front, and top are easily removable. Practically all parts can be removed or serviced without disturbing frame or putting stresses on other parts.

Air cleaning by removable spun glass filters. Humidification actuated by drip screen humidifiers.

In sizes from 2.82 to 33.0 tons of refrigeration. Units are compact, thoroughly insulated internally, and finished in attractive gray so that they need not be concealed. No field fabrication is necessary.

FINNED HEAT TRANSFER SURFACE—G-E Electro-Thermal process causes intimate Thermal Bond, providing metal-to-metal contact (aided by generously proportioned die-punched collars themselves) for high efficiency.

Assembled in different tube sheets and headers to provide coils for wide variety of heating, cooling, or freezing applications. Designed for multiple mountings in housings or ducts, these coil assemblies can be bolted together to form unbroken surface. Single coils available in finned lengths to 12 ft, face areas up to 29.25 sq ft.

Coil assemblies equipped with truly cleanable "Freon" distributor of simple design. Any manufacturer's expansion valve can be used, or G. E. will select valve for application. Coils supplied with fin spacing 3, 4, 6, or 9 fins per inch.

COMPLETE AIR CONDITIONING SYSTEMS—Multiple unit systems for the air conditioning of hotels, office buildings, apartment houses, and hospitals. Attractive, compact room units make possible personal control of conditions in individual rooms. Refrigeration in central plant furnished by reciprocating type condensing units or centrifugal refrigeration units as requirements dictate.

Hastings Air Conditioning Co., Inc.

Hastings, Nebr.

Manufacturers of

AIR CONTROL AIR CONDITIONING

Air Conditioners.
Unit Heaters.
Utility and Package Blowers.

Dealers and Representatives in Principal Cities

A Complete Line of Highly Specialized Air Conditioners For DX, Cold City Water, Chilled or Well Water Operation.

All equipment may be used for combination cooling and heating.

Water coils are six rows deep and DX coils four rows deep. Developed and designed for utmost efficiency. Constructed of copper tubing expanded and metallically bonded to pure copper fins.

FLOWMETERS (to visually control flow) are standard on all water equipment.

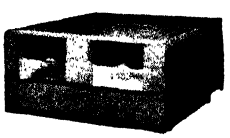
FLOOR MODELS

Floormasters — Unusual design and special features permit maximum installation possibilities with excellent results.

Cooling Capacity—
Water coils, 3 to 6 tons.
DX coils, 5 tons.
Air Delivery—2240 cfm.
Motor—½ hp Filters—three 16x25. Dimensions—Ht. 93 in., Width 48 in., Depth 25 in.

Royal—For offices, homes, hospitals, etc.
Cooling Capacity—
Water, 1 to 2 tons.
⅙ hp 590 cfm Filter 16x25.
Dimen. Ht. 40 in., Wd. 28 in., Depth 20½ in.

CENTRAL PLANTS



Sectional construction for ease of handling. Motors inside mounted to provide very neat appearing compact units.

SPECIFICATIONS

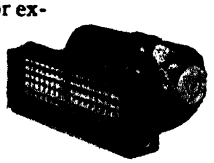
Size	CFM	Motor Hp	Filters	Capacity Tons
CP 30	3,000	1	5	4- 9
CP 40	4,000	1	8	6-12
CP 60	6,000	2	10	9-18
CP 80	8,000	3	12	12-24
CP120	12,000	5	20	18-36

STEAM UNIT HEATERS

Centrifugal Type for extreme quietness and efficiency.

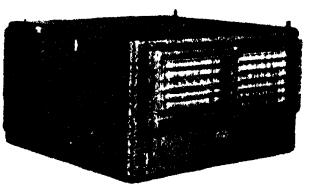
Steam pressure—to 150 lbs per sq in.

Finish—Brown wrinkle enamel and stainless steel louvers.



GENERAL UTILITY MODELS

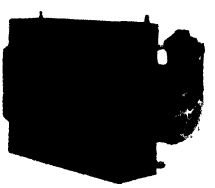
Master—Singly or in multiple are suitable for any business or space size. Large jobs handled without duct work by proper location of units.



Cooling Capacity—
Water coils, 3 to 6 tons.
DX coils, 5 tons.
Air Delivery—2,240 cfm.
Motor—½ or ¾ hp. Filters—four 16x23.
Dimen. Ht. 29 in., Wd. 49 in., Depth 50 in.

Majestic—Similar to Master except size. Cooling Capacity—Water 1½ to 3 tons. ¼ hp 1120 cfm Two 16x25 filters. Dimensions—Ht. 26 in., Wd. 28 in., Depth 40 in.

GAS UNIT HEATERS



These CENTRIFUGAL gas unit heaters present many fine and unusual features.

Squirrel-cage blowers provide SILENT operation and permit air delivery thru duct systems up to ¼ in. S. P.

Stainless steel ribbon burners result in quiet efficient combustion.

Dual directional, individually adjustable stainless steel louvers permit complete control of air delivery.

District Engineers in Principal Cities

Over 30 Years' Experience in Industrial Air Conditioning, Liquid Cooling and Air Drying

NIAGARA AERO HEAT EXCHANGER

For cooling industrial liquids, water, oils, solutions, chemicals, compressed air and gases, with Niagara "Balanced Wet-Bulb" temperature control to improve efficiency and obtain precise results. Patented (U. S. Nos. 2,296,946 and R. I. 22,553). Ask for Bulletin 96.

NIAGARA AIR CONDITIONING SYSTEMS

For human comfort and for all industrial applications requiring controlled conditions of temperature, relative humidity, air purity and air movement.

NIAGARA AIR CONDITIONER, TYPE A

High precision apparatus using saturation to obtain control of R. H. to 1 per cent for laboratory work and control of hygroscopic materials. Ask for Bulletin 58.

NIAGARA AIR CONDITIONER, TYPE C

A year around air conditioning unit providing heating and humidifying or dehumidifying. Ask for Bulletin 80.

NIAGARA FAN COOLER AND DISK FAN COOLER

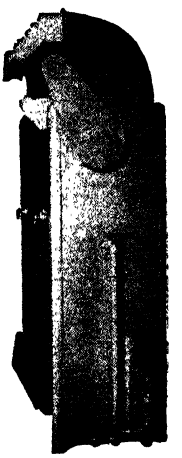
For comfort cooling, process cooling, low temperature storage for dairies, fruits, meats, food products, fur storage vaults, etc. Bulletin 72.

NIAGARA SPRAY COOLER

For all cooling applications requiring high humidity or high capacity in small space. Ask for Bulletin 72.

NIAGARA "NO FROST" SYSTEM

Using Niagara "No Frost" Liquid in spray coolers, prevents frosting of cooling coils, automatically keeps spray solution at proper concentration, gives freedom from brine troubles, corrosion. Constant, efficient operation. Temperature to −100° F. Ask for Bulletins 83 and 95.



Niagara "No Frost" Cooler

NIAGARA AEROPASS CONDENSER (Illustrated)

Saves power and water cost utilizing atmospheric air to remove heat of condensation. Patented Duo-Pass prevents scaling, saves power. "OILOUT" positively removes oil and dirt from refrigerant lines, assuring always full capacity. Ask for Bulletins 91 and 103.

NIAGARA "DUAL" COOLERS

Simultaneously cools a room and furnishes chilled water as a refrigerant. Saves equipment cost, operating expense. Patented. Ask for Bulletin 70.

NIAGARA INDUSTRIAL LIQUID COOLER

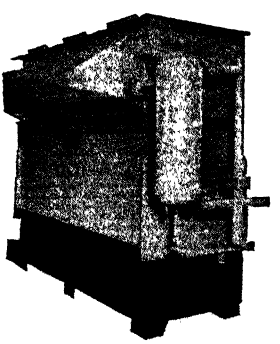
Furnishes refrigerated water or aqueous solution in any quantity up to 220 gpm. Positive control of temperature regardless of load variation. Delivers "sweet" water at 33° F without danger of freezing damage. Ask for Bulletin 100.

NIAGARA FAN HEATERS

For heating and ventilating large areas. Units of the highest quality in engineering, material and workmanship. Ask for Bulletin 73.

NIAGARA MOTOR BLOWERS

One, two and three-fan units. High and low static pressure models. Ask for Bulletin 89.



Niagara AeroPass Condenser with "Oilout"

Parks-Cramer Company

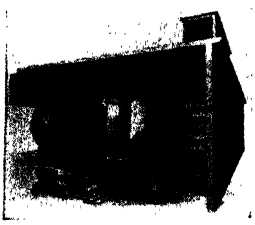
Fitchburg, Mass. **Charlotte, N. C.**

CERTIFIED CLIMATE

Complete Air Conditioning Systems including Heating, Cooling, Humidifying or De-humidifying, Air Changing, Refrigeration, Air Filtering, Air Washing

AUTOMATIC REGULATION

Merrill Process System of Hot Oil Circulation for Heating Industrial Materials
Jacketed Cocks, Fittings and Jacketed Piping

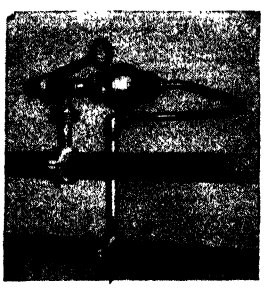


Central Station

Central Station Air Conditioning

A complete system of conditioning air, with positive circulation and controlled ventilation. One or more air washer and fan units. High humidifying and evaporative cooling capacity. Heating, filtering, and refrigerated cooling optional. Ducts with adjustable outlets distribute conditioned air uniformly. Slight air pressure also improves uniformity. No free moisture in room. Centralized maintenance.

Air Washer or Central Station Units.
Nozzles for Central Station Air Washers.



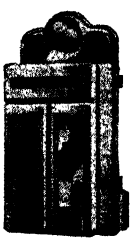
Turbomatic Humidifier

Turbomatic Humidifier

Efficient humidifier of the atomizer type. For direct humidification, as humidity boosters for Central Station systems of all makes. Self-cleaning, both air and water ports. Streamlined to prevent lint and dirt accumulation.

Parks Automatic Airchanger (not illustrated)

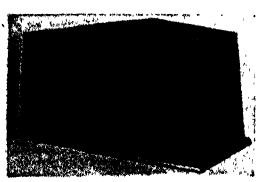
A patented system of forced air change used with a direct humidifying system. Insures fixed humidity and maximum evaporative cooling by controlling amount of air change and operation of humidifiers by a psychrometric humidity regulator. Designed for either complete new installations or for supplementing existing direct humidifying equipment.



Psychrostat

Automatic Regulation

The Psychrostat for accuracy, durability, sensitivity. Employs the principle of the Sling Psychrometer, used in all U. S. Weather Bureau Stations. Hygrostat (not illustrated) where requirements are not so exacting. An Air Conditioning System is no better than its Regulation.



Pettifogger

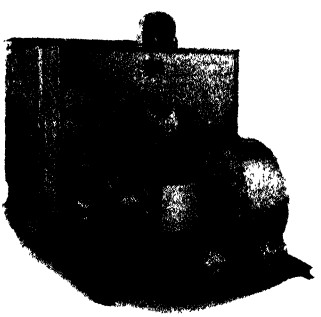
The Pettifogger

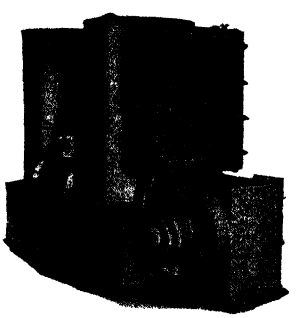
A compact humidifier for offices, stores, storerooms, laboratories, or other isolated departments. Self-contained in lacquered copper casing. Permanently though flexibly connected to water and electrical supplies. Automatic control. Adjustable capacity. Neutralizes drying effect of heating.

Pittsburgh Lectrodryer Corporation

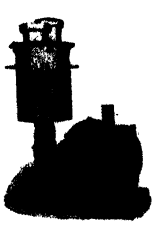
Foot of 32nd St. **Pittsburgh, Penna.**

Large **Lectrodryer** handling the make-up air for the altitude wind tunnel, National Advisory Committee for Aeronautics, Aircraft Engine Research Laboratory, Cleveland, Ohio.

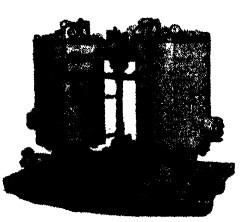




Lectrodryers are widely used for maintaining lowered relative humidities, using the activated alumina system of adsorbing water vapor from air. They are available in many standard sizes handling flows from 100 cfh up to 15,000 cfm in standard catalog units. Larger units can be designed for handling any desired flow. **Lectrodryers** are sturdy industrial type units suitable for years of efficient and reliable drying service with minimum maintenance. Reactivation is accomplished through the use of steam, gas or electricity, whichever the purchaser specifies. **Lectrodryers** can be used with or without aftercoolers.



The **Lectrobreather** shown at the left prevents the entrance of atmospheric moisture into oil and chemical storage tanks. The machine shown is mounted on a **Lectrobreather** reactivator. The dual adsorber **Lectrodryer** at the right continuously dries compressed air at 150 psig preventing the harmful effects of water and water vapor on air operated controls and instruments.



United States Air Conditioning Corporation

Heating, Cooling Ventilating and Air Conditioning Equipment

For Industrial, Commercial and Residential Applications

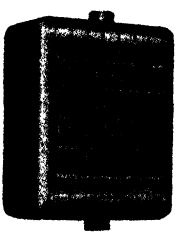
COMO AVENUE S. E. AT 33RD . MINNEAPOLIS 14, MINNESOTA
EXPORT DIVISION—GRAYBAR BUILDING, NEW YORK

Evaporative Condensers

A cooling unit that condenses refrigerants in one compact self-contained package. . Permits savings of 95 per cent in water costs, and by eliminating waste disposal problems, evaporative condensers provide unequalled economy in cooling refrigerant gases.

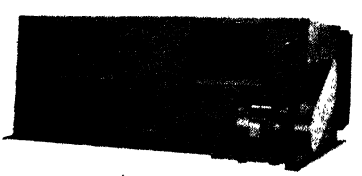
Upright Store Conditioners

A completely packaged unit designed for conditioning applications in stores, restaurants, beauty shops. 3 and 5 ton capacities.



Unit Heaters

Suspension type small area heater designed for supplementary heating in factories, garages, warehouses. Uses steam or hot water.

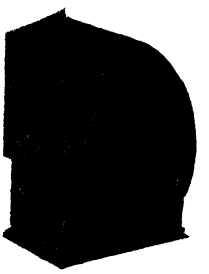


Unit Air Conditioners

Used for cooling and dehumidifying. Made in both single and double fan arrangements, and in 9 sizes from 1000 cfm to 12,000 cfm. Units available with special coils for mechanical cooling or heating.

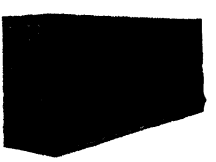
Blowers

Heavy and light duty blowers made in single or double inlet styles, and in a variety of sizes and capacities for all cooling, heating, ventilating and air conditioning requirements.



Unit Coolers

Cooling units designed by USAIR CO for industrial and commercial low temperature and comfort cooling needs.

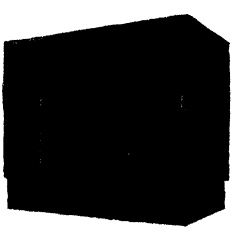


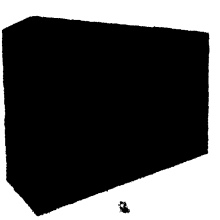
Coils

USAIRCO makes a complete line of coils for every air conditioning requirement—including steam coils for heating, standard and non-freeze type, water coils for heating or cooling, and direct expansion coils.

Air Washers

Single and double stage 2,500 to 100,000 cfm for cleansing, cooling by cold water or refrigerant, humidifying or dehumidifying.





Refrigerated Kooler-Aire

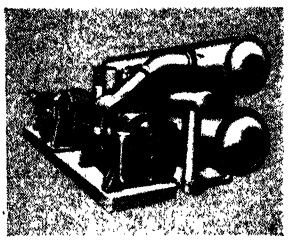
Unit combining cooling and dehumidifying units, refrigeration compressor and evaporative condenser all in one balanced assembly. 3 to 40 ton capacities.

York Corporation

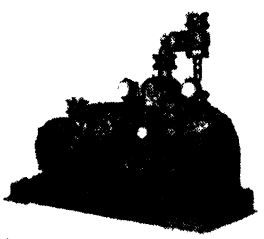
York, Pennsylvania

Factory Branches and Distributor Engineering and Sales Offices throughout the World.

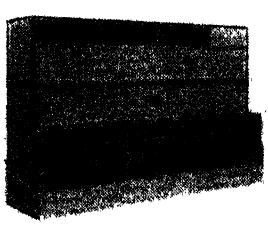
Air Conditioning and Refrigeration for maintaining proper atmospheric conditions for industrial processes or comfort requirements. Installations of unit and central systems in a complete range of capacities and types for every design requirement.



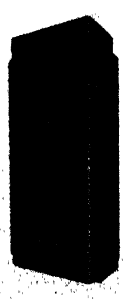
York Turbo Compressor



York V-W Condensing Unit



York Sectional Economizer



Yorkaire Unit Air Conditioner

Condensing and Water Cooling Systems—Turbo (centrifugal) brine and water cooling systems available over wide range of capacities—up to 1500 tons refrigeration for Freon-11 water cooling duty—suitable for steam turbine or motor drive.

Self-contained dynamically balanced, non-vibrating V/W type reciprocating compressors available in capacities up to 350 tons refrigeration in a single unit, with water cooled or economizer type condensers.

Efficient automatic capacity reduction available for economical operation at reduced load.

The York Economizer—A combined forced-draft cooling tower and refrigerant condenser, is available for installations where prohibitive water costs or inadequate drainage facilities preclude the use of a water cooled condenser. Standard factory constructed and built-up units may be used singly or in multiple for applications of any specified capacity. Economizers for use with Freon as the refrigerant are furnished, as standard, with a liquid sub-cooling coil. Economizers also designed for cooling of quench oil and other liquid coolants.

Air Conditioning Units: A complete line of finned coil, dry coil, wetted surface and spray type sectional air conditioners for horizontal or vertical applications, designed to facilitate installation and the distribution of air. Standard units can be equipped with by-pass feature and arranged for cooling and dehumidifying, heating and humidifying, for year-round processing.

Yorkaire Unit Air Conditioner—A compact, self-contained model occupying but 21 x 42 inches of floor space and requiring only water, drain and electrical connections to operate. Special features provide utmost flexibility to meet varying conditions. Temperature dial control provides both automatic and manual temperature control. Air volume and motion may also be adjusted by a special control and the directional grille provides ***directed air flow***—up, down or from side to side. May be used with ducts if desired.

Yorkaire Conditioners are ruggedly built, quiet in operation, equipped with standard fan and compressor motors for AC or DC.

Dehumidifiers—For central station systems where a large volume of air is to be handled and where control of humidity is an essential requirement, the York dehumidifier is especially applicable. Construction features insure a minimum space demand and maximum performance conditions. Standard washers are available in a full range of capacities for industrial installation.

ALLIS-CHALMERS MANUFACTURING COMPANY

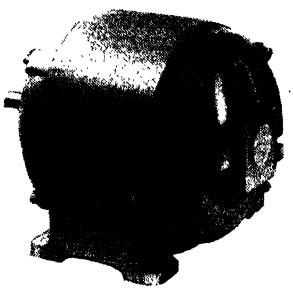
Milwaukee 1
Wisconsin

There is an Allis-Chalmers representative near you.

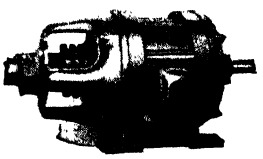
ALLIS-CHALMERS builds four major components for heating, ventilating and air-conditioning installations—in types and sizes for any requirement. A single source of supply means skilled sales service . . . coordinated installation . . . better unit responsibility. Bulletin 25B5170 describes Allis-Chalmers equipment for heating, ventilating and air-conditioning.

ALL-PURPOSE MOTORS

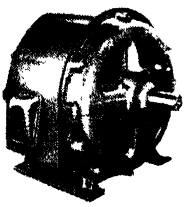
A complete line of ½ to 200 hp motors is built by Allis-Chalmers for any requirement of speed and torque. Strong, distortion-resistant construction adds to motor life.



SQUIRREL-CAGE

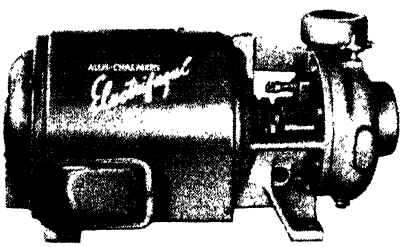


WOUND ROTOR



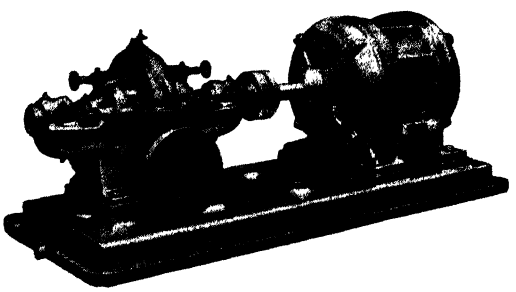
SYNCHRONOUS

CENTRIFUGAL PUMPS

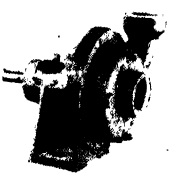


The Electrifugal

Motor and pump are built as one unit in the compact, efficient **Electrifugal** pump. Alignment is no problem. Has deep-groove ball bearings for all-position operation. Takes up ⅓ less space. 15 to 1600 gpm; heads to 500 ft. Bulletin 52B6059D.



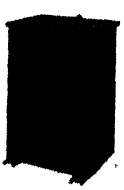
Double Suction Pumps



Low Cost Pedrifugal

Motor Controls

Allis-Chalmers supplies motor controls for every requirement of operation. Reversing and non-reversing, manual or magnetic, across-the-line or reduced voltage.



Dry Type Transformers

A compact, quickly installed Class "B" insulated transformer that has proved practical in large heating and ventilating systems. Serves all circuits; all system loads.

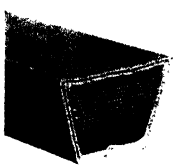
ALLIS-CHALMERS MULTIPLE V-BELT TEXROPE DRIVES



Texrope is the trade name and registered trade mark of V-belt drive products of Allis-Chalmers, pioneer in multiple V-belt drives. Texrope drives are compact, silent, easy on bearings . . . offer speed ranges of 7.1 . . . permit use of lower cost higher speed motors. Duplex-sealed cover protects Texrope V-belt internal cords against dirt, grit, moisture. Oil-Resisting, Static-Resisting, and Oil-Proof types. Bulletin in 20B6051G.

CONSTANT SPEED DRIVES

Texsteel Sheaves

Pressed steel construction. Fractional to 25 hp use.

Texdrive Sheaves

Integrally bushed for standard shafts. Of fine grain cast iron.

ADJUSTABLE SPEED DRIVES

Adjustable Sheaves

50 per cent speed change with movable threaded plate.

Vari-Pitch Sheaves

9 per cent to 28 per cent speed control for 1 to 300 hp.

Wide Range Vari-Pitch

Speed ranges up to 116 per cent, with wide section V-belts. ½ to 30 hp.

Easy To Put On . . . "MAGIC-GRIP" SHEAVES . . . Easy To Take Off

Sheave slides on shaft without forcing. *Easy "slide on" results in true alignment.* *Tightening 3 capscrews locks sheave to shaft.* *Use 2 capscrews as jackscrews in tapped holes.* *A twist of the wrist breaks bushing grip.* *Slide sheave off . . . no prying necessary.*

Let the pup be furnaceman

BRYANT HEATER COMPANY

17825 St. Clair Avenue - - - Cleveland, Ohio

Engineering, Sales and Installation information on Bryant Equipment available through Bryant Distributors, Dealers and Gas Companies in principal cities.

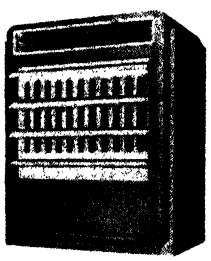
Vertical Winter Air Conditioner

Bryant Gas designed boilers include tubular cast iron sections, ribbed lower tubes, large steam liberating areas, all heating surfaces readily accessible for cleaning. Insulated metal jacketed covers and Bryant gas controls. Complete range of *AGA* inputs from 45,000 to 3,996,000 Btu/hr for steam and hot water heating systems, volume water heating and industrial process.

Bryant Vertical Winter Air Conditioners complete with blowers, humidifiers and filters are compactly designed for small housing, office or industrial use. Models available with heating sections made of either tubular cast iron or 12-gage steel. Quality controls are standard on all models. Capacities from 55,000 to 115,000 Btu/hr *AGA* input on cast iron and 45,000 to 145,000 on steel units.

Complete line of Forced Warm Air Gas-Fired Equipment from 60,000 to 375,000 Btu/hr *AGA* inputs. Efficient cast iron heating sections, large capacity blowers, humidifiers, filters and Bryant automatic controls are standard.

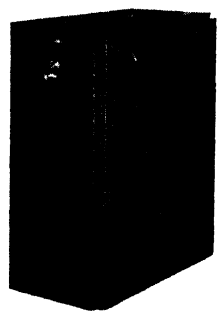
Bryant suspended type Gas-Fired Unit Heaters available in six sizes ranging from 60,000 to 210,000 Btu/hr *AGA* inputs. Efficient heat exchange of staggered vertical tube construction. Available in both cast iron combustion chamber, alloy steel tube and all steel types. Quick, clean, efficient heat for all types of industrial and commercial space. Flexible, automatic control and large volume air circulation produce ideal space heating results.



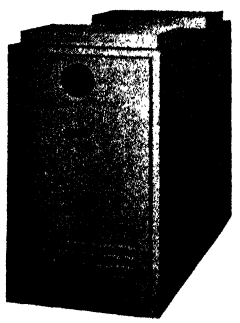
Suspended Type Gas-Fired Unit Heater

Bryant Dehumidifiers with rotary silica gel drum, is completely automatic in operation and finds application for exact humidity control in industrial processing, comfort air conditioning and the drying and storing of hygroscopic materials. They are available in three sizes, 800, 1300 and 2900 cfm. Standard units are reactivated by gas. Indirect units arranged for use with high pressure steam coils or electric strip heaters are available.

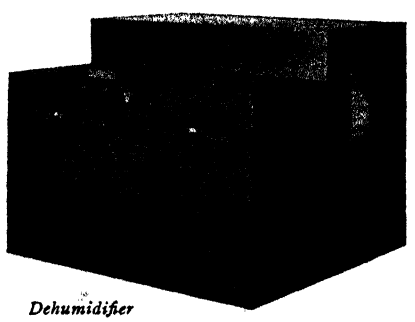
See your local Bryant Distributor or write for complete details and specifications.



Gas-Fired Boiler



Forced Warm Air Gas-Fired Equipment



Dehumidifier

DUO-THERM *Division of Motor Wheel Corporation*

Lansing 3, Michigan

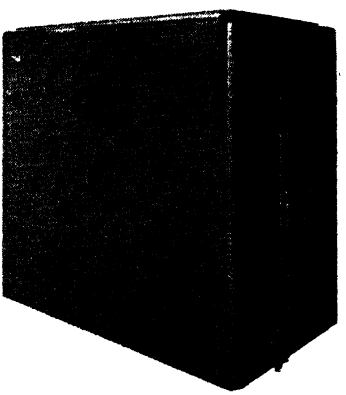
Duo-Therm Automatic Fuel Oil Furnaces are complete package unit cabinet models in baked enamel. They are designed to fit any type home of average size. Can be installed with ease in the basement or in the utility room. Listed as Standard by the *Underwriters' Laboratories* and Listed by the *Canadian Standards Association* for use with No. 1 or No. 2 fuel oil. Write for Engineering Manual on Duo-Therm Oil Burning Furnaces.

DELUXE MODEL WINTER AIR CONDITIONER in 3 sizes as follows:

330-DB— 52,000 Btu bonnet output— 800-1200 cfm blower output

340-DB— 78,000 Btu bonnet output— 1000-1700 cfm blower output

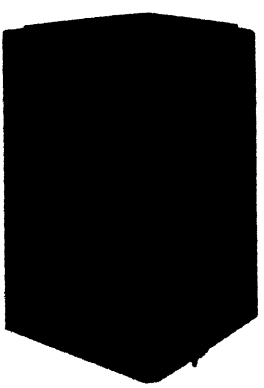
350-DB—108,000 Btu bonnet output—1500-2600 cfm blower output



UNDERNEATH BLOWER MODEL WINTER AIR CONDITIONER available in 2 sizes as follows:

330-UB—50,000 Btu bonnet output— 800-1200 cfm blower output

340-UB—75,000 Btu bonnet output—1000-1700 cfm blower output



GRAVITY MODEL FURNACE can be manually controlled or be equipped for automatic thermostatic control. Can easily be converted to either DeLuxe or Underneath blower types. Available in 3 sizes as follows:

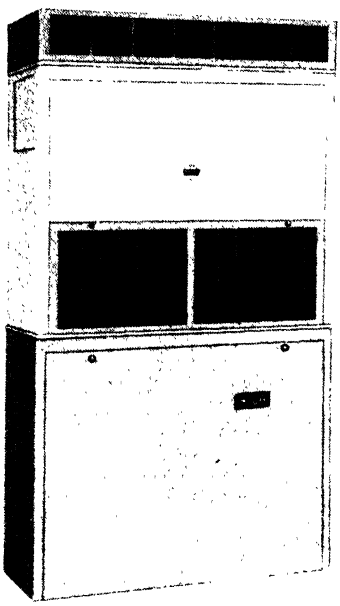
329-M—50,000 Btu bonnet output
330-T

339-M— 75,000 Btu bonnet output
340-T

349-M—104,000 Btu bonnet output
350-T

CHRYSLER AIRTEMP

AIRTEMP DIVISION OF CHRYSLER CORPORATION, DAYTON 1, OHIO



"PACKAGED" AIR CONDITIONERS

AVAILABLE IN 3 and 5 H. P.

COMPLETE—Cools, dehumidifies, filters, circulates the air. Free air discharge or duct distribution. Heating coil for year 'round service, optional.

COMPACT—Everything enclosed in a rust-resistant "Bonderized" cabinet of modern design with chrome hardware and trim. Occupies minimum of floor space—4.7 sq ft for 3 hp and 6.5 sq ft for 5 hp.

EASILY, QUICKLY INSTALLED—Tested and completely assembled at the factory. Needs only three connections; electric, water and drain.

SEALED RADIAL COMPRESSOR—Quiet, all moving parts balanced to eliminate vibration. Entire compressor assembly suspended from single rubber mounting. Long life because vital moving parts are "super-finished" and pressure lubricated.

FLEXIBLE—"Packaged" Air Conditioners can be installed singly or in multiple to meet almost any requirements. Can be moved easily.

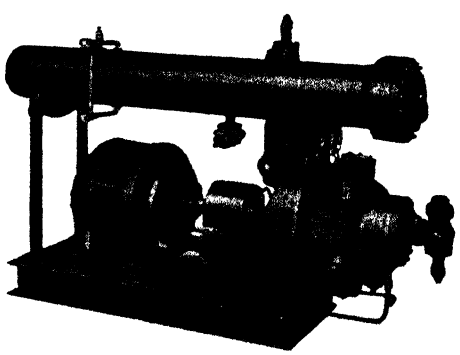
CHRYSLER AIRTEMP RADIAL CONDENSING UNITS

AVAILABLE IN 7½ TO 75 HORSEPOWER CAPACITIES

This heavy-duty Radial Condensing Unit, for use with Freon, is especially adapted for refrigeration, for industrial processes or air conditioning. Airtemp Radial compressors are direct connected and have force-feed lubrication. The automatic capacity-reduction device gives variable capacity . . . high operating efficiency. Light in weight and economical to operate, these condensing units are shipped ready to run. Vibrationless, they are very easy to install because special foundations are not necessary. Each pressure vessel approved by Underwriters Laboratories.

AUTOMATIC UNLOADER

The automatic cylinder unloading device permits starting the compressor under no load and keeps the compressor automatically adjusted to varying loads with no stopping and starting during operation.



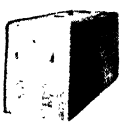
Automatic Capacity Regulation • Unloaded Starting • Direct Connected • Simplified Installation • Compact Design • Practically No Vibration • No Special Foundations Needed • Interchangeable Parts.

CHRYSLER AIRTEMP
AUTOMATIC HOME HEATING

VAPORIZING OIL-BURNING AUTOMATIC FURNACE . . . Models for forced-air—56,000 Btu output; gravity, 50,000 Btu output. Sure-Draft Fan assures highest overall efficiency. "Bonderized" and insulated jacket. Forced air model approved for closet installation, *Underwriters' Laboratories, Inc.*

OIL-FIRED AUTOMATIC FURNACE . . . Heats, humidifies, filters and circulates the air. Five models, from 70,000 to 160,000 Btu output. "Bonderized" and insulated jacket. Metal combustion chamber, seam-welded firebox of copper-bearing steel; large, slow-speed, rubber mounted fan. Airtemp oil burners on all models. Approved by *Underwriters' Laboratories, Inc.*

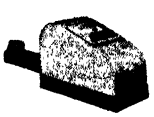
GAS-FIRED AUTOMATIC FURNACE . . . Heats, humidifies, filters and circulates the air. Steel Models 70,000 to 160,000 Btu output. Cast-iron Models 50,000 and 75,000 Btu output. "Bonderized" and insulated jacket. The Airtemp "Silent Flame" Gas Burner starts, stops and operates quietly, has many exclusive features—no popping or flash-backs. Approved, *A.G.A.* Laboratories.



OIL-FIRED STEEL BOILERS . . . Three models—BLF-110 rating 460 sq ft EDR, BLF-165 rating 690 sq ft EDR, BLF-220 rating 920 sq ft EDR, of steam at the boiler header. Combustion chamber of quality chrome steel. Boiler is combination of "Scotch Marine" and Locomotive types. Complete with Airtemp burner and all controls.

COAL-FIRED FURNACE, GRAVITY . . . Furnace body of heavy steel boiler plate—seams electrically welded. Front, heavy gauge pressed steel. Fire brick lining. Sizes 22 in., 24 in., and 27 in.; Btu at bonnet, 108,000, 119,700, and 154,200.

COMBINATION HEATING AND COOLING FOR THE HOME . . . Combination of a 3 hp Chrysler Airtemp "Packaged" Air Conditioner and any of the larger Chrysler Airtemp automatic furnaces. The same blower, filters and ducts of the automatic heating system are employed for cooling in the summer.



STOKERS . . . Domestic, available in both hopper and bin-feed models for anthracite or bituminous coal for burning 15 to 35 lb per hour. Powerful transmission, sectional retort and safety coupling . . . eliminates shear pins.

CONVERSION OIL BURNERS . . . Pressure-atomizing oil burner, 1.35 to 4.5 gallons No. 3 furnace oil per hour. All Airtemp Oil Burners are approved by *Underwriters' Laboratories, Inc.*

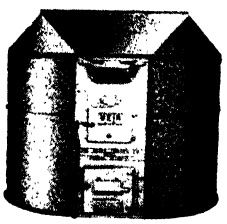
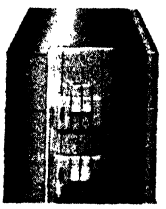
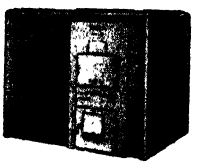
WEIR and MEYER Steel Warm-Air Furnaces, of welded-and-riveted gas-tight construction, have an 80-year reputation for efficiency, dependability and durability. They are available for small and large requirements and for all fuels in a wide variety of firing applications.



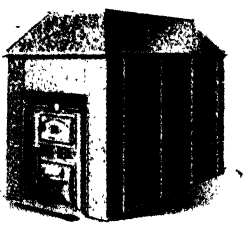
"R" Series Heavy Duty



U Series Gravity



U Series F-A



"500" Series Heavy Duty

WEIR COAL FIRED UNITS ("U" SERIES)

Available in Five Sizes For Both Gravity and Forced Air Domestic Heating

The "U" Series WEIR hand-fired coal furnace embodies a new construction principle (patent applied for) which when combined with its other time-tested WEIR features provides an outstanding heater. The gravity furnace as shown above ranges in register capacity from 50,000 to 170,000 Btu per hour. The rectangular-cased forced air furnace shown above ranges from 50,000 to 190,000 Btu per hour output at the register. This series may be stoker-fired or oil-fired though other designed furnaces are available for the particular fuels.

HEAVY DUTY

Manufactured in the Following Seven Sizes for Heavy Duty Service in all Types of Large Buildings

WEIR Heavy-Duty furnaces consisting of the "R" Series and the 500 Series illustrated above are ideal for industrial and commercial service and for schools, churches and other large spaces. Capacities range from 300,000 to 1,500,000 Btu per hour, designed only for forced air circulation but suitable for hand-firing or can be adapted for stoker, gas or oil firing.

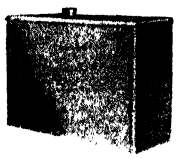
Manufacturers of Heating and Air Conditioning Equipment for Coal, Gas and Oil Burning

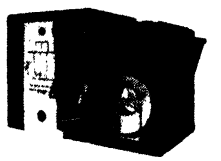
MEYER OIL AND GAS FIRED EQUIPMENT



"A" Series Oil Fired

"F" Series Gas Fired

"B" Series Hi-Boy



"K" Series Oil Fired

The MEYER oil-fired air conditioners are available in three types—the "A" Series suitable for basement installation in two sizes with outputs from 110,000 Btu to 165,000 Btu. The "B" Series Hi-Boy suitable for either basement or first floor installation in basementless houses available in two sizes with capacities of 93,500 Btu to 110,000 Btu. The "K" Series oil-fired air conditioners made in two sizes with outputs of 203,000 Btu and 294,000 Btu suitable for larger spaces.

"A" SERIES OIL FIRED AIR CONDITIONERS

Built For Fine Homes. Compact in Size. But Highly Efficient

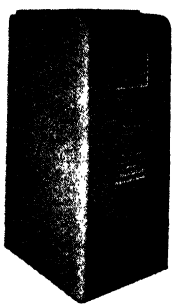
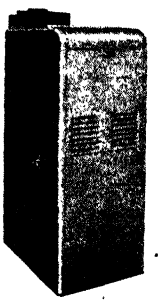
L. J. Mueller Furnace Co. - Milwaukee 7, Wis.

HEATING — MUELLER Climatrol REG. U. S. PAT. OFF. — AIR CONDITIONING



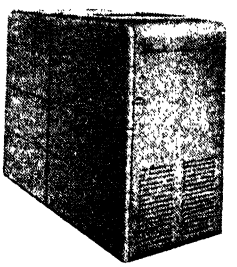
Series "SHP"

Gas-fired winter air conditioner. May be installed in basement or utility room. Available in three sizes, with *A.G.A.* input ratings from 60,000 to 100,000 Btu per hour. Provides wide range of air delivery capacities to meet specific needs.



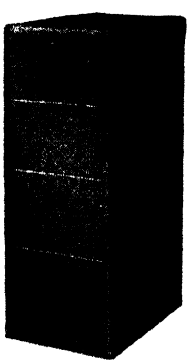
Type "107"

Gas-fired cast iron winter air conditioner for basement or utility room installation. Furnished in three sizes, with *A.G.A.* input ratings of 60,000, 90,000 and 120,000 Btu per hour. Also available for gravity operation in two sizes.



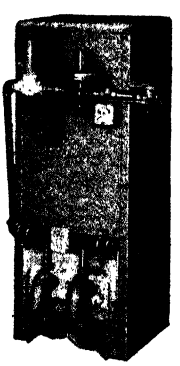
Type "102"

This gas-fired winter air conditioner is of sectional construction, with the blower compartment at the rear of the unit. It is available in three sizes with *A.G.A.* input ratings of 135,000, 180,000 and 225,000 Btu per hour.



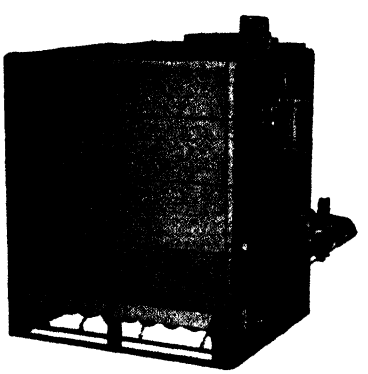
Type "10"

Gas-fired boiler, with enclosed controls, used primarily for residential installation. It has *A.G.A.* ratings of 290 to 2015 sq ft for hot water and 180 to 1260 sq ft for steam.



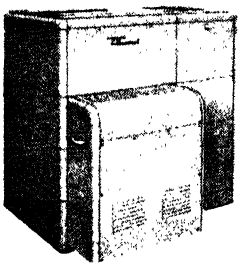
Type "11"

Gas-fired boiler, without enclosed controls, used primarily for home installation. It has *A.G.A.* ratings of 290 to 2015 sq ft for hot water and 180 to 1260 sq ft for steam.



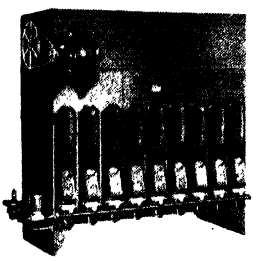
Type "20"

Gas-fired boiler used extensively for industrial installation. It has *A.G.A.* ratings of 1010 to 10,080 sq ft for hot water and 630 to 6300 sq ft for steam. Both this boiler and the Types "10" and "11" can be equipped for both direct and indirect applications.



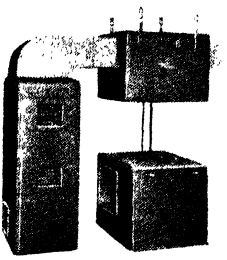
Type "105"

Gas-fired winter air conditioner with *A.G.A.* inputs of 100,000 and 150,000 Btu. Can be converted to oil. Also available for gravity operation.



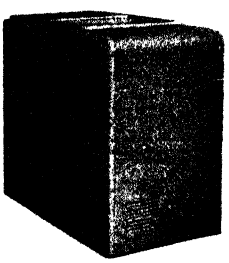
Series "UH"

Gas-fired unit heater for large space-heating requirements. Available in 4 through 12 sections, with *A.G.A.* inputs of 180,000 to 540,000 Btu per hour.



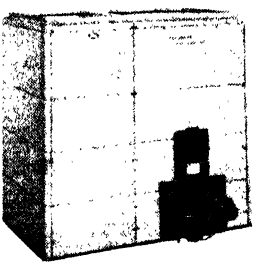
Type "900" and "SHP"

Type "900" Summer Air Conditioner is available in 3- and 5-ton sizes. It consists of a cooling coil and cabinet, compressor and cabinet, plus accessories.



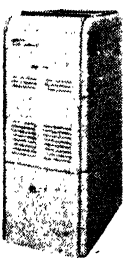
Series "50"

Oil-fired winter air conditioner with outputs at register of 100,000 to 225,000 Btu, with selection of blower sizes. Fired by pressure-atomizing burner.



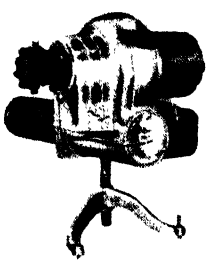
Type "202"

Oil-fired winter air conditioner available with inputs of 100,000 and 150,000 Btu. Unit may be converted to gas. Also available for gravity operation.



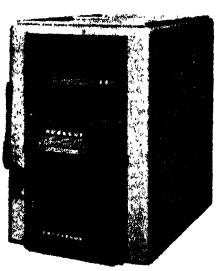
Type "209"

Oil-fired winter air conditioner with 90,000 and 120,000 Btu inputs with pressure burner; 60,000, 90,000 and 120,000 Btu with vaporizing burner.



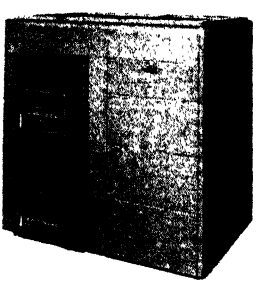
Type "450"

Oil-fired conversion burner of the pressure-atomizing type. Burner is available with inputs of 1 gallon through 5 gallons of oil per hour.



Series "FB"

Cast-iron, coal-fired winter air conditioner. Five sizes, with capacities at register from 94,400 to 198,900 Btu.



Type "702"

Steel, coal-fired winter air conditioner. 3 sizes, 20 in. to 24 in. drums, with capacities at register from 92,650 to 122,000 Btu per hour.

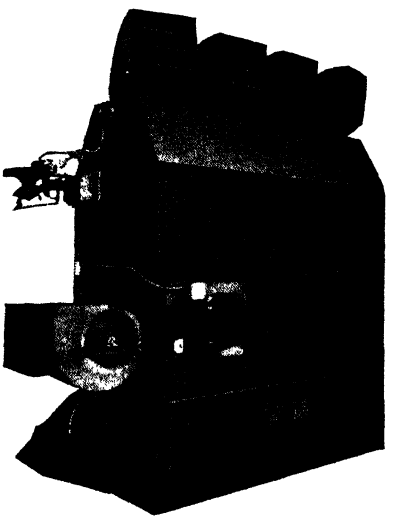
THE ENGINEERED LINE OF UNIT HEATERS



AIRTHERM

Direct-Fired Warm Air Heaters

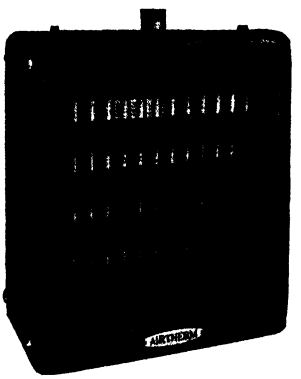
Offer You These Six Heating Advantages

1.—A complete factory heating unit.
2.—Comes to you ready to set in place.
3.—Control system wired at factory.
4.—Available in floor-mounted or suspended models.
5.—Oil burners or gas burners are interchangeable to meet future fuel conditions.
6.—Capacities from 650,000 to 1,950,000 Btu per hour.

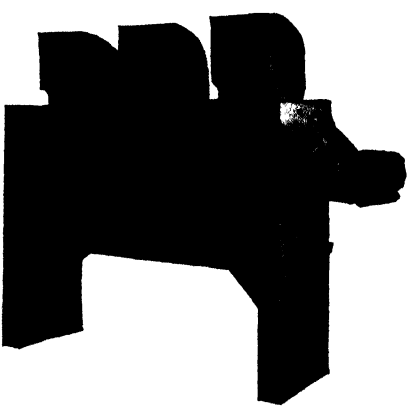
For detailed information, write for Bulletin 801-A.

AIRTHERM STEAM UNIT HEATERS

(Copper Coils)



Airtherm Horizontal Propeller Type Steam Unit Heater available in capacities from 26,000 to 274,000 Btu. Write for Bulletin 1206.



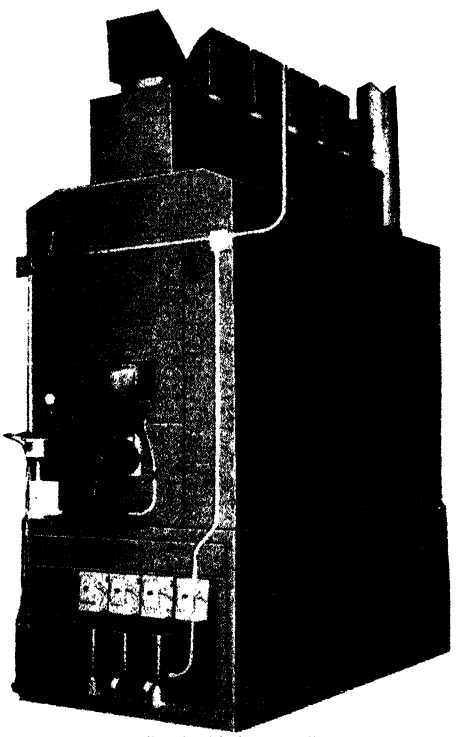
Airtherm Blower Fan Type Unit Heater available in capacities from 222,000 to 827,000 Btu. Floor, vertical or horizontal models. Write for Bulletin 401.

Chicago Steel Furnace Co.

9326 S. Anthony Ave., **Chicago 17, Ill.**

DIRECT-FIRED SPACE HEATERS

Standard Sizes Up to 1,500,000 B.T.U.



Fired with Gas or Oil

HEAT EXCHANGER—Designed and constructed in a near tear-drop shape which permits the air to flow with a minimum of friction. This design affords a maximum of both strength and area in its crown sheet, and reduces power consumption to the very minimum.

COMBUSTION CHAMBER—Fabricated from four way $\frac{3}{16}$ and $\frac{1}{4}$ in. floor plate. The chamber is of the correct size and shape to provide proper volumetric content for the complete combustion of oil or gas.

BLOWERS—Three standard up-blast discharge, multi-vane Blowers, each individually powered, are provided to supply the correct amount of air to properly cool the Heat Exchanger. Individually-driven Blowers are used because of the great flexibility of operation obtainable. Uniform bonnet temperature may be enjoyed by the simple expediency of increasing or reducing the amount of air driven around any particular section of the Heat Exchanger.

Gas-Fired Dravo Counterflo Direct Fired Heater

DRAVO COUNTERFLO DIRECT FIRED HEATERS

Dravo Counterflo Direct Fired Heaters are designed for open-space heating in factories, warehouses, terminals, garages, foundries, airport hangars, mills, machine shops, and similar establishments.

Each unit is a self-contained heating plant embodying burner, combustion chamber, supplementary heat transfer surface, motor-driven fans, louvred cowls, and automatic control system. Dravo Counterflo Direct Fired Heaters may be installed as single units, or in multiple, for buildings of any size.

Installation is simple and can be performed by any skilled mechanic. Only three connections need be made,—to fuel supply, electric power, and flue vent. This simplicity permits installation of Dravo Counterflo Direct Fired Heaters for temporary heating during building construction; permanent connections can be made when heater locations are established

Descriptive Bulletin FW-516, and specification sheets, are available on request. *Write Heating Section*, DRAVO CORPORATION, Pittsburgh 22, Pennsylvania.

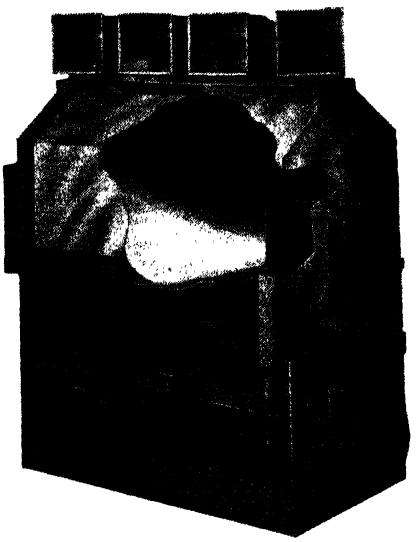
Distributors for Dravo Counterflo Direct Fired Heaters are located in key cities.

Features of Dravo Counterflo Direct Fired Heaters include:

- Stainless Steel Combustion Chamber.
- Counterflo Combustion and Heat Transfer.
- 80-85 per cent Sustained Efficiency.
- Effective Comfort-Zone Recirculation.
- Minimum Heat Loss Thru Roof.
- Simplicity of Installation.
- Flexibility of Application.
- Adaptability for Wide Range of Fuels.

Unit capacities of Dravo Counterflo Direct Fired Heaters range from 400,000 to 2,000,000 Btu per hour output. The following tables show the external dimensions and weights of the various units as well as the capacities of each size heater.



Cut-away view of heater showing counterflo principle of combustion and heat-transfer, as well as the four-pass gas-flow system

Lee Engineering Company

Union National Bank Bldg., **Youngstown, Ohio**

LEE DIRECT WARM AIR HEATING

The Lee System of warm air heating generally costs less to install than steam or hot water; utilizes fuel with a high degree of efficiency; distributes the heat exactly where needed; responds promptly without lag; requires little or no maintenance; and needs no licensed attendant. Heaters for use with the Lee System are made in the four types illustrated and described briefly below.

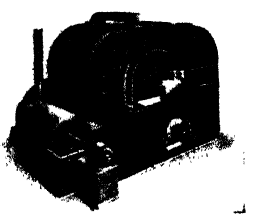
BRICK-SET TUBULAR HEATER

For use with central heating system in connection with duct distribution. Single heater capacities from 2,800,000 Btu per hour to 8,000,000 Btu per hour. Two heaters, installed as a battery serving as one unit, provide capacities over 10,000,000 Btu per hour.

Brick Set Tubular Heater

STEEL ENCASED TUBULAR HEATER

For use with central heating systems in connection with duct distribution over a capacity range of from 2,000,000 Btu per hour to 6,000,000 Btu per hour. Heater may be installed in heated area without enclosure, requires no foundation, and may be moved from one location to another by taking unit apart and reassembling.



Steel Encased Tubular Heater

TUBULAR UNIT HEATER

For use either as a central system in connection with duct distribution or with adjustable outlet nozzles as a unit heater. Capacity range from 2,000,000 Btu to 6,000,000 Btu per hour. In sizes up to 4,000,000 Btu heater is shipped as a completely assembled unit with all but mechanical equipment, refractory lining and controls in place. Heaters require no foundation and are equipped with crane hooks so that they may be moved from one location to another.

Tubular Unit Heater

SHELL UNIT HEATER

For use with or without distributing duct system. Heaters have capacity range of from 300,000 Btu to 2,000,000 Btu per hour. Available for gas, oil or combination gas-oil firing. All units are shipped completely assembled, wired and ready for operation. Units furnished with either refractory lined or stainless steel combustion chambers. Heaters may be floor mounted or suspended in any position. Also available in both hand and stoker fired models.

Shell Unit Heater

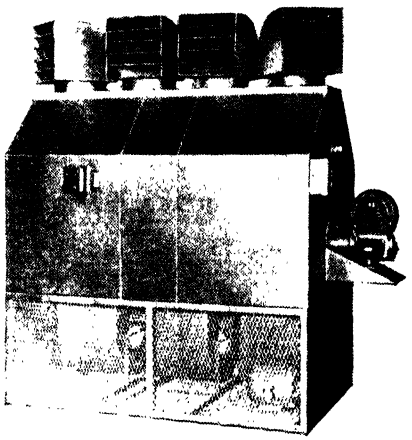
For further information write for Catalog HV-44.

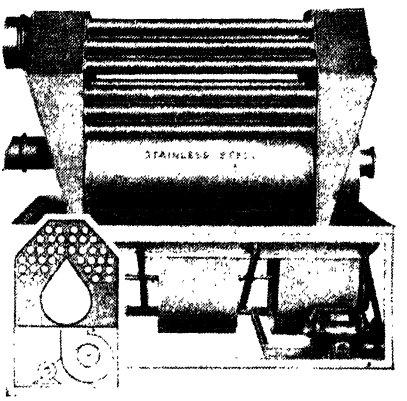
National Heater Company

2182 Cleora Avenue, **St. Paul 4, Minnesota**

NATIONAL CHAMPION

STEEL S-P-A-C-E HEATERS





GAS AND OIL FIRED UNITS

National Champion Heaters are available in both factory floor set units, as illustrated, and in quiet operating, resilient mounted models for convenient connection to duct distribution system. Skeleton view illustrates compactness of heat exchanger and blower section mounted on sturdy angle-iron base frame. Lifting eyes are provided for crane handling. Streamlined firebox of rust and heat resisting Stainless Steel requires no refractory and affords life far beyond that possible with mild carbon steel. Tear Drop combustion chamber design and convector tube arrangement assure complete efficient air impingement on all heating surface at a minimum of resistance. Induced draft blowers can be supplied when suitable chimney or stack is not available.

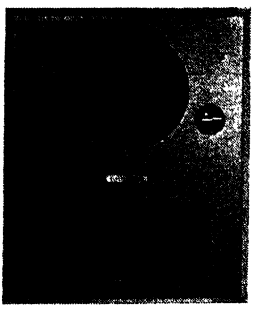
FOR HOME • ELECTROMODE All Electric HEATERS • INDUSTRY • FARM



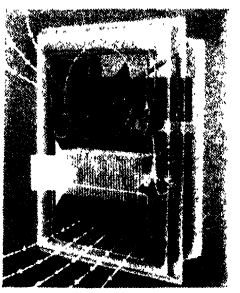
BILT-IN-WALL Heaters For Homes and Offices

These room heaters circulate warm air at floor level for greatest efficiency. No ductwork required. Economical to install as auxiliaries, or (where electric rates permit) as main heat sources. Manual or thermostatic control. Thermal cutoff prevents overheating. Electromodes are approved by *Underwriters' Laboratories;* fully guaranteed.

Model	Watts	BTU	Volts AC 60 Cycle	Shipping Wt. in Carton
W12-15S	1500	5,122	115 or 230*	40 lbs
W12-20S	2000	6,830	230	40 lbs
W12-20	2000	6,830	230	40 lbs
W12-30S	3000	10,245	230	40 lbs
W12-30	3000	10,245	230	40 lbs

*Specify which voltage

"S" denotes single heat control. All others equipped with variable heat switch. 2 KW and 3 KW sizes wired for 3-wire, S/N, 115/230 volt service. Dimensions (front plate): 21 in. high, 17 in. wide. Each heater shipped complete with wall box to fit standard 2 in. x 4 in. wall construction. Approximate wall opening required: 18¼ in. high, 14¼ in. wide. Finish: baked-on brown enamel.



X-ray View shows cast-aluminum Safety-Grid element (large arrow) which provides complete safety from fire, shock or burn. Small arrows illustrate "Down-Flo" heat circulation.

Bilt-in-SMALL-ROOM Heater

For baths, small bedrooms, dinettes, trailers, etc. Quickly installed; operates on usual 115 volt lighting circuit. Cast-aluminum Safety-Grid element, with safety thermal cutoff. Manual or thermostatic control. Two-way switch permits use of fan, without heat, when desired. White baked-on enamel finish. Approved by *Underwriters' Laboratories.* Guaranteed.

Model	Watts	BTU	Volts AC Only	Net Weight	Shipping Weight
WJ-13	1320	4508	115	13¼ lbs. including wall box	14 lbs in carton

Shipped complete with wall box, for standard 2 in. x 4 in. wall construction. Approx. opening required, 9⅞ in. x 11⅛ in. Toggle type fastener allows for various wall thicknesses. Heater front plate dimensions: 11½ in. high, 12⅞ in. wide.

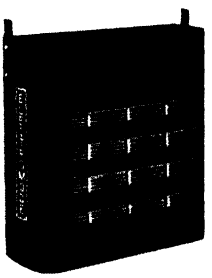
Write for Information

Specific literature is available on these and other Electromodes for domestic and industrial heating. See your electrical supplier, or write Dept. HV-18, Electromode Corporation.

ELECTROMODE CORPORATION

45 Crouch St. Rochester 3, N.Y.

FOR HOME • ELECTROMODE All Electric HEATERS • INDUSTRY • FARM



Unit Heaters For Auxiliary Warmth Cut Heating Costs; Easily Installed

SUSPENSION TYPE

For wall or ceiling mounting. 10 to 60 KW. Electromodes are approved by *Underwriters' Laboratories;* guaranteed.

No Exposed Hot Wires

Safety-Grid consists of a tubular element embedded in a finned aluminum casting. This patented design gives high thermal conductivity, safety, resistance to corrosion.

10 KW to 60 KW Heaters

For 230 or 460 volts—specify when ordering.

Model	KW	BTU	CFM Approx.	Shipping Wt. Approx.
[a]14-10	10	34,150	800	100 lbs
[a]14-12	12	40,980	800	100 lbs
[a]18-15	15	51,225	1500	180 lbs
18-20	20	68,300	1500	180 lbs
20-25	25	85,375	1800	200 lbs
20-35	35	119,525	1800	200 lbs
27-45	45	153,675	4000	360 lbs
27-60	60	204,900	4000	360 lbs

[a]Models 14-10, 14-12, 18-15 are for single or 3 phase. Other models for 3 phase only.

Heaters are furnished with 460-volt single or 3-phase heater elements; with 115 or 230-volt single-phase motor.

Thermostatic Control

Available with all models. A contactor is necessary on units above 5 KW capacity, on 3 phase and on DC, to operate safety switch, thermostat.

These all-electric units supply fan-forced warmth, directed as desired. As auxiliary heat sources, they replace the central heating system during changeable weather, or when only some departments need heat. As main heat sources (where electric rates permit), they eliminate the need for a central heating system. They require no plumbing or ductwork—only circuit wiring.

Combination Portable and Suspension Type

Contains a circular Safety-Grid element. Capacities, 1.5 to 7.5 KW. Electromodes are approved by *Underwriters' Laboratories*; guaranteed.

1.5 KW to 7.5 KW Heaters

Model	KW	BTU	CFM Approx.	Shipping Wt. in Carton
[a]AA-15	1.5	5,122	100	20 lbs
[b]AN-30	3	10,245	200	30 lbs
[c]BN-50	5	17,075	350	44 lbs
[d]CN-7.5	7.5	25,613	550	60 lbs

[a]AA-15 may be plugged into usual 115V branch circuit. Also available for 230V single phase.

[b]AN-30 is for 115V or 230V—specify which.

[c]BN-50 furnished with switch but without cord or plug. 230V single or 3 phase; 460V 3 phase.

[d]CN-7.5 furnished without switch, cord or plug. 230V single or 3 phase; 460V 3 phase.

Models AA-15 and AN-30 furnished with on-off switch, 10 ft heavy-duty cord, plug.

Heaters for Special Applications

Blower units, blast heaters for air ducts, mobile units on casters; others. Engineering help is at your disposal.

COMBUSTION CONTROL CORPORATION

Flame Failure Safeguards (fireye) *Boiler Feedwater Controls*

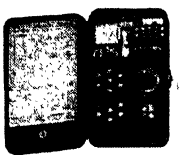
205 W. Wacker Drive, Chicago—765 Cordilleras Ave., San Carlos, San Francisco

District Offices in all Principal Cities

FIREYE PHOTOELECTRIC FLAME FAILURE SAFEGUARD AND PROGRAMMING CONTROL FOR OIL BURNERS

Type 45PH5



Type 24PJ8

Type 45JP1

Complete operating and starting protection for industrial and commercial oil burners with Flame Rod protection of gas pilot. Type 24PJ8 automatically starts burner and programs sequence of gas pilot, ignition, burner motor, oil valves, providing scavenging period, fuel valve delay, post ignition time. Flame Rod, Type 45JP1, monitors gas pilot flame, preventing opening of oil valve unless gas pilot is established. Scanner Type 45PH5 takes over monitoring of oil flame after pilot is established. Failure of either gas flame during ignition or main oil flame during normal operation results in immediate shutdown of burner system.

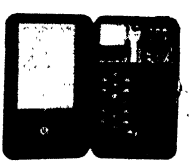
Fireye equipment is available in combinations providing one or all of these safeguard functions, depending on requirements of installation.

FIREYE ELECTRONIC ROD FLAME FAILURE SAFEGUARD AND CONTROL FOR GAS BURNERS

Operating protection for industrial and commerical gas burners. Flame Rod Type 45JQ1 constantly monitors gas pilot flame after its manual or electric ignition. Main gas valve cannot open until Flame Rod indicates pilot flame is established. Pilot flame failure after opening of main fuel valve is instantly signalled by Flame Rod to Electronic Control Type 24QJ5, which immediately shuts off Burner.

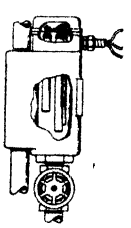
Fireye equipment is designed with completely fail-safe characteristics. Any circuit element failure results in system shutdown. A built-in low-voltage interlock completely checks system, internal and external to control, on each burner recycle.

Type 24QJ5

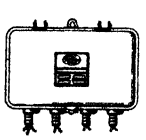


Type 45JQ1

FIREYE BOILER FEEDWATER CONTROL AND BOILER WATER CUTOFF



Type 65BF3



Type 15GK1

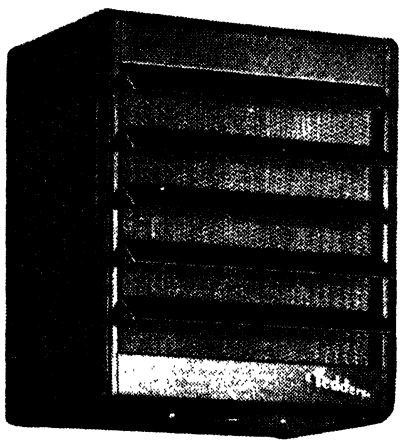
Electrically maintains desired boiler water level. When level drops dangerously low fuel supply instantly cuts off and alarm sounds. Fireye Boiler Feedwater control is alternating current control. Combines probe circuit and transformer to operate direct current relay through a rectifier. Using direct current in relay circuit increases contact pressure, makes possible use of low a-c voltages in probe circuit thereby eliminating electrolysis problems and probe sealing. Noncorrosive probe fittings, designed for pressures up to 300 psig mount parallel to boiler water control.

FEDDERS-QUIGAN CORPORATION

85 Tonawanda St.

Buffalo, New York

Heat Transfer Specialists Since 1896



Fedders Series 15 Horizontal Unit Heaters with Streamline Copper Tubes and Fins

Fedders UNIT HEATERS

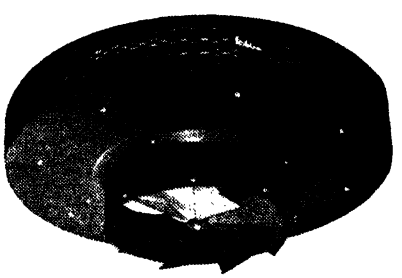
Horizontal Type

COPPER TUBES AND FINS

Fedders streamline tubes provide aerodynamic efficiency and the ample-area saddle of the fins gives generous bonded metal-to-metal contact between copper tubes and fins for high thermal efficiency. Handsome, rugged cabinets—complete relief of expansion stresses within the core as well as between core and cabinet—latest type broad blade fans provide large air volume, quiet operation and maximum efficiency. Large Btu capacity with low final temperatures assure ideal working conditions. Capacities, 100 to 1,000 EDR. Write for Bulletin 15C-3.

Fedders
DOWNBLOW
UNIT HEATERS

Used where requirements necessitate clearance for material handling equipment, tall machinery and other conditions requiring piping to be kept out of the way and for spot locations such as over frequently opened shipping room doors.



COPPER TUBES AND FINS

Straight downblow or diffusion of heat is accomplished by adjustable directional outlets to fit conditions.

Circular type for ceiling heights from 20 to 45 ft. 800 to 1800 EDR capacities.

Square models chiefly for medium ceiling heights of 15 to 25 ft.

Write for Bulletin 12C-3.

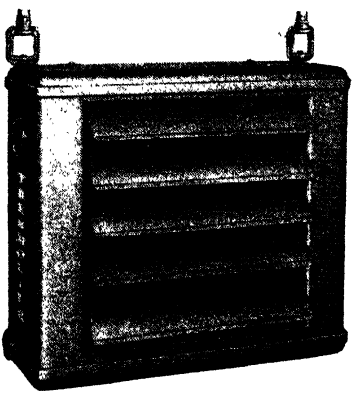
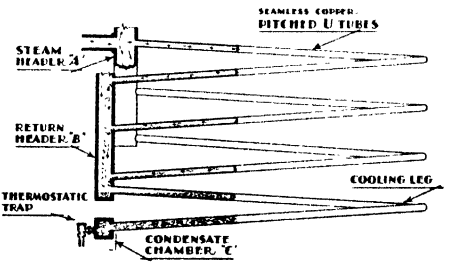
THERMOLIER

REG. U. S. PAT. OFF.

THE GRINNELL UNIT HEATER





Patented Construction of Internal Cooling Leg

In addition to its patented Internal Cooling Leg Thermolier has many other desirable features including its Single Header U-Tube construction which compensates for expansion and contraction strains. Radiation is from brass-finned seamless copper U-tubes rolled into a cast iron tube sheet.

Steam circulation and the removal of condensation in Thermolier are distinctly different than is usual in unit heaters. The actual cooling effect of this construction is equal to a run of more than 100 ft of ordinary, exterior cooling leg piping.

Steam is delivered into Chamber "A" of the header and circulates from there through the pitched U tubes, carrying its condensation with it into Chamber "B." By partitioning off the lower tube or tubes at the bottom of the Steam Supply Chamber "A" these tubes carry all condensation from Chamber "B" into Drain Chamber "C." In passage of this condensation through these tubes, the air from the fan is rapidly carrying off heat just as it does in the rest of the unit. The result is that these two bottom tubes form an efficient internal cooling leg, integral with the unit.

Thermolier is available in 9 Models. Catalog will be sent on request to Grinnell Company, Inc., 277 West Exchange Street, Providence 1, R. I., or to any branch office in principal cities listed on our page 1118.

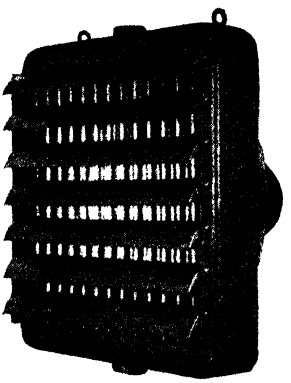
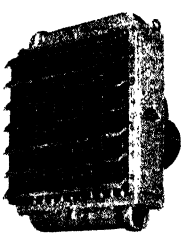
ILG Electric Ventilating Co.

2876 North Crawford Ave., **Chicago 41, Ill.**

Offices in More Than 40 Principal Cities

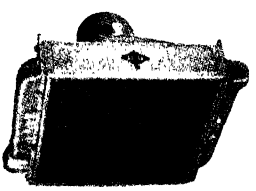


Horizontal Type Unit Heaters—have ILG-built Self-Cooled Motor which counteracts coil heat—never "slow roasts." Graduated, 2-piece, cast iron header gives "balanced" steam distribution. Brass orifice bushings expand tubes uniformly in header plate. Copper fins are *pressed* into round copper tubes for permanent union—no brazing, soldering, or welding. Bottom header "floats" to permit expansion and contraction of coil independent of casing. Tested and Rated according to codes of *I.U.H.A.* and A.S.H.V.E. Ratings certified by *I.U.H.A.*—"One-Name-Plate" Guarantee. Wide range of sizes and capacities.



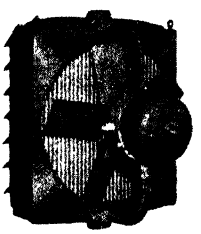
Low-Ceiling Type

For vertical mounting in buildings where headroom is at a premium. Side inlets and outlets at top and bottom assure extremely compact installation.



Vertical Type

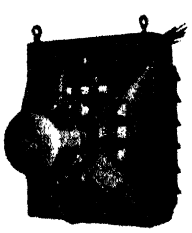
Recommended for installations with extremely high or extremely low ceilings. Air diffusers or deflectors available to direct flow of heater air.



Textile Type

More tubes, no fins—for textile mills and applications where lint or other material normally adheres to fin surfaces and clogs up coil.

ILG Electric Unit Heaters

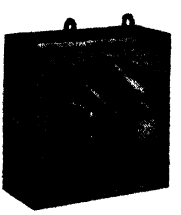


STANDARD TYPE

For instant, clean, safe, dependable heating. Coil is of black heat type which operates below 400 degrees. Protected against excessive temperature rise by patented automatic thermal cut-out and magnetic starter. Sizes 5 to 15 KW.

TYPE "HT"

For installations requiring a small volume of heat. Exceptionally efficient. Suitable for constant duty. Non-overheating black heat type coil with individually interchangeable elements. Sizes 1½ to 4 KW.



For ILG Propeller and Centrifugal Fans, see page 1075

Jaden

MANUFACTURING COMPANY

HASTINGS NEBRASKA

SINCE 1914

New and Improved Self Contained Air Conditioning Units—for use with cold water.

Capacities From 1 Ton to 20 Tons with Comparable Capacities for Heating.

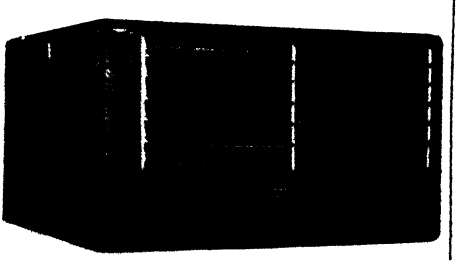
Models for Cooling Include Floor Type for Individual Rooms, Suspended Units and Central Plants for Duct Systems.

Centrifugal Unit Heaters, Package and Utility Type Blowers for Heating and Ventilating

• **Central Plants**—capacities from 3 tons to 24 tons. Air delivery from 1100 cfm to 10,000 cfm. All central plants are assembled in sections to simplify installation. All models available with steam coils for combination heating and cooling.

• **Suspended Models**—capacities from 1 ton to 4 tons. Air delivery 585 cfm to 2200 cfm. Especially adaptable to individual rooms where duct system is undesirable. Completely self-contained with motor, coils, blower and filters housed in sturdy steel cabinet with attractive featherweave finishes.

• **Floor Type Models**—capacities from 1 ton to 3 tons. Designed for use in individual rooms. All models self-contained with motor, blower coil and filters housed in well designed metal cabinets attractively finished or available in base coat for finishing in special colors.



• **Package Blowers**—capacities 1000 cfm to 4000 cfm. All models equipped with filters and available with or without fan controls. Cabinets of extra heavy steel construction with featherweave finish or with base coat for finishing in special colors.

• **Utility Blowers** both single—twin mounted double inlet type—capacity from 800 cfm to 10,000 cfm. Available in any discharge arrangement and with or without motors. Single blowers available in "base type" which includes heavy angle frame for special cabinet construction when necessary.

• **Unit Heaters**—capacities from 76,800 to 155,000 Btu/hr. std. rating, air delivery 1165 cfm to 2100 cfm. Centrifugal type for use with steam or forced circulated hot water. Unusually quiet in operation—highly efficient and easily adaptable to duct installation. Finished in attractive featherweave or base coat for special colors.

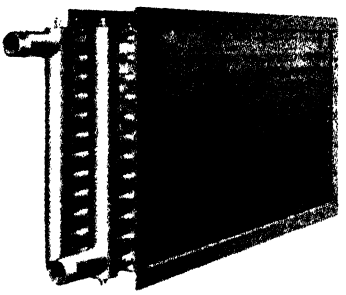
Manufacturers of

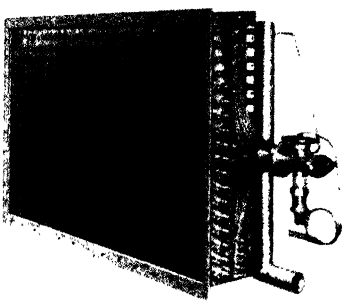
HEAT TRANSFER EQUIPMENT

AIR CONDITIONING BLOWER UNITS—HEATING AND COOLING COILS — EVAPORATIVE CONDENSERS — COOLING TOWERS — INDUSTRIAL COOLERS — UNIT COOLERS — UNIT HEATERS



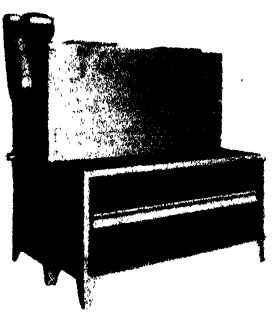
WATER COOLING AND HEATING COILS

For cooling with cold water and for heating with hot water.



DIRECT EXPANSION COILS

For freon. A complete range of sizes to meet all conditions and capacities.

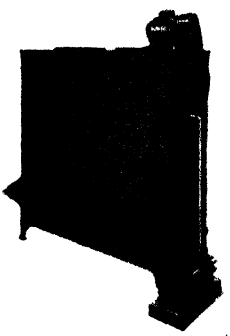


BLOWER UNITS

Ceiling and floor type air-conditioning units. 1 to 50 tons cooling capacity range and 24,000 to 1,125,000 Btu's range in heating. Various arrangements of discharge, filter box and motor drive.

EVAPORATIVE CONDENSERS

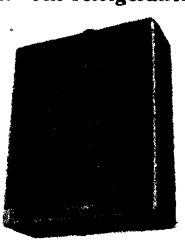
3 to 100 tons. All refrigerants. All prime surface coils. Indoor or outdoor units.



INDUSTRIAL COOLERS

(Not Illustrated)

1000 to 15,500 cfm. Floor type. Coils up to 12 rows in depth. All refrigerants.



UNIT HEATERS

Horizontal propellor fan type. Steam ratings 26,500 to 268,300 Btu's.

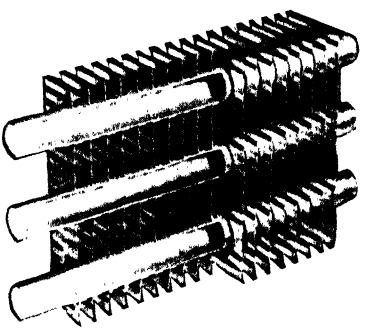
THE EXCLUSIVE McQUAY RIPPLE-FIN RIPPLE-TUBE COIL ASSEMBLY

McQuay hydraulically expanded Ripple-Fin Ripple-Tube Coils effect permanent contact between tubes and the entire surface of the fin collars—that's the advantage of the hydraulic pressure method—to create the lasting mechanical bond without the use of any "low conductivity" bonding material.

This significant advantage is a typical example of how a seemingly small detail in engineering design plays an important part in making superior products.

McQuay construction means higher flexible strength with less air friction and cleaner operation. To provide greater flexibility, all headers are of non-ferrous tubes, elipted to compensate for any unequal expansions and contractions.

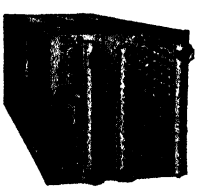


RIPPLE-FIN COIL

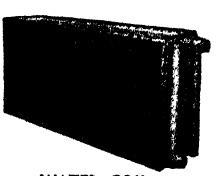
All secondary surface is of the aluminum ripple-fin continuous plate type, to give extra strength, and to provide heat transfer surface that remains clean for a longer period, thereby giving greater efficiency; all tubes are electro-tin plated for further protection and longer life.

The new standardized design provides 11 header sizes and 19 tube lengths, plus other intermediate header sizes and many other tube lengths. McQuay thus provides greater flexibility for sizing jobs.

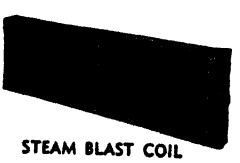
This careful attention to detail makes McQuay performance possible and establishes their preference among users. McQuay coils are available in a wider variety of styles and sizes, both standard and special coils for steam, hot water, cold water, brine, direct expansion and other applications.



COMBINATION COOLING COIL



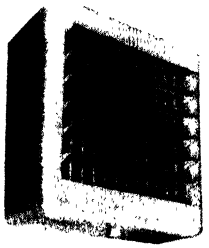
WATER COIL



STEAM BLAST COIL

MORE THAN 1,000,000 COIL TYPES AND SIZES

McQUAY manufactures a complete line of Standard Coils for the Industry.
Coils for Heating—1 to 10 rows deep using low or high pressure steam or hot water.
Jet-Tube (Non-Freeze steam inner tube) type coils 1 and 2 rows deep.
Cleanable Tube—(Removable plug) type coils 1 to 12 rows deep.
Water Coils for Cooling—1 to 12 rows deep.
Direct Expansion Coils—for cooling 1 to 10 rows deep.
Refrigeration Coils—all types and sizes.
Special Coils—of various materials furnished on order for special applications.



HORIZONTAL UNIT HEATER

HORIZONTAL UNIT HEATERS

Restyled in 1947 to provide up to the minute eye appeal. This renewed line of 12 sizes completely covers the range from 23,000 to 300,000 Btu. All sizes carried in stock. Write for Catalog 320.

DOWN FLOW UNIT HEATERS

Available with various air discharge arrangements for low, medium, or high suspension, these unit heaters fill a need on almost every job. Carried in stock in 16 sizes from 32,000 to 500,000 Btu. Write for catalog 746.

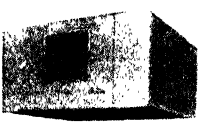
DOWN FLOW UNIT HEATER

BLOWER TYPE UNIT HEATERS

Made in 11 basic sizes covering the entire range from 1500 cfm and 125,000 Btu to 16,000 cfm and 1,136,000 Btu. Provision for handling external static; various outlet diffusers; also available with face and bypass dampers.

For long life, efficiency, and for eye appeal specify McQuay Unit Heaters.

BLOWER TYPE UNIT HEATER



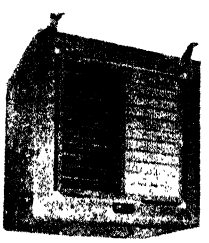
AIR CONDITIONER (YEAR-ROUND)

COMFORT COOLERS
For Small Commercial Applications

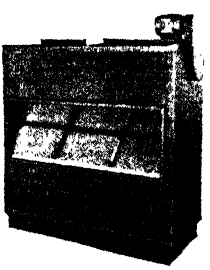
Made in two types—one for use with water or brine; another for Freon or methyl chloride. Five sizes (1, 1½, 2, 3, and 5 ton models) in each type—all with variable-speed motors. Write for catalog 81A.

SMALL AIR CONDITIONERS
Cold Water and Freon Types For Small Commercial Applications

Choice of recirculation of indoor air, entire intake of outside air, or a combination of both. Cold water or brine used in one type; Freon or methyl chloride in another. Modern "sound isolated" construction assures quiet operation. 2, 3, 5, and 7½ ton sizes. Write for Catalog 83A.



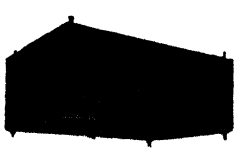
COMFORT COOLER



AIR CONDITIONER (YEAR-ROUND)

LARGE CENTRAL SYSTEM AIR CONDITIONERS
For Large Industrial and Commercial Applications

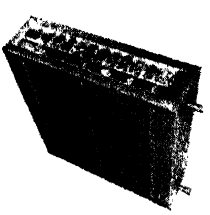
Suspended and floor types, cools, dehumidifies, filters, and circulates air in summer, heats, humidifies, filters and circulates air in winter. Extreme flexibility and accessibility "built-in." Cooling capacities from 5 to 50 tons in both Suspended and Floor Type. Write for catalog 85.



AIR CONDITIONER (YEAR-ROUND)

McQUAY
Icy-Flo Accumulators

The new practical "Storage-Battery" for refrigeration effect is now available for handling heavy loads of short duration. Ideal for churches, lodges, mortuaries, noon cafeterias, and many industrial applications. Write for catalog 105.



ACCUMULATOR

Modine Manufacturing Company

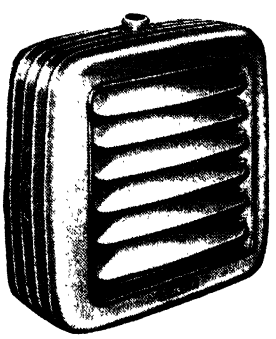
Heating and Air Conditioning Division

General Offices: 1500 Dekoven Ave., **Racine, Wis.**

Factories at Racine, Wis. and La Porte, Ind.

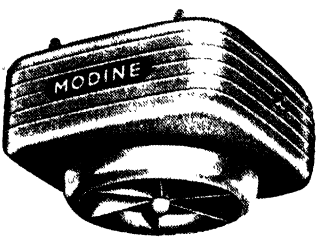
Branches in all Principal Cities

NEW MODINE UNIT HEATER LINE



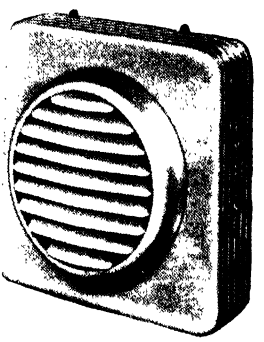
Horizontal Type

23 Models—for general industrial and commercial applications. Patented Modine center tappings permit direct-from-pipe-line suspension.



Vertical Type

16 Models—designed for overhead installation, up near ceilings of high bays to clear plant production equipment, or at low levels as in stores and offices.



New Power-Throw

8 Models—for specialized industrial applications. A new type of draw-through horizontal delivery unit heater with powerful, scouring jet action.

Three Distinct Types—47 Basic Capacities for Industrial and Commercial Unit Heater Applications

Modine's beautiful, new, integrated line of unit heaters offers new versatility in steam and hot water unit heater application. The three coordinated types may be used individually, or, where requirements indicate, in combination with each other. Thus, it is possible to meet varying heat, air delivery, mounting height, and location demands with the combined action of different unit heaters.

Condensers: Pure copper or copper alloy from inlet to outlet for maximum resistance to internal and external corrosion. Pure copper fins are metallically bonded to round, seamless, heavy-guage red brass tubes for permanent contact and to insure uninterrupted heat conduction from primary to secondary surface. Modine-patented expansion bend permits tubes to expand or contract individually as temperature requires. All steam and condensate carrying passages are brazed into an integral pressure-resisting unit.

Bonderized Casing: Attractive beige-gray casing with chrome trim protected from rust by Modine Parker Bonderizing.

Quiet Operation: Scientifically sound-silenced for quiet performance. Casing interiors are acoustically-insulated to muffle noises from within. Velocity generator eliminates air rush "peaks," subdues external air-rush noise.

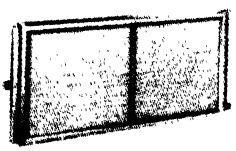
Efficient Motors: Nationally known makes of continuous-duty, totally enclosed fan type. Rubber mounted to prevent vibration noise from being transmitted to casings.

Safety Fan Guard: Staunch, steel safeguard protects against danger of unshielded fan.

WIDE NEW LINE OF HEATING COILS

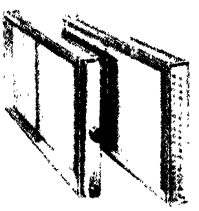
The new Modine line of Heating Coils now gives you over 1,236 coils to choose from in matching your specific performance and size requirements for heat transfer surface. But that's not all! Newly engineered and designed, Modine coils permit use of smaller duct sizes for increased convenience and efficiency! Available in four major types:

1. Standard Coil



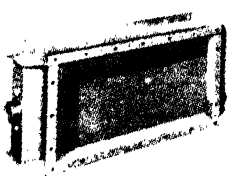
For all normal heating, ventilating, air conditioning and drying applications where steam is heating medium. 595 sizes and models.

2. Non-Freeze Coil



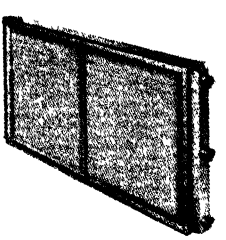
Incorporates steam distributing tubes for resistance to freezing and uniform face temperatures. Use where temperature is controlled by modulating steam supply . . . even with 32 deg F entering air. 510 sizes and models.

3. Booster Coil



For use where small volumes of air are handled. Ideal for controlling temperatures in branch ducts. Face areas as small as ½ square foot in standard and non-freeze types. 46 sizes and models.

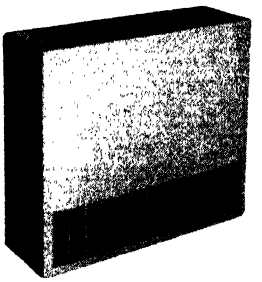
4. Hot Water Coil



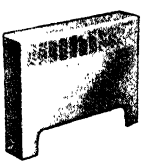
A serpentine coil for use on hot water. Exclusive Modine feature permits counterflow installation regardless of air flow direction with complete air venting and drainage provision. 85 sizes and models.

CABINET UNIT HEATERS

Designed for heating offices, lobbies, corridors, etc. . . . wherever quick, positive distribution of heat combined with quiet operation and gentle air movement are desirable. Has considerably greater heat output than convector of equivalent size. Employs copper heating coil for use on steam or hot water system. Mounted on wall or ceiling. Capacities: 105 EDR and 310 and 450 EDR.



CONVECTOR RADIATION



Floor Cabinet Type

Built to meet modern residential, institutional, and commercial heating requirements, Modine convectors operate on the principle of *natural convection*. Cooler, heavier air is drawn in through the enclosure's bottom opening; comes in contact with copper heating unit that carries steam or hot water. As air is heated, it rises; is then circulated out into room through grille at top of enclosure.

Concealed copper heating unit combines compactness with high heat capacity—to give room added floor space as well as fast, even heating. Use of copper makes the heating unit almost instantly responsive to automatic control.

Enclosures are streamlined for simplicity and harmonize readily with any type of interior. Parker-Bonderized before being prime painted, the enclosures are less vulnerable to the formation and spread of rust.

Manually installed enclosure fronts can be installed in 30 seconds without tools. Easy removal of fronts assures convenience in cleaning and gives ready access to the heating unit.

Available in recessed and cabinet types.

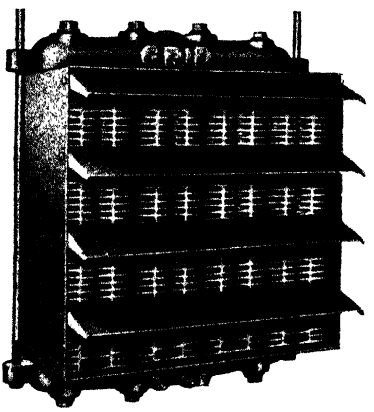
Wausau, Wisconsin

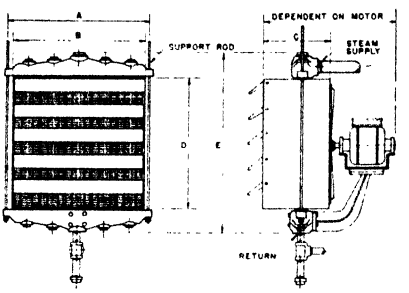
Offices in Principal Cities

MANUFACTURERS OF THE GRID UNIT AND GRID BLAST COILS



One piece construction "fin" heating sections of high test cast iron—no soldered, brazed, welded or expanded connections. Patented.

Designed and tested to operate with steam or hot water systems—for steam pressures from 2 lbs to 250 lbs. Engineered along the same lines as the standard GRID Unit which had aluminum heating sections and has been on the market since 1929.



Overall dimensions for installation of Cast Iron GRID Unit Heater

NO ELECTROLYSIS TO CAUSE CORROSION

Low maintenance expense.
More air changes per hour.
Positive "directed" heat.
No leaks—no breakdowns.
Lower outlet temperature.
Larger air volume.
No soldered, brazed or expanded joints.
Open design that keeps units clean.

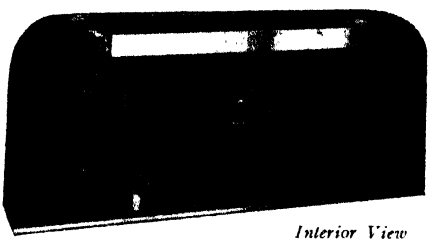
John J. Nesbitt, Inc.

Philadelphia 36, Pa.

Manufacturers of

THE NESBITT SYNCRETIZER Heating and Ventilating Unit, and
THE NESBITT PACKAGE, schoolroom ensemble consisting of the Syncretizer, Convector and storage units, sold by John J. Nesbitt, Inc., and American Blower Corporation;
NESBITT HEATING SURFACE with Dual Steam-distributing Tubes,
NESBITT SERIES H HEATING SURFACE, and
NESBITT SERIES W COOLING SURFACE,
sold by leading manufacturers of fan-system apparatus;
NESBITT CONVECTORS, sold by plumbing and heating wholesalers;
WEBSTER-NESBITT UNIT HEATERS (See page 1229),
distributed in U. S. A. by Warren Webster & Company.



Interior View

NESBITT SYNCRETIZER—Series 400

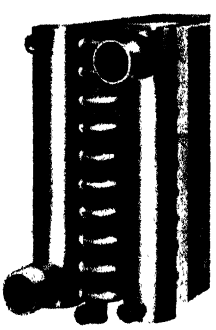
For heating and ventilating schoolrooms, offices, etc., where the continuous introduction of outdoor air is desired. For engineering data, get Publication 225-2; for "The Story of Syncretized Air," Publication 231-2. For data on The Nesbitt Package, schoolroom ensemble consisting of the Syncretizer, Convector, and storage units, get Publication 249.

Nesbitt Series B Thermovent

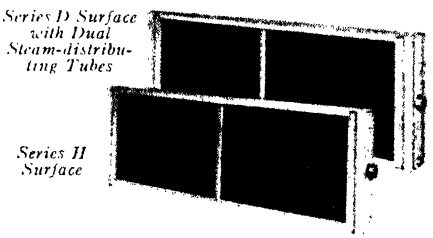
For heating and ventilating auditoriums, gymnasiums, assembly halls, and similar gathering places. Publication No. 227-2.

NESBITT COOLING SURFACE
Series W Surface

For air cooling and cooling and dehumidifying (with cold water) or air heating (with hot water). Constructed of copper tubes and plate-type aluminum fins. Available in either continuous or cleanable tube type, in single sections having one to eight rows of tubes deep, in three fin spacings, in eleven fin widths, and up to sixteen finned tube lengths. Sturdy galvanized casings. For engineering data send for Publication 246.



Uncased Surface Showing Drain Header



NESBITT HEATING SURFACES
Series D Surface
With Dual Steam-distributing Tubes

Copper tube and aluminum fin surface for low-pressure applications. Adapted to close, continuous automatic control with modulating steam valves. Steam-distributing tubes within condensing tubes carry the steam equally to the full section assuring *uniform* discharge temperatures even under throttled steam supply; eliminating temperature stratification; preventing tube freezing without preheaters.

Series D Surface is available in two types, Type DS and Type DD. Steam is supplied from one end of the surface in Type DS, which is recommended for lengths up to six feet. Steam is supplied from both ends of Type DD, which is recommended for lengths over six feet.

Cased or uncased units of many sizes and capacities. For engineering data, send for Publication No. 247-1.

Nesbitt Series H Heating Surface

A lightweight, enduring, highly efficient blast-coil heating surface designed for steam pressures up to 200 lb. gauge. Send for Publication 248.

NESBITT CONVECTORS

Designed for steam or hot water heating of residences, apartments, offices, etc. Send for Publication 252. Available in 20 stock sizes.

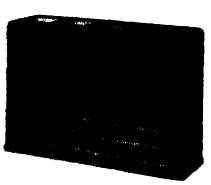
HERMAN NELSON HORIZONTAL SHAFT PROPELLER-FAN TYPE UNIT HEATERS

Designed for ceiling suspension, these unit heaters project warm air downward in an angular direction. Copper heating element for use with steam or hot water, incorporates patented stay tube which maintains proper relationship between headers without increasing strain on loops thus prolonging life of unit. A wide variety of models, sizes and arrangements.

HERMAN NELSON VERTICAL SHAFT PROPELLER-FAN TYPE UNIT HEATERS

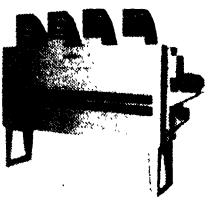
For high ceiling installations. Discharge air vertically downward, or at an angle to vertical in various directions. Long life copper heating element for use with steam or hot water incorporates patented stay tube. Units available with either high or low velocity discharge, each with a wide range of capacities.



HERMAN NELSON DE LUXE UNIT HEATERS

Efficient, economical, compact, quiet and attractive, these Unit Heaters provide the ideal method for heating offices, showrooms, corridors, markets, stores, etc. Copper heating element incorporates patented stay tube. Units may be placed on floor, wall or suspended from ceiling. Eighteen models, sizes and arrangements.

HERMAN NELSON CENTRIFUGAL FAN TYPE UNIT HEATERS

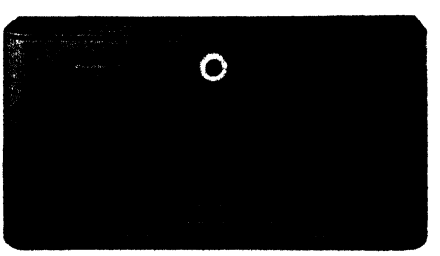


For efficient heating of large areas. Can be supplied with by-pass damper for introduction of indoor and outdoor air. Design of copper heating element assures durability and contributes to high velocity discharge. For floor, wall, ceiling or inverted wall mounting.

HERMAN NELSON UNIT VENTILATORS

Maintain desired air conditions for room or auditorium areas where large groups of people gather. Copper heating element for use with steam or hot water is sturdily constructed for long life and designed for greatest heating efficiency.

Exclusive "draw-through" design prevents unhealthful drafts and eliminates unnecessary overheating. Locating motor in end compartment provides additional space for fan assembly and use of larger fans running at slower tip speeds.



Herman Nelson Unit Heaters and Unit Ventilators are tested and rated in accordance with the Standard Test Code adopted jointly by the *Industrial Unit Heater Association* and the AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

THE HERMAN NELSON CORPORATION

General Offices and Factories at Moline, Illinois

HERMAN NELSON DIRECT DRIVE PROPELLER FANS

Provide most economical form of quality ventilation obtainable for industrial buildings of all types. 7 standard sizes available with wheel diameters from from 14 to 36 in. and capacities from 655 to 12,400 cfm. There are 7 high powered models to operate against static resistance of ⅜ in., with wheel diameters from 14 to 36 in. and capacities from 1200 to 14,600 cfm. Can be obtained in acid and explosion resisting models. Also three models especially adapted to small store and office applications.

HERMAN NELSON BELT DRIVE PROPELLER FANS

For public and commercial building installations where slow speed, quiet operation are required. Twelve sizes of the standard model with wheel diameters from 24 in. to 54 in. Also six sizes of the High Powered model with the same wheel diameters. Capacities: 5650 to 36,150 cfm. Due to quiet operation of Herman Nelson Belt Drive Propeller Fans, use of two speed motor is unnecessary.

HERMAN NELSON DIRECT DRIVE UNIT BLOWERS

Designed for many applications, such as fume hoods, toilet ventilation, chemical laboratories, industrial processing and drying problems. Compact, direct connected, motor driven units have universal discharge and mount on floor, wall or ceiling. Available in four sizes with 9 speed combinations. Wheel diameters from 6½ in. to 11 in. and capacities from 360 to 2265 cfm.

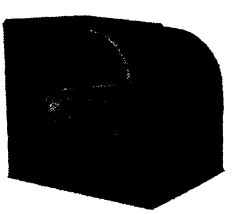
HERMAN NELSON BELT DRIVE UNIT BLOWERS

Fully self-contained unit including motor, drives and housing; forwardly curved or backwardly curved blade wheels available; adjustable motor pedestal with vibration dampers; universal discharge; nine sizes with 70 drive combinations. Available with any rotation and discharge. Wheel diameters from 11 in. to 30 in. and capacities from 980 to 16,892 cfm.

HERMAN NELSON TYPE "H" AND TYPE "HB" CENTRIFUGAL FANS

Especially suited for heating, air conditioning and ventilating systems. Type "H" has forwardly curved blade wheels. Type "HB" has backwardly curved blade wheels incorporating non-overloading power characteristics. Seventeen wheel diameters from 12¼ to 73 in.; single or double width; Class I or II construction; and any speed or discharge requirement.

Type HB



Type H

The Complete Line of Herman Nelson Propeller Fans and Blowers is tested and rated in accordance with the Standard Test Code adopted jointly by the *National Association of Fan Manufacturers* and the AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

Sales Connections All Over The World

In Canada: TRANE COMPANY OF CANADA, LTD., Mowat & King Sts., W., Toronto, Ont. (15 Branches)

A COMPLETE LINE

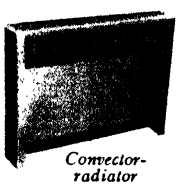
The Trane Company fabricates a complete line of heating, cooling, air conditioning and air handling equipment. Long years of experience with practical knowledge gained from close field contact, have developed products for every requirement.

Trane Systems—So comprehensive is the Trane Line that any number of complete heating and air conditioning systems can be designed in which all the major parts are made by Trane. Examples: Trane Custom-Air System of Air Conditioning for multiple-room buildings; central and unit systems of air conditioning for comfort and processes; steam and hot water heating systems. Products used in these systems are designed and made together for use together. Undivided responsibility.

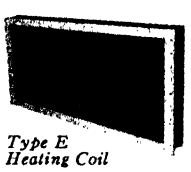
Trane Convector-radiator—The modern successor to the old-fashioned radiator, the Trane Convector-radiator is a compact, light-weight, easy-to-install unit. Available for either steam or hot water heating system. It combines attractive appearance with long life and economical service.

Currently easier to obtain and install than ever, new Type A Units are available from stock throughout the nation.

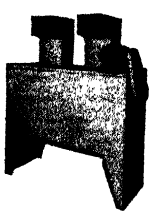
Trane Coils—There are Trane Extended Surface Coils for every heating or cooling, comfort or process application, in all types and sizes. Types include coils for steam, hot water or booster heating, direct expansion or water cooling.



Convector-radiator



Type E Heating Coil



Torridor Unit Heater

Projection Heater

Trane Blower Type Unit Heaters—Better known as Torridors, Trane Blower Type Unit Heaters are available for large space or duct work applications. Ideal for heating large spaces, exposed areas requiring a blanket of heat, and for process applications.

Trane Projection Heaters—A Trane development, the Projection Heater taps the usually wasted heat reservoir at the ceiling bringing it down where it is needed. Installed at 8 to 50 ft. heights, it projects warm air to the floor in a circular, vertical air stream. Ideal for low or high pressure systems in factories, warehouses, etc.

Trane Propeller Unit Heaters—Featuring a quiet operating, wide-bladed fan that pushes rather than bats the heated air through the coil, the Trane Propeller Unit Heater incorporates many unusual features, including adjustable louvers or grilled outlets directing heated air to the floor line, rugged motor supports, attractive appearance.

Trane Air Conditioning Manual—Trane offers the engineering profession a straight-forward and unbiased textbook covering the fundamentals of air conditioning, in a new enlarged edition. The Manual not only shows how to design every type of air conditioning system, but also clarifies underlying principles, enabling both student and engineer to reason out their own problems. Price—$5.00.

Trane Refrigeration Manual published primarily as an aid in understanding and correcting installation and service problems. Price —$1.50.

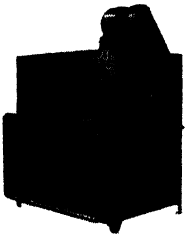
Trane Climate Changers —Trane Climate Changer, a unit type air conditioner, is designed for summer, winter, or year 'round air conditioning, commercial and industrial application, comfort or process installations. Available in various coil combinations with or without humidification equipment.

Trane Refrigeration Equipment — Outstanding in the refrigeration field is the Trane Turbo-Vacuum Compressor, a completely self-contained hermetically sealed centrifugal type water chiller, available in 50, 70, 100 and 200 ton sizes. Year 'round efficiency in constant operation with a minimum of maintenance is assured by the scientific simplicity of this machine.

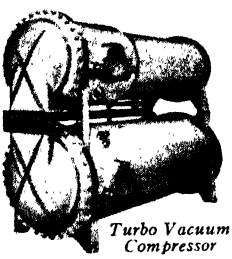
Trane also furnishes a complete line of Reciprocating Compressor and Condensing Units with capacities ranging from 3 to 100 tons. Also available are Trane Self-contained Air Conditioners for shop and office spaces.

Trane Roof Ventilators —The Trane Roof Ventilator can be used wherever an effective roof ventilator is required. This unit is available for either exhaust or supply purposes.

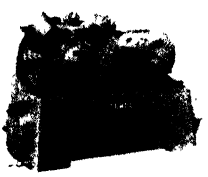
Trane Centrifugal Fans —Recommended for all types of heating, cooling, and air handling applications. In direct or belt-driven units, single or double widths, and all standard discharges in both backward and forward curved blade construction. Capacities 200 to 330,000 cfm.



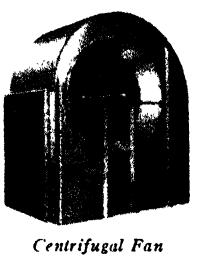
Climate Changer



Turbo Vacuum Compressor



Reciprocating Compressor



Centrifugal Fan

Lifetime Valve

Thermostatic Radiator Trap

Trane Steam Heating Specialties—There are over fifty valves, traps, vents, strainers, all allied specialties in the Trane Line. Among them are the famous Trane Hermetic Valve with the Lifetime Diaphragm that absolutely prevents steam leakage around the stem and the Thermostatic Radiator Trap which when used together provide an ideal combination for convectors and radiators.

Trane Hot Water Heating Specialties — Included among Trane Hot Water Heating Specialties are the Trane Circulator, Flo Valves, and Fittings. They combine with Trane Convectors or Unit Heaters to provide an ideal Warm Water Heating System for a great variety of applications.

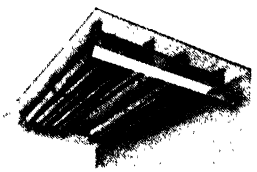
Other Trane Equipment —The complete Trane Line also includes—1. Trane Unit Ventilators for schoolroom air conditioning; 2. Trane Condensation and Centrifugal Pumps for a large variety of uses; 3. Trane Dry Type Water Chillers; 4. Trane Evaporative Condensers to condense refrigerants in the air conditioning system with a minimum use of water; 5. Trane Cooling Towers; 6. Trane Force-Flo Heater for quiet heat and neat appearance; 7. Trane Railroad and Bus Air Conditioning Equipment of all kinds; 8. Trane Shell and Tube Heat Exchangers for cooling and heating vapors or liquids in a closed system; 9. Evaporative Coolers for cooling fluids in a closed system; 10. Transformer Oil Coolers; 11. Air Washers.

Write today for Trane Condensed Catalog PB290 which describes completely all of the products listed here as well as providing sufficient data for their selection.

Refrigeration Economics Co., Inc.

1231 Tuscarawas St. E., **Canton 2, Ohio**

RECOY PRODUCTS

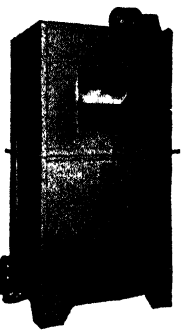


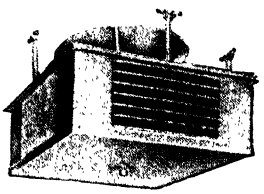
C. T. COILS

Continuous-tube down-draft fin-coils are still unsurpassed for meat coolers. Others available for practically any application.

EVAPORATIVE CONDENSERS

Evaporative condensers from 2 to 100 tons. Brine spray cooling to 25 tons.



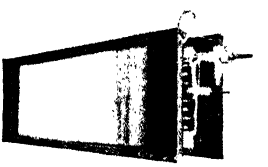


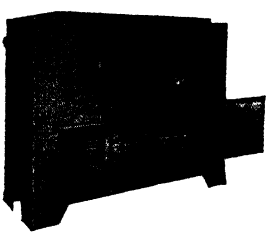
CEILING DIFFUSER

Ceiling diffusers distribute the cooled air across the ceiling, so the blast does not strike the products stored or occupants.

C. F. COILS

Continuous fin coils for unit coolers, blast heaters, air conditioning and condensers.



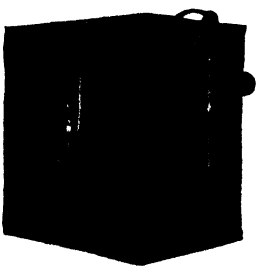


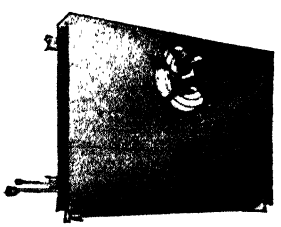
AIR CONDITIONING

Air conditioning units of ceiling or floor type in all capacities, for cooling, heating, or both.

COOLANT COOLING

Coolant coolers from 1 to 20 tons are a necessity for modern production of accurate machine parts.



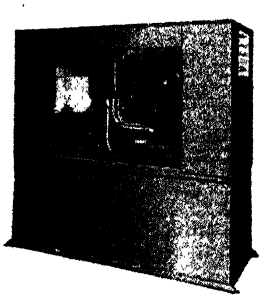


WALL UNITS

Recoy "All Seasons" wall units provide means of deflecting the cold air down along the wall or out horizontally into the room, thus providing proper air circulation for "All Seasons."

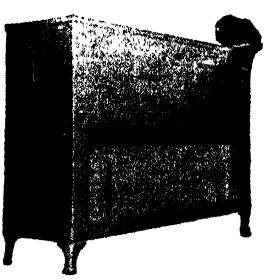
SHELL CONDENSER

Shell and tube, also shell and fin coil condensers. Both types have tubes arranged for cleaning with tube cleaner.



WATER COOLING

Self contained complete ice water and brine coolers complete with high and low sides, circulating pumps, controls, and insulation. 1½ to 50 hp.



FLOOR UNITS

Floor units with cooling surface exposed to view have a definite advantage over those with coils hidden. Design permits water defrosting.

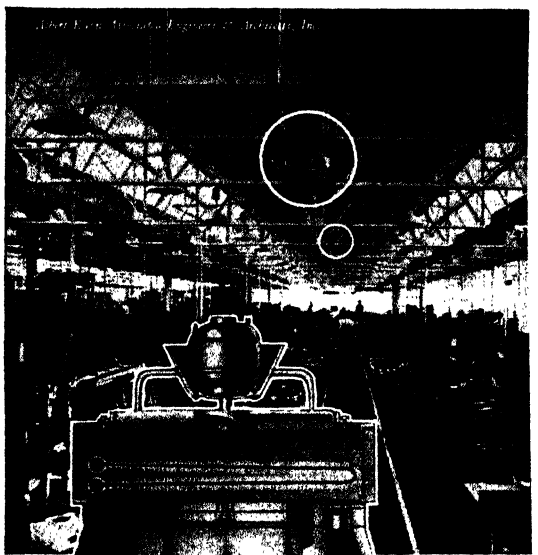
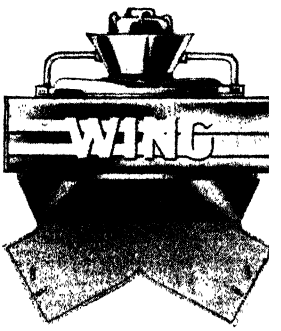
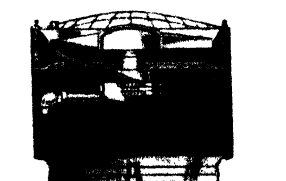
WING REVOLVING UNIT HEATERS



Cross-Section through heater showing motor, fan, heating section and revolving discharge outlet. Design No. 8.



Motor Driven Heater



(Right) Cross-section of Turbine Heater showing fan, turbine, heater section and revolving discharge outlet. Design No. 5.

Turbine Driven Heater

This innovation in the method of distributing heat produces a sensation in heating comfort never before attained—a sensation of fresh, live, invigorating air.

The fact that the outlets revolve assures uniform and thorough distribution of comfortably warmed air throughout the entire working area, without drafts, hot spots or cold spots.

Such an unprecedented high efficiency in distributing heat is the result of 25 years of constant study by Wing engineers to improve on the Floodlight System of heating pioneered by WING in 1921. This method projects the heated air vertically downward by means of light-weight, ceiling-suspended unit heaters.

It has needed only this latest refinement of slowly revolving discharge outlets to bring that method to perfection.

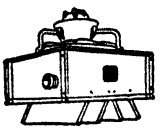
The WING Revolving Discharge type supplements the WING line of standard fixed discharge outlets, illustrated and described on the following page.
Bulletin HR-5.

The latest type of WING Unit Heater—with Revolving Discharge Outlets—is the WING TURBINE DRIVEN UNIT HEATER in which the steam used to drive the fan (instead of an electric motor) also supplies the heater section.

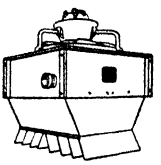
The Wing Turbine Revolving Unit Heater employs the new Wing Allsteel Steam Turbine which operates at *any* pressure. Condensate from the heater is never at a temperature exceeding 170 F. The entire unit is so designed that there is no back pressure on the turbine, assuring against leaks without the use of power-absorbing, troublesome packing. This also eliminates the need for traps and extra piping.

As in the motor-driven heater, the revolving discharge outlet distributes the heat continuously in constantly changing directions.

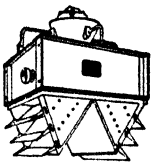
Type "HC" Fixed Discharge Design No. 7



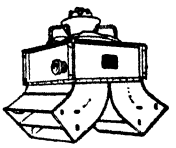
Design No. 1



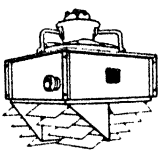
Design No. 1-HV



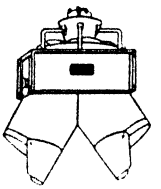
Design No. 3



Design No. 4



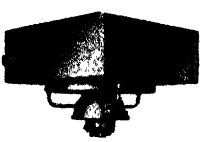
Design No. 6



Design No. 8

WING FIXED DISCHARGE UNIT HEATERS

The first light-weight, ceiling-suspended, unit heater. Eight different designs of outlets meet the requirements of every type, size and height of building or occupancy. Located near ceiling or roof, the accumulation of hot air in the upper spaces, with the accompanying costly waste of heat, is prevented. They project the air, comfortably warmed, downward to the working area. *Bulletin HR-5.*



DOOR HEATERS GARAGE HEATERS

WING developed this vertical cone-discharge heater in 1921 and today it is still applicable for heating the inrush of cold air at large doorways and for garage heating. Often cuts heating costs in half. *Bulletin HR-5.*

FOR LOW CEILINGS

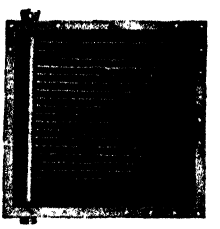
Type "LC"

In this type of WING Unit Heater the position of fan and motor are reversed to meet conditions of ceiling or roof height, form and shape of building, coverage, etc. *Bulletin HR-5.*

WING UTILITY UNIT HEATERS

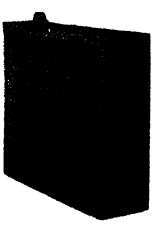
A lightweight suspended unit heater for delivering heated air in one general direction. Has the same powerful fan and rugged heating element as WING Featherweight Unit Heaters. This is the latest refinement of the original horizontal lightweight heater which was developed by WING. *Bulletin U-6.*

FEATHERFIN HEATER SECTIONS



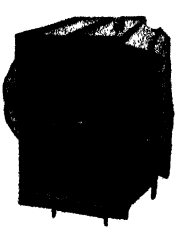
For heating or cooling air for any purpose by steam, hot or cold water or refrigerant. The heating element is extremely light and, for equal heat transfer, offers little resistance to air flow. Available for any desired final air temperature. *Bulletin HS-3.*

VARIABLE TEMPERATURE SECTIONS



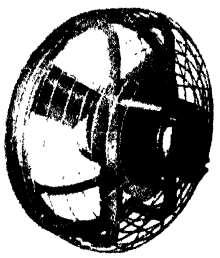
Invaluable in supplying fresh air for space heating or process work. Close control of the delivered air temperature is obtained without danger of freezing. Manual or automatic control. *Bulletin HS-3.*

WING INDUSTRIAL FOG ELIMINATORS



Eliminate fog, odor and fumes in dyeing, bleaching and finishing plants, creameries, pasteurizing, bottling, canning and packing plants, chemical works, paper mills, steel pickling plants, etc. No ducts are required. *Bulletin FE-12.*

WINGFOIL SAFETY VENTILATING FANS



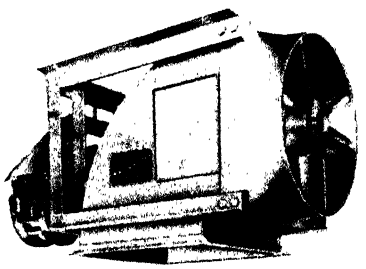
An axial flow fan that will deliver air against static pressure, quietly and efficiently.

Moves the air forward in straight lines with minimum eddy. Capacities to 100,000 cfm. *Bulletin F-9.*

WING FEATHERFIN PROCESS HEATING UNITS

For manufacturing processes such as drying, aging, etc., requiring the recirculation of the heated air. Motor or turbine located outside air current. *Bulletin P-2.*

WINGFOIL DUCT FANS



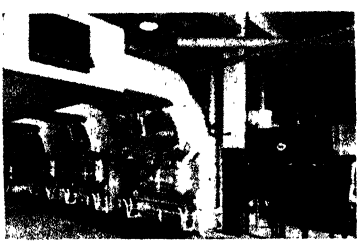
For economically moving air wherever ducts are used. It combines the efficient WINGFOIL AXIAL FLOW Fan with a housing which places the motor entirely outside the air duct. Motor and drive remain cool and clean and are easily accessible.

The powerful WINGFOIL Fan delivers high air volume with low power consumption against any pressures for which duct systems should be designed. V-belt or direct drive.

Light, compact and easy to install. *Bulletin F-9.*

WING SYSTEM OF CONTROLLED COMBUSTION

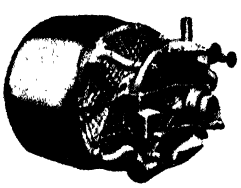
For low pressure heating boilers and small power boilers. Increases capacity and permits use of lowest cost fuel. Includes Type EM Blower equipped with fully enclosed dustproof motor with speed regulating rheostat and automatic control. Eliminates necessity of frequent firing, allowing intervals as great as 24 hours even in zero weather. *Bulletin M-96.*



Installation of Wing System of Controlled Combustion in a large school

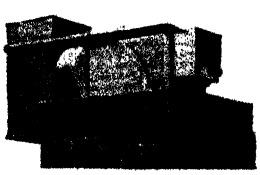
WING TURBINE-DRIVEN BLOWERS

Applied to hand, stoker, oil or pulverized fuel fired boilers, increase boiler capacity, maintain constant steam pressure and permit complete combustion of low-cost fuels. The exhaust steam, free from oil, can be used for heating or processes. *Bulletin T-98.*



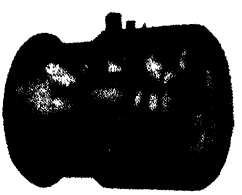
WING DRAFT INDUCERS

Installed in breeching or flue, or on chimney top; provide positive, exact draft regardless of weather conditions or inadequate chimney or breeching construction. Suitable for coal, oil, or gas-fired boilers; industrial furnaces and kilns. *Bulletin I-10.*



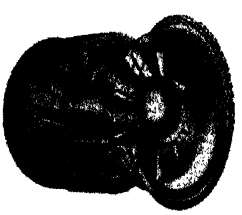
Chimney-Top Installation

WING MOTOR-DRIVEN BLOWERS



Type COM

Type COM for static pressures over 5 in. and volumes up to 35,000 cfm. Type EMD for moderate static pressures up to 5 in. Both blowers have fully-enclosed dustproof constant speed motor and built-in adjustable control vanes. Type COM has double-staged axial flow fan; Type EMD, single stage fan. Extremely compact; discharge can be vertical, horizontal or inclined. *Bulletin SW-1.*



Type EMD

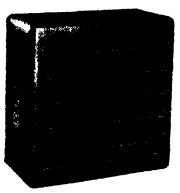
HEAT TRANSFER PRODUCTS

Oil Coolers • Gas, Gasoline, Diesel Engine Cooling Radiators • Heat Exchangers • Intercoolers • Engine Jacket Water Coolers • Gas Coolers • Unit Heaters • Convectors • Condensers • Evaporators • Air Conditioning Units • Heating Coils • Cooling Coils • Complete Line of Aircraft Heat Transfer Equipment.

"STREAMAIRE" UNITS

"Streamaire" units are a development of Young's quarter century of experience in building heat transfer products. Personalized, "on-the-job" engineering service by field men—backed by modern research and manufacturing facilities—assures the practical, economical installation as required in your plans.

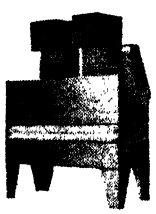


Type "SH" unit heaters for horizontal air discharge.

Available with capacities from 19,000 to 325,000 Btu per hour.

Type "V" or Vertiflow unit heaters for vertical air discharge.

Capacities from 52,600 to 552,000 Btu per hour.

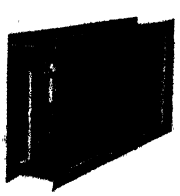


Type "BH" blower unit heaters for floor, wall or ceiling mounting.

Capacities from 109,400 to 1,047,000 Btu per hour.

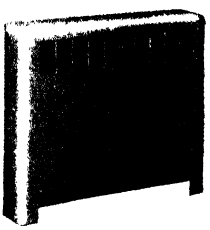
Type "W" water coils for cooling or heating with central plant systems.

Five widths, 11 to 35 in.; 2 to 8 rows of tubes; many lengths.



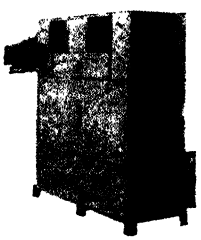
Type "E" evaporator coils for direct expansion cooling systems using Freon or Methyl chloride.

Four widths—one to six rows of tubes; many lengths.



"Streamaire" Convectors Standardized Types—circulate rather than radiate heat. Used with steam or hot water systems.

Cabinets blend with architecture and room furnishings.



"YAC" vertical or horizontal type air conditioning units provide "weather to order" year-round. A constant, quiet flow of evenly distributed clean, healthfully-fresh air at fingertips.

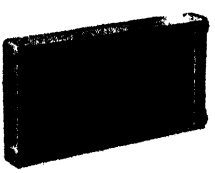
Also available in units for winter or summer conditioning only. Capacities from 400 to 16,625 cfm.

Types "B" and "A" blast coils for central plant heating and air conditioning systems.

Steam distributing tube type available.

Type "C" commercial heat transfer coils for use in factory built air conditioning units.

Steam distributing tube type available. One, two and three rows of tubes.



Revere Copper and Brass Incorporated

Executive Office: 230 Park Avenue, **New York 17, N. Y.**

MILLS—BALTIMORE, MD., NEW BEDFORD, MASS., ROME, N. Y., DETROIT, MICH., CHICAGO, ILL.

REVERE PIPE AND TUBE OF COPPER AND COPPER ALLOYS

For Heating, Air Conditioning, Plumbing, Fuel Lines, Compressed Air Lines, etc.

Revere Copper Water Tube, Types K, L, and M meets Federal and *ASTM* specifications.

Types K, and L furnished in hard and soft tempers.

Types M, 2½ in. and above, furnished in hard temper only.

Revere Type K Copper Water Tube in hard temper is not too hard to be bent with a hand bender.

Type K soft temper tube is recommended for underground water service or fuel lines.

Hot water lines of Copper Water Tube lose very little heat to ambient air, hence save fuel.

Revere Grade A Red-Brass Pipe or Copper Pipe (SPS) are recommended for piping systems where threaded connections are required.

For Radiant Heating

Revere Copper Water Tube, furnished in 60 ft coils is easily bent to form sinuous coils for heating panels.

Long, one-piece lengths of copper tube reduce the number of couplings or joints required.

Small diameters of copper tube require less thickness of embeddment.

For Refrigeration Systems, Air Conditioning, or general use **Revere Dryseal** copper tube is dehydrated and sealed.

Furnished in dead soft temper, it is easily bent and flared.

Suitable for fuel lines, compressed air lines and air control lines.

For Condensers and Heat Exchangers

Revere Cupro-nickel condenser tube has definitely been found superior for condensers, after coolers, and similar heat exchangers.

Similar tubes of Revere Admiralty Metal are widely used.

Revere Seamless Copper Tube is commonly used for finned tube coils.

For Industrial Piping and the Process Industry

Revere produces a wide range of pipe and tube made of copper and copper alloys for industrial use where high resistance to corrosion is required.

Solicitations for assistance in selecting piping material best suited to specific conditions are welcome.

Silver-brazed Joints

Revere Red-Brass Pipe or Copper Pipe is recommended where silver-brazed joints are required with standard pipe sizes.

Revere Copper Water Tube and standard soldered type fittings can also be silver-brazed with excellent results and generally at a saving in cost.

Technical Advisory Service

Revere maintains a staff of technical men to assist engineers, designers, and contractors in the selection of suitable Revere products for various applications. Their services are available without obligation.

Technical Literature

Literature relating to many fields of application for **Revere** pipe and tube products are available upon request.

Two booklets on Radiant Panel Heating cover the subject of design procedure and in the form of a non-technical and unbiased discussion for lay readers.

ANACONDA
from mine to consumer

IN CANADA: ANACONDA AMERICAN BRASS LIMITED, New Toronto, Ontario

PRODUCTS—Anaconda Deoxidized Copper Tubes and Fittings; Anaconda "85" Red Brass Pipe; Everdur Metal for storage heaters, storage tanks, ducts and air conditioning equipment

ANACONDA COPPER TUBES AND FITTINGS

For Heating, Plumbing and Air Conditioning

Anaconda Deoxidized Copper Water Tubes assembled with Anaconda Fittings offer an unusual combination of advantages in hot water heating systems at a cost only slightly higher than black iron and approximately the same as wrought iron pipe. These advantages may briefly be summarized as follows:

Low Friction Loss—Because the inside surfaces of copper tubes are inherently smoother than those of pipe and tubes made of ferrous materials and also because they do not become roughened by the formation of rust, these tubes offer a lower resistance to flow. In addition, the long radius turns of Anaconda Elbows and the smooth inside surface of Anaconda Wrought Copper Fittings further reduce friction losses.

These factors naturally increase the efficiency of the system, particularly when it includes a forced pressure circulator.

Ease of Installation—In many places the flexibility of copper tubes simplifies connections that ordinarily would be awkward and expensive to make with rigid pipe and threaded fittings. Anaconda Solder Fittings are compact. They can be installed in restricted space where the use of a wrench would be impossible.

Architects and builders naturally object to large holes and notches cut in the framing members of a building for the passage of piping. Anaconda Copper Tubes can be installed with a minimum of cutting in the structure—although holes should be large enough to permit movement of tubes due to expansion and contraction.

Temper and Thicknesses—Anaconda Copper Tubes are made in both hard and soft temper and in standard wall thicknesses.

They meet the requirements for these types of tubes in Federal Specification WW-T-799a and *A.S.T.M.* Specification B88. Type K, the heaviest, is recommended for heating lines and general piping.

Accuracy of Dimensions—Anaconda Deoxidized Copper Water Tubes are all finished to the close size tolerances required by the *A.S.T.M.* and Federal Specifications, which have been found essential for efficient assembly with solder fittings.

Anaconda Copper Tubes, in standard sizes are furnished soft in 60-ft coils; also hard and soft in 20-ft straight lengths.

The American Brass Company

REFRIGERATION TUBING

Anaconda Dehydrated Copper Refrigeration Tubes are manufactured in accordance with *A.S.T.M.* Specification B68, in all standard sizes up to and including ¾ in. O.D., in 50-foot coils. Other lengths are made to special order. These tubes are manufactured under exceptionally clean mill conditions and close technical control to assure clean, smooth inside surfaces, unusual accuracy in size and shape, and uniform softness. The tubes are cup-sealed immediately after annealing and dehydrating.

ANACONDA "85" RED BRASS PIPE

Anaconda "85" Red Brass Pipe, in standard pipe sizes, is considered the highest quality corrosion-resistant pipe commercially obtainable at a moderate price and is recommended for steam return lines.

Anaconda "85" Red Brass Pipe contains 85 per cent copper and conforms to Government specifications for Grade "A" water pipe. The mark "Anaconda 85" is stamped in the metal at one-foot intervals throughout each length.

EVERDUR*

Everdur Metal is the original copper-silicon alloy group. It is manufactured by The American Brass Company in five standard compositions and in practically all commercial forms.

This high strength engineering metal is resistant to a wide range of corroding agents. Because of a versatile combination of useful properties, Everdur has become standard as a material for equipment in many fields of engineering and industry.

In addition to their non-rusting properties and high strength, Everdur alloys possess many qualities not usually found in metals of this character. They are unusually resistant to general atmospheric conditions and other normally corrosive factors. Everdur alloys have excellent machining and working characteristics and can be fabricated into a variety of forms and shapes. Everdur alloys are available for oxy-acetylene or carbon arc welding.

*"Everdur" is a trademark of The American Brass Company registered at the U. S. Patent Office.

CORROSION RESISTANCE

The corrosion resistance of Everdur is equivalent to that of pure copper and in some cases, slightly superior.

However, like copper and all copper alloys, Everdur is not equally resistant to all corroding agents, nor to the same corroding agents under all conditions. As with copper, the resistance to corrosion may be substantially reduced in some instances by the presence of oxidizing agents. Nevertheless, Everdur does offer excellent resistance to the corrosive action of many solutions and atmospheres.

Everdur Tanks—Everdur copper-silicon alloy is an ideal material for durable, rustless water tanks of every description—from domestic range boilers to large storage heaters for hotels, laundries, hospitals, textile plants, schools or breweries.

Everdur is made in all commercial shapes including annealed tank plates which have physical properties as given in *A.S.T.M.* Specification B96.

Minimum specification requirements for hot rolled-and-annealed tank plates are: Tensile Strength, 50,000 psi.; Yield Strength (at 0.5 per cent elongation under load) 18,000 psi.; Elongation, 40 per cent in 2 inches.

Welds made with annealed Everdur tank plates meet the requirements for Class B and C vessels in the *A.S.M.E.* Code for Unfired Pressure Vessels.

For additional data and names of fabricators address our nearest office or agency.

EVERDUR FOR AIR CONDITIONING EQUIPMENT

Because of its strength and welding properties, Everdur may be substituted for steel and fabricated by substantially the same methods and with much the same equipment as steel.

Everdur metal has been used with marked success for fans and blowers, ducts, humidifiers, cast and wrought parts of other equipment items subject to corrosive influences.

EVERDUR LITERATURE

Descriptive literature containing much pertinent tabular data will be sent on request.

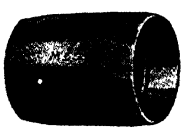
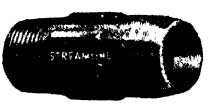
PRODUCTS—STREAMLINE Copper Pipe and Seamless Tubes; STREAMLINE Hard Copper Pipe and Solder Fittings; Valves, Flared and STREAMLINE Solder Fittings for Mechanical Refrigeration; Forgings of Brass, Bronze and Copper; Castings of Brass and Bronze; Rod; Screw Machine Products; Fabricated Parts and Special Nickel and Chromium Plated Parts; Machined Formed Tubes.



Coupling Copper to Copper



Copper to Outside I.P.S.

45 Deg Elbow

Streamline Copper Pipe and Fittings for heating, plumbing, air conditioning and industrial use are made by the STREAMLINE PIPE AND FITTINGS Division, Mueller Brass Co., Port Huron, Mich.

The **Streamline** Solder Fitting is the original solder type fitting, introduced and manufactured by the Mueller Brass Co. of Port Huron, Mich. It incorporates many advantageous features and has proved to be the revolutionary advance of the age in the development of piping systems for plumbing and heating and for many industrial uses.

The **Streamline** Solder Fitting is not connected either by threading or flaring, but by soldering. The outside surface of the copper pipe and the inner surface of the **Streamline** fitting are cleaned with sandcloth, and solder flux is then applied to the cleaned surfaces to eliminate oxidation when the assembled joint is heated. The joint is then sufficiently heated with a blow or acetylene torch and the soldering operation is performed by feeding wire or stick solder through the feed hole in the fitting.

The **Streamline** Cast Bronze Solder Fitting alone has the solder feed hole. The solder feed hole, through which the solder is introduced, enters directly into an internal feed channel. The feed channel is located equidistantly between the internal shoulder against which the pipe rests and the outer edge of the fitting. When solder is introduced it is distributed by capillarity from the feed channel and distributed evenly and thoroughly between the bonding surfaces, traveling inward to the shoulder and outward to the edge of the fitting where it appears as a continuous solder ring around the full circumference of the pipe. This ring, and feed hole completely filled with solder, constitute positive visible proof to the operator that the joint is permanently leak-proof.

Streamline Pipe and Fittings Division

MUELLER BRASS CO.

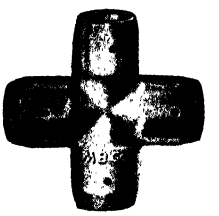
Port Huron, Mich.

Patents 1770852; 1770502

90 Deg Elbow

Tee

Tee
Copper to Inside I.P.S.



Crosses

The solder may be fed from any position, whether the feed hole is located at the top, side or bottom. Owing to the never failing phenomena of capillarity, the solder will flow up, down or laterally with equal facility.

Streamline Copper Pipe is a seamless cold drawn copper tubing conforming to *A.S.T.M.* B88. It is made in sizes ¼ in. to 12 in. and Types K, L, and M, of which Type K is the heaviest. The intermediate weight, Type L, is the preferred weight for plumbing, heating and refrigeration. Type M is manufactured only in sizes 2½ in. and larger.

For most purposes hard drawn pipe is used, though Types K and L can be furnished annealed when bending is required. Annealed Type "K" in sizes up to 2 in. is widely used for underground water "services."

Streamline Solder Fittings are furnished in all sizes to 6 in. inclusive. They are of the same thickness as Navy and MSS Fittings for 125 steam or 175 lb non-shock water pressure.

All fittings over 6 in. are flanged and may be had with either *A.S.A.* or riveted pipe standard flanges.

Mating flanges are soldered to the pipe—*A.S.A.* 125 standard flanges are available from 1 in. up.

During the last fifteen years architects and engineers have used **Streamline** Copper Pipe and Fittings successfully in every type of building construction and in thousands of installations throughout the United States and Canada.

In addition to its rust and vibration-proof qualities and long life, **Streamline** has many other advantages such as the reduction in size of pipe lines and radiator connections from those nominally used, a neat, compact installation requiring a minimum of space and important advantages in industrial and drainage applications. There is a **Streamline** product for every piping requirement.

Atlantic Metal Hose Co., Inc.

112 West 64th St. **New York 23, N. Y.**

ATLANTIC SEAMLESS FLEXIBLE METAL HOSE
ABSORBS VIBRATION
on REFRIGERATING and AIR CONDITIONING EQUIPMENT

For standard pressures in a variety of metals

Type A

For high pressures and severe service

Type A-1

For refrigeration and air conditioning Freon Lines

Vibration Absorber

Throughout the Heating, Ventilating and Air Conditioning Industry—where the ability to control vibration and compensate for expansion must go hand in hand with the ability to take punishment and withstand pressure—Atlantic hose continues to break performance and economy records year after year.

Durable—the specially selected alloy and method of construction assures long life even under severest service.

Simplifies Installations—Both slip-on as well as pipe thread fittings can be provided in all commercial sizes for quick assembly.

We also manufacture hose for the conveyance of dust, air, exhaust, steam and all liquids.

Engineering Service—Our engineering department will cooperate with prospective users in the selection of suitable standard flexible hose, or in the design of hose to meet special requirements. Advise us of the details of the service and we will be pleased to offer our recommendation.

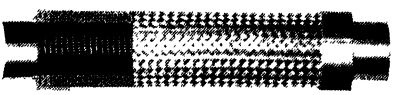
REX Vibra-Sorbers Noise and Vibration Control



Rex Vibra-Sorbers control vibration and reduce noise in refrigeration and air conditioning machinery. All-metal construction is liquid- and gas-tight, withstands high pressures, does not age, and has high corrosion resistance.

Available in copper bearing alloy for use with Freon or Methyl Chloride; or steel for Ammonia systems.

Write for detailed data.

SIZES: 3/16 in. to 4 in. inside diameters.

PRESSURES: 1,000 psi to 3,700 psi.

LENGTHS: Standard stock lengths. Special lengths available on order.

COUPLINGS: Stock units with male or female sweat fittings; also available with male pipe thread fittings.

REX-TUBE Flexible Metal Hose

Rex-Tube Convoluted Flexible Metal Hose Types have three basic formation patterns: square-locked, ball-bearing (or double-groove), and fully interlocked. Made of stainless steel, brass, steel, aluminum, bronze and other alloys. Packless and packed types. Sizes range from 3/16 in. to 12 in. inside diameters, and lengths to suit requirements.

FOR

Diesel engine exhaust lines
Refrigeration tubing armor
Air blower ducting
Ventilating ducts
Control wire casing
Wiring conduit
Suction hose
General utility hose

REX-WELD Flexible Metal Hose

Rex-Weld hose types are manufactured from uniform wall tubing by a special CMH corrugation-forming process. Metals used are steel, bronze, and other alloys. Rex-Weld sizes range from 3/16 in. to 12 in. inside diameter; with lengths and couplings to fit specific requirements. Especially designed for use under high temperatures and pressures, and where corrosive action is present.

FOR

Steam Hose
Reciprocating flexible connections
Oil burner connections
Pressure lubricating lines
Conducting searching gases and liquids
Diesel engine exhaust lines
Misalignment correction

FLEXIBLE METAL HOSE FOR EVERY USE

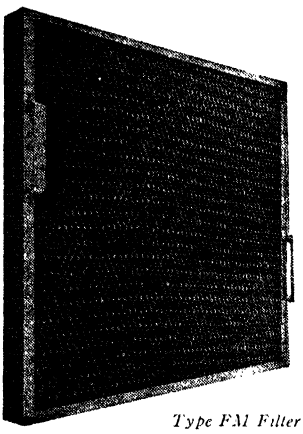
AGITAIR PRODUCTS

Agents in All
Principal Cities



Type FM Filter

AGITAIR AIR FILTERS

HIGH VELOCITY • ALL METAL PERMANENT • CLEANABLE

Designed along entirely new air filtering principles, the high velocity Agitair Type FM permanent, cleanable air filter assures an amazingly high dust arresting efficiency and dust-holding capacity coupled with sustained low resistance to air flow. This permits the Type FM to remain in service from two to three times as long as ordinary 2 in. permanent, cleanable filters.

Although these new filters do not have to be cleaned as often, particular attention has been paid to their design to make cleaning easier and more thorough. They can be restored to top efficiency easily and quickly. Ruggedly constructed to withstand the mechanical abuse of cleaning. Panels and frames are accurately designed to prevent leakage around the filters.

HOW IT WORKS

High turbulence of many finely divided air streams is the keynote of Type FM air filter's new design. The media divides the air into countless fine streams and throws those streams into violent cyclonic turbulence. Each little "cyclone" centrifuges its dirt particles against countless viscous-coated "wiping surfaces" which virtually scrub the air clean by catching and holding the dirt. There is no straining action, hence no clogging.

HIGH VELOCITY

The Agitair FM Filter is designed to perform at highest efficiency at an approach velocity of 432 fpm—or 1200 cfm through a 20 x 20 in. filter panel. The efficiency of the FM is higher than conventional filters when operating at the lower design velocity of 288 fpm.

1/3 LESS SPACE REQUIRED

The ability of the FM to filter, with greater efficiency, 50 per cent more air at the high velocity of 432 fpm reduces the number of filter panels required. Now TWO FM's will do the work of THREE ordinary filters . . . ⅓ less space required . . . fewer units to be installed . . . fewer units to be serviced . . . overall installation and maintenance costs reduced to a minimum.

HIGHER EFFICIENCY

At the recommended velocities of other leading all metal viscous type filters, the Agitair FM has a higher dust arresting efficiency, which increases as velocities are stepped up.

LOWER RESISTANCE

The sustained low resistance of the Agitair FM means sustained peak volume of air for longer periods of time . . . no loss in air volume . . . no danger of unloading . . . clean filtered air at all times.

HIGHER DUST HOLDING CAPACITY

Employing a new formula for air filtration the new Agitair FM holds more dirt, from two to six times as much as ordinary 2 in. permanent, cleanable filters. No early clogging of air passages . . . less frequent servicing . . . lower maintenance cost.

LONGER SERVICEABLE LIFE

The Agitair FM Filter with its greater dust holding capacity, stays in service for longer periods of time; gives efficient performance for months instead of weeks or weeks instead of days.

Less frequent servicing—and rugged construction combine to give the Agitair FM Filter a much longer serviceable life.

TWO TYPES OF HOLDING FRAMES

Individual Type: Designed and constructed for easy handling in single unit installations, and to facilitate "on the job" assembly, into a multiple unit bank.

Pre-Fabricated Type: Delivered completely knocked down for easy assembly, this Agitair holding frame has been especially designed for installations requiring an unusually large number of filter panels and where cramped and unusual conditions place a limitation on available space.

GREASE FILTERS

An efficient, all-metal grease catching, grease holding media. Available in all sizes.

Air Filter Corporation

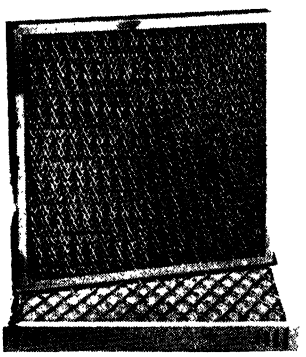
2514G W. Lisbon Ave. **Aircor** **Milwaukee 5, Wis.**

Canadian Representative
DOUGLAS ENGINEERING CO., LTD. MONTREAL

Manufacturers of AIRCOR AIR & GREASE FILTERS—the PERMANENT, CLEANABLE, VISCOUS TYPE Air Filters, designed for Heating, Ventilating, Air Conditioning and Industrial Use.

AIRCOR designers and engineers have contributed many of today's important developments in air filtration, dust, grit and grease elimination for domestic, commercial, and industrial use. **Aircor** Air Filters are well known for their high efficiency, low air resistance, great dust-holding capacity and low maintenance cost.

The specially designed **Aircor** filter core is constructed of multiple layers of crimped, electroplated wire mesh arranged to provide an exceptionally large contact area and impart a turbulent swirling action to the air passing through. Galvanized, crimped, expanded metal diffuser acts as a lint arrestor to prevent lint from imbedding in filter media. All units have heavy gauge galvanized steel frames with full welded corners.



AIRCOR AIR FILTERS—TYPE F_1 & F_2

For Air Conditioning, Heating and Ventilating

A permanent, cleanable viscous type air filter with special **Aircor** filter mesh design that traps more dust through complete depth while providing a minimum of air resistance. Dual purpose galvanized expanded metal screen deflects air stream, acts as lint arrestor—an aid in quicker, easier cleaning. Drain slots provided in filter frame. Bulletin 1245A.

Initial Resistance:	*Rated Efficiency*:
Type F_1 (1 in. thick) .060 in. w. g. at 288 fpm	98.5%
Type F_2 (2 in. thick) .065 in. w. g. at 288 fpm	98.5%

AIRCOR INDUSTRIAL FILTERS

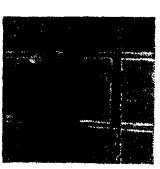
For Extra Heavy Duty

Specially designed for heavy duty service on industrial applications. Bulletin 146.

Initial Resistance:	*Rated Efficiency*:
Type D_2 (2 in. thick) .09 in. w. g. at 288 fpm	98.5%
Type D_4 (4 in. thick) .10 in. w. g. at 288 fpm	98.5%

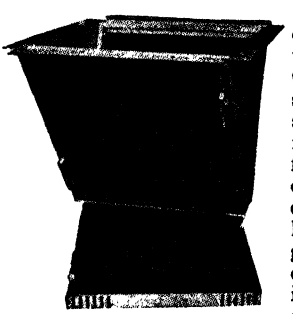
AIRCOR HOLDING FRAMES

For Flat and "V" Arrangements



Engineered holding frame design provides ample filtering capacity with a minimum of space. Compact, sturdy, extremely strong and rigid, this frame construction also simplifies filter removal and cleaning. Fireproof lining on back flange. Offers extra protection against air leakage. Available in V-type, or straight banks. Bulletin 600.

AIRCOR GREASE FILTER



Permanent, cleanable type **Aircor** Grease Filter specially designed to remove grease from exhaust ducts—a necessity in kitchens, galleys. Increases working comfort, decreases fire hazard, protects motors and brushes, and lengthens life of mechanical equipment. Assemblies for mounting on ceiling or wall, single or multiple units—includes holding frames, supporting angles and end seals. Bulletin 346.

I. *Resistance:* .07 in. w. g. at 216 fpm
Efficiency Rating: 98.5%. 2 in. Thick.

ENGINEERS AND MANUFACTURERS OF AIR FILTERS

DIRECT FACTORY REPRESENTATIVES IN ALL INDUSTRIAL AREAS

DISTRIBUTORS IN PRINCIPAL CITIES AND TOWNS THROUGHOUT THE UNITED STATES

Viscous Impingement Type Air Filter—Air-Maze viscous impingement cleanable type air filters are the result of nearly two decades of designing and building air filters exclusively. Air filter media consists of alternate layers of crimped galvanized screen cloth of various mesh, arranged to break up the air stream into minute, swirling currents. Dirt is impinged on the wire baffles, previously coated with an adhesive.

Progressive Density Provides Increased Dirt-Holding Capacity—An important feature of Air-Maze construction is the progressive density of the filter media, permitting lint and large particles to be collected on the upstream section of filter with little impedance to air flow. As shown in photos above, large quantities of dirt can be collected before filter requires cleaning. This design also lends itself to quick, thorough cleaning and recharging.

Dirt Arrestance—Efficiency of dirt arrestance varies, depending on filter design, type of test dust, dust feed, etc. Specific information on any type filter gladly furnished on request.

Resistances—Filters available with initial resistances as low as 0.045 in. water at 300 fpm. (Graphs showing resistance at various velocities are available for each type of filter.)

Face Velocities—Air-Maze offers air filters designed to operate efficiently at velocities from 106 fpm to 2000 fpm, depending upon application, pressure drop available, etc. Our representative will gladly furnish full information.

Sizes—Air filter panels made in rectangular shapes of any reasonable size and thickness. 1 in., 2 in. and 4 in. thicknesses are standard. Specially shaped filters also built to special order.

Holding Frames—Holding frames, complete with felt seal and choice of locking devices, are supplied when requested. For filter banks, Air-Maze furnishes either assembled frames or will drill frames for assembly on the job.

Cleaning Data—Filters easily cleaned with either hot water, steam or any commercial solvent. Charged by immersing in recommended adhesive or *S.A.E.* 30-50 oil. Complete instructions available upon request.

Write for Details—Write for name of nearest representative or information on any type of filter. Representatives in most principal cities. See classified section of your telephone directory.

AIR-MAZE

The Filter Engineers

AMERICAN AIR FILTER COMPANY INC.

673 Central Avenue, **Louisville 8, Ky.**

In Canada: Darling Brothers, Ltd., Montreal, Quebec

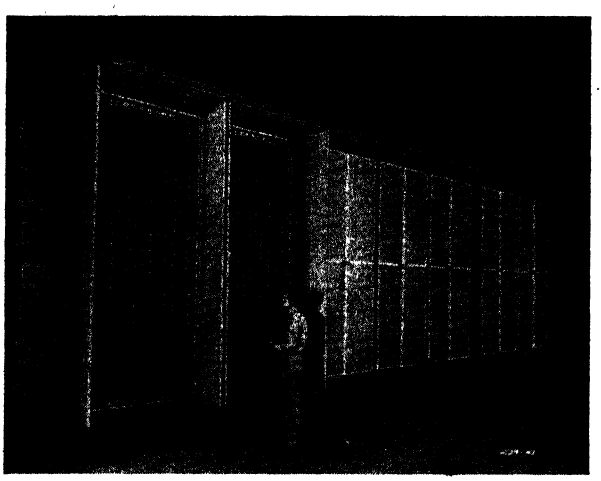
PRODUCTS: The American Air Filter Company, Inc. manufactures a complete line of Air Filtering Equipment including Electronic Air Filters, Automatic Self-Cleaning Filters, Viscous Unit Filters, and Dry Process Filters to be used for the removal of dust, soot, smoke, dirt, bacteria and other foreign matter from the air.

Because air filtration has proved to be the economical, practical and efficient method of cleaning the air, the modern air filter is now considered an absolute necessity in building ventilation or air conditioning, in the maintenance of health and personal efficiency, protection of interiors and furnishings and valuable merchandise and equipment. Shown here are but a few American Air Filter products in most general use.

The American Air Filter Company is recognized as an authority on dust problems and their satisfactory solution. Products offered embody the knowledge accumulated from twenty-six years of intensive research devoted exclusively to the study of dust problems and the development of air cleaning apparatus; the experience gained from designing, building and applying thousands of air filters; are backed by ample technical and financial resources; and may be relied upon as the most modern equipment in their field of service.

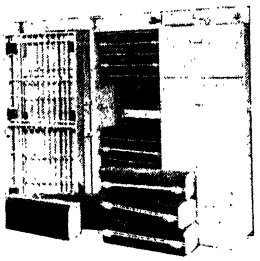
THREE TYPES OF ELECTRONIC AIR FILTERS

For more than ten years, research and experimentation with electronic air filtration have been in progress by AAF engineers. Today's complete line includes the self cleaning Electro-Matic introduced in 1939, the washable Electro-Cell with removable collector plates, and the Electro-Airmat with the replaceable Airmat paper medium. Here for the first time is high efficiency air cleaning in three types of electronic filters to meet any requirements for super clean air.

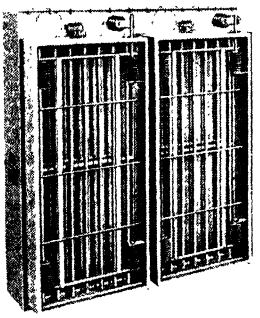


Electro-Matic Self-Cleaning Electronic Filter—The Electro-Matic filter is a self cleaning electric precipitator combining the most advanced principles of electronic air cleaning with notable improvements in construction details and method of operation. The self-cleaning feature is an exclusive advantage of the Electro-Matic filter. It eliminates the necessity of shutting down the filter for manual cleaning, minimizes the need for personal attention and permits continuous high-efficiency operation. It also allows the Electro-Matic filter to be built in standardized self-contained sections, easy to install and with all exposed parts of the filter casing electrically grounded for the protection of operating personnel. Send for Bulletin No. 250.

Electro-Cell Electronic Filter—Incorporates all of the new developments of major importance in electronic air filtration using collector plates. Installation has been simplified, performance improved and maintenance advantages provided. Built in vertical sections of two widths—2 ft and 3 ft over-all. Collector plate assemblies are removable; ionizers are hinged and extend the full height of the sections, preventing current loss. A choice of washing collector plate assemblies while in place, or removing assemblies for individual cleaning. Installation is simplified because filter is built in vertical sections rather than assembled of small units. Parts to be lifted and aligned are light in weight and electrical connections simplified. Write for Bulletin No. 252.

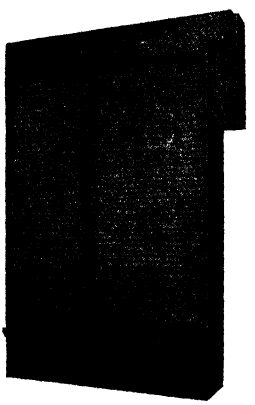


Electro-CELL Filter



Electro-AIRMAT Filter

Electro-Airmat Electronic Filter—The application of an electrostatic charge to a dielectric filtering material is an exclusive AAF research development which began early in 1934. Airmat paper is composed of a number of plys of porous tissue-like cellulose sheets. When electrically charged the plys tend to separate and each individual fibre becomes a collecting electrode which attracts and holds the dust and smoke particles. Ease and convenience of maintenance is a desired advantage of the Electro-Airmat. Requires neither water nor sewer connections for cleaning, nor spraying with oil to maintain its efficiency. When Airmat paper has accumulated its dust load it is removed and replaced with clean material by means of a mechanical loader. In case of power failure, filter media provides best mechanical air filtration known. Send for Bulletin No. 253.



American Multi-Duty Self-Cleaning Filter

American Multi-Duty Automatic Filter provides outstanding features of performance and design and will accomodate either armored screen panels or die stamped louver panels available in three types. Offers advantage of uniformly constant air supply, fixed operating resistance and automatic operation. Ideal for ventilation and air conditioning service. Available in any size or capacity. Send for Bulletin No. 241-A.

AAF UNIT FILTERS

Throway Air Filter—Throway filters are inexpensive and designed to be discarded after accumulating dust load. Send for Bulletin No. 117-E.

Airmat Type PL-24—Airmat filters use standard Airmat medium, renewable after collecting dust load. Used both for comfort and industrial air conditioning. Available with unit frames to be set up to meet any capacity requirement or space condition. Send for Bulletin No. 230-C.

M/W Filters—The M/W comes in 2 in. and 4 in. thicknesses. Ideally suited to air cleaning problems encountered in general ventilation and commercial air conditioning. Permanent type, washable. Send for Bulletin No. 202.

Air Recovery — **DOREX** — **Air Purification**

DOREX Activated Carbon Adsorbers recover the freshness of vitiated air by extracting air-borne odorous, gaseous and vaporous impurities. When applied to recirculated air in air conditioning, DOREX Adsorbers convert used, stale, *conditioned* air for ventilation thus reducing to a minimum the volume of *unconditioned* outdoor air make-up otherwise necessary.

With DOREX Air Recovery, the cooling and heating capacity of a proposed air conditioning system is decreased by the saving in outdoor air load.

With DOREX Air Recovery, an existing air conditioning system will serve a larger space or satisfy a greater conditioning load without increase in cooling or heating equipment or the consumption of more fuel or energy.

The highly active, specially processed and impregnated carbon employed will remove from the air passed through it and retain 95 per cent of all entrained gaseous impurities and maintain approximately this efficiency for from 6 months to 2 years depending upon the air contamination. Upon exhaustion the carbon is reactivated for re-use.

DOREX Air Recovery equipment is available in several types to suit individual requirements.

TYPE H—FOR COMPLETE DECONTAMINATION OF ALL AIR PASSED THROUGH IT

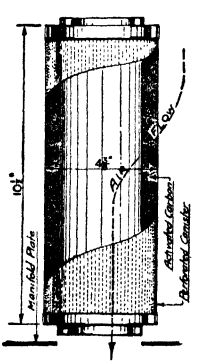

Fig. 1

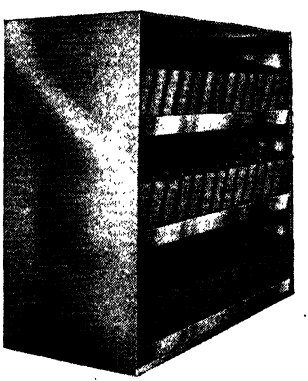

Fig. 2

Fig. 3

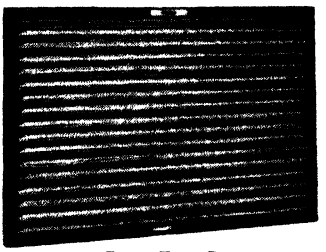
DOREX Type H Equipment consists of light-weight, removable, perforated, activated carbon-filled, adsorption canisters. These are mounted in multiple on one or more supporting manifold plates in such manner that all air to be treated will pass uniformly through the granular carbon media. The assembly arrangement is flexible to suit the space limitations. The resistance to air flow averages only 0.15 to 0.2 in. wg.

Fig. 1 shows a typical canister. It is closed at the top and the inner cylinder is open at the bottom, which opening registers with a corresponding hole in the supporting manifold plate. Fig. 2 is a photograph of a typical arrangement of canisters as installed. In this instance, three manifold plates each support 98 canisters arranged in 7 rows of 14 canisters each. Fig. 3 is a sectional view of this arrangement with the side removed and indicating direction of air flow. Each canister decontaminates from 25 to 35 cfm of air.

All Dorex equipment is covered by U. S. Patents Nos. 2,214,737; 2,303,331; 2,303,332; 2,303,333; 2,303,334 and others pending; Canadian Patents Nos. 383,986; 429,206; 395,611; 404,855; 410,088; 418,787; 443,235.

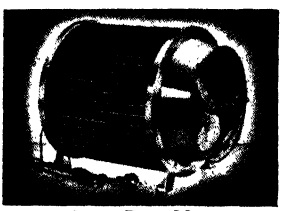
TYPE G—FOR CONTINUOUS DECONTAMINATION OF RECIRCULATED AIR

The DOREX Type G Air Recovery Panel is designed to remove accumulated odors and gaseous impurities from air recirculated by air conditioning units and systems. Its extremely compact design and the ease with which it can be installed makes it equally adaptable both to existing systems without requiring expensive alterations, and to newly designed systems, particularly where space is at a premium. It is also adapted to incorporation in *package* conditioners, railway cars, buses and airplanes, unit heaters and cold diffusers.



Dorex Type G

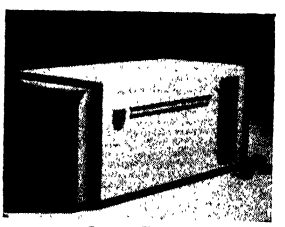
The Type G Air Recovery Panel consists of sturdy metal frames, each housing a battery of exposed perforated metal tubes which contain the granular carbon filter media. These panel units are available in stock sizes, suitable for arrangement in air ducts, or for attachment to standard dust filters, outlet or inlet grilles. They are designed to expose a maximum of carbon adsorption surface to the air stream with a minimum of resistance to air flow. Standard units are of one, two or three tube rows in depth, designated as G-1, G-2 and G-3, respectively.



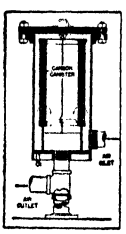
Dorex Type SQ

The DOREX Type SQ Odor Adsorber is an entirely self-contained unit suitable for either portable or stationary installation. It consists of a cage of closely spaced, perforated, granular activated carbon-filled tubes housing a quiet operating, circulating fan and motor. It is furnished assembled, equipped with starting switch and complete with extension cord and plug ready to connect to electric socket. **The DOREX Type SQ Unit** keeps the room air in continuous motion while, at the same time, completely purifying one-third of the total air circulated. It, therefore, provides both air circulation and ventilation without the use of outdoor air.

At the right is an illustration of the **Type A-100-B,** smallest of the DOREX self-contained *package* recirculating Odor Adsorbers. In its attractive enameled wood cabinet are contained a dust filter, four carbon gas adsorbing canisters, circulating fan and motor. It has a host of practical uses—in homes, offices, doctor's rooms, walk-in refrigerators, etc.



Dorex Type A



Dorex Type PL

The Type PL DOREX Vapor and Gas Adsorber is designed especially to extract oil vapors, fermentation odors and other gaseous impurities from compressed air. It is the only device which effectively removes air-entrained gaseous odors and impurities not eliminated by commercial filters, separators, after-coolers or receivers.

"AIR CONSERVATION ENGINEERING"

A complete and authoritative text book on the function, engineering and application of Air Recovery in air conditioning. Contains valuable tables and charts. Price $2.00. Complimentary copies available to recognized engineers upon request.

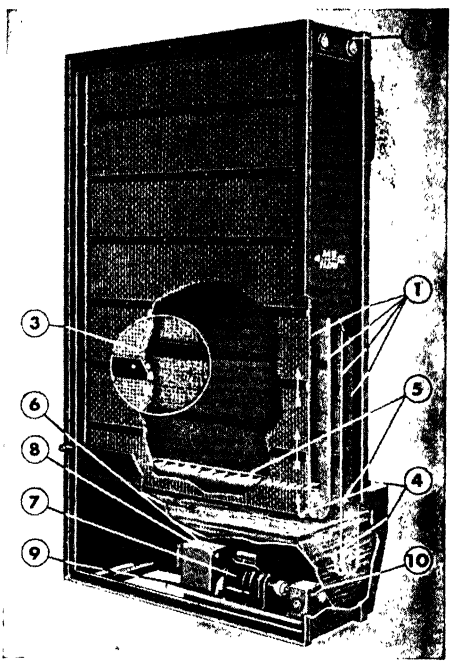
STAYNEW MODEL A-3 AUTOMATIC FILTER

An endless curtain type oil-bath filter for handling large volumes of air at low cost plus exceptionally large dust-handling ability. The efficiency of Staynew Model A-3 is unsurpassed among mechanical self-cleaning filters.



Model A-3 Automatic Filter
(numbered features are referred to in accompanying description)

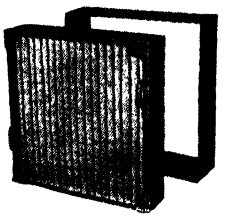
Operation and Features: *Double* filter curtains (1) carried on heavy roller chains driven by sprockets keyed to the shafts of the curtain rollers (2). These rollers float on ball bearings for quiet, frictionless operation. Curtains consist of removable panels (3) made of a single layer of bronze screen cloth to which are attached layers of woven copper mesh.

The first of the curtains is the denser, having about twice the impingement surface of the second or rear curtain. This first curtain acts as the filter and travels through the oil reservoir. The second curtain does not enter the reservoir, but acts only as a safeguard against oil entrainment. This design permits a direction of curtain travel such that cleaned panels (4) are always on the filtered air side. Therefore no dust can be carried across the back or return side of the front curtain to be blown off and carried on by the flow of air.

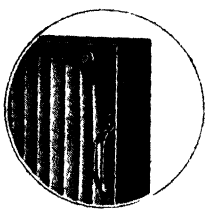
Patented, exclusive Staynew Air Brush Conditioners (5) prevent excessive amounts of oil being carried upward on the curtain panels and being entrained in the air stream.

Specifications

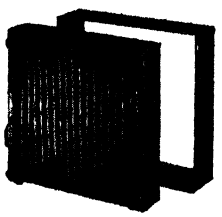
Model A-3 Filters are sectional and may be bolted together to obtain any required capacity. Sections come in two widths, 4 ft 3 in. and 2 ft 9 in. Curtain drive and control mechanism (6) arranged either as an integral part of filter unit or for remote mounting, includes a ⅙ hp motor (7) driving through a reduction gear and a momentary contact time switch (8) for testing and checking curtain travel and compressed air control. All are mounted on a common base plate (9) on clean air side of filter. Shear pin (10) is provided for protection of moving parts from accidental damage. The drive motor and the Air Brush Conditioners operate simultaneously for a few seconds at 15 minute intervals.



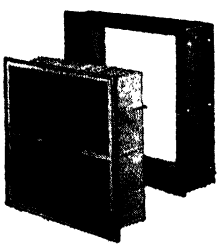
Model WKE Panel and Frame



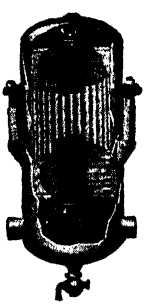
Handles and Latches



Viscous Model DPV Panel and Frame



Standard Panel Insert and Frame



Model ELS (Sectional View)

STAYNEW PANEL TYPE FILTERS

Model WKE: Dry-type finned panel filter for use in ventilation and air conditioning systems. Extremely large filtering area in relation to overall size. Adaptable to wide variety of filtering media—in fact, almost any medium obtainable in sheet form that can be crimped. Steel mesh on both sides of medium prevents sagging and makes the WKE *fire-resistant* (models available to meet Class I Fire Underwriters approval), and cleanable without possible damage from vacuum cleaning tool or cleaning nozzle. It may also be washed or dry cleaned when and if necessary. There are no cross bars, spacer bars, or other obstructions to interfere with the cleaning operation.

Filter cells are held in rigid box-type supporting frames of heavy gauge metal by spring-loaded cam-type locking latches. Two lifting handles are provided on each cell. Filtering medium supplied already crimped and cut to size. It may be inexpensively replaced in 2 to 5 minutes right at the filter bank—no special tools required.

Frames are drilled so that they can be riveted together to form a flat bank, or by the addition of angle uprights into a "V" or staggered arrangement.

Viscous Panel (Model DPV): A permanent type panel for air conditioning systems used in heavy duty industrial service. Filtering media consist of a series of layers of crimped galvanized screen cloth and woven mesh. These media when coated with PD-10 Pingene Filter Oil form an unusually efficient filter. Model DPV filters are cleaned easily with live steam or by washing in a suitable solvent. Spring-loaded locking latches and lifting handles are provided as in Model WKE.

Both Model WKE and DPV cells are furnished in 2 in. and 4 in. depths in various standard sizes.

Standard Panel: Dry-type Fin Construction, high filtering efficiency. Heavy steel Panel Insert and Frame. Cleanable. Forty-two square feet of filtering area. Thousands of Staynew Standard Panel Units have given satisfactory service for years. Available in 20 in. x 20 in. x 7 in. size only.

STAYNEW LIQUID FILTER

Model ELS: Widely used for the filtration of cooling water to prevent clogging of spray nozzles. Exclusive, low-cost SLIP-ON INSERT easy to remove, clean, replace. Radial Fin Construction provides all possible filtering area in smallest possible space. Standard models available to handle up to 1000 gpm.

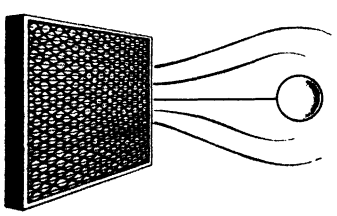
693	4.80	.20"	1250	1590	1600	2035

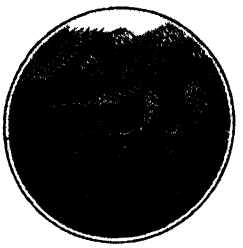
Based on our recommended face velocity of 519 fpm, Far-Air filters deliver 50 per cent more air with the same blower power. Filters are all metal, permanent construction . . . Installation of Far-Air Filters, effects a saving not only in initial costs but maintenance as well—you need only ⅔ of the filter area, with a Far-Air filter.



AIR FILTER TEST

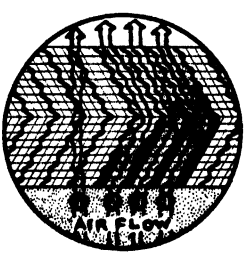
Farr Company has originated a simple procedure for testing air filter in place in order to determine the degree of efficiency. Write for information regarding this test.

*Trade Mark registered.



HERRINGBONE CONSTRUCTION

Far-Air filters' Herringbone design, which is a special cirmped wire type of construction, allows these filters to load progressively, which permits a dirt holding capacity two or three times greater. Each filter can handle 50 per cent more air with the same blower power, thus one-third fewer filters are needed to do the same job. No special equipment is needed for cleaning . . . a pressure hose and cold water. Far-Air filters can be cleaned in place. Of paramount importance to heating and refrigeration engineers is the fact that Far-Air Filters provide a filter area equal to the fin coil area. This special feature eliminates clumsy V-shaped additions on vent ducts usually necessary with other type filters.



PROGRESSIVE LOADING

As entering orifices of Far-Air Herringbone Construction Filters are loaded, air direction changes, flowing past the front loaded surface and progressively loading the clean screen mesh that remains. Greater free area permits a larger dust load with lower pressure drop. The small difference in pressure drop when a Far-Air Filter is loaded from when it is clean maintains a constant balanced air flow in the air distribution system.

For full information about other types of FAR-AIR FILTERS, write: FARR CO., Dept.H VG, 2615 Southwest Dr., LOS ANGELES 43, CALIF.

RAYTHEON — *Excellence in Electronics*

RAYTHEON — *Excellence in Electronics*

Clean air as supplied by Electronic Air Cleaning reduces heating and cooling costs; reduces cleaning and redecorating costs; improves worker efficiency; improves product quality; and provides better conditions in which to work or relax. Only electronic air cleaning efficiently removes airborne particles as small as 1/250,000 in. in diameter.

RAYTHEON PRECIPITATORS

A COMPLETE LINE OF ELECTRONIC AIR CLEANERS

For industrial and commercial applications

INDUSTRIAL

Built up cell-type units for installation in ventilating and air conditioning systems.

Fully automatic, semi-automatic or manual washing.

Capacities 1200 cfm up.

See Bulletin DL-P-503.

RESIDENTIAL

The Raytheon Home **Precipitator**

Semi-automatically and fully automatically washed.

Capacities 1200 and 1800 cfm.

See Bulletin DL-P-509.

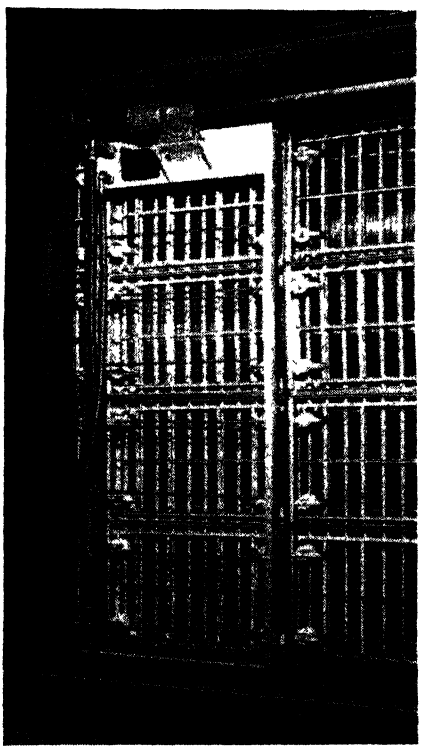
PACKAGED UNITS

For Industrial, Commercial and Residential Installations:—

Packaged, self-contained units. Fully automatic, semi-automatic, and manual washing.

Capacities 300, 1200 and 1800 cfm.

See Bulletin DL-P-505.



The new, fully automatic Raytheon Precipitator washes and dries all ionizers and collector plates, reapplies adhesive, shuts itself off. Operates without shut-down period—requires no cleaning maintenance whatsoever. In the picture above, baffle doors have been opened and louvres removed from the automatic washing unit to show construction details.

NOTE THESE IMPORTANT FEATURES

Ease of installation. Minimum maintenance. Minimum resistance to air flow. Economy of Operation. Flexibility—a size for every application. Quality products used throughout.

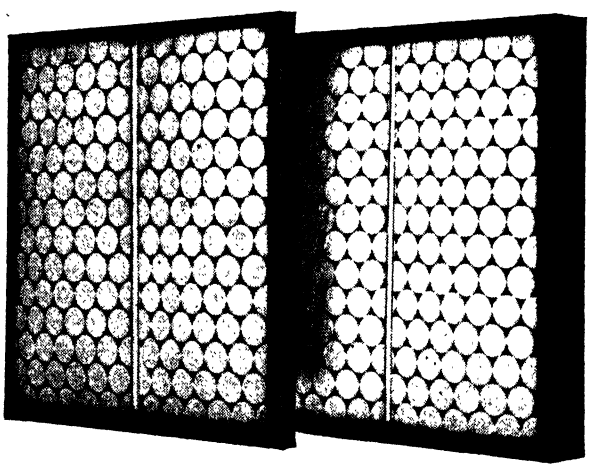
Owens-Corning Fiberglas Corporation

Toledo 1, Ohio

DUST STOP* **AIR FILTERS**

*REG. U.S. PAT. OFF.

—a FIBERGLAS* product



Dust-Stop Air Filters are replaceable impingement-type filters for use in all systems in which air is moved mechanically—central heating, ventilating and air-conditioning systems, and mechanically-circulated warm-air furnaces.

Dust-Stops provide high air filtering efficiency. They are constructed of packs of glass fibers (Fiberglas*), coated with an adhesive, faced with a metal grille, and bound on the edge with a fiberboard frame.

The Fiberglas fibers, packed to proper density, form an exceptionally effective medium for air filtration. Being glass, they are inorganic, chemically stable, resistant to heat and corrosive vapors. And being of glass, they do not absorb the nonodorous, nonevaporating adhesive with which they are coated. Each impinged particle of dust is quickly soaked, acting as a wick to carry adhesive to other particles. Thus, the adhesive remains effective until the filter is so heavily loaded with dust that resistance to air flow calls for replacement.

A minimum of manpower and time is required in replacing economical Dust-Stops—and they can be obtained quickly from near-by suppliers. Dust-Stops are made in two standard types: No. 1 (1 in. thick) and No. 2 (2 in. thick). Both are available in several sizes.

DUST STOP* AIR FILTERS AND FRAMES

*T. M. REG. U. S. PAT. OFF.

TWO TYPES OF FRAMES—

Dust-Stop Air Filters may be installed in banks of either "L" Type or "V" Type Dust-Stop Air Filter Frames. Both types of frames are designed, patented and manufactured by Owens-Corning Fiberglas Corporation for the convenient handling of Dust-Stop Air Filters.

The choice between "L" and "V" Type frames is determined by the frontal area available. The "L" Type frame requires less depth within the duct or plenum chamber but takes a larger face area than the "V" frame for the same cfm capacity. However, it can be set in various arrangements that reduce the required face area by increasing the depth.

The "L" Type frame two filters deep is designed to hold two No. 1 Dust-Stop Air Filters in each cell. The "L" Type four filters deep holds four No. 1 Dust-Stop Air Filters (20 in. x 20 in.). "L" Type frames can be provided in any size from a single unit having one cell at a rated capacity of 800 cfm at a velocity of 300 lineal feet per minute to a unit consisting of 91 cells with a capacity of 72,800 cfm.

The "V" Type frame contains two "cells" each forming one side of the "V." Each cell will hold up to four No. 1 or two No. 2 Dust-Stop Air Filters. "V" Type frames take only the 20 in. x 25 in. filters. The "V" frames are available in any size from a single unit having a capacity of 2000 cfm to a 98 cell unit with a capacity of 98,000 cfm.

All frames are cold rolled steel and are shipped knocked down and crated, complete with all parts and instructions necessary for easy and rapid assembly.

Agents in All Principal Cities

SOMERS Heavy Duty Industrial Filter

All Welded Vee Type
Patent No's. 2008800, 2130107

Somers Hair Glass Filters provide everything required in an efficient air-cleaning system.

Consider These Features:

- **High rating for dust, soot and bacteria separation.**
- **Require no adhesive, coating or impregnation.**
- **Indestructible in normal service.**
- **Minimum low-pressure drop.**
- **Odorless and non-absorptive.**
- **Fireproof.**
- **Washable.**
- **Permanent—Do not rot nor disintegrate.**
- **All welded zinc-plated 20 ga. steel frame.**
- **Metal protection strip on apex.**
- **Glass cloth between hot-dipped hardware cloth.**
- **Glass ribbon seal so air cannot short circuit.**

Somers Hair Glass Filters consist of a 20 gauge hot galvanized frame holding galvanized wire cloth packed with hair-spun glass strands. The glass strands are flexible, do not break up and cannot be drawn into air stream.

Hair Glass being chemically inert, has no facility of absorption; it cannot rust and lasts indefinitely in service. Water either hot or cold may be used to clean it, without impairing its efficiency.

These filters eliminate the necessity, the expense and the inconvenience of periodic replacement

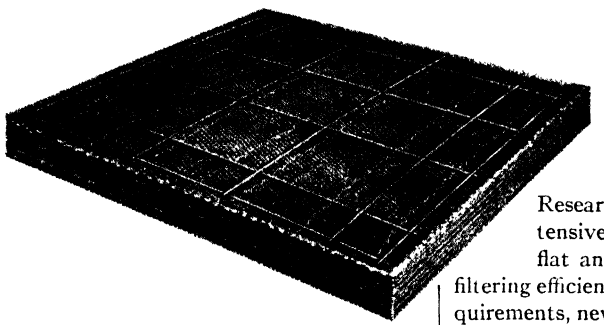
RESEARCH AIR FILTERS FOR HEATING AND VENTILATING

U. S. Patent 2070073

U. S. Patent 2294478

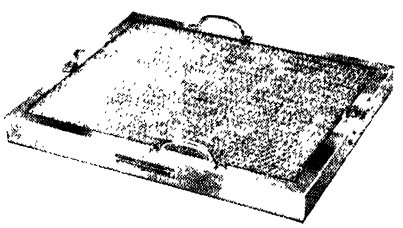
RESEARCH AIR FILTERS



Research Air Filters are widely used wherever air is moved mechanically in blown-air heating and air conditioning systems, in window ventilators and for protection of industrial equipment. Tests prove Research Air Filters have a 93 per cent dust removal efficiency (with 80-20 dust), 99 per cent ragweed pollen removal efficiency. The resistance build-up is very gradual.

Self-Seal Edge The time and labor saving **Self-Seal** edge is an exclusive Research Air Filter feature. The filtering media is a pad constructed of single sheets, cut, expanded and held together to form a honeycomb pattern of thousands of tiny baffles. This unique construction allows filter to be made slightly oversize, fitting snugly into place and eliminating all by-pass of air. When filter becomes dirt clogged, only the filter pad need be replaced.

Research Filter Banks. Research Air Filters are used extensively in filter banks—both flat and V types. For maximum filtering efficiency and minimum service requirements, new speedy **"Snap-in" grids** are used with filter pads, the removal of front grid only being necessary when changing pads.



Washable Alumaloy Filter. This filter has the same efficiency as the disposable type filter. It is about ⅓ lighter than most other washable type filters. Filter is cleaned by agitating in hot soapy water.

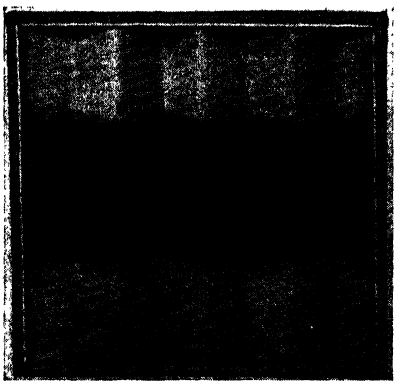
Alumaloy "Clean Duct" Grease Filter. All aluminum construction. Light weight. Easily cleaned. Retains high lustre appearance.

The Research Filter Watchman, a new automatic filter gauge, signals with light when filters are loaded to a maximum restriction to air flow; it may be set for any recommended resistance.

Supreme Air Filter Company

126 West 21st Street, **New York 11, N. Y.**

SUPREME WASHABLE DRY TYPE AIR FILTERS
AUTOMATIC OR MANUAL CLEANING



Supreme Air Filter (Before and after cleaning)

Supreme Air Filters are made of a spun glass filter media, annealed under a patented process, and covered with a galvanized or copper wire mesh 25-06, encased in a galvanized or copper frame.

Supreme Filters offer a low resistance to the free flow of air, are light in weight and easy to handle. All cells are equipped with handles and interchangeable in the same bank.

Supreme Filters are made in flat and sawtooth types: The flat filter is encased in a ½ in. frame, for convenience in ordering and lower cost production. The sawtooth type is corrugated the depth of the cell frame thereby increasing the filtering surface in a given area.

The spun glass in Supreme Filters is FIRE, ROT and VERMIN proof and not attacked by any chemical other than hydro-fluoric acid; it is approved by the Board of Fire Underwriters.

The important factor in rating a filter is generally not the removal of a certain per cent of dust by weight but rather the effectiveness for taking out certain objectionable constituents, which may be either the finest particles present or the coarser ones within a certain range. The lower number per cent of dust particles in buildings and out-of-doors occur just after air washing by rain or snow storm, and the greatest number in busy streets on dry days.

Supreme Filters can be washed in hot or cold water, adding a little soap powder or solvent, and spraying with not over 25 lb water pressure.

New mats can be supplied for all Supreme cell frames where mats become worn out or defaced, thereby saving the cost of a new frame, which has patent pending.

Westinghouse Electric Corporation
Sturtevant Division

Air Conditioning, Heating, Ventilating, Dust Control and Fume Removal Equipment, Electronic Air Cleaners, Dryers, Compressors, Mechanical Draft Equipment

Hyde Park **Boston 36, Mass.**

Westinghouse-Sturtevant Division Manufactures a complete line of air conditioning, heating, ventilating and air handling equipment. Shown here is a selection of the complete line. Individual product catalogs are available where more detailed information is required on any item.

Sturtevant Puts Air to Work

Equipment designed to "Put Air to Work" is available for all commercial and industrial buildings, to improve comfort and efficiency and to provide industrial process air conditioning. Applications range from the small ventilation and air conditioning systems to the large specially engineered installations.

Engineering Assistance

Sturtevant offers unbiased engineering assistance in the selection of the correct product for the specific application.

Many years of experience in the design and manufacture of these products combined with the benefits of close co-operation with consulting architects and engineers, assure you of reliable recommendations.

Offices and Distributors are located in all principal cities. Refer to your local classified telephone directory.

REFRIGERANT COMPRESSORS

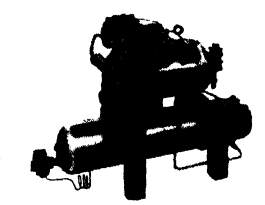
Hermetically-Sealed, Freon 12, Type CLS refrigerant compressors are designed for air conditioning and industrial refrigeration applications requiring suction evaporating temperatures ranging from 10°F to 50°F.

Westinghouse Special Features include:

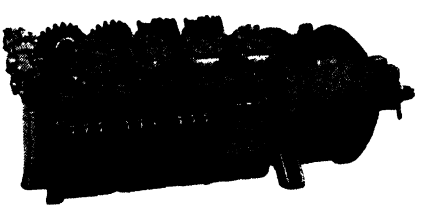
1. Shaft seals eliminated.
2. Direct drive—no belts, pulleys and couplings.
3. Sealed-in mechanism.
4. Refrigerant-cooled motor.
5. Compact size and light weight.

The hermetically-sealed compressors are reciprocating multi-cylinder, in-line type in sizes 7½ to and including 60 hp; 90 deg V-type on the 2, 3, 5, 75 and 100 hp sizes. They are protected by manually reset high and low pressure switch. Driving motors are polyphase, refrigerant-cooled induction type. Motors are protected by thermal overload protection in the De-ion magnetic linestarters.

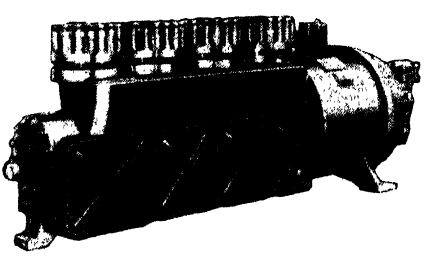
Mounting supports are available to permit mounting the compressor and suitable Westinghouse water-cooled condenser as a unit. Type CLS compressors are made in 12 sizes ranging in nominal capacities of from 2 to 100 tons refrigeration effect.



Two-Cylinder V-Type Compressor



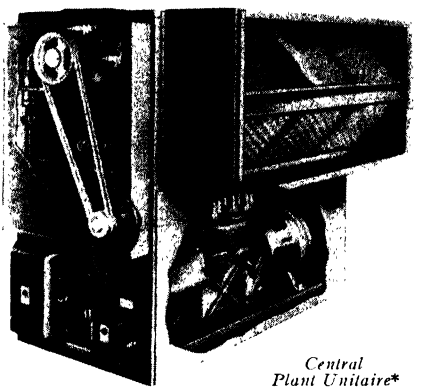
Sixteen-Cylinder V-Type Compressor



Six-Cylinder In-Line Type Compressor

Westinghouse Electric Corporation
Sturtevant Division

UNITAIRE*
AIR CONDITIONING UNITS

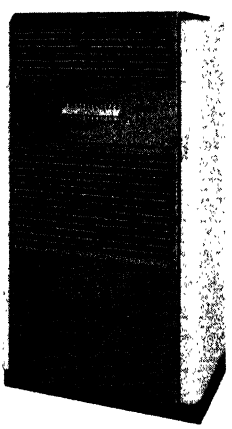


*Central Plant Unitaire**

Central Plant Type Unitaires are completely self-contained, with all the component parts of an air conditioning system, designed especially for installation with supply and return air ducts. Unitaires are completely assembled, piped, refrigerant-charged, wired and adjusted at the factory. Each is given a complete operating test to assure satisfactory performance when installed. All that is required is connection of water and electrical service and attachment to the duct system.

The condensing unit is a standard Westinghouse hermetically-sealed, direct-connected compressor, with water-cooled condenser, isolated from the supporting structure by rubber anti-vibration mountings.

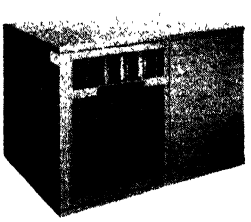
Central Plant Type Unitaires are available with 7½, 10, 15, 20 and 25 hp compressors.



Self-Contained Unitaire, Type SU*

Self-Contained Type Unitaires are widely used in small stores, restaurants, office suites and similar establishments. Usually they are installed in the room to be air conditioned, but in many cases they are remotely located with ducts supplying one or more spaces with air conditioned air. Available in sizes of 1, 2, 3 and 5 hp. Westinghouse Unitaires offer many important features:

1. Compact Size—Largest unit occupies less than 7 sq ft of floor space; smaller units often installed on shelves.
2. Attractive Appearance.
3. Completely Factory-Built.
4. Flexible Application.
5. Westinghouse Hermetically-Sealed Compressor.
6. Quiet Operation.



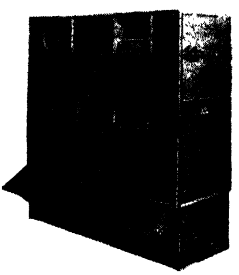
Self-Contained Unitaire, Type CU*

*Reg. U. S. Pat. Off.

Westinghouse Electric Corporation
Sturtevant Division

EVAPORATIVE CONDENSERS

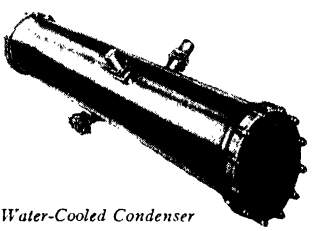
Where water is scarce or expensive, or its use or disposal restricted, the "Aquamiser" provides savings in water consumption. Westinghouse Aquamisers are available in sizes to give a range of capacities from approximately 5 tons to 100 tons each, net refrigeration effect.



"Aquamiser" Evaporative Condenser

WATER COOLED CONDENSERS

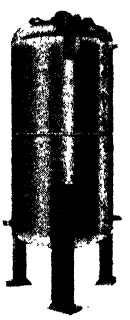
Where sufficient water is available from city water supply to cooling tower the water-cooled condenser is economical and efficient. To economically match refrigeration load requirements, Westinghouse water-cooled condensers are available in 14 sizes, ranging in nominal capacities from 2 to 100 tons net refrigeration effect.



Water-Cooled Condenser

WATER CHILLING UNITS

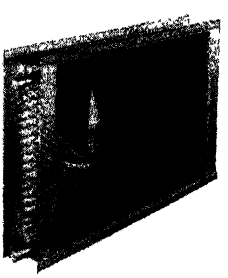
For the chilling of water for distribution to a number of cooling coils, for surface dehumidifiers and for use in industrial processes, these efficient water-chilling units range in size from 5 to 110 tons net refrigeration effect. The chiller, located close by the compressor, eliminates long refrigerant piping or long duct runs.



Water Chilling Unit

HEAT TRANSFER SURFACES

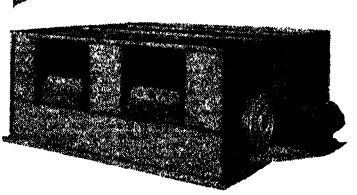
Direct expansion coils with patented refrigerant distributor, chilled water coils, steam and hot water coils are available in a great many sizes for all types of systems.



Heat-Transfer Surface

AIR CONDITIONING UNITS

Two types are available—a horizontal type for ceiling suspension and a vertical type for floor installation. In the horizontal and vertical types, year-round air conditioning is accomplished by the installation of cooling and dehumidifying surfaces for summer, and heating surfaces for winter air conditioning.



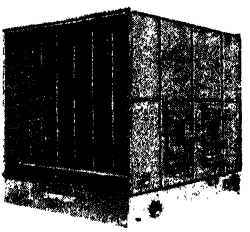
Air Conditioning Unit, Type AH

Westinghouse Electric Corporation
Sturtevant Division

AIR WASHERS

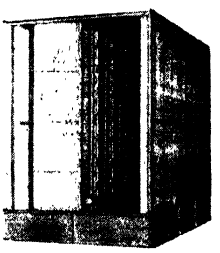
Three types are available—Type H, with one bank of nozzles, used primarily for humidifying; Type C, with two banks of nozzles, used for evaporative cooling. humidifying and dehumidifying; and Type S, with one bank of nozzles, used for humidifying, especially where space is limited.

Air Washer



FILTER-WASHERS

Self-cleaning filter-washers employ a bank of mineral wool, or glass fiber filter pads, in conjunction with water sprays to clean and humidify the air. Made in 72 standard sizes and to specifications.

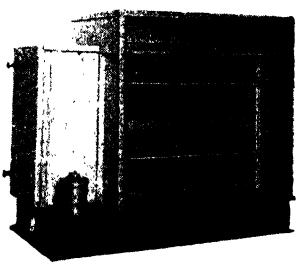


Filter Washer

SURFACE DEHUMIDIFERS

Available for either chilled water or directly expanded refrigerant, these wet surface units control accurately wet and dry bulb conditions in industrial and comfort air conditioning systems. Capacities range from 2000 to 50,000 cfm, with cooling capacities of 5 to 250 tons of refrigeration.

Unit Dehumidifier



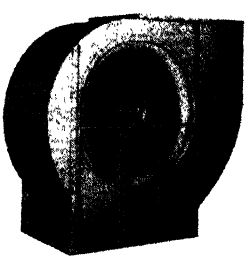
CENTRIFUGAL FANS

Silentvane*, Design 8, are high speed, exceptionally quiet heating and ventilating fans engineered for installations where fan noise cannot be tolerated. Made in 21 sizes with rotors from 12¼ in. to 87¾ in. in diameter, they operate from free delivery to 4 in. water gage static pressure, and at a maximum tip speed of 9000 feet per minute. Capacities range from 700 to 400,000 cfm.

Silentvane Centrifugal Fan Design 8*

Multivane, Design 6, high capacity, low speed fans, suitable for use in public buildings because of low tip speed, low outlet velocity, and small size for a given duty. With wheel diameters up to 87 in., they operate against static pressures up to 4 in. water gage, and at a maximum tip speed of 6000 fpm. Capacities range from 400 to 450,000 cfm.

Multivane Centrifugal Fan, Design 6

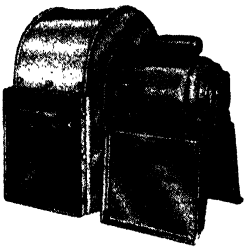


*Reg. U. S. Pat. Off.

Westinghouse Electric Corporation
Sturtevant Division

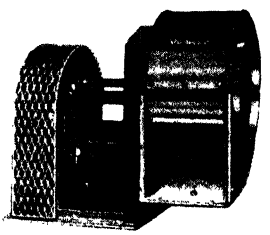
VENTILATING SETS

Rexvane* Ventilating Sets, with radial blade wheels designed for medium speed operation, are suitable for ventilating, fume exhausting and air conditioning. Rexvane Ventilating Sets are made in 7 sizes, wheel diameters from 6 in. to 17⅛ in. capacities to ¾ in. water gage static pressure, and air delivery to 4000 cfm.



Rexvane Ventilating Set*

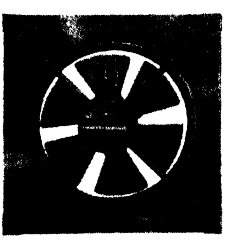
V-Belt Ventilating Sets are completely self-contained units consisting of Multivane fan and motor with V-belt drive. These sets are particularly suitable for a wide variety of heating, ventilating and air conditioning applications. Wheel diameters from 12 in. to 24 in., and air deliveries from 930 to 11,000 cfm.



V-Belt Ventilating Set

PROPELLER FANS

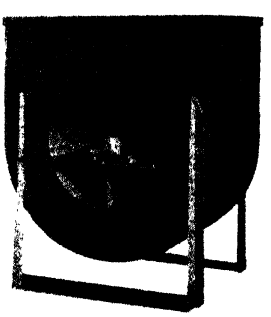
Propeller Fans, Design 7, with direct connected motors, are generally applicable to all air exhausting or ventilating problems when unit blows air directly outdoors or to another room, without ducts or high resistance to air movement. Motors are totally enclosed special fan duty type. Design 7 Propeller Fans are made in 7 sizes, from 12 in. to 36 in. diameter, and 815 to 11,050 cfm.



Elbow Axiflo Fan*

AXIFLO* FANS

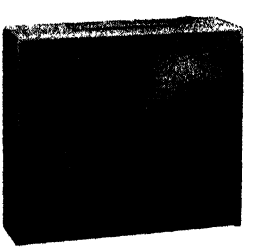
Axiflo pressure fans are axial flow type especially designed to meet industrial service requirements. They are available in straight through or elbow types, with either three-bladed aluminum or eight-bladed steel wheels. All designs or arrangements can be used in either vertical or horizontal position.



Air Blender

AIR BLENDERS

Widely used for central air conditioning and ventilating systems in commercial buildings, the Air Blender mixes cool dehumidified air or heated humidified air from a central system with predetermined quantities of recirculated air to maintain room temperatures for both winter and summer, air conditioning. It has no moving parts, and is equipped with a booster coil for winter operation. All units are built with 7 in. front-to-back dimensions, and in nominal lengths of from 18 in. to 60 in.



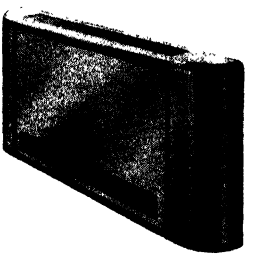
Propeller Fan, Design 7

*Reg. U. S. Pat. Off.

Westinghouse Electric Corporation
Sturtevant Division

UNIT VENTILATORS

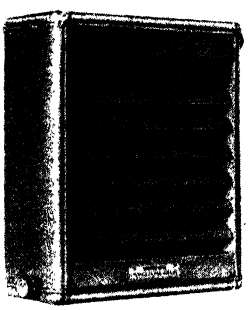
Unit Ventilators, filter, heat and circulate air through room areas. Each unit is equipped with heating coil, a fresh air inlet, motor driven fans, and controls, all enclosed in an attractive steel cabinet. Available in classroom models, or in auditorium type units for heating gymnasiums, auditoriums, and similar large room areas.



Unit Ventilator

SPEED HEATERS

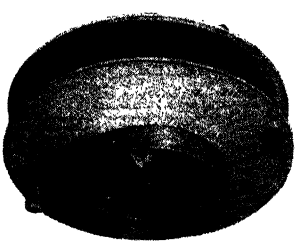
Sturtevant Speed Heaters, Design 14, are suspended type unit heaters adaptable to commercial and industrial installations to provide an even flow of heat over a large area. They are available in capacities of 25,800 to 300,500 Btu, and 398 to 5200 cfm. Attractive modern design makes Speed Heaters suitable wherever appearance is important. Their quiet, efficient operation fits them ideally for locations where economical, thorough speed heating is desired.



Speed Heater

DOWNBLAST SPEED HEATERS

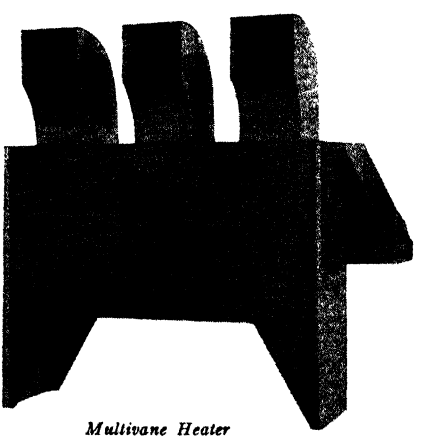
Downblast Speed Heaters are suspended type unit heaters for use with steam or hot water systems. They are designed for installation near the ceiling and are available in capacities of 40,000 to 400,000 Btu, and 695 to 5800 cfm. Downblast Heaters project the heated air downward to the working level, resulting in outstanding heating performance in buildings with high ceilings, or wherever it is necessary to project heated air downward between storage bins and other obstructions.



Downblast Speed Heater

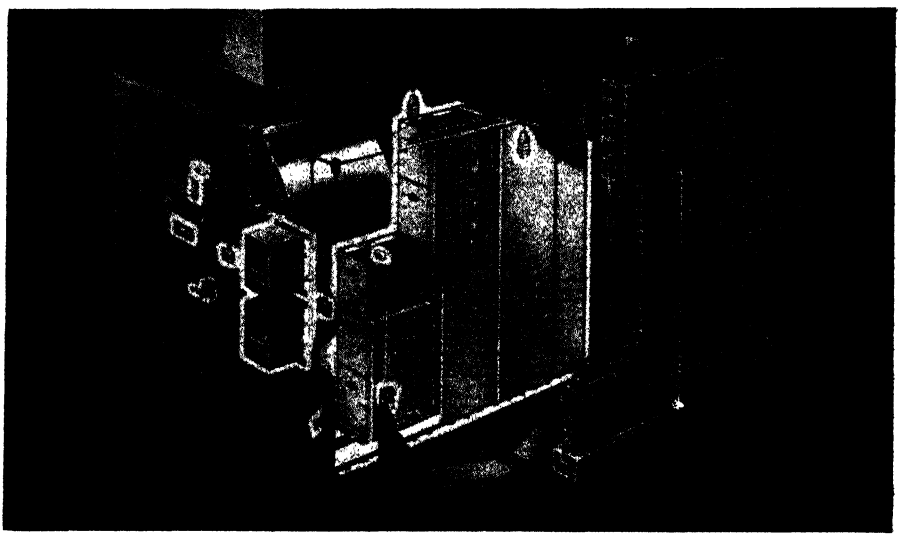
MULTIVANE HEATERS

Multivane Heaters are large capacity type for large area, severe heating jobs. They can be installed on floors, fastened to walls, hung from ceilings. Air motivation mechanism consists of multiple slow speed Multivane Fans, mounted on a common shaft—resulting in large volumes of air handled at low outlet velocity, low horsepower consumption, and quiet operation. Capacities range from 157,200 to 1,191,000 Btu, and 2100 to 18,000 cfm.



Multivane Heater

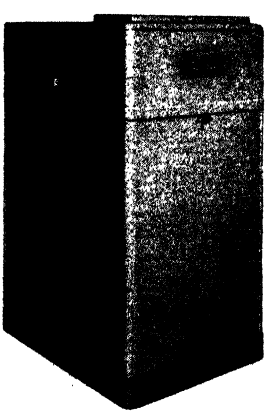
Westinghouse Electric Corporation
Sturtevant Division



PRECIPITRON*

Westinghouse Precipitron—the electronic air cleaner—makes possible greater efficiency in removing dust, dirt, smoke and other foreign particles from the air. The Precipitron cells are installed in the ventilating systems (see illustration above). Dust, smoke and soot pass through an electrostatic field, receive a charge, and are drawn to collector plates of opposite polarity where they remain until flushed down the drain.

Home Unit



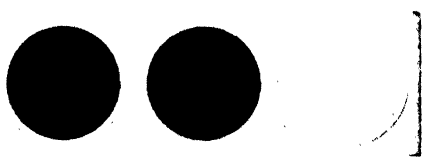
The Westinghouse Precipitron Home Unit is designed primarily for use in homes. It performs the same function, on a smaller scale, as the larger units do for commercial and industrial applications. No longer a luxury, the Westinghouse Precipitron electronic air cleaner minimizes the endless chasing of dust and dirt in the home.

It is comparable in size to a gas-fired furnace, and occupies about the same floor area. Provision is made on the unit for connection to the duct work of a forced air heating or air conditioning system. Placed in the air intake to the heating unit, the Precipitron removes more than 99.5 per cent of the dirt (by weight), and more than 90 per cent of all air-borne particles.

*Reg. U. S. Pat. Off.

Tests Prove Efficiency

Accepted testing methods previously conducted on a weight basis have been obsoleted since Precipitron entered the field of air cleaning. The Blackness Test reproduced here provides greater accuracy, approximates the actual particle count and is made without the addition of artificial dust. The efficiency of Precipitron by Weight Test showed over 99 per cent and by the Blackness Test as high as 90 per cent at air velocity of 300 fpm through the cells.



Uncleaned Air *Mechanically Cleaned Air* *Electrically Cleaned Air*

Test Comparisons Proving High Efficiency of Precipitron

Cells

The cell itself, known as the Collector, is composed of two duplicate sets of high voltage and ground plates mounted between two load-bearing end plates laced together by steel bars, angles and channels to form a rigid structure.

Precipitron is built in sizes to handle from 1200 cfm (for a single 24 in. cell) to any desired volume through multiple cell arrangements. Cells are available in two sizes: 24 in. x 24 in. x 26½ in. and 36 in. x 24 in. x 26½ in. For 90 per cent efficiency, the 24 in. and 36 in. cells are rated at 1200 and 1800 cfm respectively. For 85 per cent efficiency, ratings are 1500 and 2250 cfm.

Ionizers

Ionizing section is made of formed sheet steel, top, bottom and side plates welded together to form a rigid frame. The ground tubes run vertically between the top and bottom plates. Two sets of Ionizing wires are used; one, the usual vertical set, and another set stretching horizontal at the ends to prevent leakage around the ends of the vertical wires.

Power Packs

The Power Pack is employed to change the a-c supply to d-c of suitable voltage to charge the Ionizers and Collector Cells. They furnish approximately 6000 volts d-c to the plate circuit of Collector Cells and 13,000 volts d-c to the Ionizer circuit.

The Power Packs include an indicator system and safety device. Three types of Packs are available:

Type L—Suitable for 4 to 16-36 in. cells.
Type S—Suitable for 1 to 5-36 in. cells.
Type M—Suitable for 1-24 in., 2-24 in., 1-36 in., or 1-24 in. and 1-36 in. cell.

All Power Packs are designed to operate from 115 volts ±5 volts on single phase a-c systems.

AUTOMATIC WASHER

Traveling Header

The basic element of the automatic washer is a set of spray nozzles which spray either water, compressed air or adhesive on the Precipitron cells. Water nozzles are mounted on a horizontal header and a mechanism is provided to move this header vertically up and down over the face of the cells. The secondary element of the washer is the control of its automatic operation which is described under "Control Panel."

Illustration below shows complete header with back vanes closed, the washing being done with vanes in this position as air is prevented from going through this group and forced through the balance of the cells where it is cleaned.

Header is moved by means of roller chains driven through a gear reducer by a ½ hp 220-440 volt, 3 phase motor. A limit switch controls up and down travel of header.

Control Panel

This panel operates the two traveling headers of the washer automatically once they have been placed in position on either side of the cell group to be washed and the momentary contact push-button on the panel has been pushed.

Control Panel comes fully assembled, is internally wired and ready to be set in place. The control circuit requires 115 volts single-phase of sufficient capacity to carry a ¼ hp motor. The power circuit requires either 220-volt or 440-volt, 3-phase, power of sufficient capacity to handle two ½ hp motors in reversing service.

Control Panel

A FEW DEALERSHIPS STILL OPEN

APRIL SHOWERS is the trade name of an EFFICIENT fool proof method of preventing roof heat penetration or solar infiltration causing excessive heat in upper floors and in factories, stores, theatres, shops, etc.

City water under normal city pressure is usually adequate to serve your APRIL SHOWERS system. The sun operates it. Roofs LAST LONGER, greater comfort is assured, production during the summer's heat is kept apace, errors through fatigue are avoided, and MANAGEMENT acclaims APRIL SHOWERS a GOD-SEND.

Developed in 1933-34.

APRIL SHOWERS controlled roof cooling is protected by U. S. Patents; beware of imitators or infringers. USED BY AIR CONDITIONING ENGINEERS to cut solar load.

APRIL SHOWERS new residence heads now ready.

Foster Wheeler Corporation

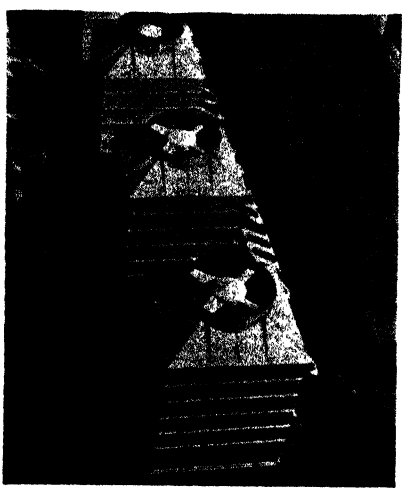
Cooling Towers

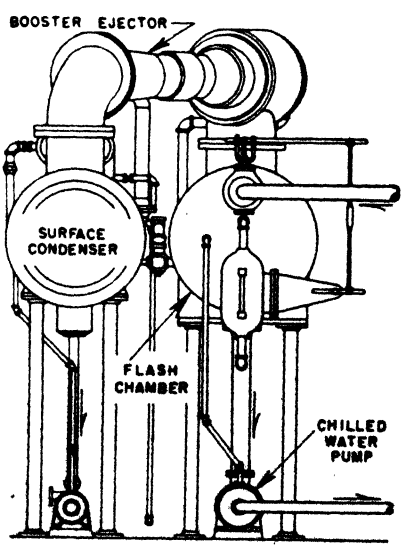
Foster Wheeler engineers have had wide experience in the design and construction of high-efficiency cooling towers for service under any climatic conditions. FW towers have been constructed all over the world to meet the cooling requirements of a variety of industrial needs, such as those encountered in chemical plants; public utilities; textile manufacture; office buildings and department stores; and oil refineries. Careful study of each proposed installation is undertaken before recommendations for the most suitable tower are given.



Left: Three of five induced draft towers installed in 1933 on the roof of the R. H. Macy department store in New York City. The first two towers cool circulating water for the condenser of a turbine; the other towers, only one of which is shown, cool water used in Macy's air conditioning system.

Vacuum Refrigeration

Schematic diagram showing arrangement of a typical vacuum refrigeration system. These systems, which cool water by subjecting it to high vacuum, supply chilled water for air conditioning or refrigeration. When a sufficient quantity of steam is available, vacuum refrigeration systems have several outstanding advantages—low initial cost; low maintenance cost; no toxic, explosive refrigerants; and, exclusive of pumps, no moving parts. Entire units designed and constructed by Foster Wheeler.



The Marley Company, Inc.

Fairfax and Marley Roads, **Kansas City 15, Kansas**

Representatives in All Principal Cities (Consult Classified Telephone Directory)

Water Cooling Towers of All Types and Capacities. Spray Nozzles

Marley Non-Clog Spray Nozzles

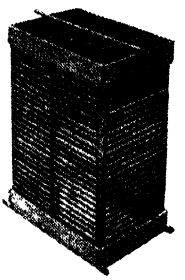
Low pressure tangential inlet with high speed whirl and uniform fine spray.

Two-Piece Nozzle for all cooling and spraying. Readily cleaned.

One-Piece Nozzle for cooling towers, spray ponds; large capacity.

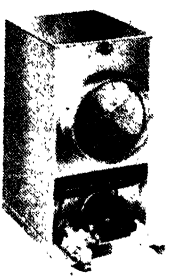
Atomizing Nozzle for humidifying, vaporizing; a "mist-like" spray.

ATMOSPHERIC SPRAY TOWERS



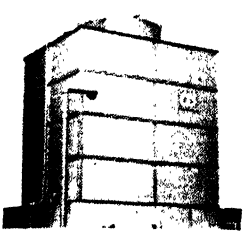
Marley Atmospheric Towers are designed for lowest cost, high efficiency installations on roof or ground where breeze is unobstructed. They are easily installed, simple and economical to operate. No fans, motors or other moving parts are employed. All are sturdily constructed from durable wood for long, trouble-free life. These towers owe their efficiency to the use of Marley low pressure spray nozzles and distribution systems. They are made in a wide range of closely graduated sizes and are shipped complete with necessary hardware, ready to erect.

MARLEY AQUATOWERS



Completely self-contained, these new "packaged-unit" cooling towers are the latest product of Marley's constant research and development program. Each Aquatower contains a built-in pump of ample capacity driven by the fan motor. Pump may be omitted if desired. Their small over-all space requirement permits installation in limited areas indoors or out. Aquatower capacities range from 3 to 15 tons of refrigeration. Shipped completely assembled, entire unit may be placed in operation by making electrical and hot, cold and make-up water connections.

SMALL SERIES VERTICAL STEEL



These attractive induced draft steel cased towers are specifically designed for medium capacity refrigeration and air-conditioning service. Small Series Vertical towers are equipped with Marley Triple Effect eliminators, Marley low pressure spray nozzles and distribution system. They are prefabricated and piece-marked for simplified field assembly. V-belt fan drive is standard equipment for all models. Marley Geareducers are available for larger capacity towers.

MARLEY DOUBLE-FLOW TOWERS

For large capacity installations, Marley patented Double-Flow Towers are designed to provide maximum efficiency and flexibility.

Engineers—Constructors—Manufacturers for the Refrigerated Industries
Specialized Equipment for Use with Refrigeration and Air Conditioning

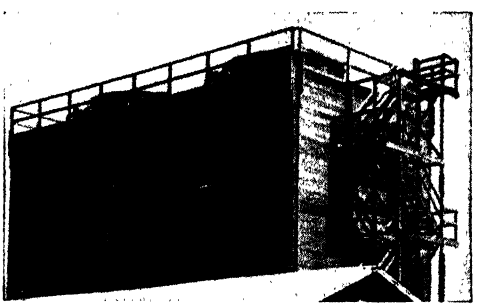
ENGINEERING-CONSTRUCTION

Many years of experience, covering large plants and small, all types of cold storage and refrigeration processing, qualify Pritchard to handle complete plants, revamps or additions, from plans to operation, on a full-responsibility turn-key basis that saves time and money. Any *part* of the complete Pritchard service (process designing, economic studies, plant layout, unit installations, etc.) is available separately.

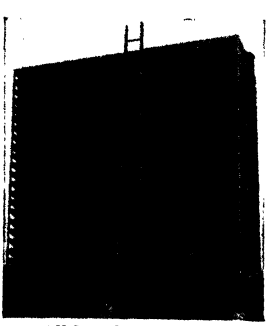
AIR TREATER—Renders Air Germicidally Pure—Removes Dust, Pollen, Smoke and Other Solid Particles and Microorganisms—Controls Humidity—A compact "package" unit for easy installation.

AIR & GAS DRYING EQUIPMENT—Total or Controlled Dehumidifying—Adaptable for Various Solid or Liquid Adsorbents—Standard units, all capacities, automatic or manual regenerating.

HEAT EXCHANGERS AND CONDENSERS—All types of heat transfer apparatus, high or low pressure, shell and tube, atmospheric or submerged, standard or special designs. Pritchard has facilities and application knowledge to meet any need.



Induced Draft Cooling Tower



All-Metal Spray Tower

Indoor Forced Draft

COOLING TOWERS—Pritchard has long been one of the foremost suppliers of cooling towers of all types and capacities. Specifications, prices, ratings and application recommendations furnished promptly.

Small Mechanical Draft Towers—Forced or induced, for indoors or out. Self-contained steel-cased units, easy to install, 2-ton capacity and up.

Natural Draft Spray Towers—With or without deck filling, with or without basins. Simple to assemble; slip-fit louvers; Redwood or all-metal; any capacity.

Natural Draft Deck Towers—Celebrated Pritchard "drift retrievers" minimize drift loss without restrictive secondary louvers. Free air flow gives higher efficiency. Rugged construction; low-pressure, uniform water distribution.

Induced Draft Towers—Extra-sturdy structural members and joints; double-wall casing. Valuable exclusive features include "Featherweight Fans" of wrought monel, superior air delivery per horsepower; trouble-free gear drives, either right-angle type with flex-coupled shaft to motor outside of fan ring or the famous "Sealdflow" unit streamlined to the fan hub, mounting motor and gears vertically on the fan shaft; low pumping head, uniform water distribution.

ALL-MONEL COOLING TOWER FANS—No gears, belts or couplings. Spherical hub houses slow-speed ball-bearing motor, lubricated for life, suspended in the fan ring by hollow vanes which ventilate the motor and guide the air stream. 36 in. to 96 in. diameters, avoid costly problems common to ordinary fans. Available as replacements, any make.

"AIRDFIN" AIR-COOLED HEAT EXCHANGERS—New efficiency and economy for many cooling and condensing functions, i.e., steam and other vapors, jacket water, oils, gases, quenching baths, etc. High-efficiency fan propels air through banks of finned tubes. No water problems.

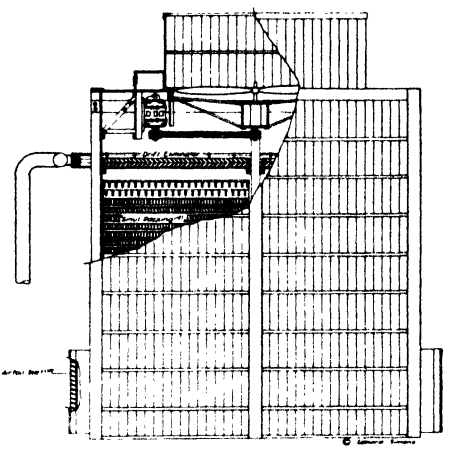
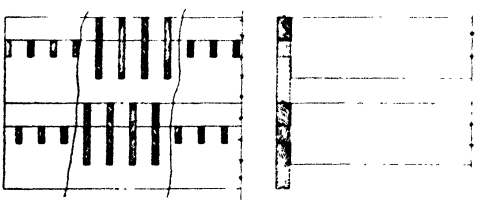
INDUCED DRAFT TOWER

Designed for modern requirements in 50 stock sizes from 75 to 2,000 gpm capacity. Equipped with multiple fans and of cell type construction for simplicity in erection and maintenance. Exclusive features permit compactness, low pumping head and automatic control of off peak loads. Structurally engineered by timber experts. Metallic connectors and tie rods concealed. Double sheathed. Fabrication at Nulco plant in the Redwood Empire.





SINUL PACKING

(Pat's. Pending)

Constructed of California Redwood in stout self aligning mats, this efficient surface is responsible for the compactness and low pumping heads of R.M.C. Cooling Towers. Protected against warping and rigid enough to support workmen, it is a gravity packing not dependent on metal fastenings. When combined with Sinul Airfoil Inlet (Pat. Pend.) low static pressures are achieved.

ATMOSPHERIC COOLING TOWERS DECK TYPE

In 43 stock sizes from 4 ft x 4 ft x 6 ft to 6 ft x 28 ft x 20 ft. All units plant fabricated for k.d. shipment with hardware, drawings and erection instructions.

Recommendations and prices for unusual applications furnished promptly.

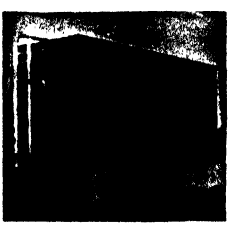
MANUFACTURERS OF MECHANICAL DRAFT AND ATMOSPHERIC COOLING TOWERS

FORCED DRAFT COOLING TOWER

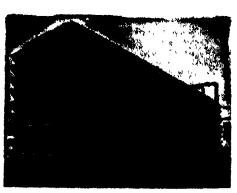
41,500 gpm, twenty-two cell, heavy duty, double forced draft cooling tower . . . equipped with twenty-two 12-foot diameter adjustable pitch, propeller type fans.

REDWOOD "WATERFALL" ATMOSPHERIC SPRAY COOLING TOWER



Factory fabricated and shipped knocked-down with all hardware, spray headers and spray nozzles. Complete erection instructions and drawings are furnished to assist in the assembly of the tower.

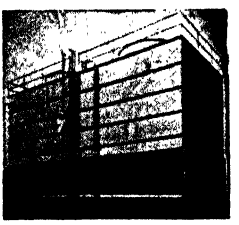
These towers are portable and can be knocked-down and moved simply by removing the louvres and bolts. Shipment can be made from stock. Write for Bulletin 125-A.



REDWOOD ATMOSPHERIC DECK TYPE COOLING TOWER

PRODUCTS

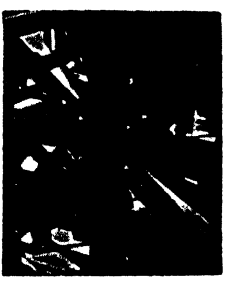
Heavy duty forced and induced draft cooling towers, standard induced and forced draft towers, induced draft coil towers, atmospheric deck cooling towers, atmospheric spray towers, spray ponds and spray nozzles.



INDUCED DRAFT

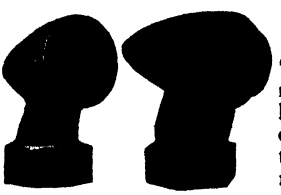
This type of cooling tower is recommended for installations where noise is a prime factor of consideration. The noise of the mechanical items is carried upward and discharged into the air. The mechanical draft cooling tower assures a positive cooling of the water to a specified temperature independent of wind velocity.

TIMBER JOINT CONNECTOR



Special cast iron timber joint connector used to develop the full strength of the timber joint, an accomplishment almost impossible to achieve by bolting.

Patent No. 2,280,121



Patent No. 2,123,697

SPRAY NOZZLES

"Whirlcone" non-clogging, low pressure, centrifugal type spray nozzles for spray ponds, spray towers and other uses. Write for Bulletin 76-A.

ENGINEERING

Design and construction are based on sound engineering principles to meet specific requirements for cooling performance and structural strength. Redwood, steel or other suitable materials are used.

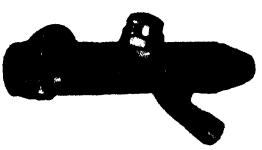
AMCO

UNIT HUMIDIFYING AND AIR CONDITIONING EQUIPMENT

A few of many AMCO products with a Long Record of Dependable Performance

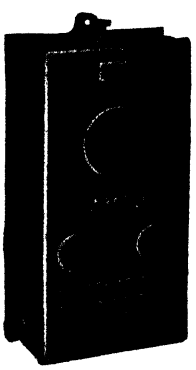
Self-cleaning Atomizers.
Sectional Humidifiers.
Ideal Humidifiers.
Amtex Humidifiers.
Hand Sprayers.
Fabric and Paper Dampeners.
Electro Psychrometers.
Sling Psychrometers.
Hygrometers.
Mine Sprays.

The Amco line of devices for the supply, maintenance and control of humidity is complete in its ability to meet any presented problem of applied humidification. Used independently or as an adjunct to Central Station equipment, these devices automatically maintain any required humidity condition in a capable uniform performance.



AMCO ATOMIZER—No. 5

Quality and quantity of spray are maintained even under adverse conditions because this atomizer is automatically self-cleaning. When the compressed air supply is shut off, either manually or in response to a humidity control, *both* air and water nozzles are thoroughly cleaned.



AMCO HUMIDITY CONTROLS

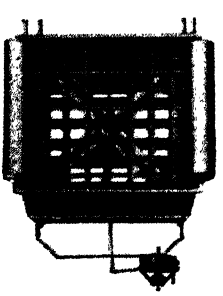
Compressed Air Operated

An extremely accurate and active device operated by compressed air which assures a regulation of humidity within exceedingly close ranges.

AMCO HUMIDITY CONTROL

Electrically Operated

Similar in principle to the Compressed Air Type except that the hygroscopic element operates electrical contacts which control the units.



AMCO EVAPORATIVE COOLING UNIT

The Amco System of evaporative cooling contributes to smooth production at high speeds in two ways; it maintains the percentage of relative humidity best suited to the fibre and process involved, and at the same time promotes the comfort and efficiency of personnel by obtaining the maximum practical cooling effect from evaporation. It does this by introducing outside air into the room in varying amounts, regulated in accordance with climatic conditions and inside requirements.

A ductless system—very flexible and portable. Can be applied in conjunction with an existing humidifying system.

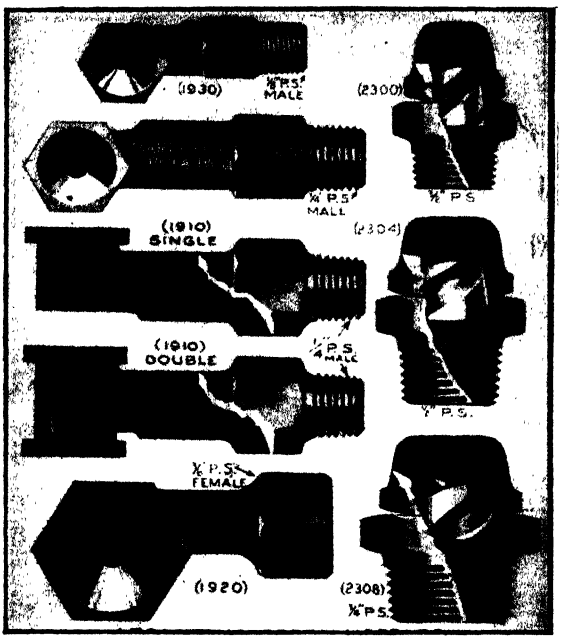
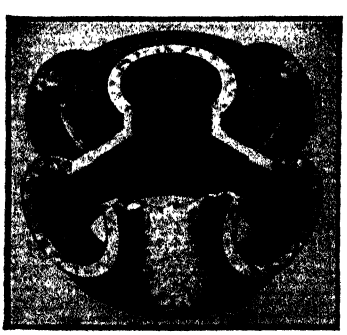
229-31 North 13th Street, **Philadelphia, Pa.**

SPRAY POND AND ATOMIZING SPRAY NOZZLES





MARTOCELLO

Atomizing Spray Nozzles produce a uniform, good, wide spray with less friction and at minimum pressure requirements.

Nozzles illustrated at the right are manufactured with precision in Brass Forgings and Bar Stock. Their design has been thoroughly tested for results and durability and will give you satisfaction.

Successful, Efficient Results depend largely upon selecting the proper number and type of Nozzles with Brass or Monel cap suitable for your job. Therefore we suggest you send us your specifications as we also have several Types other than illustrated and we will gladly assist you to obtain the most efficient application.

MARTOCELLO

Spray Pond Nozzles of a sturdy one-piece construction —cast of High Grade Red Brass with Inlet and Outlet accurately machined, are less clogging, offer less friction and give unsurpassed overall efficiency.

MARTOCELLO CLUSTER CASTINGS

Sturdy Grey Iron Construction with large area for reduced friction and even distribution. They are Hot Dipped Galvanized after fabrication.

Furnished with **Nozzles** and continuous Standard Steel **Long Sweep** Galvanized Pipe **Spray Arms** and **Center Nozzle** Nipple in accordance with layout required.

Sizes Carried in stock for **Prompt Shipment** 1½ in. P. S. Outlet, 3 in. P. S. Inlet and 2 in. P. S. Outlets, 4 in. P. S. Inlet Cluster Castings.

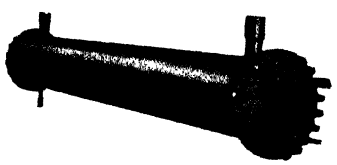
REFRIGERATION AND AIR CONDITIONING EQUIPMENT

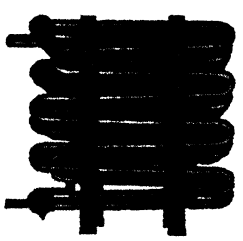
FREON CONDENSERS
AMMONIA CONDENSERS

Shell and Tube Type for use with Ammonia, Freon or other refrigerants. Standard or special designs to meet varying water temperatures available and condensing temperatures desired.



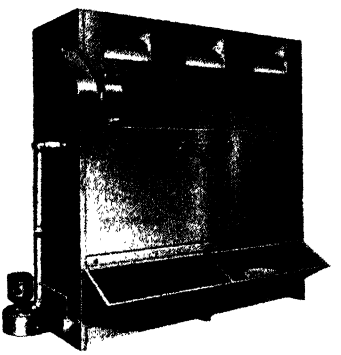
DRY-EX COOLERS

Refrigerant in tubes, solution baffled through shell. For cooling water, brine, glycols or alcohols by direct expansion of refrigerant.



PIPE COILS

Fabricated in all shapes and sizes from ½ in. IPS to 2 in. IPS. Special assemblies available for custom built evaporative condensers, raceway coils.

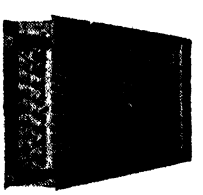


EVAPORATIVE CONDENSERS

All prime surface for Freon and Ammonia refrigerants. Heavy gage sheet metal casing, especially processed for maximum resistance to rust and corrosion. Capacities to 100 tons.

HEAT INTERCHANGERS

Shell and coil units for small capacities. Shell and tube units for large installations. 16 standard models from one ton to 180 tons capacity.



FIN COILS

Direct expansion coils with liquid distribution for Freon. Low temperature, wide fin spacing all steel coils hot dip galvanized for flooded ammonia.

Acme Industries, Inc. also manufactures flooded water and brine coolers, receivers, oil separators and lowside specialties.

Syracuse 1, N. Y.

AEROFIN

Standardized Light-weight Heat Exchange Surface

Branch Offices

CLEVELAND, CHICAGO, NEW YORK, PHILADELPHIA, DETROIT, DALLAS, TORONTO

Aerofin is the modern Standardized Light-Weight Encased Fan System Heating and Cooling Surface originated by *Fan Engineers* to meet the present and future requirements of this highly specialized field. All Standard AEROFIN Units are furnished as completely encased Units, ready for pipe and duct connections. The patented casings are built of pressed steel and are exceptionally strong and rigid, protecting the Unit from all the strains of pipe connections and expansion or contraction in service. The casings are flanged on both faces, top and bottom, and template punched for bolting together adjacent Units, or for duct connection.

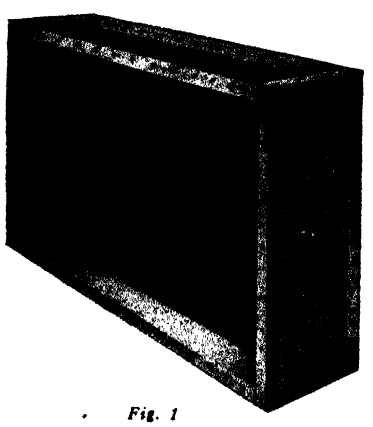

Fig. 1

Aerofin Non-freeze heater (Fig. 1) is non-freeze, non-stratifying spiral fin coil built into casing for air conditioning units or for installing in ducts. May be installed horizontally or vertically. Used on any two-pipe steam system for preheating or reheating. Modulating control on preheaters.

Available in 13 lengths and 3 widths, from net face area of 2.76 sq ft to 26.28 sq ft.

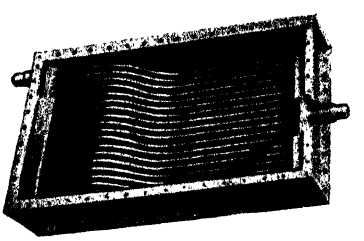

Fig. 2

Flexitube Aerofin (Fig. 2) is distinguished from all other developments by its off-set tubes, so arranged as to absorb all expansion and contraction strains.

Headers—Steel.

Tubing—⅝ in. O.D. copper, admiralty or aluminum.

Joints—Where admiralty or copper tubes are used together with bronze or steel headers tubes are brazed to headers. Where both aluminum tubes and headers are used tubing is welded to headers.

Casings—Copper, aluminum or galvanized iron.

Design—Constructed with headers on opposite ends making possible installation of units with tubes horizontal or vertical.

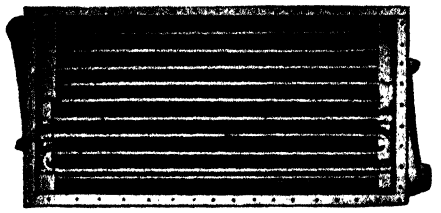

Fig. 3

Universal Aerofin (Fig. 3) is distinguished by its "S" bend construction of tubing, units designed with steel headers on opposite ends, the ends of the "S" bends being connected thereto by compression nuts, the bends taking care of the expansion and contraction of the tubing.

Recommended where close control is desired.

Headers—Pressed steel.

Tubing—1 in. O.D. copper or admiralty.

Casings—Copper, aluminum or galvanized iron.

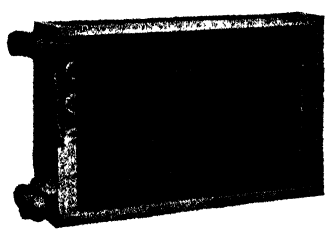

Fig. 4

Aerofin Heavy-Duty Industrial Heating Coil for use where extra-rugged coil is needed for close control. Steam pressures from 25 to 350 lb gauge; temperatures to 500 F.

Headers—Pressed steel.

Tubing—1 in. O. D. heavy copper.

Casings—12-gauge galvanized iron.

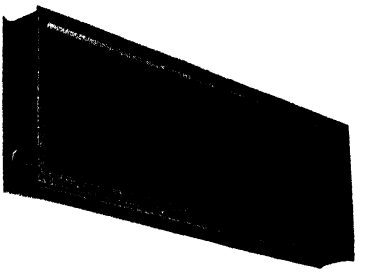

Fig. 5

Booster Aerofin—straight tube type, single pass construction for pressures from 1 to 200 lb gauge.

Headers—steel.

Tubing—$\frac{5}{8}$ in. O.D. copper.

Casings—copper, aluminum or galvanized iron. Recommended where small coils are needed or to raise the air temperatures in branch ducts.

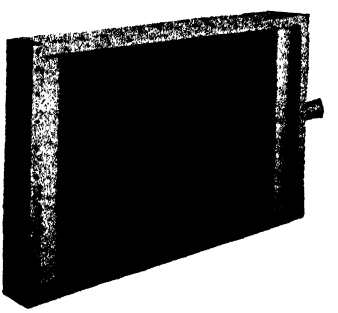

Fig. 6

Narrow Width Aerofin: (Fig. 6) recommended for water cooling or for flooded Freon systems. Made in straight tubes only with headers on opposite ends, joints between headers and tubing being brazed. Construction similar to Flexitube AEROFIN.

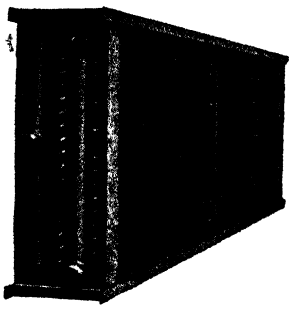

Fig. 7

Aerofin Continuous Tube Water Coils (Fig. 7) are designed for air cooling by circulating cold water through the AEROFIN and air over extended fin surface. Made for either horizontal or vertical air flow.

Tubes and fins are copper, completely tinned with permanent metallic bond between fin and tubes. Headers are made of steel and casings of heavy galvanized iron or copper.

Tested to 100 lb steam, followed by 450 lb air with coil submerged in water.

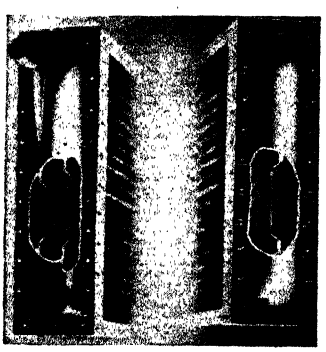

Fig. 8

Aerofin Cleanable Tube Units (Fig. 8) for cooling only made with headers removable to permit cleaning tubes. Recommended for use where sediment or scale forming chemicals are present in the cooling water.

Headers—Cast iron.
Tubing—Copper or admiralty.
Casings—Copper or glavanized iron.

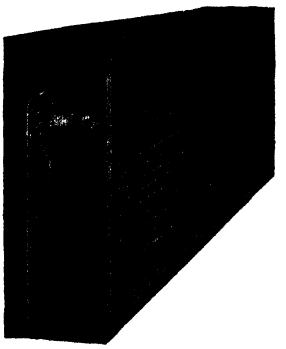

Fig. 9

Aerofin Direct Expansion Units: (Fig. 9) Centrifugal Header Type—For cooling air, using Freon expanded directly into the coil.

AEROFIN Sizes

Flexitube: 13 standard lengths, three widths, one and two rows deep.

Narrow: same as Flexitube.

Universal: 17 standard lengths, two widths, one and two rows deep.

Continuous Tube: 13 standard lengths, three widths, 2-3-4-5 and 6 rows deep.

Cleanable Tube: 17 standard lengths, one width, 2 and 4 rows deep.

Direct Expansion: Centrifugal Header—11 standard lengths, three widths, 2-3-4-5-6 rows deep.

Steel Supporting Legs: 18 in. and 24 in. high. Punched same bolt hole centers as standard casings. Quickly attached. No other foundation required.

Sale: AEROFIN is sold only by manufacturers of nationally advertised Fan System Apparatus. List upon request.

Write Syracuse for Heating Bulletin G-32; Direct Expansion Bulletin DE-34 on refrigeration type units; Continuous Tube Bulletin C. T. 34 for Water Cooling Coils; or phamplet on Cleanable Type AEROFIN for cooling.

Twenty years of specialized experience *designing*, building, fabricating and a special feature—a designing organization which also services heat exchangers—assures sound design, quality construction and economical operation. Conseco builds heat exchangers for all types of air conditioning systems using, Freon, CO_2, ammonia, methyl chloride and SO_2.

Conseco maintains a highly-trained service organization equipped with special tools developed by us to save time, labor and material, ready for action any time of day or night, anywhere on the continent. Heat exchangers are retubed or repaired in the shortest possible time, and at low cost. Tube sheets, tubes, ferrules, all types of packing, and other necessary materials are always stocked, ready for instant shipment.

The keynote of our service organization is fast, accurate, dependable service performed by competent, properly equipped men working under qualified engineering supervision.

Every detail of a Conseco heat exchanger is designed to profit from good and bad features uncovered by years of service work on units of every type and make. This has resulted in the production of simple, efficient units, low in original cost and inexpensive to maintain.

Conseco engineers will be glad to serve you. If you want fast action, write, phone or wire.

G&O

SQUARE FIN TUBING

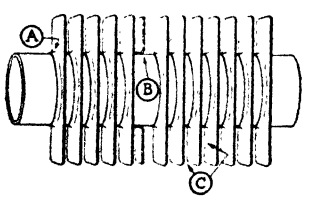
STRAIGHT LENGTHS—U-BENDS—CONTINUOUS COILS

THE use of INDIVIDUAL fins results in high efficiency in heat transfer from primary tube surface to secondary fin surface.

Fins of any size or shape may be obtained giving any desired proportion of primary and secondary surface.

A square fin has about 30 per cent greater surface than a round fin of a diameter equal to one side of the square.

Individual fins permit of any fin spacing; also, of using fins in groups at intervals along tubes.



A—Generous Fin Collar provides large contact area between Tube and Fin.
B—Tube expanded against Fin Collar; insures mechanically tight joint, made permanent by bond of high temperature alloy—complete thermal contact.
C—Free air-flow passages; non-clogging.

STANDARD SIZES

O.D. of Tube	Fin Size	Fin Spacing per Inch	Surface per Linear Foot
3/8"	7/8" sq.	6	0.80 sq. ft.
3/8"	7/8" r'd.	6	0.60 sq. ft.
5/8"	1 1/8" r'd.	6	0.87 sq. ft.
3/4"	1 1/2" r'd.	6	1.55 sq. ft.
3/4"	1 5/8" sq.	6	2.40 sq. ft.
1"	2 1/8" sq.	6	4.00 sq. ft.
1 3/8"	2 3/8" r'd.	4	2.33 sq. ft.

RADIATING ELEMENTS FOR ALL HEAT TRANSFER PURPOSES

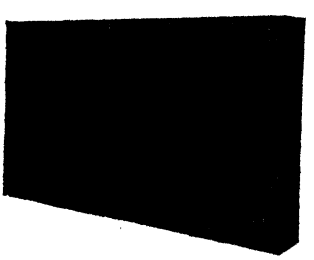
Universal U-102



Standard No. 10

Send for Catalog and Price List

Shaw-Perkins Manufacturing Company

Pittsburgh 19, Pa.

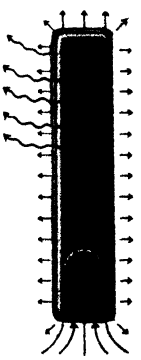
RADIATORS

Developed far beyond ordinary types of radiators and convectors, the Shaw-Perkins units have brought to radiation pleasing appearance and greater operating economy. Users have been particularly impressed by their highly efficient heat distribution. Installed in homes, ships, hospitals, office and industrial buildings.

The Shaw-Convector Radiators

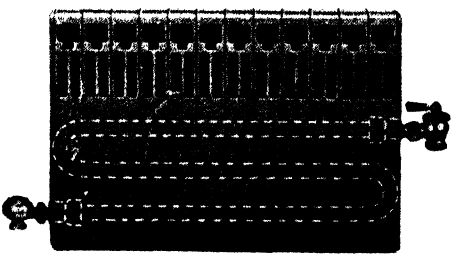
The Shaw Convector-Radiator is an attractive self-contained unit requiring no cabinet or expensive recessing. Occupies little floor space and harmonizes with modern decoration.

Designed to operate on high or low pressure steam or forced hot water. Frequently the high pressure steam feature alone justifies its selection for with such an installation smaller heating units and piping are required resulting in considerable installation and operating savings.



Wide air spaces between smooth steel fins induce the movement of large volumes of low temperature air thereby assisting in the fast and even distribution of heat through the room.

Because of its high heat output, it combines sturdy construction with a weight less than half that of ordinary exposed radiators of the same capacity.

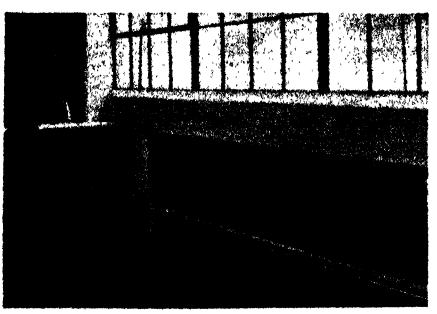


The Shaw Construction

The heat from the steam or hot water contained in the copper tube is conducted through all the steel radiating fins over which large quantities of low temperature air pass constantly and joins with the radiant heat from the exposed metal surfaces to produce a quick and economical form of comfortable warmth.

The Perkins-Convector Radiators

A Modern Industrial Heating Unit for High or Low Pressure Steam



Perkins Radiator installed in a Pittsburgh laboratory

This Advanced Radiator embodies a heavy copper tube arranged in the form of a continuous coil to which are mechanically bonded a series of steel plates, the whole assembly being locked into a rigid unit by a combination of tie rods and spacers.

The Perkins convector-radiator has been designed to move large volumes of low temperature air in order to produce quick, uniform, economical heating. The amount of air is greater than that of other types of radiators.

It is designed for operation on either high or low pressure steam. At high pressure the heat emission is greatly increased, so there is a reduction in the number of heating units and auxiliary equipment. Furthermore by modulating the pressure of the steam, the heat output of these radiators may be made to balance the heat loss of the building under varying conditions, resulting in a remarkable steam economy.

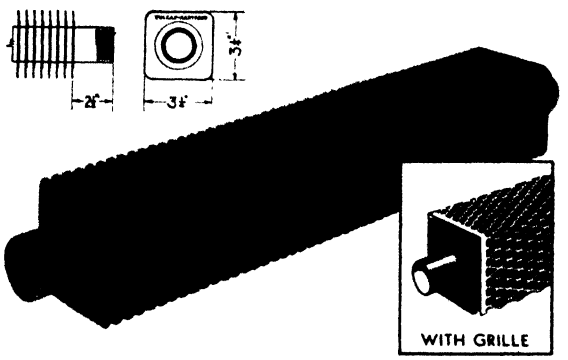
Representatives in principal cities. Send for catalog.

The Vulcan Radiator Company

26 Francis Avenue **Hartford 6, Conn.**

MANUFACTURERS OF FINNED TUBES FOR OVER TWO DECADES

Vulcan Radiation is used in railroad cars, ships, hospitals, schools, churches, homes and industrial plants. Available in steel or copper . . . easy to install . . . light in weight . . . requires few fittings and supports . . . pipe ends threaded or chamfered for welding. Heat distribution is uniform. Steel radiation comes in two sizes . . . 2 in. IPS, rated—5¼ sq ft per lineal ft at 1 lb steam and 70 deg air . . . for 1¼ in. IPS see illustration—this size also available in copper.

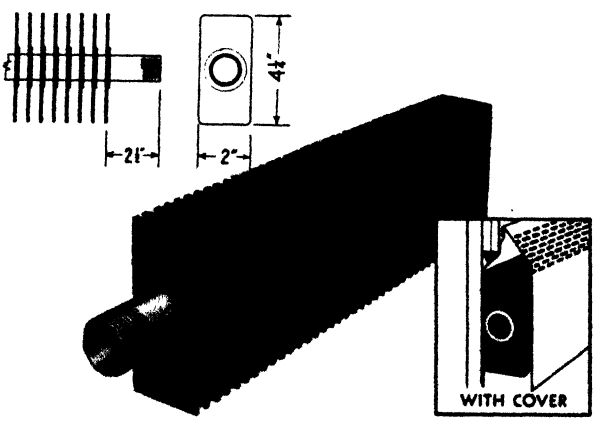


1¼ in. IPS, rated—4¼ sq ft per lineal ft.

Vulcan Radiation is fabricated by mechanically imbedding offset fins or plates on a tube or pipe. The patented offset fin construction gives complete rigidity to the entire assembly and extends the heating surface of the tube.

Because of its comparatively light weight and compactness, Vulcan Radiation responds quickly to thermostatic control. Full heat output is obtained almost immediately after steam is supplied. Since most of the heat is given off by convection, the result is EVEN, UNIFORM HEAT from floor to ceiling.

Vulcan Baseboard Radiation . . . fin - on - tube construction with grille covers combines radiant and convection heating. High safe working pressure . . . either hot water or two-pipe steam systems. Light in weight . . . easy to install . . . requires few fittings or supports. Comes in two sizes . . . 1¼ in. IPS . . . steel fins 2¾ in. wide by 3¾ in. high. Rated 4.0 sq ft per lineal ft. For 1 in. IPS see illustration.



1 in. IPS . . . steel fins 2 in. wide, 4¼ in. high. Rated—2.6 sq ft per lineal ft at 1 lb steam and 70 deg air.

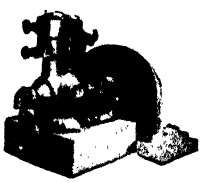
BUILDERS OF DEPENDABLE REFRIGERATION EQUIPMENT SINCE 1905

● **PRODUCTS: Ammonia Compressors; Self-Contained Ammonia Units; Self-Contained "Freon-12" Units; Shell and Tube Condensers, Vertical or Horizontal; Refrigeration Valves and Fittings; Water or Brine Coolers, Shell and Tube or Multi-Unit Type; Coils and Cooler Units of all sizes; Automatic Refrigeration Controls and Accessories; Evaporative Type Condensers.**

BAKER AMMONIA COMPRESSORS

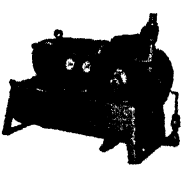


From 1 to 100 tons capacity. V-belt drive or direct connection to motors or engines. Vertical enclosed single-acting type. Duplex or multiple installations to obtain any desired capacity.

BAKER AMMONIA COMPRESSOR UNIT

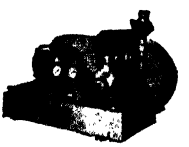
Model F6B from 7½ to 20 hp. Bore and stroke 3½ in. x 3½ in. Four cylinders, reciprocating single acting type. Force feed lubrication. Timken Roller Bearings. This model available in single or multiple compressor or condensing units as desired.

BAKER "FREON-12" UNITS



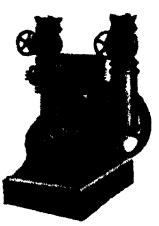
"Freon-12" Units of the self-contained automatic type from ¼ to 20 hp capacity in single units. Furnished in air-cooled type ½ to 20 hp and water-cooled type 3 to 20 hp.

"FREON-12" COMPRESSOR UNITS



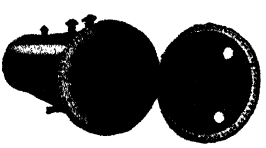
Arranged for use with evaporative type condenser or separately mounted shell and tube condensers. Sizes from 3 hp to 20 hp. Two and four cylinder types. Automatic controls.

BAKER AMMONIA BOOSTER COMPRESSORS



For sub-zero temperature work. Lubrication under pressure. Single or multiple compressor installations. V-belt or direct drive. Large gas manifold at compressor suction ports allows complete filling of cylinder at variable speeds.

BAKER SHELL AND TUBE CONDENSERS AND COOLERS



ASRE welded single units to 150 tons, multiple units any capacity. Shells 8 in. or 50 in. diameter. Removable heads. Vertical or horizontal, single-pass or multi-pass. Brine or water.

Baker Also Manufactures a Complete Line of Industrial-Type Cooling Units, Ammonia Valves, Screw-End Fittings, Capped Valves, Flanged-Type Fittings

Curtis Refrigerating Machine Division

of Curtis Manufacturing Company

1959 Kienlen Ave., **St. Louis 20, Mo., U. S. A.**

ESTABLISHED 1854

Full Line of Units from ¼ to 30-hp

CURTIS REFRIGERATION AIR CONDITIONING COMMERCIAL

Unit Coolers and Evaporator Coils

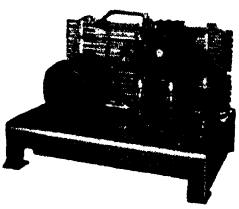
PRODUCTS: Complete Refrigerating Equipment for Dairies, Creameries, Ice Cream Cabinets, Ice Cream Making Plants, Cold Storage Locker Systems, Walk-in Coolers, Drinking Water Systems, Commercial and Low Temperature Cooling, Processing and Air Conditioning Installation, Packed and Remote Types.

Commercial Refrigeration

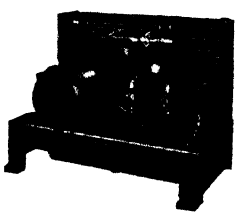
¼ to ½ hp Self-Contained Condensing Unit.

Air cooled condensing units from ¼ to 3 hp, inclusive, and water cooled units from ⅛ to 30 hp, inclusive. All models available for either Freon (F-12) or Methyl Chloride. Mechanical advantages include Timken Bearings, Centro-Ring Positive Pressure lubrication.

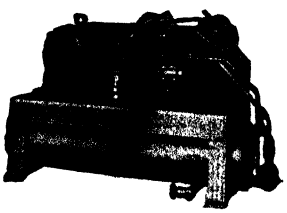
Special models are available for ice cream, frozen food cabinets and for the dairy industry.



5 hp Water Cooled (Counterflow) Condensing Unit. Other from sizes ¼ to 5 hp.



1½ hp Air Cooled Condensing Unit. Other sizes from ¼ to 3 hp.

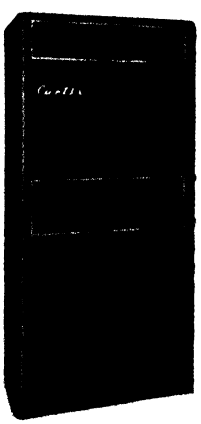


15 hp Cleanable Shell and Tube Condensing Unit. Other sizes from 3 to 30 hp.

Air Conditioning

For today's Air Conditioning requirements Curtis offers complete packaged, refrigerated air conditioning units, requiring only water and electrical connections to install. Cools, dehumidifies, circulates and filters the air. Eliminates costly installation expense. Adaptable for heating.

7½-10-15 ton Remote or Central Type Air Conditioner.



3 and 5 ton Packaged Type Air Conditioner.

AIR CONDITIONING

Ask for Frick Bulletins 502, 503, 504 and 505 on Air Conditioning

Complete Frick systems; also refrigeration for use with equipment supplied by others. Over 1000 installations attest the value of Frick equipment. Successful experience with exacting commercial and industrial jobs enable us to solve your air conditioning problems.

AMMONIA REFRIGERATION

Combined units and vertical enclosed compressors, with two or four cylinders, in sizes from ½-ton up. Widely used for air conditioning, with material savings. Ask for Bul. 503 on this subject.

Pratt and Whitney use Frick Ammonia Refrigeration for Precision Air Conditioning Service

FREON-12 REFRIGERATION

Frick "Eclipse" and the larger F-12 compressors provide a complete and efficient line. Coils, coolers, condensers and controls to suit. Patented Flexo-Seal at shaft, pressure lubrication from submerged pump, capacity controls, and other superior features make Frick machines your logical choice.

Frick Equipment Air Conditions Three Test Rooms for Bendix Radio at Towson, Md. Temperature and Humidity are Automatically Controlled between 194 and —76° F

LOW-PRESSURE REFRIGERATION

Commerical and industrial units in sizes from ¼ hp. up. Charged with Freon-12. Air and water-cooled condensers. Coils, coolers, and air conditioners. Get in touch with your Frick Distributor; ask for Bul. 97. Our service includes estimates, layouts, manufacture, installation, maintenance.

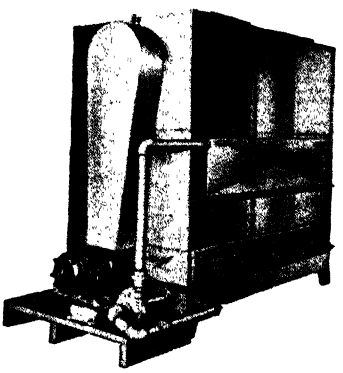
Marlo Coil Co.

6135 Manchester Ave., **St. Louis 10, Mo.**

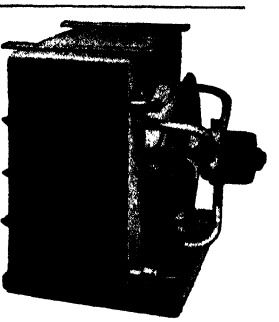
Manufacturers **MARLO-HEAT TRANSFER** Equipment
Since 1925

Industrial Coolers — Unit Coolers — Evaporative Condensers — Low Temperature Units — Air Conditioning Units — Heating and Cooling Coils — Cooling Towers — Diesel Engine and Oil Evaporative Coolers.



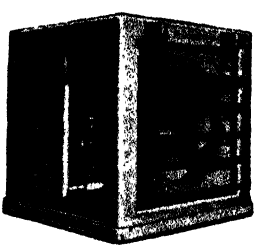
COOLING TOWERS

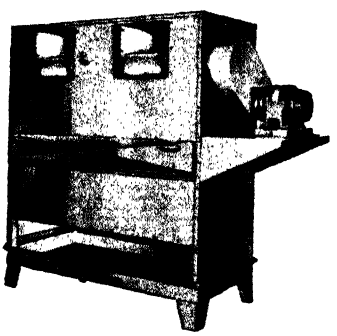
Triple-Type: Induced Air — Wetted Surface —Water Spray. Compact in space, weight and price. Outdoor—Indoor—3 to 50 tons—Built sectionally. Write for *Bulletin* 406.



EVAPORATIVE CONDENSERS

3 to 100 tons—All refrigerants — All prime surface coils—No fins —Quiet—Motor Unidrive. Indoor or outdoor units—Durable construction. Write for *Bulletin* 404.



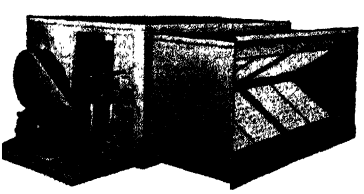


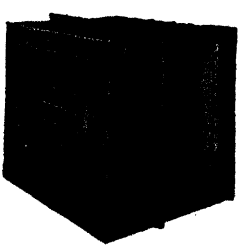
INDUSTRIAL COOLERS

15 unit sizes—1000 to 24,000 cfm—Floor type. Galvanized frame and pans—Sectionally built. Variables: (1) Rows of coil and fin spacing. (2) Circulating brine spray or dry coil. (3) Defrost sprays optional. (4) All Refrigerants. Write for *Bulletin* 403.

UNIT COOLERS

Pull-through (DUC) and Blow-through (UC) types —for all refrigerants. 11 unit sizes—4 and 6 row coils—full range of capacities. 675 to 4160 cfm—Venturi fan ring—Deflector louvers. Sturdy—Economical—Quiet. Also Wall Panel Type. Write for *Bulletins* 412 and 392.





AIR CONDITIONING UNITS

Cooling — Heating — Dehumidifying — Humidifying. 10 sizes—3 to 35 tons—900 to 13,000 cfm. Noise level ratings—Ceiling suspended or floor types. Write for *Bulletin* 409.

(U.S. Patent 2266373)

BLAST COILS

Air conditioning—Industrial Refrigeration —Heating. Any material—All refrigerants—Every application. "BALL-BONDED"—mechanically expanded tubes to fins. Write for *Bulletin* 396.

ELECTRIC DEFROST LT UNITS

Compact ceiling type—High capacity—Low cost. 7 sizes—Ammonia or Freon—½ to 2½ tons at 12 deg TD. Defrosted electrically. Quickly installed—Sectional doorway-sized. Write for *Bulletin* 408.

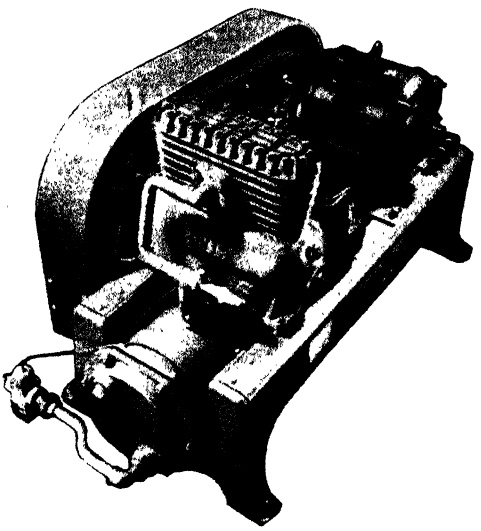
MILLS *Industries, Incorporated*

Refrigeration Division 4100 Fullerton Avenue · Chicago 39, Illinois

Mills Compression Equipment
for Air Conditioning • Commercial and Industrial Refrigeration

COMPRESSOR

2½ in. x 3 in. four cylinder, vertical, single acting, reciprocating type . . . heavy, one piece alloyed semi-steel cylinder block and crankcase . . . oil sight glass . . . alloy semi-steel pistons, two compression rings, one oil ring . . . hardened piston pins . . . drop forged steel connecting rods . . . bronze piston pin bearing . . . bronze main bearings . . . exclusive Mills design shaft seal.



CONDENSING UNIT

Base of cast iron ends and formed steel sides . . . shell and tube type receiver condenser with removable heads and leak alarm fittings . . . complete with automatic water valve, starting box, low pressure control with high pressure safety cut-out . . . complies with Underwriters' specifications . . . dynamically balanced and non-vibrating, light in weight, compact, requiring a minimum of floor space. Mills Condensing Units are economical to operate and maintain. Condensing units are shipped ready to operate. No special foundations are necessary.

APPLICATIONS

Refrigeration in air conditioning applications for comfort, food preservation, and industrial uses for processing and testing. Compactness of condensing units make them ideal for self-contained applications.

ENGINEERING

Mills Industries, Incorporated maintain an engineering test laboratory as a service to their customers, equipped with three hot rooms, calorimeter, indicating and recording, pressure and electrical instruments and all apparatus necessary for a thorough analysis of the use of condensing units to any manufacturer's product or field applications.

CAPACITIES AT 40° F SUCTION GAS

Size	RPM	Displacements CFM	Capacities in BTU	Width	Depth	Height	Net Weight
5 hp	480	16.37	65000	63"	29½"	32"	895 lb
7½hp	700	23 86	90500	63"	29½"	32"	945 lb
10 hp	890	30.34	125000	63"	30"	34"	1050 lb

Air cooled models from ¼ to 3 hp.
Water cooled models from ½ to 10 hp.

All models are designed for use with Freon-12 or Methyl Chloride refrigerants for low, standard, and high back pressures, for operation throughout the complete range of temperatures.

Compressors are designed for low head temperatures and high volumetric efficiency.

Condensers are matched to the performance ranges of each compressor.

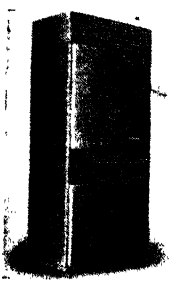
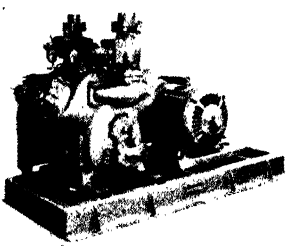
Self-contained Air Conditioners



Cooling (or heating, if desired), dehumidification, ventilation, circulation and air cleaning for commercial and small industrial applications. 3 and 5 ton capacities. Compressor, finned copper tubing condenser, large-surface finned cooling coils, quiet low-speed fan, throw-away filters, concealed temperature and air volume controls. Freon-12.

Self-contained Units



Small sizes range from ¼ to 10 hp. Large sizes, capacities up to 100 tons. Freon-12 compressor units for use with evaporative condensers or water-cooled condensers. Automatic capacity control.

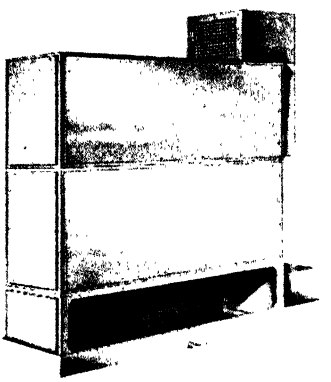
Centrifugal Refrigeration

Water Cooling Systems

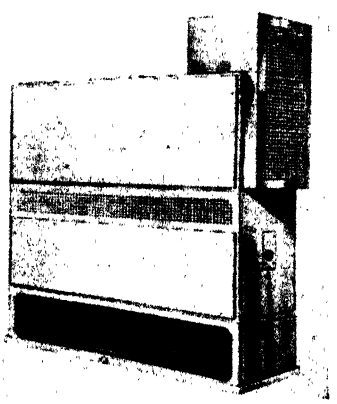
Freon-11 centrifugal compressor, water cooler and water-cooled condenser in compact unit assembly. Electric motor or steam turbine drive. 56 unit sizes . . . 150 to 1200 tons.

Air Conditioning Units

For Direct Expansion Freon-12 or Chilled Water Circulation



Vertical and horizontal; 1500 to 12,000 cfm; large air passages; slow speed, quiet rugged fans; separable sections; readily accessible. The design permits flexibility in installation arrangements.



Evaporative Condensers

A combined condenser, receiver and modified cooling tower, in one assembly, for Freon-12, methyl chloride, and ammonia systems; 10 to 60 tons refrigeration; all parts easily accessible.

Jacket Water Coolers

For cooling jacket water for Diesel and gas engines, air compressors, etc.

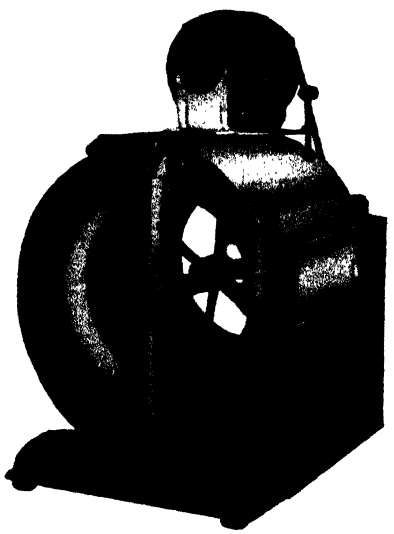
REX BLOWERS

DESIGNED and Engineered for MAXIMUM PERFORMANCE

Engineered to meet all modern needs and proof-tested for performance, **REX** Blowers set the pace for leadership by better design, smooth operation and trouble-free service. You can give your equipment an added sales feature by using **REX** Blowers—it's a feature you cannot afford to overlook.



Outstanding Features Of The REX Blower Line

Accessible, long-lasting oiling element . . .

The new streamlined bearing bracket with the sight-feed oil gage, and oil reservoir cap near the top of the blower, permits ease of lubrication. This revolutionary bearing holds 2 to 4 times as much oil as conventional bearings.

Adjustable cutoff . . .

Equally efficient against high or low resistances by simple adjustment.

Rigidity . . .

The extra heavy construction of the new **REX** Blower line, insures sturdiness. Cross-bracing maintains alignment and quiet operation.

Reliable . . .

The operating record of thousands of **REX** Blowers which are in actual operation on air conditioning equipment, is the best testimonial of their reliability.

For Complete Information, Write For Catalog No. 247 Which Contains Complete Performance & Specification Data.

American Coolair Corporation

3606 Mayflower Street, **Jacksonville 3, Florida**
Charter Member, Propeller Fan Manufacturers Association

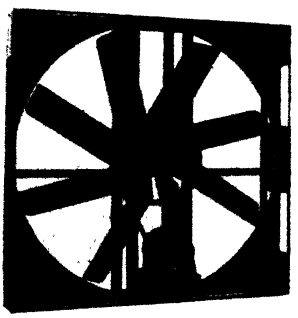
BUILDERS OF V-BELT DRIVE EXHAUST FANS FOR 20 YEARS

The principle of **Rapid Air Change** for the effective cooling of commercial and industrial buildings has been used by Coolair for 20 years, and the company specialized in the development of V-belt drive exhaust and home-cooling fans. Coolair manufactures a wide range of fan sizes and types to fill the ventilating and cooling requirements of all kinds of buildings.

In planning a Coolair installation, provide for a complete change of air once every 30 seconds to one minute. Select fan from table on opposite page to conform to cubic contents of space to be cooled. Write for FREE bulletins containing detailed information, or for the name of nearest Coolair dealer or distributor.

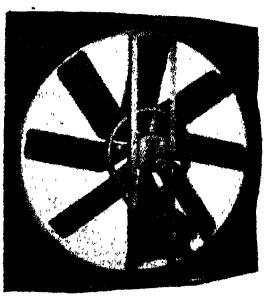
QUALITY FEATURES OF COOLAIR FANS

1. **Patented Spring Mountings on Smaller-motored Units.** All moving parts float on resilient springs, absorb noise.
2. **Compact Welded-steel frame.** Cannot warp or twist. Easy to install.
3. **Reversible Operation.** Fan will blow in or exhaust as desired when equipped with reversible motor.
4. **Oversize Ball Bearings in Fan Hub.** Eliminate chatter and thrust knock, assure long life. Permit operation in any position if ball bearing motor is used.
5. **Eight Steel Blades.** Up to 12 in larger fans. Multi-blade design means slower speeds, steadier air flow, quieter operation.
6. **V-belt Drive.** Small motors operate at most economical running speeds.
7. **Long Hour Service Motor.** Nationally known motors.
8. **Certified Air Ratings.** Set in accordance with ASHVE-NAFM Standard Test Code.
9. **Full Streamlined Orifice.** Avoids "spill-off" of air, reduces power consumption.



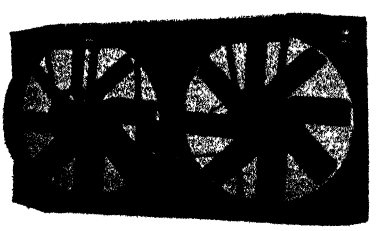
TYPE S—For Large Industrial Jobs

Especially designed for ventilating and cooling industrial plants, shops, power stations, warehouses and other large buildings. Heavily braced double frame, special pillow-block ball bearings on each side of fan wheel, 8 to 12 reinforced fan blades, multiple heavy duty V-belts. Lowest possible operating cost. Type S Fans range from six to nine feet with several motor sizes for each.



TYPE O—For Industrial, Commercial, Home Use

Patented built-in springs (on smaller motored sizes) and streamlined orifice combine to make this type extremely quiet in operation. Designed for reversible operation. Equally efficient in any position when equipped with ball bearing motor. Usually installed in window openings, walls, skylight openings, penthouses or attics. Available in seven fan sizes ranging from 26 to 62 inches with several motor sizes for each. U. S. Patents 1992112 and 2191418.



TYPE OT—Twin Unit

This unique Coolair Twin-unit is two fans of Type O specifications mounted side by side in one frame and operated by a single motor. For use where limited headroom or wall space will not permit the use of a single fan of ample size. Can be placed on end to fit into existing window and door openings. Covered by U. S. Patents 1992112, 2108738 and 2191418.

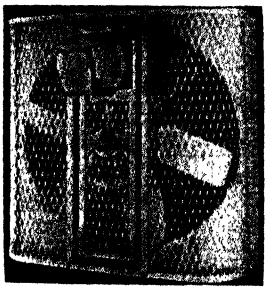
Dimensions in Inches

Fan Size	Overall Height	Overall Width	Overall Depth (Approx)
28-W	31	33	15
2-O	30⅝	30⅝	16
2½-O	36⅝	36⅝	18
3-O	42⅝	42⅝	18
3½-O	49	49	19
4-O	55⅛	55⅛	19
4½-O	61⅛	61⅛	19
5-O	67⅝	67⅝	19
6-S	75¼	75¼	30
7-S	87	87	32
8-S	99⅝*	99⅝*	49
9-S	112⅛*	112⅛*	54
2-OT	30⅝	61¼	18
2½-OT	36⅝	73¼	18
3-OT	42⅝	85¼	19
3½-OT	49	98	19
4-OT	55⅛	110¼	22

*These dimensions include five-eighths inch for bolt heads.

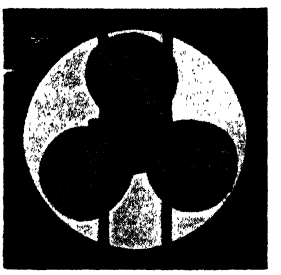
28-W FAN WITH SAFETY GUARD

Coolair's lowest priced belt-drive fan is equipped with built-in springs, adjustable diameter motor pulley and safety guard. This fan can be easily and quickly installed in upper or lower half of any standard window of work rooms or offices where proper ventilation is necessary for health, comfort and efficiency of workers. See tables for data.



DIRECT DRIVE FANS

Four sizes 16 to 24 inches in diameter. General purpose exhaust fan for most commercial and industrial uses. Data on sizes, performance and dimensions furnished on request.



COOLAIR AUTOMATIC CEILING & WALL SHUTTERS

Precision-built all-steel shutters that open and close automatically when fan is turned on or off. Ceiling shutters eliminate need of ceiling grille and trap door in attic installations. Wall shutters give weather protection for fans discharging directly to open air.

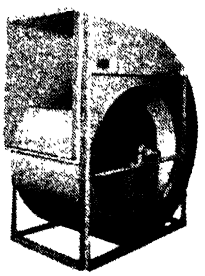
B—Very Quiet (Homes, Theatres, Hospitals, etc.).
C—Quiet (Stores, Offices, Restaurants, Barber Shops, etc.)
V—Equipped with built-in springs.
D—Industrial (Laundries, Factories, Canneries Bakeries, Pressing Clubs, Garages, etc.).
L—Has adjustable diameter motor pulley for Very Quiet and Quiet performance.

Aladdin Heating Corporation

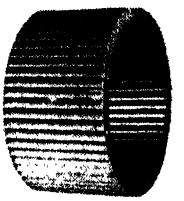
2222 San Pablo Ave., **Oakland 12, Calif.**

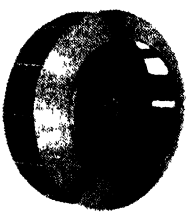
Manufacturers of Centrifugal Blowers, Heating and Ventilating Equipment.



FC Fan and Rotor

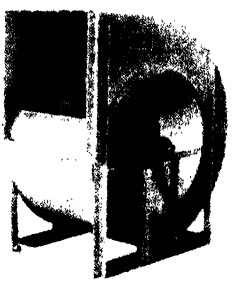
The Aladdin FC fan having a forward curved rotor is built in 14 standard sizes, single or double width, of 8 arrangements of drive and 8 directions of discharge. The low tip speed which is characteristic of this fan makes it ideal for general application where quiet operation is essential. Write for Bulletin No. 490.

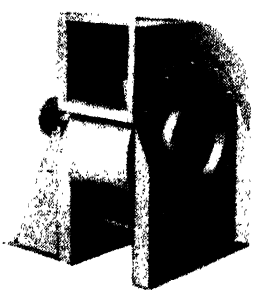




BB Fan and Rotor

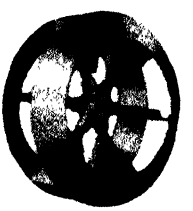
The BB fan is a backward curved fan with the non-overloading horsepower characteristic. This fan is built in 12 standard sizes, single or double width of 8 arrangements of drive and 8 directions of discharge. These fans are available in class I, II, III or IV and can be built for special application where required. Write for Bulletin No. 485.

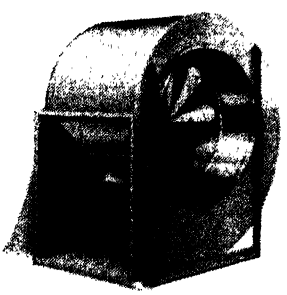




EX Fan and Rotor

The EX fan is used chiefly for the conveying of materials, fume exhaust etc. These fans are reversible and can be furnished in 13 standard sizes of 8 arrangements of drive and 8 directions of discharge. They can be designed for special applications such as for handling abrasive materials or for acid fumes. Write for Bulletin No. 460.





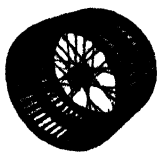
RB Fan and Rotor

The RB fan having a radial curved rotor is used chiefly for kitchen exhaust duty. They are well suited for handling grease and other sticky materials, also for exhausting fumes and vapors from tanks, hoods, etc. This fan is built in 12 sizes, single width only, of 8 arrangements of drive and 8 directions of discharge. Write for Bulletin No. 450.

Bayley Blower Company

1817 S. Sixty-Sixth Street **Branches in Principal Cities** **Milwaukee 14, Wis.**

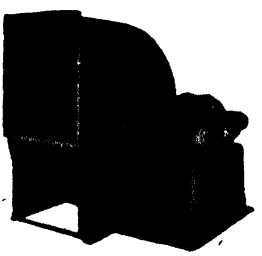
Builders of Heating, Ventilating, Cooling, Purifying, Humidifying and Air Washing Equipment; Exhaust and Drying Apparatus, Mechanical Draft and Blast, Fans and Blowers of all Types



TYPE "F" PLEXIFORM FANS AND TYPE "AP" AEROPLEX FANS

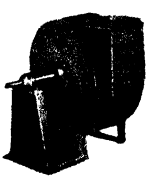
Plexiform and Aeroplex Fans are both designed for heating, ventilating and air conditioning service. The **Type "F"** fan is using a multi-blade wheel (see cut at left) while the type **"AP"** fan is built around a wheel of high speed design (see cut at right.)

The wheels determine the character of the performance or the fan "Characteristics," thus the Type "F" is a slow speed fan having a rising power curve, while the **"AP"** is a high speed design and has self-limiting power characteristics. Both fans are highly efficient and can be built single inlet, single width, or double inlet, double width in ten different arrangements of drive and eight directions of discharge. The standard fans range in capacity from 1200 to 300,000 cfm and these fans are readily available in Class I or II designs for various types of duty. Class III and IV can be furnished on special application.



Type "EX" Fans

For all exhaust problems, pneumatic conveying, fume exhaust etc. **"EX"** is highly adaptable, feasible and serviceable fan. It is sturdy in construction, easily installed and maintained. The design is reversible and standard sizes Nos. 15 to 80 inclusive are available.



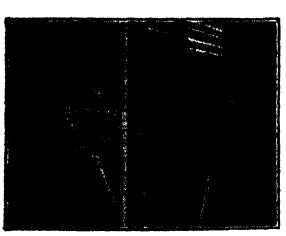
Type "H" Fans

For pressure applications from 6 in. to 42 in. for belt drive or direct connection to motor, **Type "H"** is a most practical design. Standard sizes Nos. 25 to 80 are listed but the design is suitable for modification of wheel diameters to meet various motor speeds.

Both **"EX"** and **"H"** fans can be designed to fit specific applications. The design permits easy modification of details and the fans can be used for induced, forced draft, cupola service, primary or secondary air supply to oil burners, etc. Special details, outlet and inlet, or mounting can be designed to suit your special assembly.

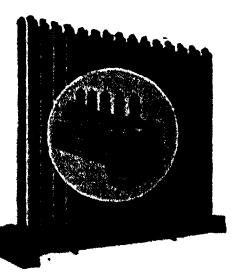
Turbo Spray

The Turbo Spray for industrial and comfort conditioning, cooling and humidifying, is a practical design as the atomization is by mechanical means, thus there can be no clogging or interruption of service even in atmosphere heavily laden with fibers or other foreign material. Single or multiple bank washer, one or two stage designs can be furnished from 2500 to 100,000 cfm capacity. To fit space requirements width and height can be modified to suit.



Chinook & Chinookfin

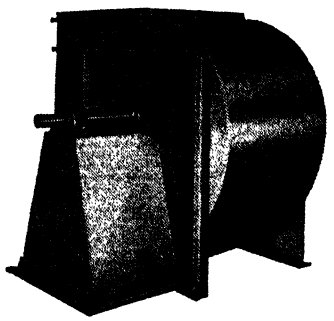
Both **Chinook and Chinookfin Coils** are based on the tube-within-a-tube design, originated by Bayley. The principle involved permits single header with all tube ends free expanding, thus eliminating the likelihood of freeze ups and cracking usually due to expansion and contraction strains. Both type coils are designed for usual hot blast heating and cover a wide range of capacities and applications.



The Bishop & Babcock Mfg. Co.

Massachusetts Blower Division

4901 Hamilton Ave. **Cleveland 14, Ohio**

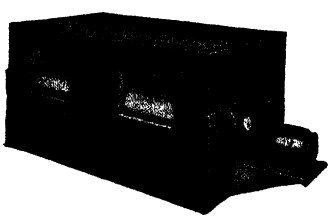


SQUIRREL CAGE AND POWER FIXED FANS

Squirrel Cage Fans, outstanding in performance, slow speed characteristics.

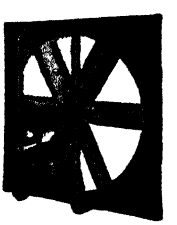
Power Fixed Fans are backward curve blade type, with non-overloading characteristics. Double width, double inlet, Class I or Class II construction, built in a wide range of sizes. Rating and dimension tables available. Write for catalogs.

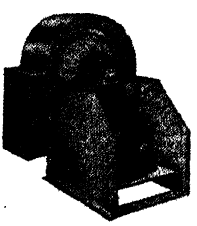
The new Design 2 Air Conditioning Furnace Blowers are now available, with a wide variety of stock combinations and discharge arrangements. They can be furnished in special widths or in multiples. Also available are wheel assemblies, housings and housing sides. Write for catalog.



Unit Heaters. Blower type. Floor and Ceiling type made in 13 standard sizes, with regular or non-freeze coils, filter and damper sections. Ratings from 50,000 Btu up. Propeller Fan type "H," Horizontal made in 16 sizes. Type "V" Vertical projection for ceiling mounting. Write for catalogs for full information.

Propeller Fans available with Belt drive with wheel sizes 24 in. to 48 in. Direct Drive with wheel sizes 12 in. to 36 in. Both types available with single or 2 speed motor. A complete line of Automatic Shutters and Fan Houses are obtainable. Write for catalog.





Ventilating Sets. Series MSV Design 2. Belt Driven, with or without motor and drive cover. Type "S" Design 2 are direct connected, designed for either supply or exhaust on small ventilation problems. Write for catalog.

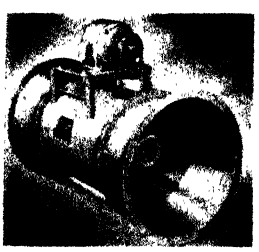
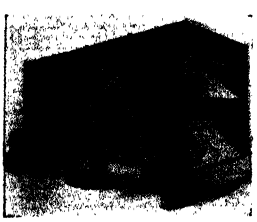
PRODUCTS—Equipment for all types of Heating and Ventilating, including: Unit Heaters, Multiblade Fans, Air Washers, Unit Air Washers, Unit Coolers, Drying Equipment, Mechanical Draft Fans, Air Preheaters, Blowers, Exhausters, Disc Fans, Spray Nozzles.



BUFFALO AXIAL FLOW FANS

High pressure ventilating fans with non-overloading characteristic, vibrationless operation and straight line air propulsion. The axial flow design cuts energy losses and power costs to a minimum.

BUFFALO AIR WASHERS



Where washing, tempering and purifying of air under changing atmospheric conditions is required, Buffalo Air Washers are available in designs to handle every plant problem. At left, above, a Buffalo Air Washer widely used in many plants.

BUFFALO LIMIT-LOAD CONOIDAL

Dynamically balanced, these fans are non-overloading regardless of operating conditions. Well suited to moving large volumes of air at low power cost. Sturdy rotor and housing construction throughout.

BUFFALO UNIT HEATERS

For throwing quick heat economically into desired areas of plant and public buildings, Buffalo "Highboy", "Lowboy" and "Breezo-Fin" unit heaters are available in floor, wall or ceiling installations.

VENTILATING INFORMATION ON REQUEST

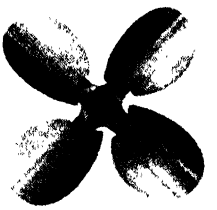
Buffalo fans and air conditioning units cover practically every air application. The Buffalo representatives above will gladly give you advice on your problem, or simply write us.

Burden Company

1000 North Orange Drive, **Los Angles 38, Calif.**

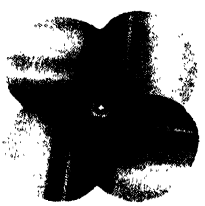
Manufacturers of Aluminum-Fan Blades
Aluminum and Steel Blower Wheels

Burden Blades and Blower Wheels are designed to operate smoothly and efficiently, on a minimum of horsepower, giving maximum volume of air flow. All Burden Blades and Blower Wheels are tested for dynamic and static balance by the patented Burden electronic Balancer. All blade hubs are standard for motor on suction side of blade. Burden products are outstanding for their low noise level, resistance to corrosive action, slight weight and great strength. For specifications of Blades and Blower Wheels and for types not listed, write factory.



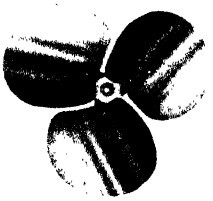
ATTIC

Balanced for quiet efficient operation. Full air volume affords greater cooling capacity. Built of polished aluminum with steel spider. Light weight. Sizes: 36, 42 and 48 in. diameters.



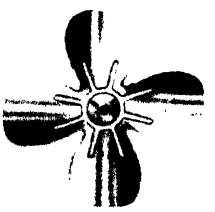
FULL PRESSURE

Four overlapping aluminum blades with plated steel hub and spider. Available in 8 in. through 24 in. sizes.



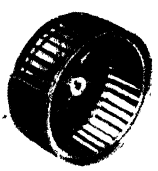
SEMI-PRESSURE

Three aluminum blades, with plated steel hub and spider. Available in 10 in. through 30 in. in diameter.



FREE AIR

A four bladed, one piece fan. Available in either stamped aluminum or plated steel. Made in sizes ranging from 6 in. through 12 in. Also available in colors.

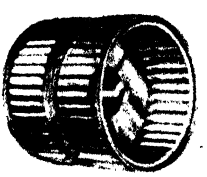


SINGLE BLOWER WHEEL

Light weight aluminum or steel construction. Anodized or plain finish. Rigid. Sturdily built. Cadmium plated steel hub. Sizes and widths according to needs.

SINGLE BLOWER WHEEL

Made of aluminum with choice of plain or anodized finish. Also may be had in steel. Strong, rigid wheel in wide variety of diameters and widths.



DOUBLE WHEEL

Constructed of aluminum or steel with double inlet and outlet. Rigidly mounted cadmium plated steel hubs. Available in wide variety of diameters and widths.

IND60	32000	1½

Fans for corrosive fumes or excessive heat quoted on request.

This fan is one of the most efficient fans built today. Under static pressure, that is, operating in moderate length ducts or against automatic louvers, the Industrial fan can move more air with less power than most fans on the market. The carefully designed venturi orifice and blades make this efficiency possible.

The fan is belt-driven for three (3) reasons:—first, to reduce power consumption through increased efficiency of higher speed motors; second, to give more quiet operation through reduced fan speeds; third, to reduce original cost of fan to consumer.

The frame is all steel, welded to a steel orifice. It is rigid, yet light in weight, simplifying installation.

On special order, these fans can be built to operate against static pressure up to 2 in.

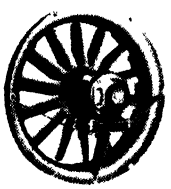
Certified Wind Tunnel Ratings • Non-Overload Power Characteristics

EFFICIENT AGAINST PRESSURE

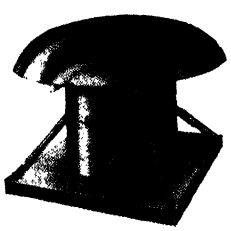


Axial-Flow Vent Set

DeBothezat Axial-Flow Fans are built in a wide range of sizes, from 16 inches through 12 feet in diameter. Volume fans (4 blades) are for low to moderate static pressures. Pressure fans (14 blades) are for high static pressures, up to 2 in. SP. Non-overloading power characteristic prevents motor burn-out and eliminates need for oversize motor. All DeBothezat Axial-Flow Fans have certified performance ratings. Catalog furnished on request.

DeBothezat Giant Fans, 5 feet through 12 feet in diameter, are suitable for gear, "V" belt or direct drive, for use with electric motor, steam turbine or gasoline engine. Catalog furnished on request.

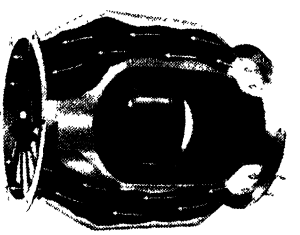
CONTROLLED VENTILATION



Power-Flow Roof Ventilator

Motor driven fan with weatherproof housing provides positive controlled ventilation at all times, independent of wind or weather. Streamlined appearance, low height. Operates efficiently with or without duct system. Hinged hood permits ready access to fan and motor. Available in four sizes, with fan wheels 16 in. through 36 in. in diameter. Catalog furnished on request.

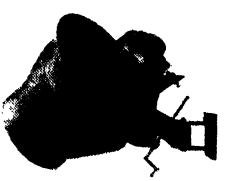
FUME REMOVAL



Bifurcator (Cut-away view)

For exhausting air that is abnormally hot, corrosive, flammable or explosive. Motor is mounted in separate, through-ventilated chamber completely isolated from air stream. Destructive fumes are by-passed (bifurcated) around motor. DeBothezat Bifurcators install directly in the duct, in any position from horizontal through vertical. Available in eight sizes, with fan wheels 18 inches through 48 inches in diameter. Catalog furnished on request.

SPOT COOLING



"Hy-V" Air Jet

DeBothezat "Hy-V" Air Jets are extraordinarily efficient man coolers, particularly for workmen who are exposed to radiant heat from ovens, furnaces, forges and molten metals. Arranged for either column or floor mounting, they are adjustable to blow a concentrated blast of cooling air in any direction to remote spaces without the aid of ducts. Available in 18 in. through 30 in. sizes. Catalog furnished on request.

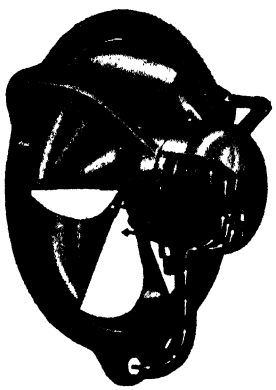
ILG Electric Ventilating Co.

2876 North Crawford Ave., **Chicago 41, Ill.**

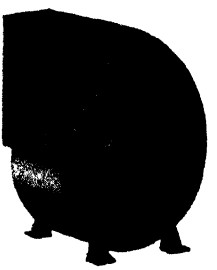
Offices in more than 40 Principal Cities

Propeller Fans, Centrifugal Fans, Unit Heaters, Kitchen Ventilators, Night Cooling Fans



ILG Direct-Connected Self-Cooled Motor Propeller Fans

Used for exhaust of stale air, fumes, heat, dust, odors, etc. Self-cooled motor combines protection of enclosed motor with low operating cost of open motor—constantly cooled by fresh, clean air, circulated internally—never "gums-up" from contact with foul air—saves 5 to 10 per cent on power costs. Rugged, heavy-duty framework. Dynamically-balanced fan wheel, direct-connected to motor. Smooth, quiet, effortless operation—economical, long lived. "ONE-NAME-PLATE" Guarantee. Certified ratings. Sizes, 8 in. to 54 in.



ILG Direct-Connected Centrifugal Fans

Type "BC"—Load-limiting type with backward curved blades. Motor load remains constant over wide range of air volume and change in static pressure. Wheel mounted directly on motor shaft with motor partially recessed in side of casing. No motor base required. Unobstructed inlet. 10 sizes. Also available for belt-drive in 12 sizes.

Type "B" Volume Blowers

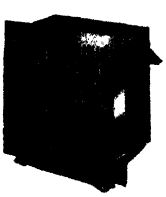
Small volume, low pressure, quiet running. Multi-blade wheel direct-connected to motor shaft. Cast iron base. Universal discharge. 12 capacities.

Type "P" Volume Blowers

For exhausting dust, fumes, removal of steam, vapors. Four discharge positions to avoid friction in short bends. 7 capacities.

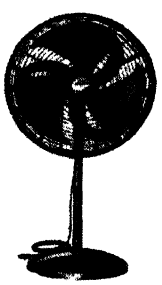
Type "6S" Utility Blowers

Designed for building into apparatus which requires ventilation or air movement. Extremely flexible in arrangement, furnished with or without inlet flange, outlet flange stand, etc.



Kitchen Ventilators

Built-in becomes permanent part of kitchen wall. Quiet high capacity, efficient, equipped with ILG Self-Cooled Motor. 3 sizes. Also models for window installation.



Night Cooling Fans

Portable model for use at attic or downstairs window. For permanent installation in attic, use ILG Self-Cooled Motor Propeller Fans (top of page).

SERIES 1000 AXIVANE INDUSTRIAL AND COMMERCIAL FANS

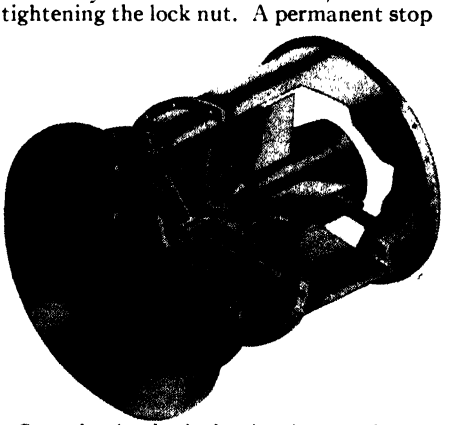
Joy Series 1000 adjustable blade **Axivane** Industrial fans are available in 124 sizes ranging in volume capacity up to 100,000 cfm with pressures up to 9.6 in. W. G. Housing diameters range from 18 in. to 60 in. For complete specifications, construction details, and selector charts giving pressure-volume range for each fan, write for bulletin number J-605.

Joy **Axivane** Series 1000 fans are efficient, quiet, compact, flexible, and easy to install.

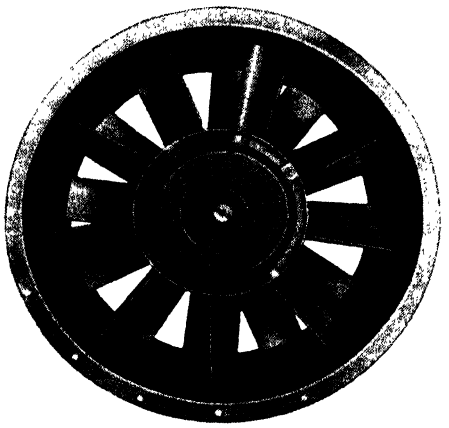
ADJUSTABLE BLADES

Joy **Axivane** Industrial Fans have the extra performance flexibility of adjustable blades. Adjustable blades, are standard equipment on all Series 1000 fans. The factory blade setting can be quickly changed to provide either a wide pressure range for any particular volume or a change in volume simply by loosening a lock nut with a wrench, setting the blades uniformly with the indicator, and re-tightening the lock nut. A permanent stop

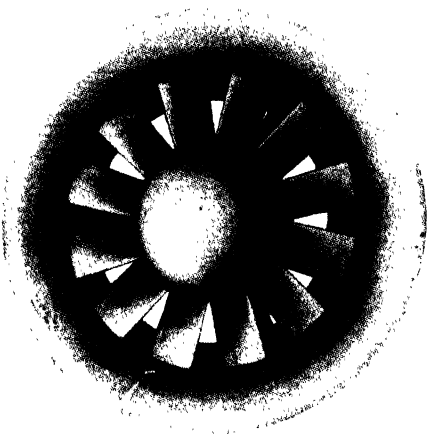
Blades are adjustable on the job by loosening one lock nut



Cutout drawing showing location of motor and compact construction



Rear view, showing vanes and motor



Front view, showing simplicity of construction

prevents setting blades in a position likely to overload the motor. Minimum blade settings are limited by the fan housing.

Adjustable blades permit on-the-job correction for unpredictable duct resistance or for poorly installed duct work.

MORE EFFICIENT

Stationary straightener vanes, located immediately behind the rotor, partially recover the rotative energy imparted to the air by the rotor, and re-establish axial flow to the air leaving the vanes. This eliminates excess turbulence at the point where the air enters the duct system and increases efficiency by decreasing pressure loss.

The Joy **Axivane** fan utilizes an aerodynamically efficient blade and stationary vane design.

QUIETER OPERATION

For equal weight and space the Joy **Axivane** fan is quieter than a centrifugal type fan of equal volume and pressure. The streamlined airflow from an **Axivane** fan makes sound insulation a simple and inexpensive operation when required for the ventilation and air conditioning of quiet spaces such as hospitals, auditoriums, radio stations, etc., where insulation against system noise must be used.

MORE COMPACT

Joy **Axivane** fans are built around the motor, the fan housing becoming an actual part of the duct system. This produces a more compact design than is possible with a centrifugal fan. An **Axivane** fan, installed on an in-line connection with ventilation ducts, parallel to and close by an overhead structure, may require 70 per cent less space than a conventional belt-driven centrifugal fan. The compactness of a Joy **Axivane** fan assures a maximum of net operating or rentable area. Fan rooms are virtually eliminated.

EASIER TO INSTALL

The Joy **Axivane** Series 1000 fan develops a greater volume and pressure per pound of fan and motor because of its compact, in-line construction. This light weight permits a simplicity of installation that minimizes installation costs and total weight by eliminating heavy foundations, complex duct offsets and elbows, drives, and guards. **Axivane** fans can be installed quickly and easily, even by relatively inexperienced or unskilled labor.

MATCHED ACCESSORIES

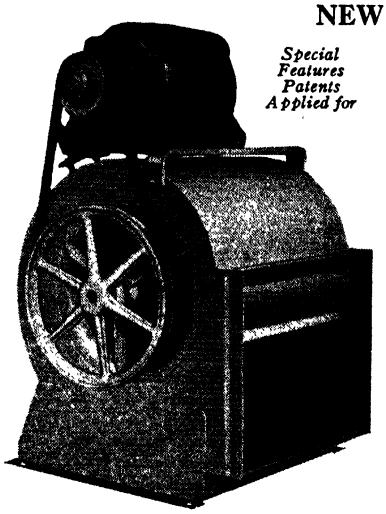
Inlet bells, screens, and fan supports are accessories designed to fit all **Axivane** Fan housings. In ordering, it is only necessary to state the model number with or without the accessories, as desired. If required with accessories these will be furnished to fit the fan model ordered without special number.

No matter how carefully a duct system is planned, an incorrectly selected inlet bell will reduce fan efficiency by increasing intake turbulence. This excess turbulence will also increase the noise level of the fan. When a fan takes its air directly from the weather, a plenum, a fan room, or from a duct system larger in circumference than the fan housing, a bell should be used.

The Lau Blower Company

2007 Home Avenue, Dept. H, **Dayton 7, Ohio**

Engineers and fabricators of general Air Handling Equipment
Blower Assemblies • Blower Wheels • Propeller Fans • Accessories

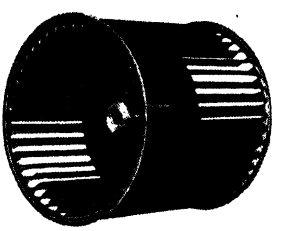


Special Features Patents Applied for

NEW Series "A" Blower Assemblies

The Lau Series "A" Blower Assembly—result of years of exhaustive tests of all types of blowers—years of research and design evolution—is the all-time, outstanding achievement in the blower field. Greater mechanical strength. Greater efficiency. A more compact unit (overall size considerably smaller than formerly). Will fit more jobs. Embodies many new and revolutionary features exclusive with Lau. Includes new 3-point suspension type bearing bracket—an integral part of the shroud—identical for various angles of discharge. New frictionless, self-aligning bearing—completely encased in Neoprene. New center suspension wheel (see below). New discharge outlet design and construction. Cut-off cannot set crooked on outlet. No wavy edges. Faster installations. New 1-piece motor mounting easily convertible, rear to top or vice versa, by simple use of two sheet metal screws. Many other features. Complete range of sizes. Every size tested and rated for performance in accordance with A.S.H.V.E. and *N.A.F.M.* Codes.

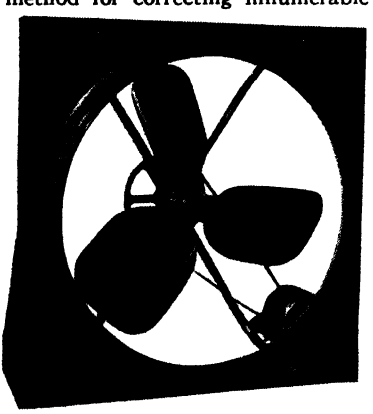
NEW Series "A" Blower Wheels

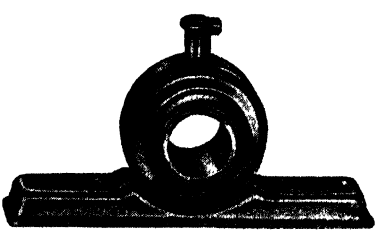


New center-suspension wheel *tested and proved* by us to have greater mechanical strength, truer concentricity, and far more efficient performance than ordinary types of wheel. Complete details supplied to interested parties upon request.

Propeller-type "Niteair" Fans

For a wide variety of applications where it is necessary or advantageous to exhaust undesirable air and provide fresh air from the outside. Equally applicable for industrial, commercial, residential and farm building installations. Efficient and economical method for correcting innumerable air-control problems—removing dust-laden, foul, contaminated, or excessively hot air, fumes, gases, smoke. Circulating cool night air through living and sleeping rooms for greater summer comfort. Venturi-type entrance housing reduces air "drag" and turbulence—eliminates most common cause of "air noise." 6 sizes—18 in. to 48 in.





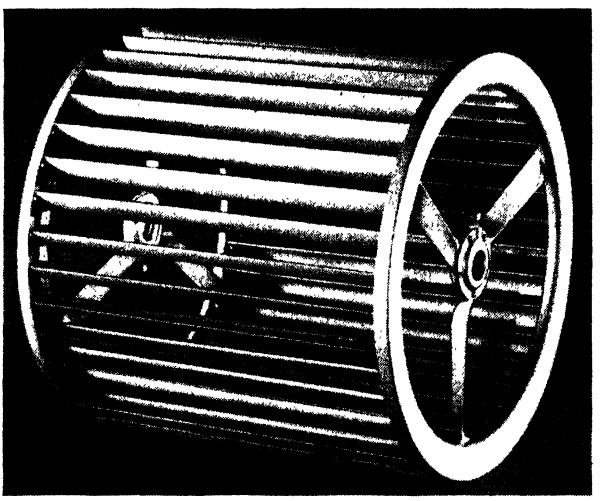
Self-aligning Pillow Blocks

Catalogs, performance data, specifications, and prices available on request on above and other air handling equipment. Inquiries solicited for any application. Our engineers will gladly assist you. *Write Dept. H regarding your requirements.*

Morrison Products, Inc.

A 25 Year Firm

East 168 Street and Waterloo Road, **Cleveland 10, Ohio**



BLOWER WHEELS

for

Manufacturers of Warm Air Heating and Air Conditioning

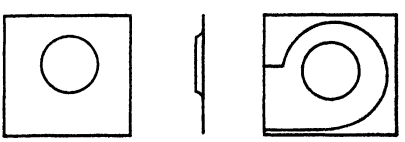
Morrison Airstream Blower Wheels are made exclusively for original equipment manufacturers in heating, ventilating and air conditioning. Wheels are double width—double inlet in standard diameters from 10 in. to 16 in. and in widths from 6 in. to 16 in.

One-Piece Blade Construction:—Blades made from single strips of steel on progressive die equipment. No possibility of blades coming loose.

Three-Piece Balanced Assembly:—Blower wheel consists of one-piece blade assembly and two pressed rings with integral hubs. These three pieces are spot welded together giving extra rigidity, strength and balance for smooth running.

Equalized Weight Distribution:—End mounting of blower wheels distributes weight closer to bearings. Smaller shafts and bearings therefore possible. Shaft whip eliminated. Shaft deflection reduced.

Available:—Complete engineering service including templates, shop drawings, tables, data, cost analysis, graphs, charts, sources of component parts.



- Housing Squares and Scroll Sides available for Low Cost Assemblies.

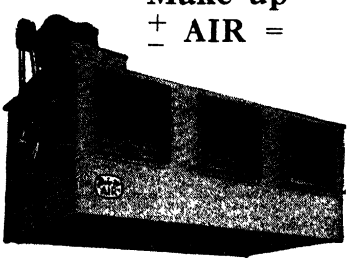
FANS • BLOWERS • UNIT HEATERS • MAKE-UP AIR UNITS
AIR WASHERS • HEAVY DUTY HEAT SURFACE

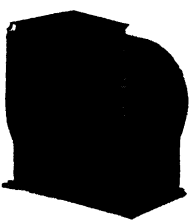
Make-up ± AIR =



M15—15,000 cfm

A unit that delivers, warmed, filtered, outside air to industrial spaces to replace exhausted air and balance minus pressure. Corrects drafty conditions and uncontrolled infiltration. Made in 4 sizes from 5,000 cfm to 20,000 cfm. Described in *Bulletin 453.*

Type ME Centrifugal Fans

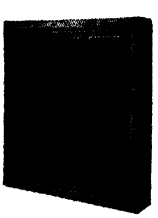


Capacities up to 101,000 CFM

Slow speed wheels offered from 7½ to 15 in. and 36 to 66 in. Capacities up to 70,000 cfm.

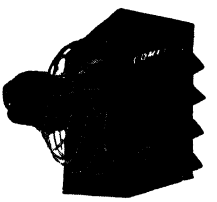
Quiet operating medium speed wheels with non-overloading horsepower characteristics for heating, ventilating and air conditioning or industrial applications. Wheel diameters from 18 in. to 66 in., with any speed or discharge required. Class I, II, III or IV construction. *Write for Bulletin 471*

Steelfin Hot Blast Heating Surface



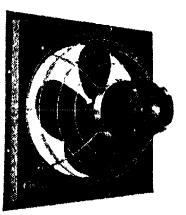
Extra heavy duty, fin-and-oval tube, all-steel, welded construction. A hot dip metallic coating over all, including headers, affords perfect bonding and conductivity. Suitable for continuous heating service on steam pressures up to 150 lb.

Comet Unit Heaters



Heavy duty, welded steel, fin-and-tube heating element. Suitable for continuous heating service on steam pressures up to 150 lb or more. 9 sizes with capacities from 31 Mbh to 300 Mbh. *Bulletin 454.*

Comet Exhaustair



Delivers large volumes of air at low resistance and low current consumption. All wheels are machine balanced for smooth, vibrationless operation. Made in two types and eight basic sizes. Wheel diameters from 12 in. to 60 in. Direct or belted drive. Capacities from 400 cfm to 22,000 cfm. *Ask for Bulletin 462.*

Type GI Industrial and Heat Fans

For dust and gas removal, conveying of materials and handling hot gases. Housings, drives, and discharge arrangements to meet any requirement. Wheel diameters from 14 in. to 66 in. Capacities from 450 cfm to 60,500 cfm.

Details and engineering data in Bulletin 461.

General Purpose Fans

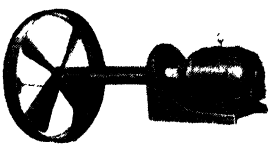
Portable, self-contained units for Class I industrial and ventilating applications. Recommended for ease of installation, low maintenance and space saving features. Made in three types and eight basic sizes. Capacities 400 cfm to 18,000 cfm. *Bulletin 482.*

PROPELLAIR Div.

ROBBINS & MYERS, INC.
1947 Clark Boulevard
SPRINGFIELD, OHIO

VENTILATING SPECIALISTS IN ALL PRINCIPAL CITIES

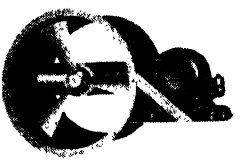
For Ducts, Walls, Windows, Hoods, Roof Ventilators



PROPELLAIR DIRECT-CONNECTED FANS

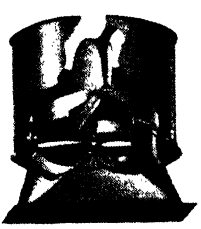
For use wherever motors may operate within the air stream, from free air to medium and relatively high resistance. A compact, durable design with fan having two to six blades. Sizes: 12 in. to 60 in. Capacities: 800-85,000 cfm. Type "CD."

For Heat, Acids, Alkalies—Fumes, Gases, Dust



BELT-DRIVEN PROPELLAIR DRUM-TYPE

A complete fan unit in short duct section ready for installation in lines from 20 in. to 48 in. diameter. Type "CS" may be used for severe acid or alkaline conditions, explosive fumes and gases. Type "CSV," for excessive temperatures, circulates outside air through belt and fan shaft tubes to keep drive and bearings cool. Also furnished without duct section. Capacities: 4100 to 43,000 cfm.



For Roof Ventilation

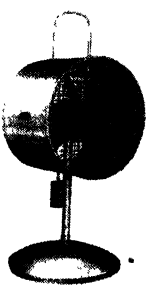
PROPELLAIR VERTI-STACK

Dependable and economical power roof ventilators. Butterfly dampers open wide the instant fan is started, close automatically as fan coasts to a stop, offer virtually zero resistance as heat, fumes, moisture, dust shoot high into air. Rain is prevented from entering by fan when operating. Drainage gutter prevents leakage when dampers are closed. Sizes: 20 in. to 60 in. Capacities: 3700 to 77,000 cfm.

For Heat, Moisture, Fumes, Dust, and Gases

PROPELLAIR EXTENDED-SHAFT FANS

This design locates motor outside air stream when fan is installed in duct at right angle turn, elbow, "Y," or offset. Simple installation usually can be supported by duct without auxiliary bracing. Drive shaft is enclosed and sealed within steel tube. Sizes: 12 in. to 60 in. Capacities: 2000 to 68,000 cfm. Type "CE."



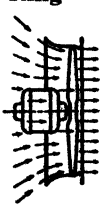
For Cooling Men and Materials

PROPELLAIR PEDESTAL & CRADLE-MOUNTED FANS

Pedestal-type Man Coolers have sturdy steel drum protected front and rear, formed steel base, rigid support, and crane hook. Also made with adjustable cradle mounting (Type "CU"). Capacities to 20,650 cfm.

AIRFOIL-SECTION Blades

Airfoil Principle Entrance Ring



Propellair fans have airfoil-section blades with variations of pitch, curvature, and thickness to compensate for different lineal speeds of points at various radii. Air movement is uniform over whole fan area. The Propellair curved entrance ring eliminates eddy currents; helps efficient Propellair blades deliver highest pressure and volume.

Schwitzer-Cummins Company

1145 East 22nd Street

Indianapolis 7, U.S.A.

Engineers and Manufacturers of Centrifugal Blowers and Blower Wheels—Attic Fans—Exhaust Fans—Ventilating Fans of All Types

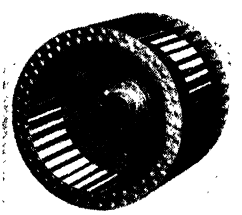
PRODUCTS OF THE VENTILATING DIVISION

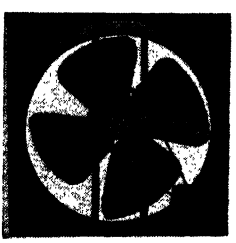
HY-DUTY BLOWERS SINGLE INLET AND DOUBLE INLET

Ruggedly built and designed for fine performance and quiet operation. Double inlet models, four outlet positions—single inlet models, eight outlet positions. Wheel diameters 8½ in. to 25 in.—200 cfm to 15000 cfm. *N.A.F.M.* code tested.

HY-DUTY BLOWER WHEELS

Large range of size, single and double inlet. Diameters 4½ in. to 50 in. Can furnish our standard wheel or to your specifications. Wheels for Hy-Duty Blowers are the center disc, wide blade type, accurately balanced.



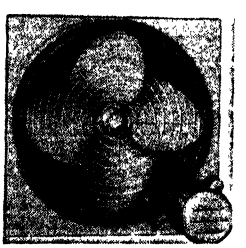


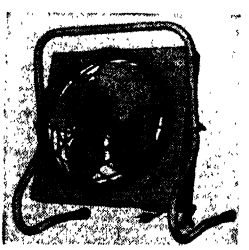
FRESH-AIR MAKER VENTILATORS

An all welded, light weight, low cost, high delivery, ball bearing ventilator with unusual flexibility for installations in homes, apartments, factories, business establishments.

←FIVE FAN DIAMETERS

24 in., 30 in., 36 in., 42 in. and 48 in. 4200 cfm to 20,500 cfm.





FRESH-AIR MAKER EXHAUST FANS

12 in., 16 in. and 20 in. arranged also for portable floor use or window mounting.

WINDOW OR ATTIC FAN

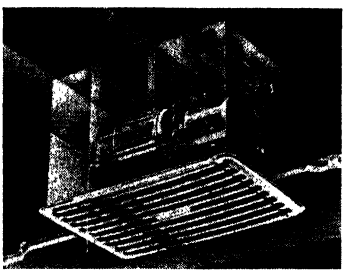
A handsome Fresh-Air Maker for universal application. Ideal for inexpensive installation in apartments and small homes. Air delivery 4200 cfm, very quiet. 24 in. fan diameter.

Trade-Wind Motorfans, Inc.

5725 So. Main St.
Los Angeles 37, Calif.

Representatives In All Principal Cities. Carried In Stock By Many Electrical Jobbers

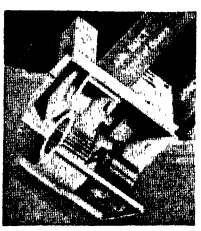
CLIPPER BLOWERS



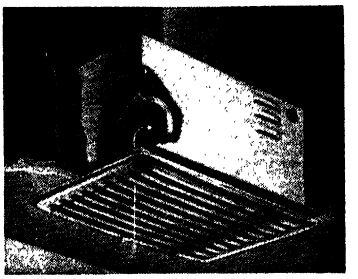
Phantom View of Model 1301 shows partition which isolates motor from air stream, increasing motor life.

The Trade-Wind Clipper Blower is a small capacity centrifugal blower, primarily used for exhaust application. While used extensively for home kitchen ventilation, it is widely used for other applications. Many thousands of these units have been in service ten years or more in school toilets, therapy and treatment rooms in hospitals and clinics, dental laboratories, ticket booths, offices, x-ray and photographic dark rooms, and hundreds of kindred desirable uses.

This is a "Unit Package" assembly, complete with ceiling grille and proper electrical connections. It is Underwriters approved and listed and carries a (prorata) five year guarantee, made possible by the use of the highest quality electrical motor component. The installation requires only the application of a discharge duct of the same dimension as the outlet collar and the optional addition of an automatic shutter for the end of the duct.

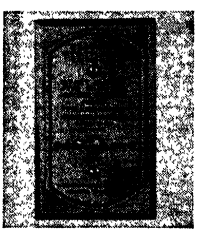


Motor and blower assembly easily removed without tools.

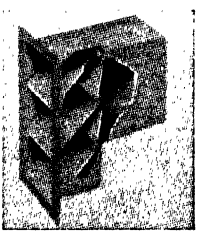


Model 1401 Clipper Blower, single wheel, vertical discharge, with "dripless" grille.

The assembly is inherently quiet and is installed rigidly in the structure without need for resilient mountings or flexible duct connections. Variable speed controls are available on single wheel models for the purpose of controlling variable air capacity. The blower is normally quiet at its maximum speed. The motor and wheel unit is removed easily without tools through the ceiling inlet opening. The patented construction of the Clipper entirely isolates the motor from the air stream. This exclusive feature adds to the service life of the motor and keeps the motor free from contaminated air.



Two-speed control unit fits standard single switch box.



Automatic shutters available for single and double blowers.

Selection Chart and Specifications
CLIPPER BLOWERS—110 Volt, 60/50 Cycles, A.C.

Cat. No.	Description	Type Blower	Net Air CFM*	Recommended Max. Room Size Cu Ft	Duct Size	Motor Watts	H.P.
1301 B Clipper	Horizontal Discharge Complete with Grille	Single Wheel	275	1500	7" x 4½"	100	1/30
1401 B Clipper	Vertical Discharge Complete with Grille	Single Wheel	275	1500	7" x 4½"	100	1/30
2501 Duplex Clipper	Horizontal or Vertical Interchangeable Discharge Complete With Grille	Two Wheels	425	2500	10½" x 5¼"	90	1/20

*This rating is based on ⅛ in. S.P. (W. G.) or the approximate resistance of 30 ft of duct the same size as outlet on Blower. The Blower will operate against a maximum of 3/10 in. S.P. with a reduction of approximately 4070 rated air capacity.

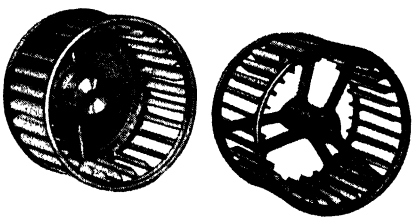
The Torrington Mfg. Co.

50 Franklin Street, **Torrington, Conn.**

Manufacturers of Blower Wheels and Propellor Type Fan Blades.

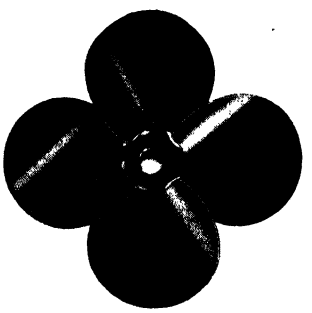
AIRISTOCRAT Quiet Propeller Fan Blades

AIROTOR Blower Wheels

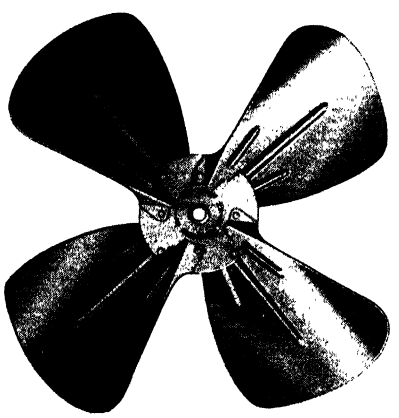


Left—Airotor Blower Wheel—Single Width—Single Inlet Patents 2,231,062; 2,272,695 Des. 126,043

Right—Airotor Blower Wheel—Double Inlet—Spider End Plates



Airistocrat "Standard" Series Pats. 2,072,322 and 2,021,707



4-Blade Airistocrat Attic Fan "M" Series

Torrington Airotor Blower Wheels are light, sturdy and inexpensive—incorporate new principles of design and construction, which insure rigidity and concentricity. **Single Width—Single Inlet** wheel is of simple four-piece construction. **No rivets or welds are used;** concentric rib serving as backing for blade strip is formed at same time as hub socket, insuring trueness of wheel. Rigid radial ribs prevent deflection by thrust. Three thicknesses of metal in rims make for maximum strength. Excellent for many heating and ventilating uses. Manufactured in both aluminum and steel in 1½ in., 2, 3, 3⅝, 4½, 5, 6, 7½, 9 and 10½ in. diameters. Clockwise or counterclockwise rotation. Same sizes available in DA type double width, double inlet wheels.

Torrington Airotor Blower Wheel—Double Width—Double Inlet—Spider End Plates. Has blades punched and formed in a single strip, rigidly held by flanged single piece end rings. Hubs are rigidly mounted by peening. Wheels of 2½ in., 3⅝ in., and 10½ in. diameter are available at present. Additional sizes now being developed.

AIRISTOCRAT Quiet Propeller Fan Blades are widely recognized for their all-around excellent performance. The unique, patented construction embodies entirely new principles in the art of fan design—produces a blade unsurpassed for quiet operation, rugged construction and attractive appearance. Every **Airistocrat** unit is carefully built and the blades are hand gauged for correct contour and alignment. Statically balanced, these blades deliver full air volume with a minimum of noise. Aluminum alloy blades and steel spiders are standard except where otherwise noted.

Available in a variety of finishes. Catalog gives detailed dimensions and guaranteed performance curves recorded under *NEMA* and *NAFM* code tests at various speeds for each of the **Airistocrat** models described.

New Blower Wheel Catalog charts capacities, gives detailed dimensions, suggests housing dimensions for all above wheels. Valuable "Tips" for designing air impelling units are also included.

"Standard" Series—Has blades mounted on a steel spider. Sturdy, attractive steel or aluminum blades which have withstood extreme laboratory breakdown tests. Sizes 8 in., 10, 12, 14, 16, 18, 20 and 24 in. diameters in a variety of pitches to meet every need.

AIRISTOCRAT "M" Series Attic Fan Blades—Three outstanding features of this new design are: (1) Extremely high efficiency, which gives maximum cfm per horsepower; (2) knockdown construction which drastically lowers shipping costs; (3) quiet operation—a point of major interest to the consumer.

This all steel four-blade fan is manufactured for attic use exclusively, in 36 in. and 42 in. diameters, in 40 deg pitch only.

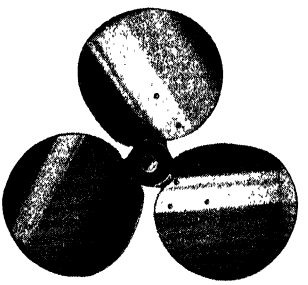
Three Blade "Y" Series—The design of this blade is the result of two years of laboratory experiment to produce a better air circulator blade. At recommended speed these blades produce a high velocity air stream effecting deep penetration with unusual quietness. Sizes 10 in., 12, 14, 16, 18, 20, 24 and 30 in. diameters, steel or aluminum blades.

Pressure "P" Series—Similar in construction to "Standard" Series but with blades especially designed for higher pressures. Sizes 10 in., 12, 14, 16 and 18 in.

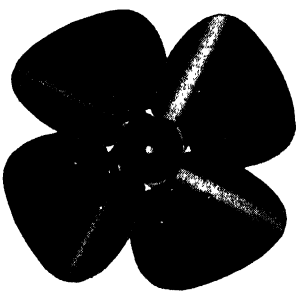
Pressure "U" Series—Four blade models of steel designed for pressure operation. Sizes 20 in., 22, 24, 26, 28 and 30 in. diameters.

AIRISTOCRAT "B" Series Attic Fan Blades have the same proportions, proved aerodynamically correct, in all diameters. New larger center disc and heavier spider arms increase strength and a new blade shape adds to the appearance of this carefully designed product. Available in 3, 4 or 5 blades in standard diameters 24, 30, 36, 42 and 48 in. All steel construction. Available in the following finishes: 1. Plain. 2. All one color lacquer.

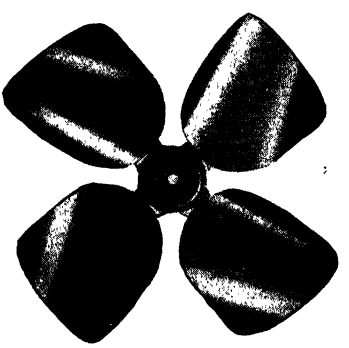
"One-Piece" Airistocrat Fan Blades—Exceptionally rigid models blanked from one piece of metal. Made in both steel and aluminum. Sizes 3 in., 4, 4½, 5, 5½, 6, 6½, 8, 9, 10, 12 and 16 in. diameters, all four blades; also 5½, 7, 8, 9, 10 in. 5-blade. Available in the following finishes: 1. Plain. 2. Lacquered. 3. Zinc or cadmium plated (steel only).



3-Blade Airistocrat "Y" Series



4-Blade Airistocrat Pressure Fan "P" Series



4-Blade Airistocrat Pressure Fan "U" Series

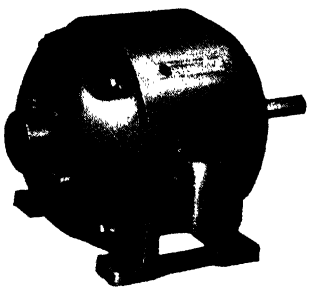
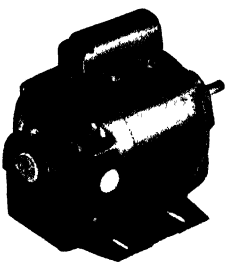
MOTORS FOR HEATING, VENTILATING, AND AIR CONDITIONING

General Electric offers a complete line of motors for compressors, fans, and pumps, from which you can select easily the motors with electrical and mechanical characteristics best adapted to your equipment. Many of the most common applications are listed below. Information on other motors—vertical, enclosed, etc., with various electrical and mechanical modifications—can be obtained at a G-E office near you.

For additional information, ask for Motor Catalog GEA-42S1.



Tri-Clad induction motor, Type K, polyphase*



Fractional-horse-power capacitator-motor, Type KC

SOME G-E MOTORS AND THEIR USES

Application	Speed	Type Winding	Type	Horsepower Range	Power-supply Classification
Fans and Centrifugal Pumps	Constant or Adjustable	Shunt	B & CD	1/8—200	Direct-current
		Compound	B & CD	1/8—200	
Reciprocating Pumps and Compressors	Constant	Capacitor, Normal torque	KC	1/4—3	Single-phase Alternating-current
		Capacitor, High-torque	KCJ	1—3	
Small Direct-connected Fans	Constant	Resistance, Split-phase	KH	1/40—1/3	
		Shaded-pole	KSP		
	Constant or 3-speed	Capacitor, Low-torque	KCP	1/50—5	
Belted Fans, Centrifugal Pumps	Constant	Capacitor, Normal-torque	KC	1/4—3	
		Repulsion-induction	SCR	5—10	
Reciprocating Pumps and Compressors	Constant or Multispeed	Squirrel-cage, Normal-torque	K	1/4—1000	Polyphase, Alternating-current
		Squirrel-cage, High-torque	KG	5—200	
Pumps, Compressors, Fans	Constant or Adjustable-varying-speed	Wound-rotor	M	1/2—1000	
	Constant	Synchronous	TS	25—2000	

Types of Enclosures: Open (dripproof)—protected from falling objects or dripping liquids. Splashproof — where wetness is a factor. Totally enclosed — for complete protection. Explosion-proof—for inflammable gases. Dust-explosion-proof—for combustible dusts.

*Trade-mark reg. U. S. Pat. Off.

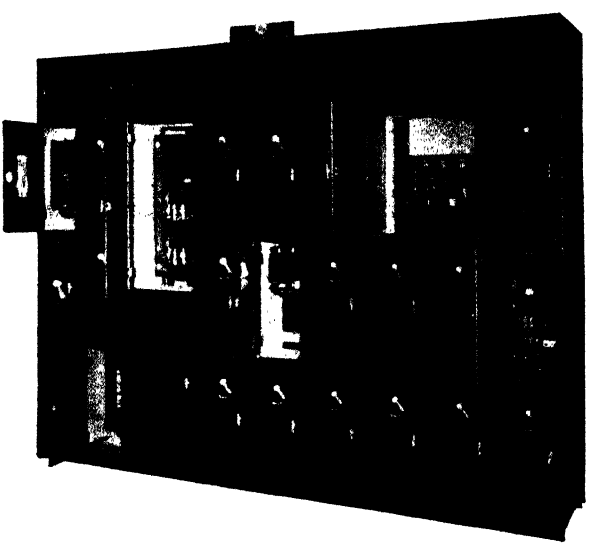
CONTROL FOR HEATING, VENTILATING, AND AIR-CONDITIONING MOTORS

General Electric offers a complete line of standard manual and automatic controls for all types of motors driving compressors, fans, pumps, etc. Publications describing these items, as well as such control accessories as pressure governors, pressure switches, float switches, electrically operated valves, and indicating selsyns, are available on request. For special applications, G-E control to meet your exact requirements can be designed. Most frequently, however, the needs of the air-conditioning industry are best served by one of the many possible G-E "packaged" control combinations designated as Cabinetrol* equipments.



Typical Cabinetrol unit, showing open motor-starter panels

The Cabinetrol system of motor control is based upon the use of standardized enclosures equipped with standard control devices. General Electric can build quickly most air-conditioning control systems—simple or complex—by properly combining standard control units and accessories into the required number of basic Cabinetrol sections. If future expansion should require further control equipment, additional Cabinetrol units can easily be added to the basic system.

The standard enclosures used in the Cabinetrol system will mount standard motor-starting devices up to and including NEMA Size 4. Ample space is provided for incoming-line, feeder, and metering equipment. Bulletin GEA-3856 details more fully the advantages of this new system of centralized low-voltage control.

The General Electric Company will gladly assist in the solution of any electrical problem related to air conditioning.

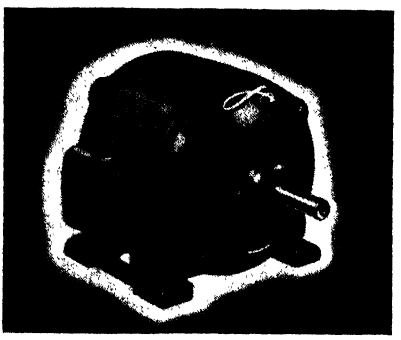
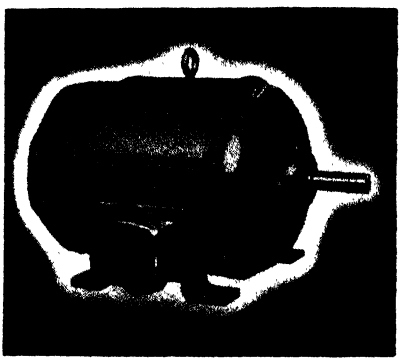
The Louis Allis Co.

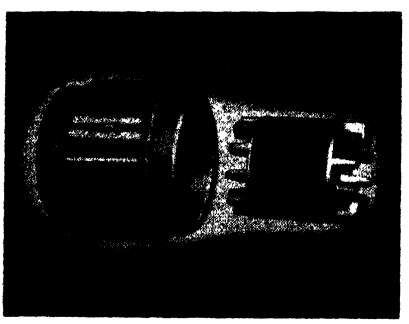
Milwaukee 7, Wisconsin



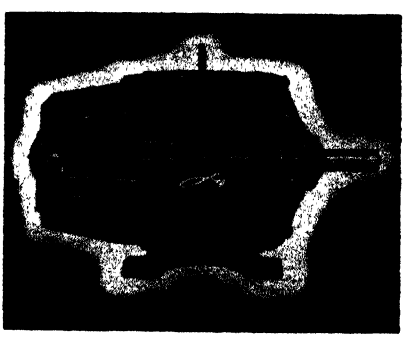
Louis Allis protected type Squirrel Cage motors (Type OG) are specially engineered and designed for applications requiring greater protection.



These Direct Current motors are correctly engineered and precision built—available in a very wide range of both electrical and mechanical modifications. The extra rugged construction of these motors assures long life to dependable performance.



The wide-spread experience of our engineering staff will be placed at your disposal to assist in powering your product with these compact efficient Shaftless motors. Available in a wide range of sizes and electrical modifications.



Wound Rotor (slip ring) motors are ruggedly constructed throughout. A wide range of speed variations are obtainable with comparatively simple control. Available with mechanical modifications for every industrial use.

We manufacture a size and type electric motor for every industrial requirement.

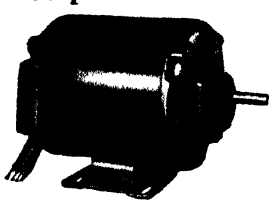
SINGLE-PHASE
POLYPHASE
DIRECT-CURRENT
MOTORS

For Heating, Ventilating and Air Conditioning Equipment

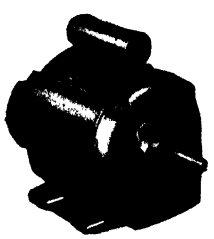
SINGLE-PHASE MOTORS

Repulsion-Start Induction



1/6 to 15 hp, all standard frequencies and voltages; sleeve and ball bearings; open or totally enclosed; horizontal and vertical; rigid, flange, or resilient mounted (in smaller ratings).

Capacitor-Start Induction

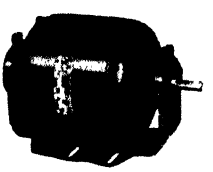


1/6 to 3/4 hp, all standard frequencies and voltages; sleeve and ball bearings; dripproof and totally enclosed; horizontal and vertical; rigid, resilient and flange mounted.

Permanent Split-Capacitor

1/20 to 3/4 hp, constant speed, two-speed, or adjustable-speed, all standard frequencies and voltages; sleeve bearings; totally enclosed; round frame with rubber rings.

Shaded-Pole Fan Duty



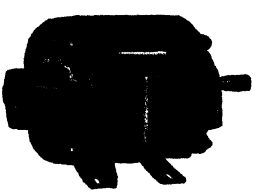
1/125, 1/80, 1/40 and 1/30 hp, 50 or 60 cycles, 115 or 230 volts; sleeve bearings; totally enclosed; rigid, round frame and resilient mountings; with or without 3-speed regulator.

POLYPHASE MOTORS

Squirrel-Cage Induction

1/6 to 400 hp, 2 and 3 phase, all standard frequencies and voltages; sleeve and ball bearings; open or totally enclosed; horizontal and vertical. Built in several electrical types.

DIRECT-CURRENT MOTORS



1/20 to 3 hp, all standard voltages, sleeve or ball bearings, dripproof frames, rigid mounted. Wagner direct-current motors in the 44 frame are shunt-wound, all others are compound wound.

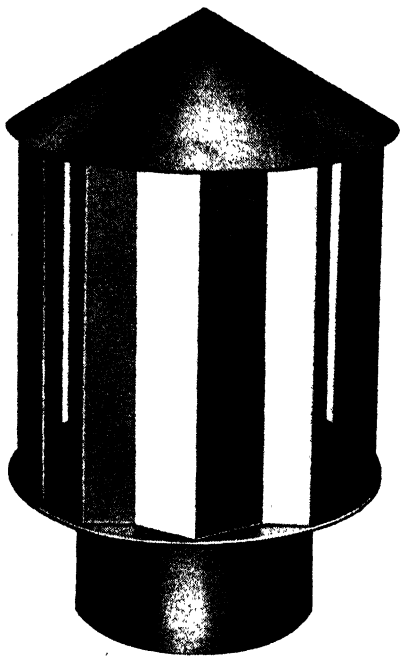
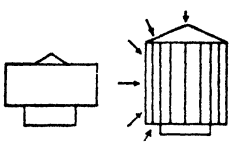
BREIDERT AIR-X-HAUSTERS FOR ROOF VENTILATING, VENT FLUES & CHIMNEY TOPS



Type B

The Breidert Air-X-Hauster introduces a new principle in ventilator design. Because of the revolutionary, aerodynamically-correct design of the Breidert Air-X-Hauster, wind currents striking it from *any* angle are converted into a powerful suction force that rapidly exhausts stale air from the interior of the house, kitchen or building. The Breidert remains stationary, has no moving parts. *Back-drafts are eliminated where there is no interior negative pressure!*



Old Method *Breidert Method*

The Breidert ventilator offers *certified* capacity ratings based on tests made with wind blowing at *all* angles (as shown). These high capacities were proved and certified by Smith, Emery Co., Pacific Coast branch of Pittsburgh Testing Laboratories. *Insist* on certified ratings based on directional wind tests at various vertical angles as shown in considering *any* ventilator. Breidert Air-X-Hausters were used extensively during the war on many types of combat and cargo ships, war housing, military barracks, and other government buildings. They also are widely used on all types of factories, commercial buildings, and residences.

For Kitchen Ventilation . . . The Breidert system provides a continuous, silent, effective circulation of air that exhausts heat and odors *at their source*, with no operating or maintenance expense. There are no "hang-over" cooking odors because the exhaust action of the Breidert is continuous. The neat, compact appearance of the "Type A" Breidert especially recommends it for residences.

For Vent Flue Caps . . . The Breidert does not have the defects of conventional types of caps and accessories. It eliminates the necessity for down-draft diverters, with accompanying dangers of explosion in case unburned gas accumulates or is blown into the room.

For Chimney Tops . . . By stopping all down-drafts (interior negative pressure excepted), a Breidert Air-X-Hauster on the chimney absolutely prevents the fireplace from smoking and damaging furnishings. *It provides positive "draw" regardless of wind direction!*

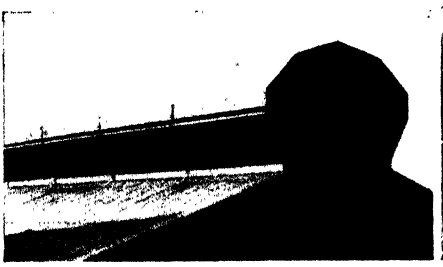
The Swartwout Company

18511 Euclid Avenue, **Cleveland 12, Ohio**

Representatives in Principal Cities

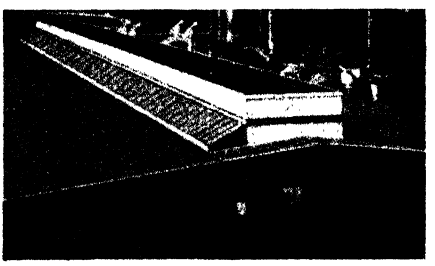
Gravity and Powered Industrial Roof Ventilators

GRAVITY ROOF VENTILATORS



Swartwout-Dexter Heat Valve

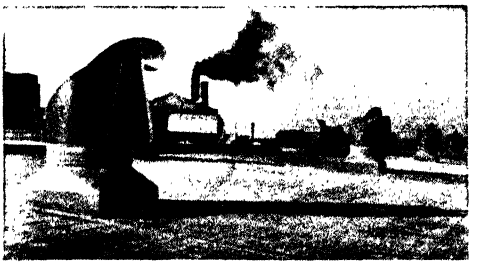
Continuous opening natural draft ventilator particularly effective for ridge of peaked roof, saw-tooth construction or skylights; adaptable to flat or slant roofs. Air takes but one turn, flows directly upward. Made in throat opening sizes 4 in., 6 in., 9 in., 12 in., 15 in., 18 in., 24 in., 30 in., 36 in. and 42 in. Ten foot lengths may be assembled continuously for any roof length. Adjustable damper.



Swartwout AIRMOVER

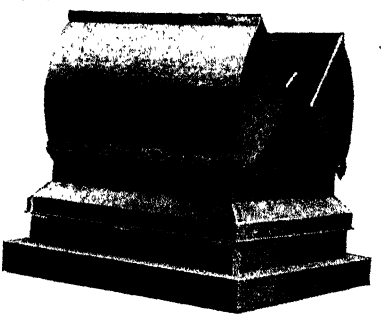
A horizontal type multiple heat valve featuring exceptionally short air travel, built in units 10 ft x 7 ft 6 in. x 32 in. high; 30 sq ft of opening per unit. Large scale ventilation achieved by use of continuous runs, or can be used as single units over heat concentration centers. Installed on curbs of wood, steel or concrete. Can be adapted to any type of roof.

POWERED ROOF VENTILATORS



Swartwout AIRJECTOR

Streamlined rotary head type roof ventilator using propeller type fan. Curved head turns with wind—outlet points away from wind to take advantage of suction effect. Made in 13 throat sizes, from 12 in. to 72 in., with wide range of capacity ratings. Adaptable to special conditions where high temperatures or fumes are a problem. Available without fan as a rotary gravity unit.



Swartwout JECT-O-VALVE

Powerful exhauster of the straight-through type, particularly effective over vats, furnaces, foundry pouring floors, etc. Air stream opens top dampers, which return to closed position when fan is off. Completely weathertight in either open or closed position. Hinged top section permits easy access for servicing. Made in 28 in., 36 in., 40 in., 44 in., and 48 in., throat size, in a variety of cfm capacities.

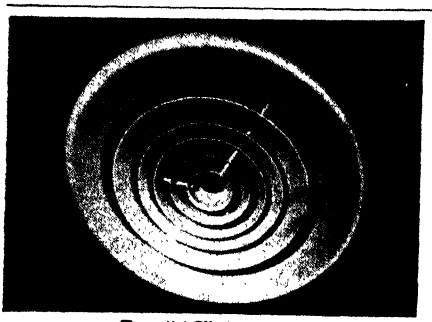
All of the above made in galvanized steel as standard; can be supplied in copper, aluminum, A.P.M. or stainless steel.

See *Sweets Architectural File* for further data, or send for complete Swartwout catalog, Bulletin 324.

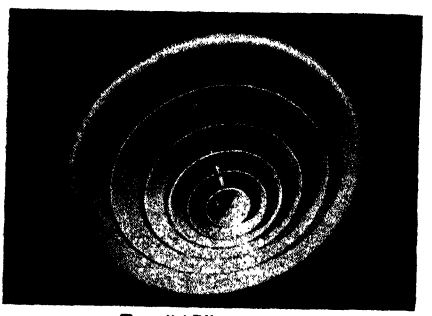
Anemostat Corporation of America

10 East 39th Street, New York 16, N. Y.

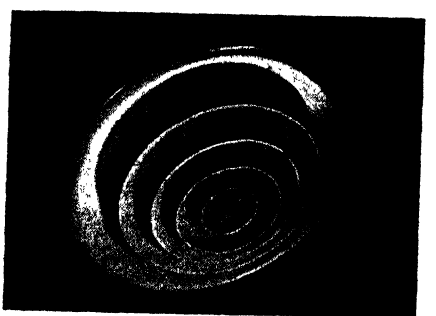
The Anemostat Draftless Aspirating Air-Diffuser



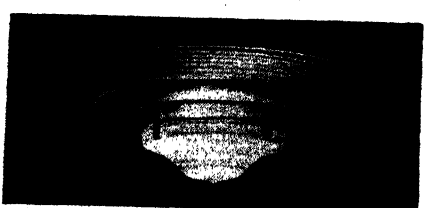
Type "AC" Anemostat



Type "AR" Anemostat



Type "B" Anemostat



Type "NL" Anemo-Light

THE ANEMOSTAT PRINCIPLE

ANEMOSTATS produce unparalleled results because of their unique design which operate on the following interdependent principles:

1. Air expansion within the device, which reduces velocity instantly.
2. True "Aspiration," which causes room air—equal to from 25 to 35 per cent of the supply air—to be drawn into the device, where it is mixed with the supply air. The percentage of aspiration depends on the type of Anemostat used.
3. Creation of a multiplicity of air currents and counter-currents at low velocities which cause slow but adequate secondary air motion.

CEILING OR WALL TYPES

TYPE "AC" ANEMOSTAT is a combination device for diffusing supply air and exhausting room air. It is designed to exhaust 75 cfm of room air for every 100 cfm of supply air. Furthermore, it has an aspiration effect of 30 per cent. The Type "AC" may be used with velocities up to 2500 fpm and wherever both supply and exhaust are required through the same unit. The Type "AC" Anemostat should not be used with ceiling heights exceeding 16 ft.

•

TYPE "AR" ANEMOSTAT is a diffuser for supply air only and aspirates a volume of room air equal to 35 per cent of the supply air. Type "AR" Anemostat is used in enclosures where temperatures to be maintained require a high rate of air changes.

•

TYPE "B" ANEMOSTAT is a diffuser for supply air only. It has 35 per cent aspiration. Type "B" may be used with velocities up 4000 fpm and is suitable for industrial and commercial installations. It can be used on either exposed or concealed duct work.

"NO AIR-CONDITIONING SYSTEM IS BETTER THAN ITS AIR-DISTRIBUTION"

NEW TYPE C-1 Anemostat is an *adjustable* diffuser for positive control of heated, cooled, or ventilating air. It may be used flush with ceilings or on exposed duct work. Any desirable air pattern may be obtained by simply turning the regulating knob.

An entirely new simplified method of installation is employed for the first time on this unit.

Complete technical data available.

•

TYPE "HU-3" and TYPE "HU-4" ANEMOSTATS are diffusers for the draftless, uniform and economical distribution of heat from vertical-discharge Unit Heaters. Both types provide approximately 25 per cent aspiration. "HU" Anemostats offer very little resistance to the air discharged from the heater. "HU" Anemostats may be combined with practically all sizes and types of vertical-discharge heaters on the market.

"HU" Anemostats are efficient and inexpensive diffusers for use also with general heating installations. They will function equally satisfactorily attached to either concealed or exposed hot air ducts.

•

TYPE "W" ANEMOSTAT is a diffuser of supply air from the wall-outlet. It has an aspiration effect of 35 per cent. Excessive air motion from the floor to well above the breathing level is eliminated . . . and the temperature differential, both horizontally and vertically between points in the occupied zone, is reduced to a minimum. The effective diffusion covers an area within a radius of 180 F. This result cannot be obtained by any other method which introduces air from a wall outlet.

•

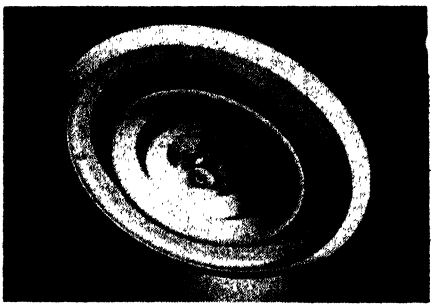
TYPE "NL" ANEMO-LIGHT is a combination diffuser and a built-in lighting unit . . . attractive in appearance . . . efficient in air-diffusing and lighting.

•

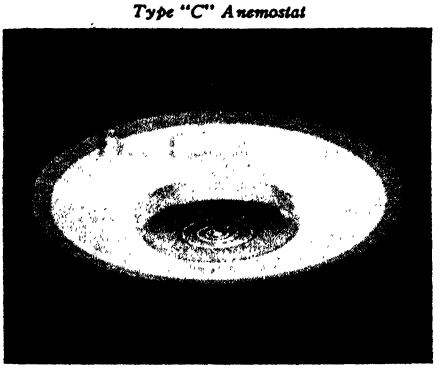
TYPE "CSL" COVE-LIGHTING COMBINATION is an indirect cove-lighting unit with a Type "CSL" Anemostat, particularly suitable for use in theatres and auditoriums . . . and wherever varied and unusual lighting effects are desired.

•

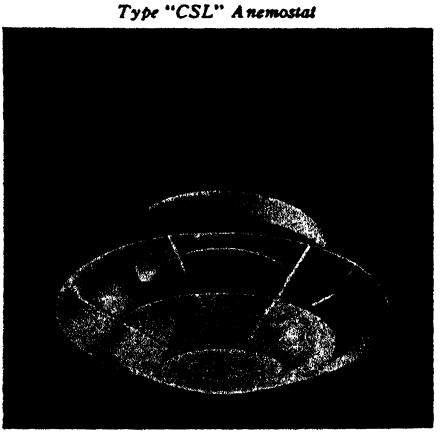
PENDANT LIGHTING FIXTURES of all types, standard or special, can be hung from the center of the ceiling-type Anemostat.



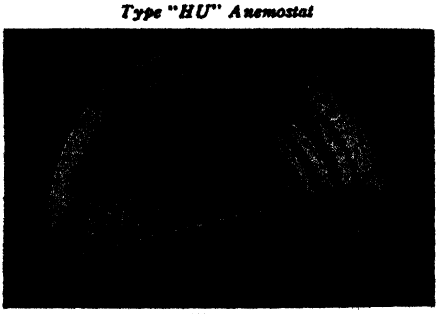
Type "C" Anemostat



Type "CSL" Anemostat



Type "HU" Anemostat



Type "W" Anemostat

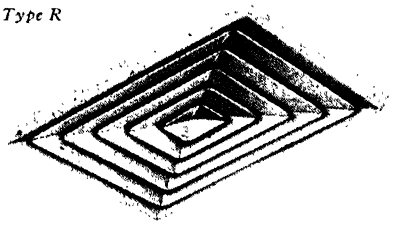
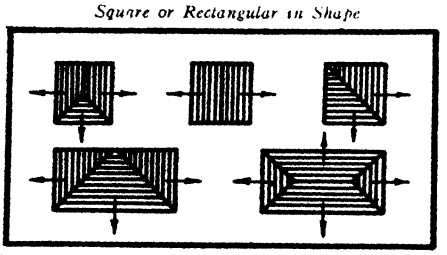
AGITAIR DIFFUSERS

Type R

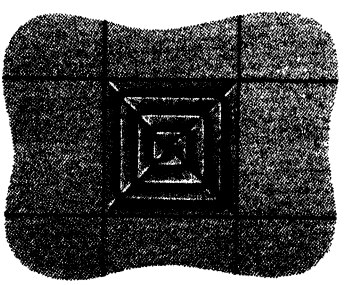


Square or Rectangular in Shape



Type R AGITAIR is the only diffuser that offers the higher efficiency of the square or rectangular shape in diffusing air quietly, draftlessly and with rapid temperature equalization throughout any shaped room. Its patented construction can be assembled into patterns which discharge the required amount of air in one to four directions.

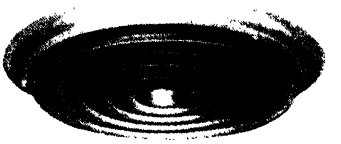
Each side delivers a quantity of air proportional to the areas served. Thus the engineer or architect can select an attractive diffuser that fits his design—rather than make his design fit the diffuser.

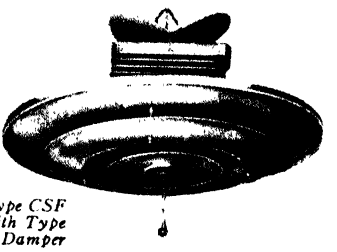


ACOUSTICAL CEILINGS

An improved, re-styled air diffuser known as the AGITAIR **Type RTC,** square or rectangular in shape, especially designed for installation in acoustical ceilings. Made in sizes to comform to standard tile dimensions.

Type A





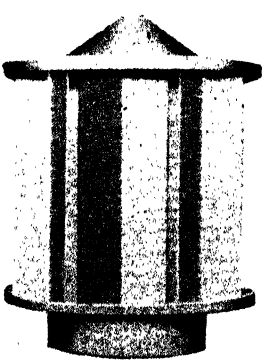
Type CSF with Type B Damper

Circular AGITAIRS combine beautiful design with finest operating features to give rapid temperature equalization and draftless diffusion of air. Model CSF is quiet, easy to install. Pressure losses at minimum. Type A diffusers are smaller, weigh less, are easy to install. Type CM is for marine use. In all sizes for all types of mounting and with lighting combinations. Dampers are provided where needed.

The AGITAIR Diffuser Data Book, available to architects and engineers, will help you design and install air distribution systems. Consult our engineers.

AGITAIR WIND-ACTUATED EXHAUSTERS

Provide proper ventilation regardless of wind direction, and with positive elimination of down-draft. Functions at peak efficiency at average low wind velocities. Will not restrict the flow of air or gases when there is no movement of outdoor air across the head. Fan-equipped units also for higher ratings. ***Bulletin EX-101.***



The Auer Register Co.

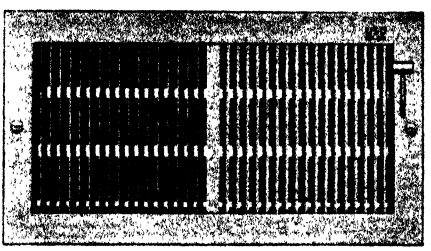
3608 Payne Avenue, **Cleveland 14, Ohio**

Manufacturers of Registers and Grilles for Gravity and Air Conditioning Systems; Metal Grilles for Radiator Enclosure, Ventilation, Concealment

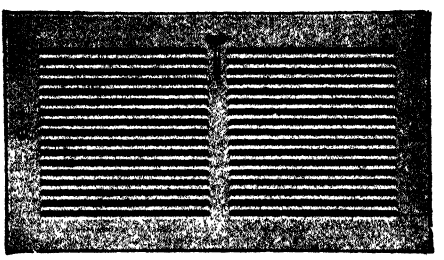
AIR CONDITIONING REGISTERS AND GRILLES

The Auer line of registers and grilles for all warm air heating and air conditioning systems is complete and modern, with a wide choice of styles for every purpose. Only a few are shown here. For gravity systems, the Auer Heat-Rite is a popular, streamline model adjustable for up-or-down flow. For extra strength, also for floor furnaces, use Dura-Bilt Registers and intake, with cross-bars set edgewise and all joints inter-locked and mortised. All Auer models are designed with due regard for air capacity, and supplied in all standard sizes and finishes. Latest Auer Register Book showing entire line sent on request.

Auer flat stamped metal grilles are made in many designs, all sizes, for all purposes. Furnished in steel (or stainless), aluminum, brass, or bronze, and finished in prime coat, special finishes or platings. Send us your specifications. Ask for special Auer Grille Catalog "G," with full scale details and tables of openings and free areas.



Airo-Flex No. 4432 Register—Multi-louvres adjustable up, straight or down. Grille bars adjustable for right or left flow. Grille to match.



Airo-Flex No. 7032 Register—Grille bars set to direct air downward at 22½ deg, but adjustable for other angles. Single louvre. Grille to match.

ENGINEERED AIR DISTRIBUTION OUTLETS

VENTURI-FLO
Overhead Air Diffusers

Venturi-Flo overhead air diffusers have flow characteristics similar to those of the well known fluid-flow measuring device—the Venturi Meter. The relationship between the neck area of the unit proper and the Venturi-Flo throat area is so proportioned as to create a slight back pressure in the neck at all times, thereby automatically insuring uniform distribution around the entire periphery of the unit.

Three types of overhead diffusers are available, the recessed, the surface, and the thermostatically controlled types. A wide range of sizes permits handling air volumes up to 15,000 cfm per unit. Fittings for attaching any standard light fixtures to the outlets may be obtained for all designs. The surface and recessed types can also be furnished as combination supply and exhaust units and with adjustable dampers.

Uni-Flo Grilles and Registers are especially designed for air conditioning applications. They are engineered and prefabricated with directional flow fins for each individual application. Proper air distribution is assured and the necessity for adjustment after installation obviated.

Uni-Flo Grilles and Registers can be furnished in a variety of shapes and sizes for plain and curved surfaces.

Registers are similar in construction to grilles but with the addition of spring loaded positive closing fan or key-operated dampers.

Electroplated Finishes: Gunmetal, brushed bronze, plain zinc, and satin copper; also available in gray prime coat and satin aluminum.

Uni-Flo Air Distribution Accessories: Include the Volocitrol and the Airturn. The Airturn is a scientifically designed and highly efficient air turning member. The aero-dynamically correct vanes reduce losses caused by eddies, reverse air flow and low pressure areas at the turn to a minimum. Airturns are prefabricated and are available in units of one piece construction in sizes up to and including 48 in. x 48 in.

The Volocitrol has been designed to noiselessly provide positive and adjustable control of air volume, pressure and distribution across a supply outlet. They are available in two models, one for use with side wall and the other for overhead systems of air distribution.

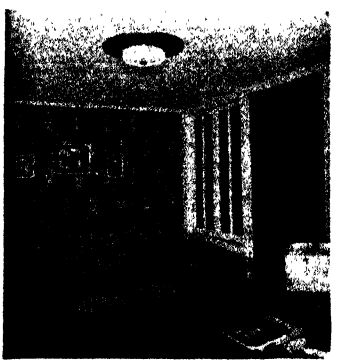
Charles Demuth & Sons

Mineola, N. Y.

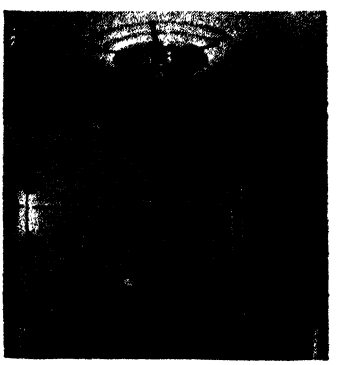
Air Distributors—Oil-Fired Conditioners

THE DEMUTH AIR DISTRIBUTOR is known to the Air Conditioning industry as the Distributor with Curved Vertical Vanes. Operates without any special attachments or devices. This special design imparts a series of turbulent air streams, resulting in a noiseless and positive 360 deg circulation and recirculation of the air—without a draft. Turbulent air streams plus an injector principle provides complete air mixture.



Type S-L

Type S



Special Type

FURNISHED in Polished or Satin Aluminum, Galvanized iron Stainless Steel and Enameled steel, as standard finishes, with sizes from 4 to 30 in.

Features a practical and simple installation method.

Available with lighting fixtures as shown in the left photograph.

All spinning operations required in the production of Demuth distributors are performed in the manufacturer's own shop.

Heavy Duty Industrial Oil Fired Forced Air Unit

Demuth "Samoyede" Oil Fired Furnaces

Heats, humidifies, filters and circulates the air. Domestic and Industrial models from 100,000 Btu to 2,500,000 Btu. Steel welded construction of Demuth patented design. Gun type oil burner, high temperature refractory combustion chamber. Large heating surface providing long flue passage, offers high efficiency and fuel economy.

Quick heating and troublefree performance. Enameled finish, with polished aluminum trim. All large sizes for industrial use made to order.

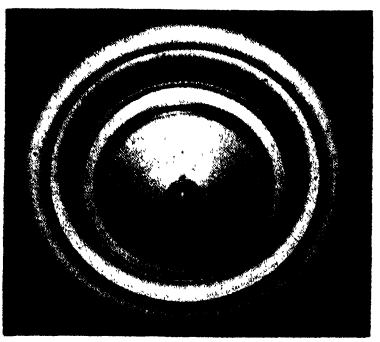
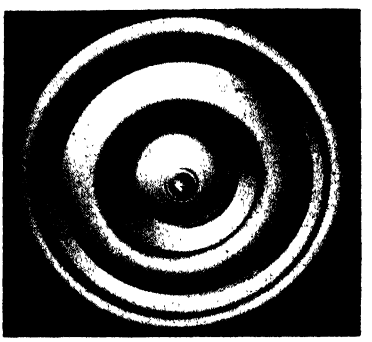
KNO-DRAFT *Adjustable* AIR DIFFUSERS

KNO-DRAFT Adjustable Air Diffusers insure efficient air distribution, maximum secondary air induction, noiseless and draftless diffusion, and uniform temperature throughout the occupied zone, *regardless* of season or ventilation requirements. Every KNO-DRAFT unit is easily and quickly adjustable for individual or seasonal requirements. The same KNO-DRAFT Diffuser is equally effective to expel chilled air **parallel** to the ceiling or eject heated air downward to prevent stratification.



TYPE KDA FOR SUPPLY AIR—Attractive—light, yet sturdy—for high or low ceilings or attachment to exposed ducts. Anti-smudge rim prevents streaked ceilings. Sizes 4 in. to 36 in. neck diameter for capacities from 50 to 15,000 cfm per unit.



TYPE SRD FOR SUPPLY AND RETURN AIR—To simplify duct work. Sizes 6 in. to 24 in. supply-air neck diameter for supply capacities from 50 to 2,500 cfm per unit, with central, return neck area 75 per cent of supply neck area.

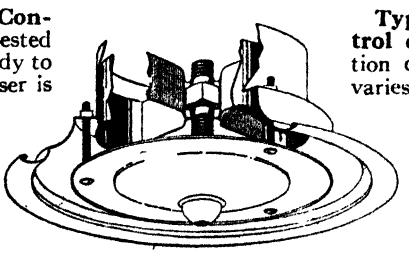
The KNO-DRAFT Diffuser will effectively distribute large volumes of air—premixing room and supply air. It permits the use of higher duct velocities—resulting in smaller ducts and lower costs. Duct designs are simplified and fewer outlets are required. KNO-DRAFT Diffusers are simple in construction, light in weight, and easily installed.

KNO-DRAFT Diffusers are geometrically proportional, size for size, insuring like resistance at like neck velocity for any size—and balanced static pressure throughout the system.

THE TYPE D AIR VOLUME CONTROL is designed for application exclusively to KNO-DRAFT ADJUSTABLE CEILING AIR DIFFUSERS. It is furnished already assembled within the diffuser and requires neither field assembly nor attachment to ducts, angle rings or other external appurtenances.

Type D Air Volume Control is adjusted and tested before shipment and ready to function when the diffuser is installed.

Its operation is entirely independent of the air direction adjustment which is part of all standard KNO-DRAFT Air Diffusers.



Type D Air Volume Control complements the function of the air diffuser. It varies only the *quantity*, not the *characteristic* of the air distribution. With it, a series of diffusers may be balanced without affecting the air diffusion efficiency.

With KNO-DRAFT TYPE KD ADJUSTABLE CEILING AIR DIFFUSERS the desired air pattern for any room or zone is AT YOUR FINGER TIPS

Kno-Draft Diffusers are covered by U. S. Patents Nos. 2,365,867; 2,369,119; 2,432,280 and others pending; Canadian Patents Nos. 429,206; 443,235.

APPEARANCE

The **KNO-DRAFT** Adjustable Air Diffuser lends itself well to any architectural or industrial requirement. Its simple, unobtrusive appearance and functional design make it an attractive air conditioning accessory in any commercial or manufacturing area.

UTILITY

An air diffuser is the sole "point of contact" between the conditioning system and the people it serves. If the diffuser is not adjustable *after installation* everything about that "point of contact" must be decided in advance. This can impose an often difficult, and always unfair, limitation on the designer. Air diffusion, especially in a room not yet built, can be a hazardous element to predict with complete accuracy. Air movement requirements, in a structure already built, may sometimes change with relocation of heat-producing equipment, people, or partitions. The advantage of adjustment *after installation* offers a new approach to this phase of the system design problem. With KNO-DRAFT Adjustable Air Diffusers, the behavior pattern of an air distribution system can, within fairly wide limits, be controlled, hence altered, after installation.

ECONOMY

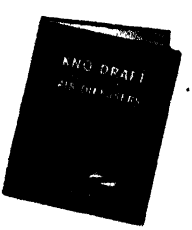
The economy of the KNO-DRAFT Adjustable Air Diffuser is a combination of three distinct economies, each contributing an added control over costs.

INSTALLATION—The self-contained removable inner assembly can reduce installation time by as much as 50 per cent. Where ceilings already exist the outer cone is attached to duct or collar quickly and easily.

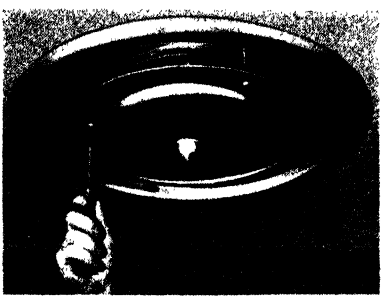
BALANCING—A minimum of time and effort is required to balance a KNO-DRAFT air distribution system. The single annular air stream permits immediate and accurate velometer reading. Desired air supply ratios may be rapidly obtained by adjusting the volume control dampers.

ADJUSTMENT — By simply raising or lowering the inner cone the diffuser is adjusted for any direction of air discharge from vertical to horizontal. By adjusting the volume control damper the air supply may be increased or decreased at will at individual points or zones.

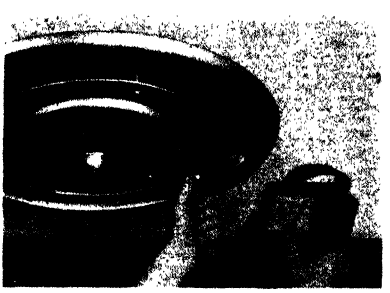
NEW CATALOG AND HANDBOOK—This new catalog contains in one complete and concise manual all the data necessary for the proper selection of air diffusers. Much information on air diffusion in general is included. *Write for Bulletin K-20.*



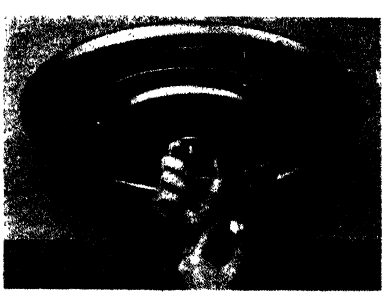
***INSTALLATION**—Removable self-contained inner assembly cuts installation time and costs.*



***AIR DIRECTION ADJUSTMENT**—Raising or lowering inner assembly provides any air direction angle—after installation.*



***BALANCING**—Single air stream allows direct velometer reading of volume immediately.*



***AIR VOLUME ADJUSTMENT**—Twist of wrist regulates air volume instantly after installation.*

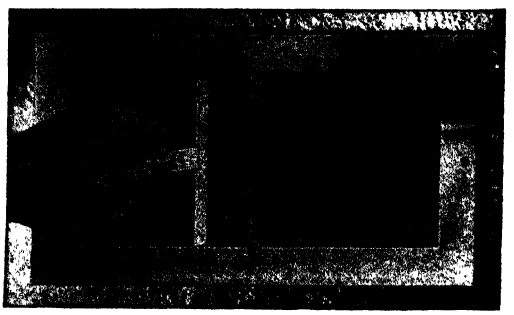
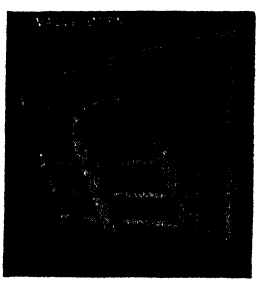
Air Conditioning Registers and Grilles - Warm Air Registers
Damper Regulators - Furnace Regulators - Pulleys - Chain

Holland, Mich.

NO. 75 DESIGN—FLEXIBLE FIN TYPE with TURNING BLADE VALVE to provide DOUBLE DEFLECTION. Also without Valve as Grille or Intake



CONTROL OF AIR FLOW IN TWO PLANES



Instant Adjustment of Air Flow (Up, Straight or Down)

Is obtained by turning the regulator on the register face to the proper setting with a key furnished with each register. When the valve is opened, as shown at the left, the individual valve louvres automatically stop in position to provide the proper air flow—Up (Fig. 1) for cooling systems to avoid drafts; Straight (Fig. 2) for ventilating systems; Down (Fig. 3) for heating systems to prevent stratification. When the valve is closed, as shown at the left below, it completely stops the flow of air.

Air Flow Can be Quickly Adjusted Sideways

No. 75 Design has a flexible fin-type face. Each fin may be twisted individually with a wrench furnished, to provide any desired sideway deflection of air flow.

Greatly Reduced Turbulence and Resistance

Figs. 1, 2, and 3 show the air flow with No. 75 Design; Fig. 4, with the conventional register. Compare the turbulence in the stackhead of the latter with the smooth flow obtained with No. 75 Design.

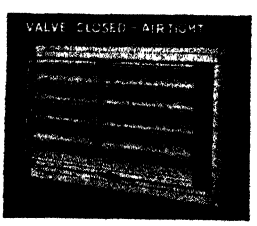


Fig. 1

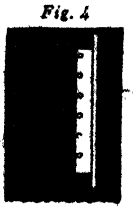
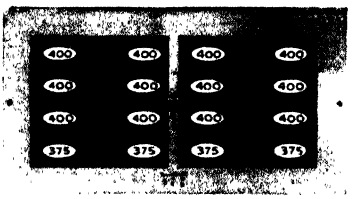
Fig. 2

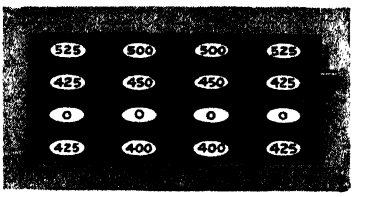
Fig. 3

Fig. 4





Velocities with No. 75 Design



Velocities with Conventional Register

EVEN DISTRIBUTION OF AIR OVER ENTIRE FACE

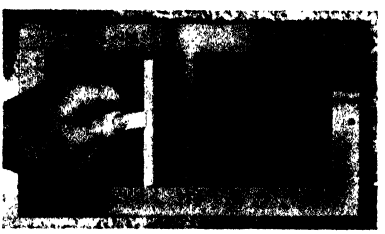
The turning blade valve distributes the air evenly with a uniform velocity over the entire face, as shown in Figs. 1, 2, and 3 on the preceding page. Note how the air rushes through the upper part of the face with a conventional register, as shown in Fig. 4. Since the entire face of No. 75 Design register is utilized for discharge of air, smaller and in some cases fewer registers can be used without causing excessive velocities.

Prevention of Streaked Ceilings—With either UP, STRAIGHT, OR DOWN deflections the air does not strike the ceiling immediately in front of the register; streaked ceilings are thus avoided.

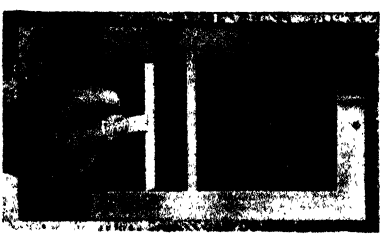
Excellent Concealment of Duct—The depth and close spacing of the vertical bars, combined with the valve, provide almost complete concealment of the duct, adding considerably to the pleasing appearance of the register face.

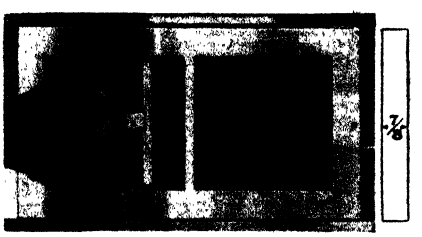
Special Settings—No. 75 Design functions equally well when located at the end of a horizontal duct or, by installing it upside down, when the air is delivered to it from above.

AVAILABLE IN FOUR TYPES



With Turning Blade Valve—No. 751 Register (Left) has Sponge Rubber Gasket and 3/16 in. turndown. No. 754 Register (Right) is similar except has 7/8 in. projection and is furnished without gasket.





Without Valve—No. 750 Grille (Left) has 3/16 in. turndown. No. 757 Intake (Right) has 7/8 in. projection

FOUR TYPES OF INSTALLATION FRAMES AVAILABLE

No. 75 Design items can be used with or without installation frames. No. 3 Sidewall Stud Frame (illustrated), fastens directly to stud, forming a solid, streak-proof foundation for register. No. 8 Frame is similar for baseboard use. No. 5 Baseboard Stack Frame provides inexpensive, streak-proof installation. No. 2 Band Iron Frame provides for connecting register to stackhead.

CATALOG 48 showing the complete H & C line, available upon request.

Hendrick Manufacturing Company

48 Dundaff Street, **Carbondale, Pa.**

Sales offices in principal cities—consult telephone directories

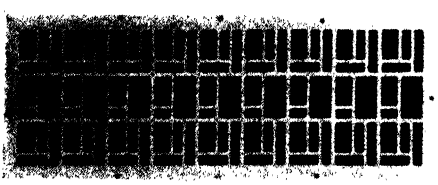
Hendrick Bulators; Hendrick Perforated Metal Grilles; Hendrick Mitco Open Steel Flooring, Armorgrids, Shur-Site Treads

HENDRICK BULATOR*

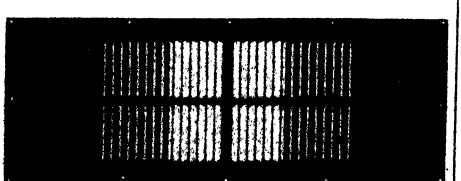
Recently developed by Hendrick, and tested at the Case Institute of Technology, Cleveland, the Bulator* Grille meets every requirement of architect and engineer for attractive appearance with proper air throw and spread.

Hendrick Bulator* is a practicable combination of an ornamental grille and a deflecting vane grille. The architect may select from a wide variety of Hendrick ornamental metal grilles a design that harmonizes with the decorative motif. Properly placed behind the ornamental grille, the deflecting vanes of the Bulator give the air throw and spread specified by the engineer. But the deflecting vanes are not noticeable behind the grille; only the decorative grille catching the eye.

The deflecting vanes are so constructed that the air flow can be deflected to right or left, up or down, or in a combination of directions.



Photograph taken with deflecting vanes less than an inch behind grille, shows that vanes are not noticeable.



Vertical deflecting vanes, showing how the vanes may be set to produce any desired air stream pattern.

The tests made under the direction of Prof. G. L. Tuve, at the Case Institute of Technology, Cleveland, show that correctly designed ornamental metal grilles, properly mounted in front of the deflecting vanes, have little effect on the air stream pattern and air throw.

Using a 24 in. wide by 8 in. high combination of control louvers, vertical deflecting vanes, and a metal grille with 65 per cent open area, the test showed the following resistance pressure in inches of water:

Cubic feet of air per minute				
400	600	800	1000	1200
with grille attached				
0.03″	0.08″	0.13″	0.21″	0.29″
with grille removed				
0.02″	0.05″	0.09″	0.14″	0.20″
Total throw of air stream, feet				
5.5′	8.2′	10.9′	13.6′	16.4′

The report states: "In the series of tests, we found that at a given air volume the presence or absence of the 'Mosaic' (pattern) grille made very little difference on either the air stream pattern or the throw, but the resistance was changed by the presence of the grille, as shown by the table."

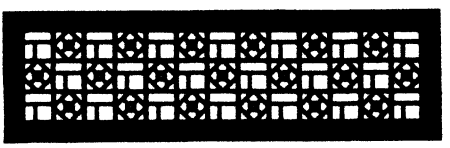
Hendrick's engineering department will be glad to cooperate with architects and engineers in the selection and installation of Bulator Grilles, incorporating any type of control desired.

*Beauty+Ventilator

HENDRICK PERFORATED METAL GRILLES

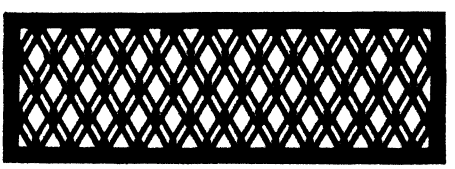
Hendrick decorative grilles are furnished in over a hundred patterns, and in a wide variety of overall dimensions, bar sizes, and number and size of perforations.

Many exclusive Hendrick designs, originally produced to meet an architect's specifications for some particular project, are now available as standard numbers, and facilities for making special designs to specifications make the Hendrick service even more complete. The wide range of patterns permits the choice of a grille that will harmonize with any style of architectural design or period construction.

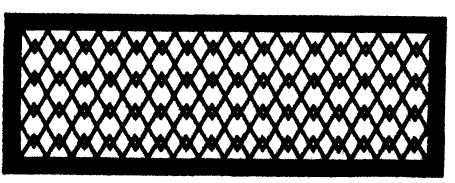


Arglin—63 per cent Open Area

Grilles are fabricated in heavy-gauge aluminum, bronze, copper, Monel, steel, stainless steel, and other commercially rolled metals. With ample open areas and accurate sizes, Hendrick grilles are characterized by clean-cut perforations, fine finish, and freedom from burrs and other imperfections.

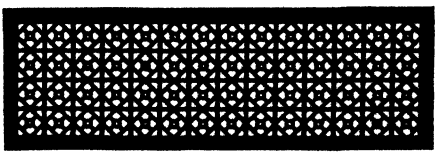


M–No. 8—57 per cent Open Area

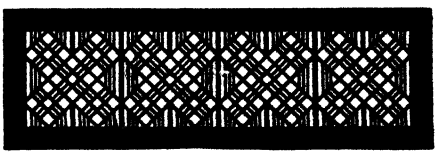


M–No. 9—67 per cent Open Area

They are easy to install, and always lie flat because of a special flattening operation in their manufacture.



Argive—60 per cent Open Area



La Crosse—55 per cent Open Area

AIR CONDITIONING GRILLES AND REGISTERS

Hendrick air conditioning grilles and registers for directed air flow are made in various meshes, the standard having 3/8 in. opening between face bars. All types are furnished with either horizontal or vertical directional bars.

The standard mesh can either be furnished with grille bars permanently set at the factory for straight or directional air flow, or furnished so that the grille bars may be individually adjusted on the job to direct air flow to any desired degree.

Vega

Any of the three following functions may be obtained with **Vega** ventilation outlet, invented by J. Fourtier:

—delivery of a direct air vein,

—diffusion of the delivered air,

—no delivery at all.

An adjustable device, formed by 4 semi-circular blades set in a circular opening, may change the direction and the diffusion of air delivered by the ventilation outlet.

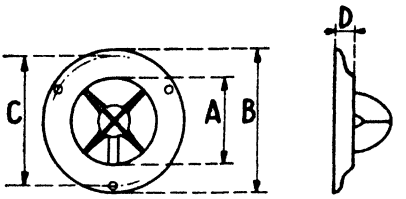
The **Vega** ventilation outlet is of a very reduced size, because the adjustable device is placed in the delivered air vein. Of very light weight, it is easily fitted up; it can be placed on a receiver supporting one or several devices, or on the ventilation duct itself, either vertical or horizontal. Its working is simple and rapid.

The various working settings and the numerous applications of this ventilation outlet place the **Vega** on a universal standard.

Ventilation outlet

Patent Applied for No. 665,689

Main Dimensions



Type No.		Nominal Capacity cfm	A mm	B mm	C mm	D mm
AIRPLANE	A1	20	37.5	80	70	10
	A2	30	45	80	70	10
	A3	40	53	80	70	10
NAVY	M1	60	65	132	116	17
	M2	90	75	132	116	17
	M3	135	90	132	116	17

The special design and fitting of the device enable the quick adjustment of any outlet from one number to another.

Vega ventilation outlet is made of cast metal or cast material; its finish is made to suit all applications and to be in harmony with any kind of decoration.

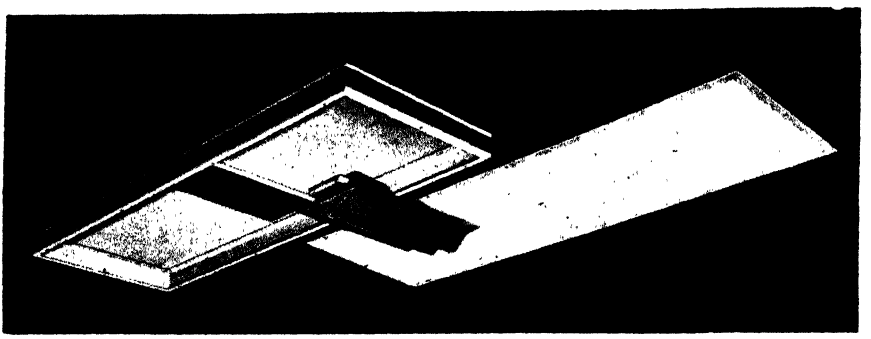
Manufacturers of

MULTI-VENT

Panels

for Heating • Ventilating • Air Conditioning



Control Plate *Valve* *Distribution Plate*

MULTI-VENT Panels are used for the even distribution of warm, cool or fresh air within room spaces. The control plate frame is inserted in the overhead duct at the ceiling. The orificed adjustable air valve provides absolute displacement of static head, and may be set for varying quantities of air to enter the conditioned space, and at varying velocities or speed of entry, producing the comfort zone rate of air motion and degree of temperature desired by the occupant (provided the system includes the required auxiliaries). The perforated distribution plate, of large area, located in the ceiling, accomplishes a wide, gentle, uniform spread and dilution of the conditioned air and simultaneously provides panel heating or cooling. When used with the other correct auxiliaries Multi-Vent results in uniform temperatures and comfort.

Application data will be furnished on request

REGISTER & GRILLE MFG. CO.

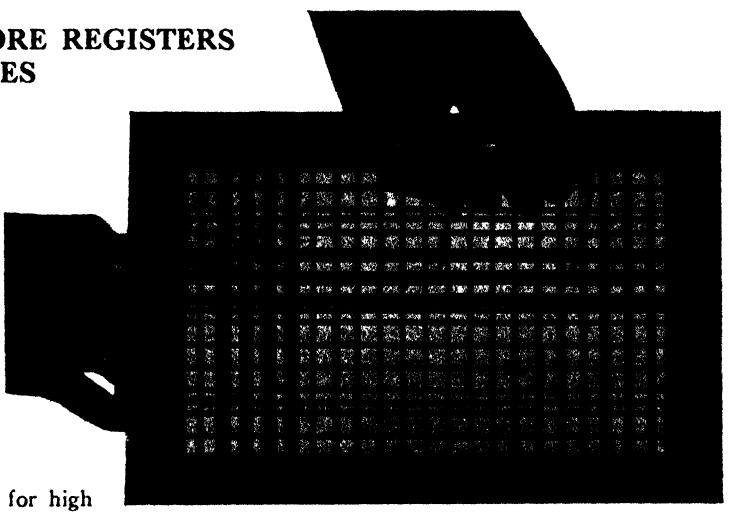
Incorporated

70 Berry Street, **Brooklyn 11, N. Y.**

Headquarters for all types of Registers and Grilles

RESIDENTIAL AND COMMERCIAL

DOUBLE CORE REGISTERS AND GRILLES



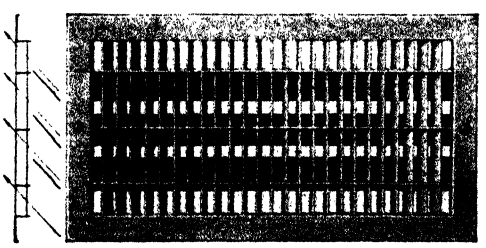
Designed only for high grade work where appearance and performance are the first consideration.

Style 620—Six-Way Adjustable Deflection

When used as a grille only, style 620 gives complete control of directional throw, and, when fitted with one of our many types of shutter, permits control of volume as well.

Can also be had with outside adjustable bars running horizontally (Style 610).

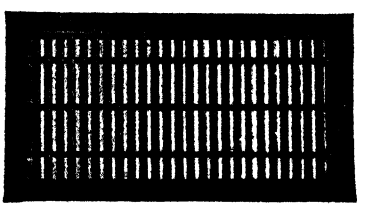
FOUR-WAY ADJUSTABLE DEFLECTION



Style 20 Grille and HMV deflecting vanes

Front bars vertically adjustable, rear vanes horizontally adjustable; *or* Front bars horizontally adjustable, rear vanes vertically adjustable.

TWO-WAY ADJUSTABLE DEFLECTION



Use No. 20 Grille for adjustable right and left deflection. Style 10 has horizontal adjustable bars for up and down deflection.

Ask for our catalog which shows other types of air controls; also 81 different Stamped Metal designs and over 100 designs in Cast Metals—Iron, Brass or Bronze.

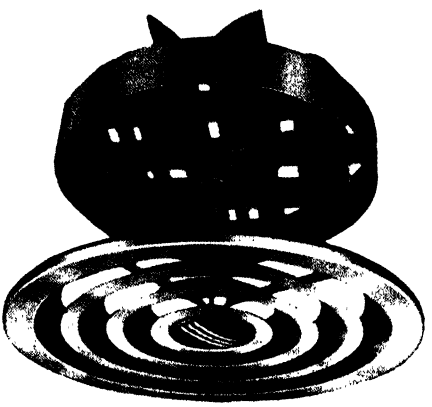
TUTTLE & BAILEY

Engineered Products for Residential, Commercial and Institutional Air Conditioning, Heating, Ventilating

NEW BRITAIN, CONNECTICUT

AEROFUSE

Diffuser and Damper



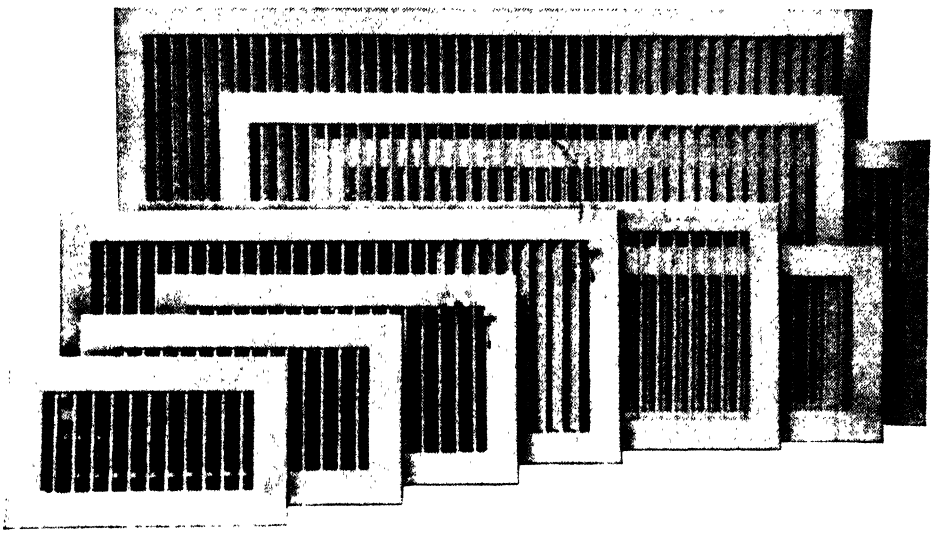
The satisfactory, efficient performance of an air conditioning installation depends largely upon the design of the units which provide distribution. The combination of Tuttle & Bailey AEROFUSE Diffusers and Dampers specified *at the vital point of air delivery* assures that this much of the system will do the job it is intended to do . . . provide the proper amount of supply air, delivered as you want it, where you want it, evenly distributed and without drafts.

Aerofuse Diffuser — Five standard types in a range of sizes—plus special adaptations for specific applications—means meeting the requirements of every air conditioning, heating or ventilating installation regardless of type or size of building. Rigid, one-piece construction facilitates installation . . . attractive appearance assures a design that will harmonize with any style interior.

Aerofuse Damper No. 4—An improved multi-louvre damper with exclusive designed-in features that provide positive volume control. Adds real efficiency when installed with AEROFUSE Diffusers. Minute adjustment of volume for accurately balanced system . . . multi-louvres divide supply stream, mean uniform distribution over diffuser, minimum turbulence and quiet operation. In open position, damper provides effective area greater than that of corresponding size diffuser . . . closed, it assures 100 per cent shut-off. Tamperproof, louvres may be locked in any position.

Tri-Flex SUPPLY AIR GRILLES AND REGISTERS

26 Standard Sizes for Quick Specifying, Easy Installation



T60 Grille—Full control of air deflection in horizontal plane. Individually adjustable bars, pivoted at front assure alignment regardless of setting.

T64 Double Deflection Grille—Combines T60 and deflector unit. Individually adjustable face bars and deflector blades.

T62 Multi-Shutter Register—Multi-Shutter unit attached to T60 Grille. Horizontal damper blades interlock when closed, eliminate air leakage. Lever or key operator.

T642 Double Deflection Multi-Shutter Register—Combines grille, deflector unit, multi-shutter damper. Provides 4-way air control. Face bars and deflector blades individually adjustable. Damper blades lever or key operated.

AEROVANE RETURN AIR GRILLES AND REGISTERS

T70-T80 Return Air Grille—Horizontal bars (T70) set for straight flow or 22 deg upward or downward deflection. Vertical bars (T80) set for straight flow.

T72-T82 Return Air Register—Combines AEROVANE Grille and multi-shutter unit as used with TRI-FLEX supply register. Same bar settings as T70 or T80.

For detailed engineering data, write Tuttle & Bailey, New Britain, Conn.

Choose the Correct ARMCO Grade

There is a grade of ARMCO sheet steel especially suited to every air conditioning application. For detailed information get in touch with the nearest district office or write direct to The American Rolling Mill Company, 390 Curtis St., Middletown, Ohio.

ARMCO Ingot Iron
(Galvanized)

Ducts
Washer Chambers
Plenum Chambers
Steam Line Casings
Spray Towers
Drip Pans
Housings
Machine Guards
Unit Conditioners
Roof Ventilators
Eliminator Blades

ARMCO PAINTGRIP
(Galvanized)

A special mill-Bonderized galvanized sheet that can be painted without pretreatment. Preserves life and beauty of paint and enamel.

ARMCO Cold Rolled PAINTGRIP: A zinc-flashed sheet with a special mill-Bonderized surface that takes and holds paint.

Hot Rolled
(Sheets and Strip)

Fan Blades
Blower Casings
Fuel Oil Tanks
Unit Conditioners
Stoker Hoppers

ARMCO ZINCGRIP

A special zinc-coated sheet that can be severely formed without peeling or flaking of the tightly adherent zinc coating. Also available with a mill-Bonderized finish for immediate painting.

Cold Rolled
(Sheets and Strip)

Furnace Casings
Room Unit Casings

Plates
(ARMCO Ingot Iron)

Smoke Stacks
Coal Hoppers
Breeching
Unfired Pressure Vessels
Low-fired Boilers
Tanks

Stainless Steel
(Sheets, Strip, Bars, Wire and Plates)

Oil Burner Nozzles
Worm Gears for Stokers
Combustion Chambers
Heat Flues and Tubes
Humidifier Pans
Pre-heaters
Furnace Parts and Supports
Fan and Blower Blades
Spring Wire
Welded Wire Fabric

Special grades have excellent resistance to destructive heat-scaling up to 2000°F.

ARMCO ALUMINIZED Steel

An aluminum-coated sheet steel with exceptional resistance to heat and corrosion. Resists heat discoloration up to approximately 900° F, and will withstand heat scaling at even higher temperatures. Also offers exceptional heat reflectivity where this is desirable.

U·S·S COPPER STEEL

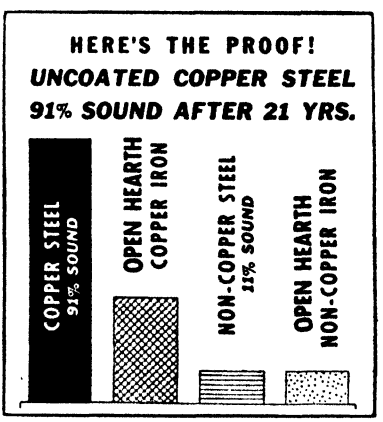
For Superior Rust Resistance at Low Cost

Corrosion resistance and cost are two determining factors of the type of metal to be used for various air-conditioning jobs.

Copper Steel has 2 to 3 times the atmospheric corrosion resistance of plain steel or pure iron as shown in the results of unbiased tests made at Pittsburgh, Ft. Sheridan and Annapolis by the American Society for Testing Materials.

The cost of U·S·S Copper Steel is less than that of pure iron or copper-bearing pure iron and only slightly more than plain steel. Thus there often is a dividend of 200 per cent to 300 per cent longer life and a saving in the first cost as well.

When galvanized, U·S·S Copper Steel produces a sheet that is rust resistant all the way through—not just on the surface. It should be used for all ducts carrying humidified air or placed in damp locations such as basements, shower rooms, etc.



Corrosion test of A.S.T.M. on 28 gage black sheets exposed at Annapolis, Md., October, 1916. The copper steel sheets outlasted all others in the test.

U·S·S PAINTBOND

U·S·S PaintBond should be used whenever galvanized steel is to be painted. This special Bonderized sheet can be painted immediately, offers a much better surface for painting, lessens danger of the paint flaking and retards corrosion. It is used for ductwork, furnace housings and outdoor metal work.

Send for our PaintBond booklet.

U·S·S GALVANNEALED

U·S·S Galvannealed has a tight, matte-surface zinc coating that withstands severe forming operations without peeling or cracking. Suitable for immediate painting without aging or other surface preparation.

U·S·S DUL-KOTE

U·S·S Dul-Kote is a specially treated non-spangled galvanized sheet which also can be painted immediately without aging or otherwise preparing the surface. It is available in the South and in the West.

Send for our Dul-Kote booklet.

OTHER U·S·S PRODUCTS INCLUDE:

Black Sheets—All grades, hot rolled, cold rolled in a number of different finishes.

Stainless—Heat resisting steel for various uses where temperatures are high and corrosion severe.

Cor-Ten—High strength steel—greater strength, greater atmospheric corrosion resistance for smokestacks, hoods, etc.

BADGER "PACKLESS" CORRUGATED EXPANSION JOINTS

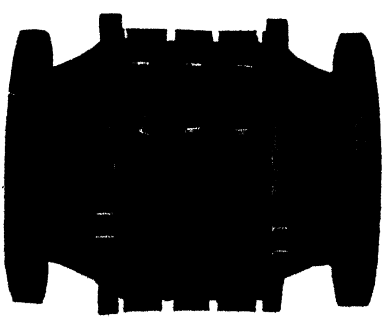
Engineers and Manufacturers of Chemical, Petro-Chemical and Petroleum Refining Equipment; Process Engineers, Designers and Constructors of Complete Plants.

BADGER "PACKLESS" CORRUGATED EXPANSION JOINTS

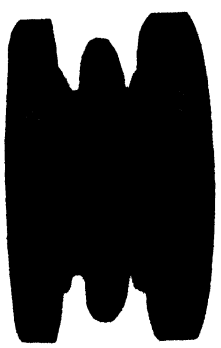
Protect equipment; eliminate costly shut-downs; prevent loss of materials flowing through pipe lines. The Badger "Packless" Corrugated type of expansion joint has been used for many years to relieve stresses, absorb vibrations between connected equipment, and compensate for changes in pipe lines due to temperature differentials.

BACKED BY FIFTY YEARS OF EXPERIENCE

Badger engineers pioneered the corrugated "packless" joint and brought it to its present high state of dependability and usefulness. To meet the increasingly severe conditions in industry, the more recent developments are included in the following brief descriptions.



Standard Flanged-End Badger Directed Flexing, Self-Equalizing "Packless" Corrugated Expansion Joint. ***Also made with standard welding end. (Double units available.) Bulletin No. 100.***



Badger Non-Equalizing "Packless" Corrugated Expansion Joint, Single Corrugation. ***Also made in multiple corrugation and special shapes. Bulletin No. 200.***

FLANGED AND WELDING ENDS. Badger "Packless" Corrugated Expansion Joints can be furnished with either flanged or welding ends.

TELESCOPING SLEEVES. Badger "Packless" Corrugated Expansion Joints can be furnished with telescoping sleeves if required.

INSTALLATION, OPERATING, MAINTENANCE ECONOMIES

• ***"Packless"***—Since this type of expansion joint is made from a *single tube*, no packing is required—hence no servicing. This is particularly advantageous in underground installations, because the expense of manholes and tunnels can be eliminated.

• ***Flexible***—This type of joint is readily flexed, thus reducing to a minimum the thrust on adjacent equipment or fittings.

• ***Wide Range of Traverses***—By varying the number of corrugations, the Badger "Packless" Corrugated Expansion Joint can be made to take care of traverses ranging from small fractions of an inch up to any practical limit.

• ***Wide Range of Pressures***—Standard joints are constructed for normal operating pressures; special joints for higher pressures.

• ***Compactness***—Outside diameter of Badger "Packless" Corrugated Expansion Joint is about that of a flanged fitting.

• ***Ease of Installation***—The Badger "Packless" Corrugated Expansion Joint is as easily installed as any fitting.

COPPER AND STAINLESS STEEL. Badger "Packless" Corrugated Expansion Joints are made in self-equalizing or non-equalizing types; and are made of copper, stainless steel, or other metals to meet varying conditions with respect to temperature, pressure and corrosion.

HEAT TREATMENT. Every Badger "Packless" Corrugated Expansion Joint is scientifically heat-treated during the process of manufacture to remove forming stresses. This Badger process increases resistance to flexing stresses, lengthening the life of joint.

DIRECTED FLEXING—SELF-EQUALIZING

This feature, *exclusive* with Badger "Packless" Corrugated Expansion Joints, greatly lengthens the life of the corrugated type of expansion joint. Through Self-equalizing Rings, the flexing movement is not only limited but is progressively controlled throughout the movement. Flexing stresses are kept distributed.

PRODUCTS AND SERVICES—

Complete Service on materials to Specification on Power Plant Piping, Industrial Piping, and Industrial Heating Systems; Prefabricated Piping including Pipe Cutting and Threading, Pipe Bends, Welded Headers, Welded and Welding Fittings, Lap Joints and the Grinnell line of products for Super Power.

Grinnell Equiflo Valves for forced hot water heating systems; Grinnell Adjustable Pipe Hangers and Supports; Grinnell Cast Iron and Malleable Iron Pipe Fittings; Grinnell Flared Tube Fittings; Grinnell Malleable Iron Unions; Grinnell Welding Fittings; Grinnell Thermoliers (Unit Heaters); Thermoflex Traps and Heating Specialties.

Also Humidifying Systems; Piping for acids and other special materials.

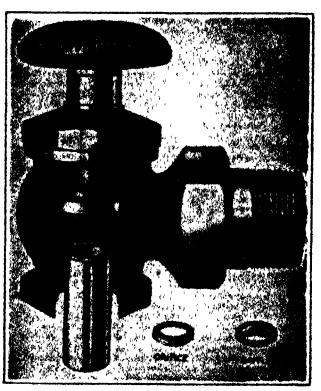
Malleable Iron, Brass, Bronze and other Castings; Brass, Cast Iron, Wrought Iron and Steel Pipe; Seamless Steel Tubing in Iron Pipe Sizes.

Valves: Check, Diaphragm, Globe, Pressure Reducing and Regulating, Quick Opening, Safety and Y.

Automatic Sprinkler Systems; Stand Pipes; Underground Supply Mains; Hydrants; Fire Pumps; Pressure and Gravity Tanks.

Grinnell Equiflo Valves

For Forced Hot Water Heating



Equiflo Valve

The designing of forced circulation hot water heating systems is so simplified by the Grinnell Equiflo Valve that they can be laid out and installed as easily as vapor or steam systems. This valve consists of a regular type packless radiator valve with a cartridge or tube made up of a series of orifices and baffles capable of setting up any required frictional resistance. This method of establishing any desired resistance does away with elaborate calculation of pipe sizes. Grinnell guarantees perfectly balanced circulation to each and every radiator where these valves are installed throughout the system.

Equiflo Data Book sent to interested parties.

GRINNELL ADJUSTABLE PIPE HANGERS AND SUPPORTS

One of the chief advantages of Grinnell Adjustable Hangers is that they permit adjustment of pipe lines after installation, thus obviating the necessity of turnbuckles or the removal of hangers. Their time and trouble-saving qualities during installation are equally exceptional. Below are shown a few Grinnell Hangers and Supports of particular interest to heating engineers. Send for Hanger Catalogue showing complete line.

Adjustable Swivel Rings (Patented)

Fig. No. 101
Solid Ring

These Malleable Iron Adjustable Swivel Rings can be used with Coach Screw Rod or Machine Threaded Rod in connection with practically any type of Ceiling Flange, Expansion Case, Insert, etc.

Adjustment of at least 1½ in. is secured by turning Swivel Shank. Swivel Shank automatically locks, preventing loosening due to vibration in the pipe line.

The Split Ring permits adjustment either before or after Ring is closed. A wedge type pin is loosely but inseparably cast into the hinged section for fastening this section after pipe is in place.

Fig. No. 104
Split Ring

Adjustable Swivel Pipe Rolls (Patented)

An adjustable type of pipe roll using a single hanger rod. Swivel Shank allows vertical adjustment and automatically locks, preventing loosening from vibration.

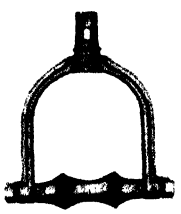


Fig. No. 174
Swivel Pipe Roll

CB-Universal Concrete Inserts (Patented)

Made of malleable iron, in one body size, to take a special removable nut, tapped for ⅜ in., ½ in., ⅝ in., ¾ in. or ⅞ in. rod as required. Nuts automatically lock by means of V-type teeth on both insert and nuts.

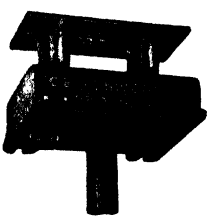

Fig. No. 282
CB-Universal Insert

GRINNELL WELDING FITTINGS

Grinnell Welding Fittings are made from Seamless Steel Pipe or tubing and possess the same physical characteristics as standard, extra strong and o.d. steel pipe or seamless steel pipe of comparable size. They can be used under the same conditions, pressures and temperatures as the pipe itself.

All Grinnell Welding Fittings have welding faces for all plain circumferential butt welds scarfed or beveled as follows: For wall thicknesses 3/16 to ¾ inch inclusive, 37½ deg. ± 2½ deg., straight bevel. Angles of bevel other than 37½ deg. can be furnished on special order.

90° Elbow, Long Radius

45° Elbow, Long Radius

ENGINEERS AND BRONZE FOUNDERS—FABRICATORS
OF NON-FERROUS METALS AND STAINLESS STEEL

Metals Fabricated—Aluminum, Block Tin, Brass, Bronze, Copper, Everdur, Monel, Nickel, Inconel, Stainless Steel and KA2 SMO. Bulletin on request.

Bends

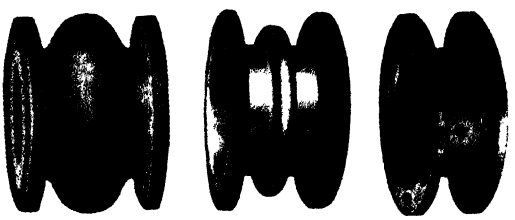
We make bends in every shape from all sizes of copper water tube, pipe and tubing in copper, brass, aluminum, stainless steel, monel, tin and nickel. Standard or special connections. U-bends for storage water heaters.

Also special pipe work for industrial installations, plumbing, heating and brewing.

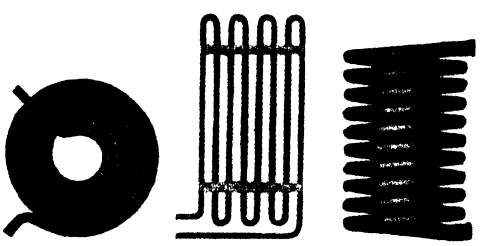
Non-Ferrous Castings—"Dairywhite" nickel silver for Process Industries Equipment. Suitable for milk and food products machinery. Castings also of 88-10-2, 80-10-10, 85-5-5-5, silicon bronze and manganese bronze, and special mixtures.

Copper Expansion Joints

For low pressure and vacuum. Made in two styles—convex and concave. Sizes 4 in. to 60 in. diameter. Cast iron or steel flanges. Flanges drilled to American standard unless otherwise ordered: B-290 available only in sizes 4 in. to 15 in. inclusive.



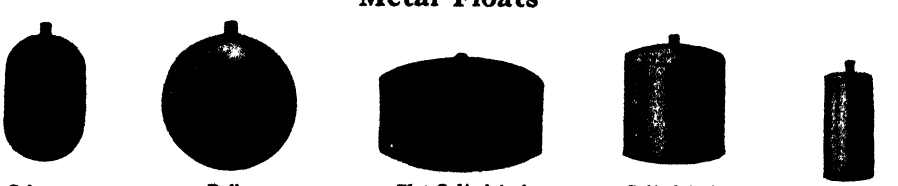
B-280 Convex *B-290 Convex* *B-281 Concave*



Coils

For heating, cooling and condensing. All shapes made from any size pipe or tube—standard or special connections, of copper, brass, aluminum, stainless steel, KA2 SMO, monel, inconel, nickel, block tin, and Everdur.

Metal Floats



Column *Ball* *Flat Cylindrical* *Cylindrical* *Cylindrical*

Made of copper, plain steel, stainless steel, KA2 SMO, aluminum, brass, Monel, pure nickel, Admiralty and Everdur, for open tank and all pressures.

Seamless copper ball floats carried in stock in diameters of 3 in., 4 in., 5 in., 6 in., 7 in., 8 in., 10 in., 12 in. for open tank and pressures of 25, 50, 100 and 150 lb. Floats in special sizes and pressures—made to order. Stainless steel ball floats 2½ in. to 12 in. for high pressure and corrosion carried in stock—special stainless steel floats made to order—stainless steel ball floats larger than 12 in. diameter can be made up specially. Float catalog sent on request.

Alco Valve Company

ENGINEERED REFRIGERANT CONTROLS

851 Kingsland Avenue, **St. Louis 5, Mo.**

NEW YORK OFFICE: 122 EAST 42nd STREET

THE COMPLETE LINE OF REFRIGERANT CONTROLS

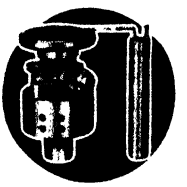
ALCO THERMO EXPANSION VALVES

THERMO EXPANSION VALVES: for automatic control of liquid refrigerant on all types of refrigeration and air conditioning systems. *Capacities*—from fractional tonnage to 100 tons Methyl Chloride, 50 tons "Freon-12."

Thermo-Limit—with pressure limiting feature and capacity change

Type TK—"3 valves in 1"

Type TCL

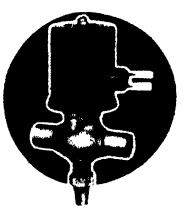


Type TR—Multi-Outlet

ALCO SOLENOID VALVES

SOLENOID VALVES: for all types of service. *For Liquid:* "Freon"—up to 75 tons. Methyl Chloride—up to 150 tons. *For Suction:* "Freon"—up to 8.8 tons. Methyl Chloride—up to 17 tons.

Type S1

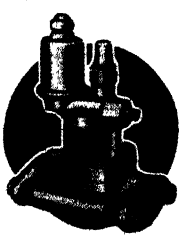


Type M3

Type R2

ALCO AMMONIA CONTROLS

AMMONIA CONTROLS: *Solenoid Liquid Valves*—up to 172 tons. *Solenoid Suction Valves*—up to 28 tons. *Thermo Expansion Valves*—from fractional tonnage to 60 tons.



Type EPR1S

Type M9F

Type TG

ALCO ALSO MAKES: ***Evaporator Pressure Regulators* for "Freon", Methyl Chloride and Ammonia with connection sizes up to 6 in.—*Solenoid Valves* for brine, water, gas, air and steam—*Float Switches*—*High Pressure Float Valves*—*Constant Pressure Expansion Valves*—*Liquid and Suction Line Strainers.***

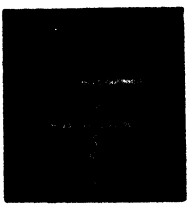
AUTOMATIC PRODUCTS COMPANY

2450 NORTH THIRTY — SECOND STREET

MILWAUKEE WISCONSIN

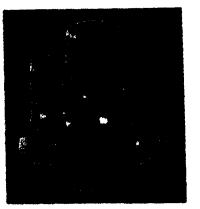
A-P DEPENDABLE CONTROLS

For Heating, Refrigeration and Air Conditioning



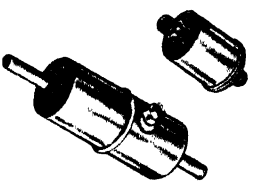
• **A-P Thermostatic Expansion Valves.** Several models and sizes, for capacities up to 16 tons Freon or 32 tons Methyl Chloride. Also available with pressure limiting feature in capacities to 1 ton.

• **A-P Solenoid Operated Water Valve.** Made especially for Deep Well Cooling.



• **A-P Thermostats**
For Cooling or Heating

• **A-PSolenoid Refrigerant Valves.** Capacities up to 50 tons Freon.

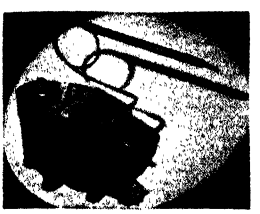


• **A-P Water Regulating Valves.** Capacities up to 1200 Gallons per hour.

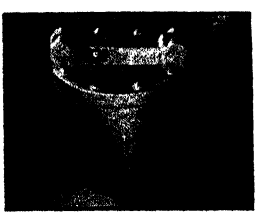
• **A-P "Trap-Dri"**
Combined Filter-Strainer-Drier
Traps dirt, scale, moisture in refrigeration systems.

A-P Controls for Oil Burning Gravity-Feed Heating Plants.

A-P Constant Level Oil Control Valve—With Fuel Compensator. Used on Gravity Oil Burning Appliances.



A-P Complete Furnace Control Set—Made in variety of types for Gravity-Feed Oil Burning Furnaces.



A-P Fuel Oil "Trap-It"—Traps dirt and water in fuel systems. Improves operation of all oil burning devices.

A-P Valve DEPENDABILITY
is widely recognized in Refrigeration, Air Conditioning and Heating. This reputation is born of close adherence to a rigid standard of perfection—in materials used, careful testing, inspection and simplicity of construction.

Detroit Lubricator Company

Division of American Radiator & Standard Sanitary corporation

General Offices 5900 Trumbull Ave., **Detroit 8, Michigan, U. S. A.**

New York 18, N. Y., 40 West 40th Street — Chicago 5, Ill., 816 S. Michigan Avenue

Export Department—Box 218, Ridgefield, N. J.

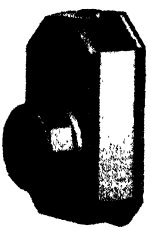
Canadian Representative:

Railway and Engineering Specialties Limited, Montreal, Toronto, Winnipeg

Automatic Controls

Detroit Lubricator Company manufactures a very complete line of electrical controls, designed to open or close an electrical circuit with changes of temperature or pressure. The No. 411 Thermostat (illustrated) is a low voltage model and is made in plain and Day and Night types. All No. 411 Thermostats are available with heat compensation to provide smooth, accurate temperature control. The No. 855 Mercoid Room Thermostat (illustrated) is a line voltage type—available in heating, air conditioning and refrigeration ranges.

No. 411



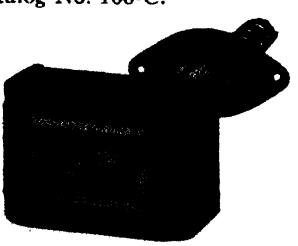
No. 855

For industrial use the No. 250 and No. 450 line of pressure and temperature controls is available, in pressure ranges from 20 in. vac. to 350 lbs. and in temperature ranges from −30° F to 495° F. Write for Catalog No. 100-C.

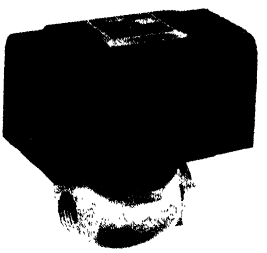
Furnace Controls

Also available is a full line of blower controls, combination blower and limit controls, such as the CA-815 illustrated.

There is a "Detroit" control available for practically every application where a dependable device is required to open or close an electrical circuit with changes of pressure or temperature. Write for complete information. Our Engineering Department is always ready to make recommendations on any specific problem. Write for Catalog No. 100-C.



No. CA815

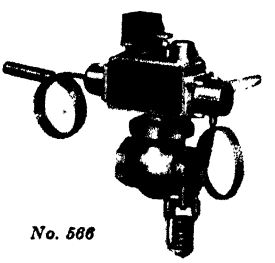


No. V-570

Gas Valves

The No. V-570 Electric Gas Valve is an electrically operated valve for control of gas lines from ½ to 1¼ in. It provides partial opening upon initial operation, permitting quiet ignition of gas. Inexpensive, compact, and attractive in appearance, it employs an easily serviceable bimetal strip motor for actuating force. Write for Bulletin 201.

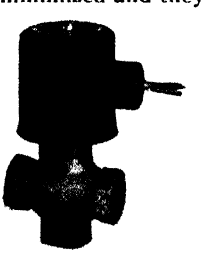
The No. 566 Valve combines in one compact unit all of the functions of a control system for gas heating. All safety functions are mechanical and operate independent of electric current. Adjustable for full snap or any degree of throttling action. Limit control closes valve with a snap action. Valve may be manually operated in case of current failure. Applicable to all gases, natural, manufactured, or mixed. Write for Bulletin No. 80.



No. 566

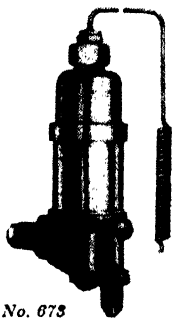
Solenoid Valves

"Detroit" Solenoid Valves for control of water, air, oil, gas, or refrigerant, embody many desirable features. A.C. hum is minimized and they will open against high pressures. Available in all standard voltages and cycles A.C. or D.C. No. 683-3 (illustrated) is a small size valve with ⅜ in. connections. No. 681 is a pilot operated, intermediate size valve, and the No. 686 is a large pilot operated valve with

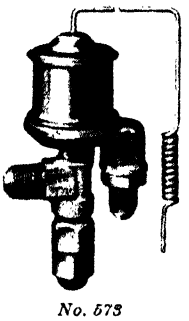


No. 683-3

capacity up to 17 tons Freon-12. No. 686 valve available with flanged connections. No. 681 and 686 are furnished with manual opening feature to permit opening in case of current failure. All models may be taken apart and cleaned in the field without removing from pipe lines. Write for Bulletin No. 199.



No. 673

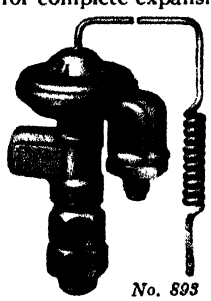


No. 573

"Detroit" Thermostatic Expansion Valves

"Detroit" Thermostatic Expansion Valves are designed to keep the evaporator in a refrigerating system completely refrigerated. Power elements are "gas charged" to a definite pressure, for motor overload protection; providing quicker response and more sensitive control. Capacities from ½ to 20 tons Freon-12. All needles and seats are made of Delubaloy, a very hard, corrosion resistant alloy to insure long, trouble-free service.

No. 673, the "standard of the industry," has a long record of dependability. It is sensitive and accurate in operation. No. 573 has the quality and operating characteristics of the 673 for smaller installations. It has a *single* power element with double diaphragm. Write for catalog No. 200B for complete expansion valves listings.

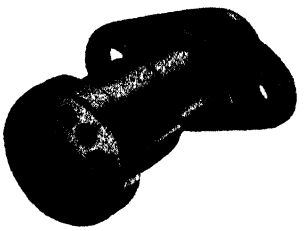


No. 893

"Detroit" Expansion Valves

These valves are of single diaphragm construction. The diaphragm is made of special alloy, carefully tested for flexibility to assure uniform capacities and smooth operation. Power elements are gas charged for protection against motor overload and for maximum sensitivity. Needles and seats are hard, corrosion resistant Delubaloy.

Automatic and thermostatic types in capacities from ½ to 20 tons Freon-12 and .9 to 36 tons methyl chloride. Write for Catalog No. 200-B.



Refrigerant Distributors

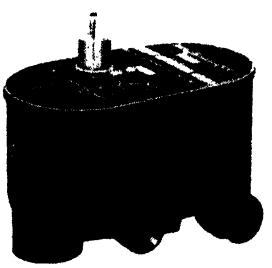
"Detroit" No. 790 Refrigerant Distributors insure a uniform supply of refrigerant to all sections of multiple circuit evaporators and are attached directly to the expansion valve by means of a flanged connection. These corrosion-resistant distributors are available for "Detroit" Thermostatic Expansion Valves No. 786, No. 787, No. 788 and No. 899.

They are made in five types of 2 to 18 passes for the above valves.

All distributors are designed for use with ¼ in. O.D. copper outlet tubes.

For complete capacity tables write for Bulletin No. 207.

"Detroit" Float Valves for Vaporizing Oil Burners



CRC-246 Single Metering Float Valve. The Greatest Improvement in Float Valve Design in Many Years.

For space heaters, furnaces, floor furnaces, water heaters, ranges, etc., the CRC 246 mounts directly on the burner nipple, eliminating tee, fittings and tubing. Low flows are extremely accurate, assuring exact control of fuel delivery for low pilot burners. Rate of flow constant for inlet heads from 2 inches to 84 inches—eliminates dying fire when fuel is low. Automatic temperature compensation assures even fuel flow regardless of fuel temperature—an important "Detroit" feature. Magnetic trip mechanism is positive—will not trip from vibration. Valve may be tilted a reasonable amount without affecting flow. Leveling by eye is satisfactory. So simple to clean that servicing is no problem. Write for Bulletin No. 217.

Fulton Sylphon Div.

ROBERTSHAW-FULTON CONTROLS CO.

Knoxville, Tenn.

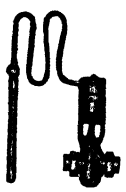
Sales Representatives in Principal Cities

Manufacturers of

Sylphon Automatic Temperature Controlling Instruments and Packless Expansion Joints

HOT WATER SUPPLY

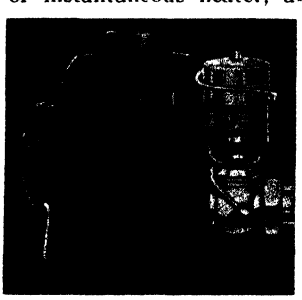
No. 923 Temperature Regulator—For controlling water temperature in heaters, open or closed tanks and other equipment. Operation unaffected by temperature fluctuations at the valve, either above or below bulb temperature. All parts, except steel adjustment spring, made of non-ferrous metals. May be installed in any position. Ranges from 40° —80° F to 290° —330° F. Bul'n HVG-20.



No. 923 Temperature Regulator

Sylphon Thermostatic Water Mixers

Utilize hot water from any storage tank or instantaneous heater, and effectively regulate the amount of cold water required to temper it to the desired degree, actually mixing the hot and cold water together before delivery. Temperature remains constant in spite of fluctuations in supply water temperatures or pressures. Four sizes with capacities ranging from 5 to 131 gpm. Bulletin HVG-20.



No. 902 Sylphon Thermostatic Water Mixer—1¼ to 131 gpm depending on water pressure

REFRIGERATION CONTROLS

Adapatable wherever brine is used as the refrigerant. Latest development is a "freeze-proof" valve (illustrated at left on the popular Sylphon No. 945-Z Regulator). Bulletin HVG-20.

No. 945-Z Regulator

PACKLESS EXPANSION JOINTS

The Sylphon Packless Expansion Joint eliminates useless building height, expensive construction, non-revenue producing space. No leaks or repairs, no repacking, always tight; heating system operates at full efficiency. Bulletin HVG-140.

No. 110 Sylphon Expansion Joint

SPACE HEATING CONTROL

No. 885 Automatic Radiator Valve—For exposed radiation. Small, neat, attractively finished, adjustable to room temperature desired. Simply replace ordinary radiator valves with these Sylphon Automatic Valves—no wiring, piping or auxiliary equipment is required. These valves answer the demand for an inexpensive means of providing accurate, dependable space temperature control in rooms, sections or throughout large buildings, new or old. Similar type valves for concealed radiation—get Bulletin HVG-80.

Sylphon No. 885 Automatic Radiator Valve

No. 890 Radiator Control Valve—For either exposed or concealed radiation. Similar in appearance and action to other Sylphon Automatic Valves, but operated by an electric wall thermostat. The closing of the thermostat circuit energizes a low voltage electric heater coil surrounding a bulb containing a volatile liquid. This liquid expansion causes pressure on a bellows in the valve head operating the valve. This provides radiator valve control from a remote location, permits regulation of several radiators from a single thermostat, enables a time switch to be installed, if desired, offers effective zone control of large areas at a fraction of the cost of conventional motor-operated valve systems. Bulletin HVG-70.

Sylphon No. 890 Electric Control Valve

No. 7 Temperature Control—A self-contained, self-powered regulator for controlling unit heaters, wall or ceiling type radiators, heating coils in duct-type heating systems, etc. Quickly installed, holds temperatures within close limits. Valve placed in steam line to one or a battery of heaters, thermostat mounted on wall or column. For use on regular heating pressures up to 15 lb. Similar regulators, Nos. 7-2 and 7-3 for 50 and 75 lb. Pressure and temperatures up to 170°F. Bulletin HVG-220.

Sylphon No. 7 Temperature Control (Self-operating)

HEATING AND AIR CONDITIONING CONTROL

Almost any type of heating, ventilating or air conditioning system can be advantageously controlled wholly or in part by Sylphon Regulators. Basic advantages of Sylphon Controls are:

Modulating—Maintains ideal conditions —not continually correcting too hot, too cold, too humid or too dry conditions.

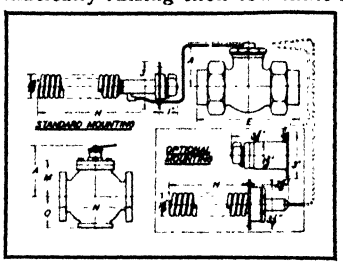
Compensating—Many Sylphon Regulators offer compensating control, automatically raising their low limit setting at a predetermined rate as outside temperatures fall.

Sensitive—Close operating temperature differentials. Quick response.

Simple—in design.

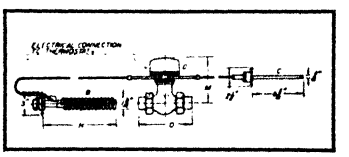
Rugged Construction—To give years of satisfactory service.

Adapatable—Any one of many combinations of Sylphon Instruments can be arranged to control any air conditioning system and to provide exactly the conditions desired. *Write for Bulletin SA C—220.*



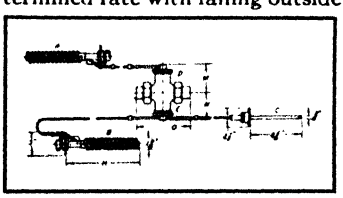
Regulator 928-C

The No. 928-C Regulator—Simple, compact yet highly sensitive. Suitable for modulating control of air temperatures in ducts. Bulb is constructed of numerous coils of copper tubing giving sensitivity to the slighest temperature variation. Packless valve eliminates service problem and makes this regulator ideal for installation in inaccessible locations. Suitable for steam pressures up to 15 lb; other types available for pressures up to 75 lb.



Regulator 928-ECC

The No. 928-ECC Sylphon Regulator—Room control and low-limit control in a single valve regulator for modulating control of ventilating systems. Main control from an electric room thermostat operating through the electric head "D" on the valve. Low-limit control by Bulb "B" located in discharge duct from the heater. Bulb "C", located in inlet side of the duct to the heater, compensates Bulb "B". Compensating thermostat can be furnished to raise low-limit setting at predetermined rate with falling outside temperature. Suitable for steam pressures up to 15 lb.

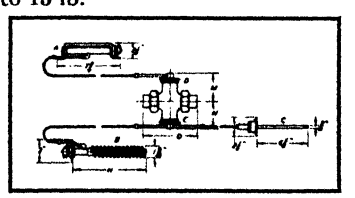


Regulator 829-C

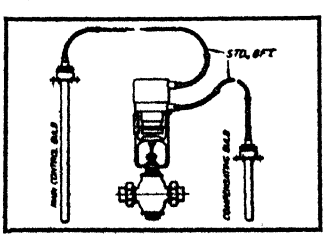
The Sylphon No. 889-C Regulator—A modulating, dual-function regulator for control of duct heating and ventilating systems—two independent valves in a single body.

Adjustable Thermostat "A" governing Valve "D" functions to maintain room temperature from temperature of recirculated air. Adjustable Thermostat "B" acts as a low-limit ductstat controlling Valve "E" to maintain minimum discharge air temperature. Bulb "C" compensates Bulb "B" to maintain even discharge air temperature irrespective of demand. Compensated Thermostat "B" can also be furnished to raise its setting at a predetermined rate with falling fresh air temperatures, if desired. Suitable for steam pressures up to 15 lb.

The Sylphon No. 889-C7 Regulator—The No. 889-C7 regulator has a wall type adjustable thermostat that is placed in the room or space to be controlled. This thermostat "A" operates upper half of the regulating valve. Otherwise, same as No. 889-C regulator described above.



Regulator 889-C7



Regulator 971

Sylphon No. 971 Differential Regulator—For controlling room temperature on the cooling cycle, where chilled water or brine is used as cooling medium and where it is desired to have a gradual increase in room temperature as outside temperature increases. This regulator is modulating in action, thereby affords better control over humidity than is procured when usual on-and-off type control is employed.

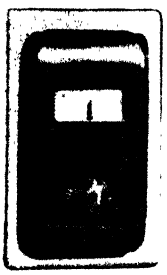
AUTOMATIC TEMPERATURE—PRESSURE—FLOW CONTROLS



The Trimtherm

THERMOSTATS

Trimtherm provides accurate, remote control of desired temperature. Streamlined, compact—extends only ⅞ in. from wall, yet sensitive to slightest temperature change (Differential ½ F.) Chrome cover, natural ivory base.

MAGNETIC GAS VALVES

Type K-3B

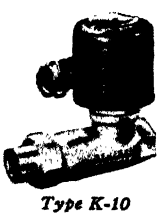
Versatile, two-wire, straight magnetic current-failure valve. Packless. Insures tight shut-off indefinitely. Humless. Size range, ⅛ in. to 6 in. I.P.S Operating pressures up to 5 lb. Voltages and frequencies, A.C. or D.C. Quiet, positive, trouble-free. Available in explosion-proof housing.

SLOW OPENING GAS VALVES

Type B-55

For industrial and commercial burners and furnaces. Adjustable opening time, 5 to 50 secs. Wide pressure range up to 5 lb. Size ¾ in. to 6 in. I.P.S. Ample power for louvre control. Damper arm easily rotated. Packless.

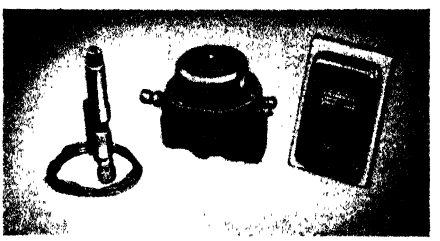
MAGNETIC VALVES



Type K-10

Provides six times more power than ordinary solenoid valves. Controls air, gas, water, light, heavy oils, steam. Positive opening, complete shut-off, packless, hum-free. Available for any voltage, A.C. or D.C., in sizes up to 1¼ in. I.P.S., port sizes up to ⅝ in. K-20 Series is designed for applications where single needle port sizes provide sufficient flow capacity. W-3 Series are magnetic 3-way valves for controlling fluid to piston and diaphragm operators on valves, doors, gates, etc.

B-60 GAS ACTUATED PACKAGE SETS



Everything needed in a convenient package for remote gas control—B-60 Valve, Trimtherm Thermostat, Pilot Burner Generator and 25 ft of wire. No outside current required. Safe, quiet, dependable. Applicable to gas furnaces, floor furnaces boilers, circulators, gas radiators. Operates on all types of gases.

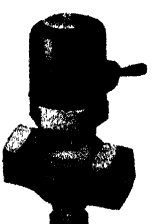
*hi-g MAGNETIC VALVES

Type PV (AV)-3

Designed for positive operation on aircraft, trucks, tractors, tanks, graders, ships, and other moving equipment. Handle all fluids, vapors and gases on anything that rolls, floats or flies at pressures up to 3000 lb or more. Packless, two-wire, current-failure type, available normally open, normally closed for intermittent or continuous duty.

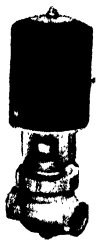
*Trade Mark—"hi-g" indicates positive ability to function in any position, regardless of vibration, change of motion or acceleration.

REFRIGERANT CONTROLS



Type K-18

Magnetic piloted, two-wire, current failure, high pressure, packless. Handle large capacities with minimum pressure drop and loss. Tight shut-off. Operates on wide variety of fluids and gases.

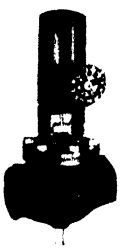


Type G-1-7

HYDRAMOTOR VALVES

Simplify valve control installations. Two-wire, current failure, electric-hydraulic operation. Ample motor-driven power, slow opening and closing movement. Operator drives against a spring in one direction; power failure or opening of circuit causes spring to operate in other direction.

MANUAL RESET VALVES



Type MR-1-2

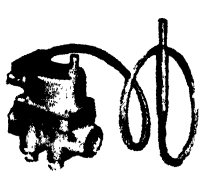
Equipped with manually-reset electromagnetically-held valve operator. Current flowing to operator permits manual opening by turning valve wheel at side. Current failure releases operator allowing valve to close. Trip-free mechanism cannot be opened under unsafe conditions. Once closed, valve is re-opened manually because applying current has no effect.

STRAINERS

Type S-5-1

Actual tests prove importance of strainers in prolonging operating life and reducing leakage of flow controls. S-5 Series STRAINERS come in 8 types; meshes 3/16 in. diam. to 120-per-inch.

THERMOPILOT (Valve Model)



Type MR-2

Manually-reset, electromagnetically-held-open valve with current generated by single couple subject to heat of pilot flame. Available 3/8 in. to 1½ in. I.P.S.

THERMOPILOTS

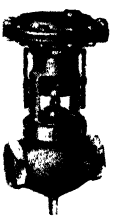
Type A-100

Proven principles of operation insure dependability. Flame applied to thermocouple maintains electrical contact, allowing electrical gas valve to open. When flame fails, Thermopilot opens circuit to main gas valve. Flexible, armored, asbestos-covered cable detachable from relay. 2 or 3-wire control. Electrical rating, 2 amp., 24 volt; 1 amp., 115 volt; 0.5 amp., 230 volt.

THERMAL EXPANSION VALVES

Type V-200 provides unmatched sensitivity and dependability. Handles freon, methyl chloride, sulphur dioxide. Quickly removed orifice cartridges eliminate need for stocking several sizes for low tonnage installation.

GAS FUEL GOVERNORS



Type V-25-1

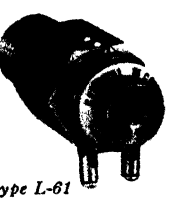
Throttle gas lines according to boiler pressure applied to diaphragm. Ball bearing thrust adjustment, ground and polished non-corrosive stems, low friction packing gland seal, multiple calibrated springs, high lift for maximum capacity. Suitable for butane, natural or manufactured gas. Available 3/8 in. to 3 in., I.P.S.

RELAYS AND TRANSFORMERS

Type RS-100

Type RS-100 handles single phase motor loads up to 1 hp or heating loads up to 1.1 kw. Combines double-break relay and integral transformer. Normally open; large double-break contacts. Two-wire control circuit; maximum holding current 0.4 amps. Furnished with ½ in. conduit connections and low voltage outlet. A.C. only.

TANK THERMOSTATS



Type L-61

Averages 6 to 10 degrees effective differential on water heater. Saves fuel by eliminating overheating due to large differentials. Temperature range, 60 to 170 F. Also to 230 F.

LOW PRESSURE GAS REGULATORS

Type V-300

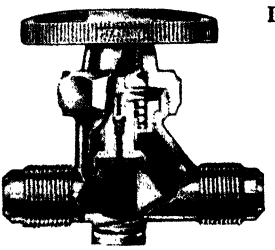
New V-300 Series are reliable, trouble-free valves with high capacity, close regulation, yet small and compact. Regulator sizes range from 3/8 to 2 in. I.P.S. Internal parts, corrosion-resistant. Cast iron regulator bodies, ong life calibrated springs, properly fitted all-metal valves.

GENERAL CONTROLS manufactures a complete line of Automatic Temperature, Flow and Pressure Controls. For complete specifications write for *Catalog 52B*.

Henry Valve Company

3260 W. Grand Avenue., **Chicago 51, Ill.**

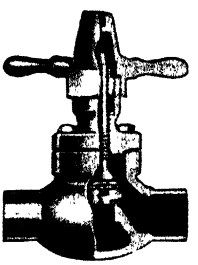
HENRY PRODUCTS FOR REFRIGERATION, AIR CONDITIONING, AND INDUSTRIAL APPLICATIONS: CONTROL DEVICES, VALVES, STRAINERS, DRIERS, FITTINGS, AND ACCESSORIES.



DIAPHRAGM PACKLESS VALVES

Line shut-off, branch shut-off, and angle types; flare, solder, or pipe connections. Hand expansion types also available. Forged brass body and bonnet, ports-in-line, non-directional, stainless steel diaphragm and working parts. Stock sizes ¼" to 1⅛" S.A.E., ¼" to 1½" solder, ¼" to 1" F.P.T.

WING CAP PACKED VALVES



Globe and angle, types, bronze with solder connections, semi-steel with solder and pipe connections. Floating, replaceable stem disc, back-seating to permit repacking under pressure, wrench socket in top of wing cap operates valve. For "Freon" or methyl chloride. Sizes: Bronze globe, ⅞" to 4⅛" solder; bronze angle, ⅞" to 3⅛" solder; flanged semi-steel globe with tailpieces for ⅞" to 5⅛" solder and for ¾" to 5" I.P.S. butt weld.

SOLENOID VALVES

Made in a wide range of sizes for refrigeration and industrial applications. Details furnished on request.

RELIEF VALVES

Diaphragm Type (Illustrated): For low-pressure refrigeration.

Approved under safety codes. Diaphragm actuated. Sizes, ½" F.P.T., ⅝" solder. Solder extensions provided to protect internal parts from heat. Smaller relief valves also available. See Catalog 97.

Ferrous Type: For ammonia, "Freon," or methyl chloride. Approved under safety codes. Sizes ⅜" to 2" F.P.T. See Catalog 65 for illustrations and details.

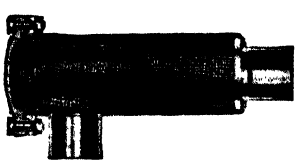
DRIERS

Henry Abso-Dry Driers are charged with dehydrated air. When seal caps are opened at time of installation, hiss of escaping air proves dehydrant is moisture-free. Perforated dispersion tube prevents channelling. Complete line of refillable and non-refillable types for air conditioning and refrigeration. See Catalog 97.

Type 756 (Illustrated): Cartridge-type drier with side outlet, compression spring, dispersion tube, and distortion-proof access flange. Dehydrant volume capacity 12 to 300 cu in. Sizes ⅜" to 1⅝" O.D.S.

STRAINERS

Henry strainers feature large capacity, large screen area, easy cleaning, all-brazed construction. Sizes and designs for all applications. See Catalog 97.



Type 866: Angle strainer with solder connections, reinforced monel metal screen, drawn brass shell, distortion-proof access flange. Screen area 23 to 275 sq in. Sizes ¼" to ⅝" O.D.S.

Type 895: Steel "Y" type strainer. Welded construction, distortion-proof access flange, protective baffle on inlet. Screen area 23 to 175 sq in. Capacity and connections for ⅝ "to 4⅛" O.D.S.; 1" to 3" pipe.

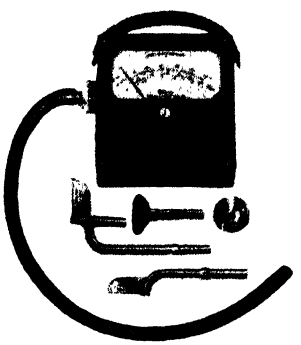
Illinois Testing Laboratories, Inc.

Room 516, 420 N. La Salle St., **Chicago 10, Ill.**

Alnor

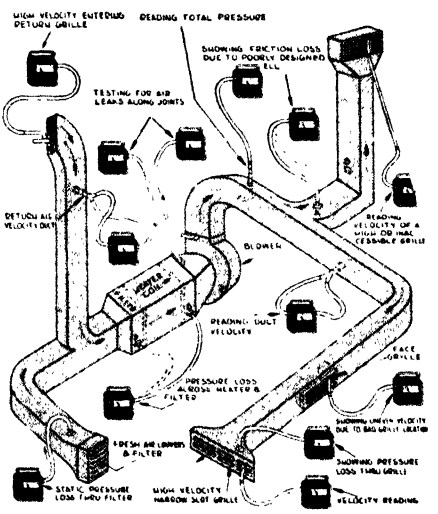
Precision Instruments for *Every* Industry

The direct-reading ALNOR VELOMETER



The Alnor Velometer is an instantaneous, direct-reading air velocity meter designed for convenient, rapid determination of air velocities in air conditioning, heating and ventilating, and exhaust systems. It gives instantaneous direct readings in feet per minute, without timing, calculations, or reference to tables or charts. Accurate information on performance of equipment, duct systems, etc., can be obtained with a few moments' inspection with the VELOMETER. It can be effectively used to locate drafts and leaks around windows and doors, or in duct systems.

The Alnor Velometer is built in several standard ranges from 20 fpm to 6000 fpm, and up to 3 in. static or total pressure. Special ranges available as low as 10 fpm and up to 25,000 fpm velocity and 20 in. pressure.



TYPE 4-F Standard minimum set for heating and air conditioning air velocity measurements.

ALNOR PYROMETERS

Alnor Pyrometers include a wide range of portable and wall mounting types, both single and multi-point instruments, for a variety of industrial temperature measurements. Temperature readings of molten metals, industrial furnaces, and similar equipment, and temperatures of surfaces, either metallic or non-metallic, moving or stationary, are readily obtained with standard ALNOR Pyrometers.

Johnson Service Company

AUTOMATIC TEMPERATURE AND AIR CONDITIONING CONTROL

General Office and Factory

Milwaukee, Wis.

Direct Branch Offices in Principal Cities

JOHNSON TEMPERATURE REGULATING CO. OF CANADA, LTD., 113 SIMCOE ST., TORONTO, ONT.
HALIFAX, N. S. MONTREAL, QUE. WINNIPEG, MAN. CALGARY, ALTA. VANCOUVER, B. C.

PRODUCTS AND SERVICES

Manufacturers, Engineers and Contractors for automatic temperature and humidity control systems applied to all types of heating, cooling, ventilating, air conditioning and industrial processing installations.

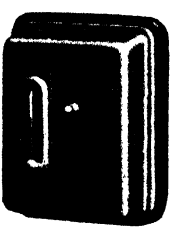
Space Control—Automatic control of room temperatures and humidities, applied to radiators, radiant heating, unit ventilators, unit heaters and heat delivery ducts. Johnson "Duo-Stats" maintain proper relationship between outdoor and heating system temperatures for groups of radiators, or "heating zones." A complete line of controllers for air conditioning systems, heating, cooling, humidifying, dehumidifying.

Process Control—Automatic temperature and humidity control for every range required in manufacturing and industrial processing. Thermostats, valves and dampers applied to tanks, dryers, vats, kettles, curing rooms, coolers, kilns, etc., in textile, rubber, pulp and paper, petroleum refining, meat packing, dairying, baking, sugar refining, brewing and distilling, tanning, candy making and other industries.

Nation-wide Service—Johnson sales engineers, and trained installation men available at all branches listed above. None is an agent, jobber, or part-time representative. All are salaried employees, devoting their efforts to the interests of the Johnson Service Company and its customers.

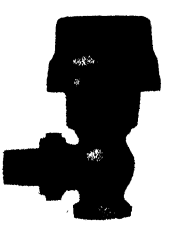
Send for Bulletins describing Johnson controllers.

Single Room Thermostat T-401



"Dual" Room Thermostat T-460

Room Humidostat H-107



"Sylphon" Radiator Valve V-111

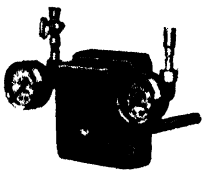
JOHNSON THERMOSTATS

Room Thermostats—Proportional (gradual) or two-position (positive) action, maintaining temperatures within one degree above or below point of setting. Various covers, allowing wide selection of adjusting features, guards and method of mounting. Red-reading thermometers with magnifying tube attached to covers.

Insertion and Immersion Thermostats—Rigid stem or capillary. Liquid or vapor-filled capillary systems for temperatures which are measured at point remote from location of operating mechanism. Various types of bulbs. Standard connecting tubing lengths: 8, 15 or 25 ft. Up to 50 ft on special order.

Thermometers—High grade insertion or immersion thermometers to measure temperatures in ducts, tanks, etc., with red-reading mercury column in heavy lens glass tube and 9-in. scale. Insertion thermometers have patented adjustable tilting feature.

Special Controllers—For applications encountered in industrial processes. "Record-O-Stat," combination capillary temperature controller and recorder. 12-in. chart and liquid or vapor-filled capillary systems. Single or duplex type, the latter controlling and recording wet and dry bulb temperatures . . . **Pressure Regulators**—Pressure ranges 27 in. of vacuum to 150 lb pressure. Bourdon tubes of types and sizes for required pressure range and for medium to be controlled: Air, water, steam or freon. Other regulators for pressures between ¼ lb and 200 lb . . . **Liquid Level Regulators** (Float type)—Control within extremely close limits. Mounted through wall of containing vessel by stem with 1 in. pipe thread. Floats of copper, stainless steel or special alloys . . . **Static Pressure Regulator**—Measures variations in pressure from .009 in. to 3 in. of water. Also used as differential regulator, measuring difference in pressure between two chambers.



Rigid Stem Insertion Thermostat T-860

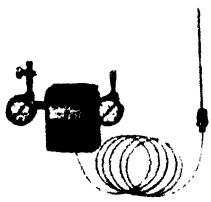
Sub-Master Thermostats—An important development for industrial applications and air conditioning. Applied to various controllers where readjustment must be made from a remote point.

Johnson Sensitivity Adjustment—A distinctive feature affording convenient means of adjusting the sensitivity of thermostats and humidostats, on the job, balancing "time-lag" with respect to capacity of conditioning apparatus. "Hunting" and temperature fluctuations prevented. Available on Johnson proportional action insertion and immersion thermostats, insertion humidostats, and certain room thermostats and humidostats.

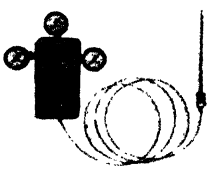
JOHNSON HUMIDITY CONTROL

Johnson Humidostats—Automatically control supply of moisture delivered to air by a humidifier or other means, maintaining constant relative humidity. Available in room and insertion patterns with various elements, the most sensitive controlling within 1 per cent at relative humidities as high as 95 per cent at 100 F. Humidostatic elements are wood cylinder, by-wood strip, bow-wood, horn, hair or animal membrane.

Johnson Humidifiers—"Steam grid" type (perforated pipe supplied with low pressure steam) or pan type with copper evaporating pan, brass heating coils and float control.



Capillary Thermostat T-860

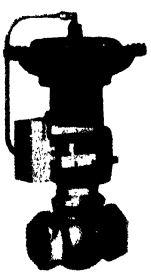


Sub-Master Capillary Thermostat T-901

JOHNSON VALVES

Johnson Diaphragm Valves—Simple and rugged. Diaphragms of special molded rubber, resistant to age and oxidation, operate valve stems against pressure of dependable springs. Available also with Sylphon seamless metal bellows. Made in standard sizes and patterns. Normally open (direct acting) or normally closed (reverse acting). Three-way mixing and by-pass valves, for steam, water, brine and other gases and liquids.

Johnson "Streamline" Diaphragm Valves—With modulating discs and special internal construction. Superior proportional control . . . Where maximum power is required for repositioning at slightest demand of controlling instruments. Johnson molded rubber diaphragm valves are fitted with pilot positioner, independent of friction and pressure variations.



Globe Valve with Pilot Positioner V-103

JOHNSON DAMPERS AND SWITCHES

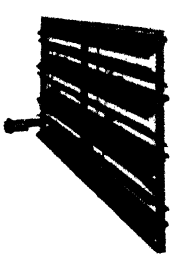
Standard Johnson Dampers—Steel blades in flat steel frames with adequate bracing to form rigid assembly. Black lacquer or special corrosion-resisting finishes. Angle iron frames optional.

Special Dampers—Galvanized iron, monel metal, aluminum, copper, rust-resisting steel, etc. Brass pins in steel bearings or ball bearings.

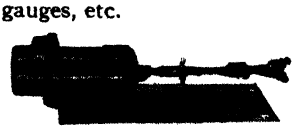
Johnson Damper Operators—Similar in principle to valves. Seamless metal or specially molded rubber diaphragm operates damper through suitable linkage. Johnson "Piston" damper operators afford long travel at full power. With or without pilot mechanism, as described for "Valves."

Johnson Pneumatic Switches—For operation of dampers and to place controllers in and out of service, from remote points. Oiled slate is standard. Ebony asbestos, polished oak, and genuine or imitation marble on order. Various apparatus, at central control points, is mounted on special switchboards, including lever type switches, gradual and multiple-step switches, clocks, air pressure gauges, recording gauges, etc.

3-Way Mixing Valve (Rubber Diaphragm) V-108



Proportioning Louver Damper D-225



Piston Damper Operator D-251

The Mercoid Corporation

Main Office and Factory, 4201 BELMONT AVENUE, **Chicago 41, Illinois**
NEW YORK OFFICE, 205 EAST 42ND ST. PHILADELPHIA OFFICE, 3137 N. BROAD ST.

AUTOMATIC CONTROLS FOR HEATING, AIR CONDITIONING, REFRIGERATION AND VARIOUS INDUSTRIAL APPLICATIONS

FOR PRESSURE & TEMPERATURE

These controls have a wide range of applications. They are noted for their accuracy and dependable performance. The outside double adjustment feature and visible dial eliminate all guesswork when setting the operating range.

VISAFLAME

The Mechanical Eye Actuated by Light. A positive safety control system for domestic and industrial oil burners. Operates direct from the light of the flame instead of from heat in the stack. Tried and proven to be the most practical method for dependable oil burner performance. (See next page.)

OIL BURNER SAFETY CONTROLS

Type JMI provides positive protection against flame or ignition failure on intermittent ignition oil burners. This control insures having ignition circuit closed before every starting operation of burner. Type JM is used for constant ignition burners.

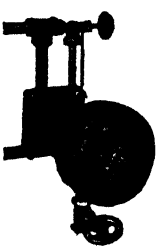
THE ONLY 100% MERCURY SWITCH EQUIPPED CONTROLS

The distinguishing feature of Mercoid Controls is the exclusive use of Mercoid hermetically sealed mercury switches. These switches are not subject to dust, dirt or corrosion, thereby assuring better performance and longer control life. The items shown below are but a few miscellaneous items. See Catalog No. 700 for complete line.

MERCOID THERMOSTATS

Mercoid low voltage room thermostats are known by their trade name SENSATHERM. They operate on a total differential of 1 degree F. Type H is the regular popular room thermostat. Type DNH is a hand wound day and night Sensatherm. Type HBH is the two-stage type for control of high-low oil or gas burners. Recommended also for stokers. Type 855 is designed for direct line voltage applications recommended for unit heaters, air conditioning, etc.

LOW WATER CONTROLS



Available also as a combined low water and pressure control to prevent firing into a dry boiler or building up excess pressure. There are a number of different types for various requirements. The illustration shows type provided with quick-hook-up fittings designed in accordance with the *A.S.M.E.* code.

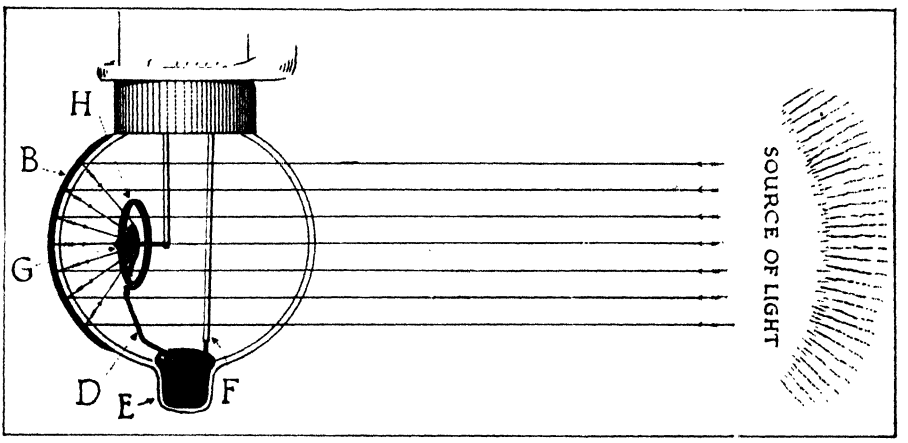
STOKER TIMER CONTROLS

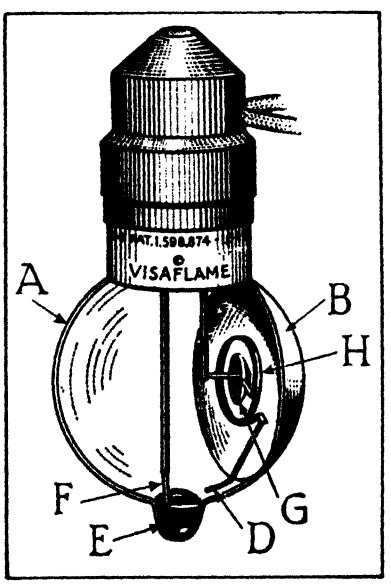
Type TV2 Stok-A-Timer combines a Mercoid Transformer-Relay and a synchronous motor timer mechanism for maintaining the stoker fire during periods when thermostat is not calling for heat. Interval adjustment can be set for ½ hour or 1 hour merely by moving a lever.

MERCOID VISAFLAME CONTROL SYSTEM

(Actuated by Light)

FOR DOMESTIC AND INDUSTRIAL
OIL BURNER APPLICATIONS





The Visaflame is a departure from the usual oil burner control operation. Instead of having a safety control on the stack, actuated by the heat from combustion, the Visaflame is located within or adjacent to the oil burner where it uses the light of the flame as a means of actuating the control system. This permits a more direct and positive method for protection against flame failure, power failure, or low line voltage.

The Visaflame System lends itself to streamline burner design as it can be built into the burner unit by the manufacturer, thereby making it possible to test the complete burner with safety device at the factory which also simplifies and reduces the cost of installation in the field.

MANNER OF OPERATION

The Visaflame, when properly focused, closes its circuit in the presence of light and opens its circuit when the light is absent. The light of the flame passes through bulb "A" and is picked up by the concave reflector "B" which concentrates the light waves on the small bimetal coil "G". This bimetal coil is opaque and therefore transmutes the light waves into heat, which causes it to move the attached electrode "D" into the pool of mercury "E." The electric circuit is then closed between the fixed electrode "F" and the movable electrode "D." The outer bimetal coil "H" to which the movable electrode is attached, compensates for varying ambient temperatures.

The Visaflame is available for Intermittent Ignition or for Constant Ignition oil burners. Also for manually operated industrial burners. Adaptable to high-low flame operation.

Temperature Controller

AUTOMATIC CONTROLS FOR EVERY APPLICATION

Minneapolis-Honeywell manufactures a complete line of electric, pneumatic, and self-contained control units and regulators designed for every type of heating, ventilating, and air conditioning installation. Indicating, recording, and controling instruments manufactured by Honeywell's Brown Instrument Division have wide application in the control of industrial processes.

Line Voltage Thermostat

RESPONSIBILITY FOR ENTIRE CONTROL SYSTEM

Minneapolis-Honeywell can supply a complete line of both electric and pneumatic controls. You can place full responsibility for **all** phases of automatic control with Honeywell. And you gain the advantage of unbiased advice about every type of control—advice based on Honeywell's 60 years of specialized engineering knowledge and experience.

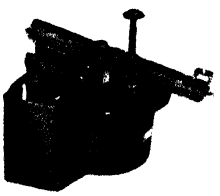
"Modutrol Valve"

THE MODUTROL SYSTEM OF ELECTRIC CONTROL

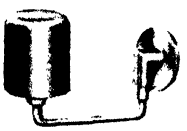
The Modutrol System designation is applied to any combination of Minneapolis-Honeywell Automatic Electric Controls or Self-contained Automatic Valves used to govern the operation of air conditioning or heating systems other than the small domestic installations. A wide variety of both modulating and two position motors, controllers and valves are available thus making the Modutrol System extremely flexible as to the selection of control equipment to produce the desired results.

Gradustat

Grad-U-Trol Valve

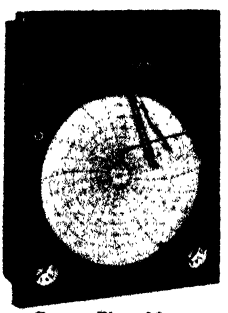


"Grad-U-Motor"—Pneumatic—for modulating control of dampers



Outdoor Weatherstat

Weatherstat Panel



Brown Flow Meter

THE GRADUTROL SYSTEM OF PNEUMATIC CONTROL

The Gradutrol System designation is applied to any combination of Minneapolis-Honeywell Automatic Pneumatic Controls used to govern the operation of air conditioning or heating systems. Such features as infinite positioning with the Gradutrol Relay and accurate graduation of valve and damper motors makes the Gradutrol System a truly remarkable advance in pneumatic control of commercial air conditioning and space heating installations.

COMBINATION ELECTRIC AND PNEUMATIC SYSTEMS

The outstanding advantages of both the electric Modutrol System and pneumatic Gradutrol System of control may be combined in a single installation. Thus maximum flexibility and low installation cost are obtained. Minneapolis-Honeywell can offer either an electric or pneumatic system, or a combination of the two. This is your guarantee of an unprejudiced recommendation.

WEATHERSTAT HEATING CONTROL SYSTEM

Heat Metered to the Weather

The outdoor control system that responds to wind, sun, and temperature conditions. Saves fuel, offers greater comfort to occupants by keeping a building in proper heating balance with all types of weather. Has wide usage on apartments, hotels, and other commercial and industrial buildings. The Weatherstat system is designed for direct control of the heating plant, or for zone applications. Zone systems are available in modulating or on-off control.

BROWN INSTRUMENTS

The extent to which air conditioning equipment is being used in office buildings, theatres, stores, industrial buildings, etc., has opened up a wide demand for indicating and recording resistance thermometers. To obtain uniform conditions and maximum economy from modern equipment, it is necessary that the engineer in charge have a visual picture of actual temperatures throughout the system.

Brown Resistance thermometers are available for indicating, recording, and controlling service and are applicable to all types of air conditioning and space heating installations.

In addition to Resistance Thermometers, The M-H Brown Instrument Division manufactures:

Thermometers
Hygrometers
Pressure Gauges
Vacuum Gauges
Potentiometer Pyrometers
Flow Meters
CO_2 Meters
Tachometers
Liquid Level Gauges
Protectoglo System

Moeller Instrument Company

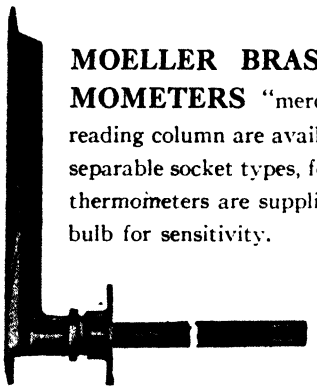
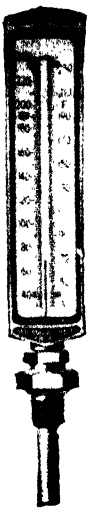
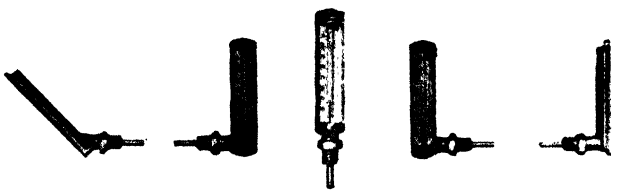
INSTRUMENTS FOR HEATING AND VENTILATING

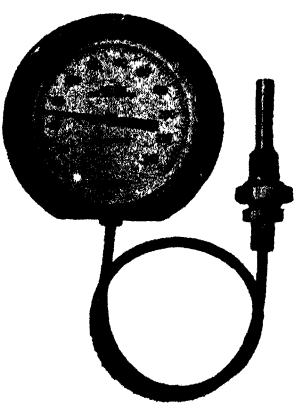


MOELLER BRASS CASE INDUSTRIAL THERMOMETERS "mercury filled" with MOELLER glass red reading column are available in 7, 9 and 12 in. cases, fixed, union or separable socket types, for pipe line and tank applications. Air duct thermometers are supplied with flanged union connection and bare bulb for sensitivity.

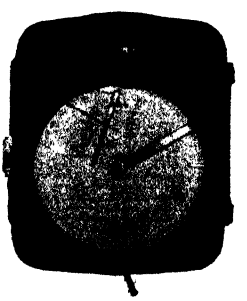




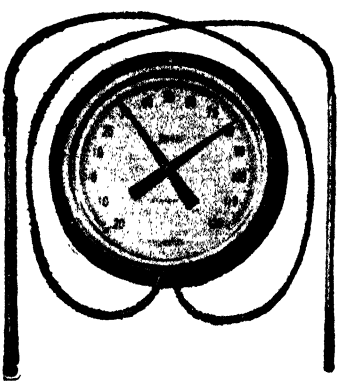
MOELLER DIAL AND RECORDING THERMOMETERS are mercury actuated, built for accuracy and long life. Dials are available in 4½, 6 and 8 in. sizes, single or duplex type. Recorders in 10 and 12 in. sizes, in 1, 2, 3 and 4 pen types.



Remote Reading Type, mercury actuated with separable socket connection. Back connection or flush mounting.



Single and multiple pen. Remote Reading types in rectangular or round cases.



Duplex mercury actuated, plain bulb type indicates temperatures at two separate points.

HEATING CONTROLS

The Penn line of controls includes models for every type of heating service on steam, vapor, hot water or warm air systems whether gas, oil or coal fired. In this complete line there are: Low and line voltage Room Thermostats—Stoker Timers—Oil Burner Stack Switches—Hot Water and Warm Air Temperature Controls—Vapor Controls—Steam Pressure Controls—Relays—Humidistats—Day-Nite Tem Clocks—Damper Motor Controls—and Solenoid Valves. Condensed description and specifications are given in Bulletin 1508. *Write for your free copy.*

REFRIGERATION CONTROLS

Whatever your need may be in refrigeration controls—choose the exact type to fit the job from Penn's complete line of automatic controls. New series "270" pressure and temperature controls feature two-pole construction and direct reading calibrated scales. Also: Cooling Room Thermostats—Humidistats—Relays—Solenoid Valves—and Water Regulating Valves. All of these controls are described and illustrated in condensed Bulletin 1487. *Write for your free copy.*

Spence Engineering Company, Inc.

28 Grant Street, **Walden, N. Y.**

SPENCE METAL DIAPHRAGM "DEAD END" REGULATORS

Advantages of Spence Regulators

Dead-end Shutoff—Spence Regulators are guaranteed to hold a dead-end.

Single Seat—Spence design makes possible a balanced single seat even in large sizes.

Metal Diaphragms—Under normal conditions never require replacement.

Accurate Regulation—Regardless of fluctuations in either load or initial pressure.

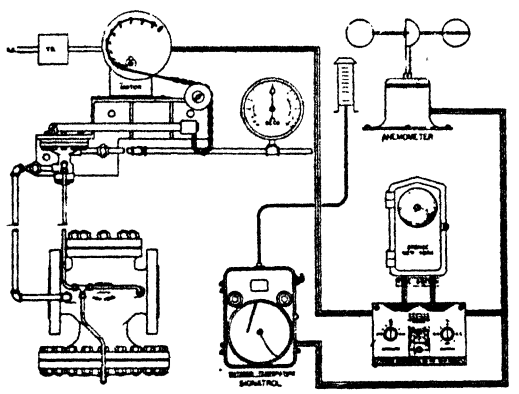
SECO Metal—Guaranteed to resist the wiredrawing action of steam.

Interchangeable Pilots—Any type of pilot will fit any size main valve.

Accessibility—Pilot is connected to main valve with unions.

No Stuffing Boxes—All main valves and most pilots are packless.

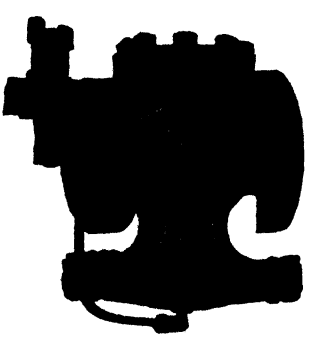
Spence Weather Compensator and Orifice Zone Control System



This simple, dependable Control, when installed on a properly designed orificed heating system, will show a substantial degree-day steam saving, at a low maintenance cost.

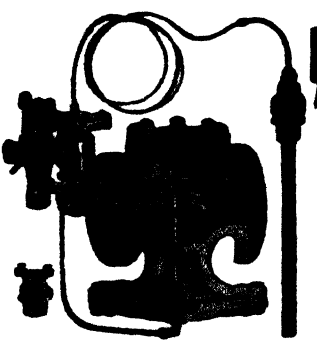
The delivery pressure of the Regulator is automatically adjusted in direct proportion to the building heat losses. In other words, as the losses become greater, steam pressure on the system is automatically increased.

Any number of zones can be controlled by one automatic Signatrol, automatic Wind Loss Compensator (Anemometer), Time Switch and Master Control Panel equipped with Manual and Automatic Dials for each zone. In this way each zone can be set individually and at the same time be under the Master Control.



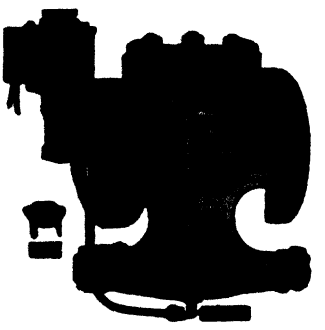
Pressure Regulator—Type ED

Designed to regulate a steady or varying initial pressure so as to maintain a constant, adjustable, delivery pressure. Applicable to heating systems, power plant operations, or manufacturing processes.



Combined Temperature and Pressure Regulator—Type ETD

Self-contained, pilot operated, dead-end. Designed to control flow of fluid to a heating or cooling element, so as to maintain a constant, adjustable temperature, and protect the element against excessive pressure.



Electrically Operated Valve—Type EM

Can be opened or closed independently by an electrical switch.

Type ET—Same as ETD except pressure control is omitted.

Order a SPENCE Regulator for 40 days' free trial.

Fall-O-Matic Universal Pipe Intersection Cutter.

Taylor Instruments for Indicating, Recording and Controlling Temperature, Pressure, Humidity, Flow and Liquid Level

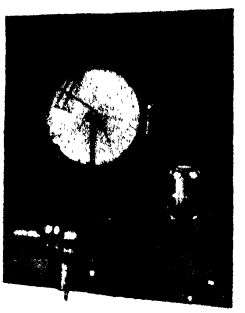
Taylor Industrial Thermometers—with new "BINOC" Tubing—Includes many styles and scale ranges with bulbs for every application. These thermometers contain a new and radical development of tremendous importance—*"BINOC" Tubing*. This newly designed and optically correct glass tubing assures an ease of reading that has been generally lacking in industrial thermometers. *"BINOC" Tubing* more than doubles the angle of vision within which readings can be made. Because of the patented Triple-lens construction its broad mercury column can be read easily and accurately with both eyes. Bore reflection is absent.

Taylor Biram's Anemometer—For measuring air velocities with fan revolutions indicated on dial. Various models for a wide range of air speeds and registration limits.

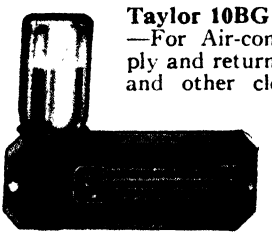
The Taylor "Fulscope" Recording Controller—An air-operated controller that gives practically any character of process control regardless of *time lag* in apparatus.

Available for controlling temperature, pressure, humidity, rate of flow, liquid level. Where extreme load changes or badly balanced operating conditions exist, precision control can be maintained by the automatic reset feature. For applications where a record is not needed, Taylor supplies an Indicating "Fulscope" Controller.

Taylor Recording Hygrometer—Records both wet- and dry-bulb temperatures on the same chart in different colored inks, making comparison very easy.



Type shown has motor-driven fan for conditioned rooms or passages where circulation is poor. Furnished without fan for installations where circulation across bulb is good.



Taylor 10BG Hygrometers—For Air-conditioning supply and return ducts, dryers, and other closed compartments where temperature and humidity readings are desired. Combines the accuracy of an etched-stem thermometer and ruggedness of an industrial thermometer. Easily installed. Available with bottle or constant automatic water supply.

Taylor Sling Psychrometer—Two accurate etched-stem thermometers mounted on die-cast frame, with the bulb of one covered with a wick to be moistened. Whirling bulbs subject this hygrometer to complete air contact to produce extreme accuracy of temperature and humidity measurement.

Taylor also offers a complete line of the famous Taylor Recording and Dial Thermometers; Ratio, Pneumatic Set, Self-Acting and Type "P" Controllers; Indicating Hygrometers and many types of Humidiguides.

United States Gauge

Sellersville 44, Penna.

Division of American Machine and Metals, Inc.

MANUFACTURERS OF PRESSURE, TEMPERATURE, FLOW AND ELECTRICAL MEASURING INSTRUMENTS

OFFICES AND DISTRIBUTORS IN PRINCIPAL CITIES

MOST COMPLETE LINE OF ITS KIND

You will probably find in the U. S. Gauge line, the instrument you need for indicating or recording pressure, temperature, flow or electrical values.

USG Instruments have a reputation for performing accurately, uniformly over a long period—as evidenced by the choice of experts—the manufacturers who install U. S. Gauges on over 6 out of every 10 pieces of original equipment. The **USG** system of quality control and 40 years of instrument manufacturing experience is your guarantee of dependable service from instruments that always "TELL THE TRUTH."

COMBINATION THERMOMETER AND ALTITUDE GAUGE

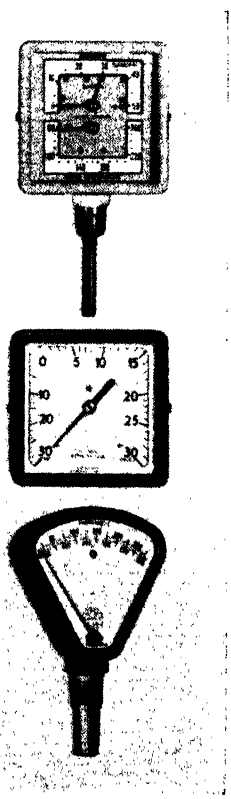
For use on hot water heating systems. Indicates on one dial: water temperature, head of water above gauge and pressure in system. Rugged construction with easy-to-read dial. Available in round or square case.

COMPOUND PRESSURE AND VACUUM GAUGE

Designed for installation on boilers, steam pressure, refrigeration, air conditioning and house heating systems, where it is desired to read pressure and vacuum on one dial. Available with or without an internal syphon, it has a sturdy corrosion resistant movement and a bronze bourdon tube. Furnished in dial sizes from 2 in. to 4½ in. Ranges from 15 to 300 lbs per sq in.

BI-METAL THERMOMETER

Attractive fan shaped dial thermometer, for installation on hot water boilers in house heating systems or other apparatus where sensitive bi-metallic element mounted in bulb can be used. Can be supplied in black, satin, chromium or nickel-finished case. Temperature range 60-260 F. Also made with back connection.



White-Rodgers Electric Company

1209 Cass Avenue, **St. Louis 6, Mo.**

AUTOMATIC CONTROLS

for

HEATING • AIR-CONDITIONING • REFRIGERATION

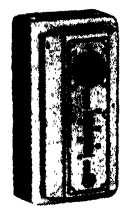
White-Rodgers controls with Hydraulic-Action have many features that assure complete accuracy and dependability in all applications—

- Maximum Sensitivity.
- Positive Settings.
- Full Range Accuracy.
- Consistant Differential.
- No Temperature Drift.
- Easily Adjusted.
- Extra Sturdy Switch.
- High Electrical Ratings.
- Versatility.
- Protected Switch.
- Not affected by Ambient Temperature or Atmospheric pressure.

THERMOSTATS

Series 120

Series 150



Series 130

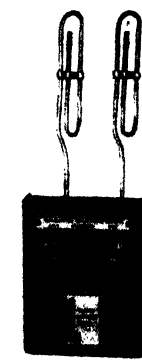
Series 120 and 130 light-duty, low-voltage thermostats are smartly designed with visible touch temperature adjustor. Unusually sensitive with powerful snap action that assures long life. Series 150, with Hydraulic-Action, are heavy-duty, line-voltage thermostats . . . for unit heaters, unit coolers, display cases, walk-in boxes and similar applications.

WARM AIR, STEAM AND HOT WATER CONTROLS

These controls are recommended wherever maximum flexibility must combine with extreme accuracy: Series 1100, Hydraulic-Action hot water controls designed for strap-on installations or with vertical or angle immersion wells; single or dual open and close-on-rise in compact case. Series 500, Hydraulic-Action warm air fan and limit, single or dual. Series 1200, steam or vapor pressure controls; short bellows movement insures long life.

Series 1200

Series 1100



Series 500

GAS CONTROLS

Series 3000

Series 2500

Series 2600

White-Rodgers Diaphragm Gas Valves, Series 2600, are readily applicable to all types of domestic and small industrial heating installations including boilers, conversion burners and floor furnaces. Light weight, easy to install, provided with manual operation switch in case of power failure. Also available with built-in mechanical limit control.

Series 2500 Solenoid Gas Valves, are desirable on installations requiring small overall dimensions. Especially designed centering springs eliminate chattering and magnetic hum. Each valve and seat individually ground and lapped for perfect fit. Series 3000 Gas Safety Pilots, made completely of stainless steel, employ a principle of differential expansion to close the main valve when pilot flame is extinguished. Economical . . . use less than 2 cu ft per hour at a line pressure of 3½ inches.

Burnham Corporation

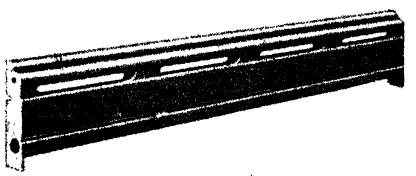
BOILERS and RADIATORS

Irvington-on-Hudson, N. Y.

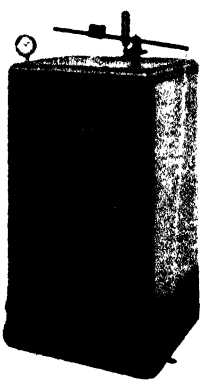
***There's a Burnham for Every Purpose*—Catalog No. 80 Sent on Request**

BASE-RAY Radiant Heating with Radiant Baseboards

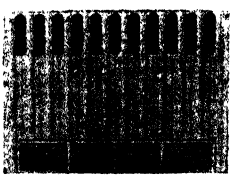
STANDARD Model BASE-RAY—Ratings—1.25 sq ft per lineal foot. Tappings—¾ in. at bottom only of both end panels. Sections are 7 in. high, 1¾ in. thick and in 12 and 24 in. length.



HY-POWER Model BASE-RAY—Ratings—2.08 sq ft per lineal foot. Tappings—¾ in. at bottom only of both end panels. Sections are 7 in. high, 2 in. thick and in 12 and 24 in. length.

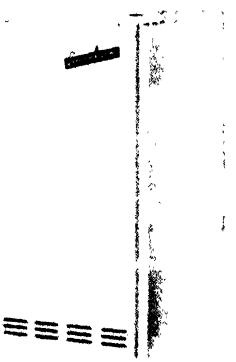


No. 1, 2, 3 and 36 in. Series—All Fuel. 230 to 4920 sq ft Steam and 370 to 7880 for Water.

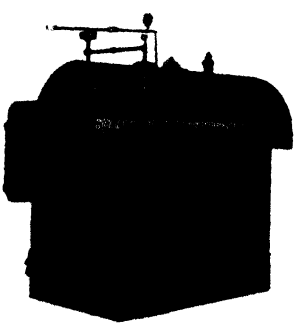


Burnham Radiant Radiator—Two heights. 20 and 23 in.

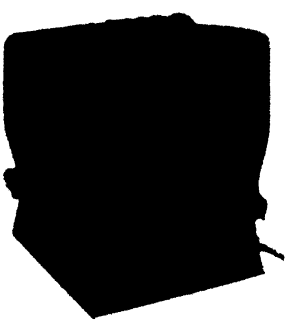
Burnham Slenderized Radiators (not shown) made in three to six tubes in all heights from 19 in. to 33 in.



YELLO-JACKET Boiler (with extended Jacket)—All Fuel Convertible. 305 to 935 sq ft for Steam and 490 to 1495 sq ft for Water.



Welded Steel Boiler—Capacities from 2500 to 35,000 sq ft for Steam and 4800 to 56,000 sq ft for Water. Furnished for coal, oil or stoker firing.



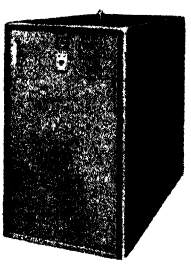
50 In. Twin-Section—4500 to 14,600 sq ft for Steam and 7200 to 23,360 sq ft for Water.

AMERICAN RADIATOR & Standard Sanitary CORPORATION

Pittsburgh 30, Pa.

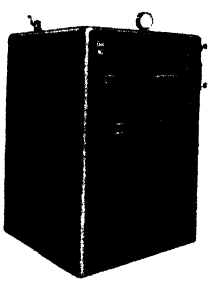
SEVERN BOILER FOR Coal (hand fired or stoker), or Oil

An efficient Boiler with many new features for convenience and economy. *Ratings:* Steam—350 to 780 sq ft, Water—560 to 1250 sq ft, installed radiation.



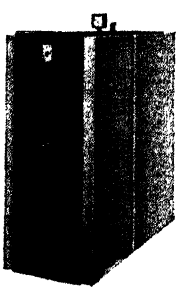
OAKMONT OIL BOILER

Exclusively for oil firing. Also supplied as complete boiler-burner unit with Arcoflame Burner. *Ratings:* Steam—390 to 810 sq ft, Water—625 to 1295 sq ft, installed radiation.



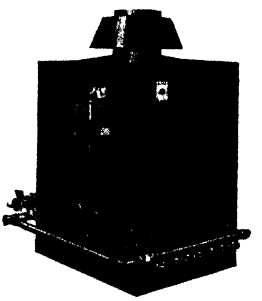
EXBROOK BOILER—For Oil or Stoker

A new boiler in sizes adapted for larger than average homes and buildings. *Ratings:* Steam 775 to 1650 sq ft, Water 1240 to 2640 sq ft installed radiation.



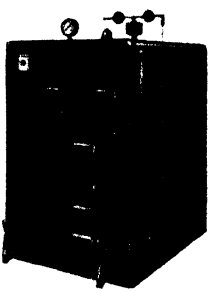
ARCOLINER OIL BOILER

A boiler of advanced design for smaller homes. Wet base construction *Ratings:* Steam—260 to 520 sq ft, Water—420 to 835 sq ft, installed radiation.



STANDARD GAS BOILER

Designed by experts to burn gas efficiently, and economically. *Ratings:* Steam — 400 to 12,420 sq ft, Water — 135 to 19,860 sq ft, installed radiation.

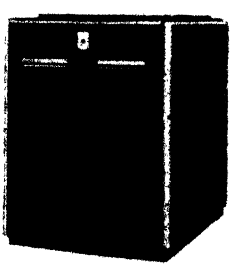


REDFLASH BOILERS For All Fuels

Economical heat for any size or kind of building. Ingot red jacket, fully insulated. *Ratings:* Steam—770 to 9900 sq ft, Water—1230 to 15,840 sq ft, installed radiation.

WATER TUBE BOILERS Stoker or Oil

For medium to large buildings. Efficient and economical. *Ratings:* Steam—930 to 4600 sq ft, Water—1490 to 7360 sq ft, installed radiation.



MOHAWK Winter Air Conditioner Gas-Fired

Provides automatic gas-fired Winter Air Conditioning in homes of any size. Capacities range from 43,200 to 216,000 Btu input per hour.

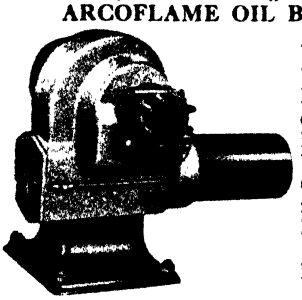
AMERICAN RADIATOR & Standard Sanitary CORPORATION

Pittsburgh 30, Pa.

YOU CAN FILL EVERY HEATING NEED FROM THIS COMPLETE LINE

From AMERICAN-Standard come Boilers, Warm Air Furnaces and Winter Air Conditioners of all types and sizes for Coal—stoker or hand-fired—Oil, or Gas, and a full line of Radiators, Convectors, Oil Burners, Domestic Water Heaters, and Accessories—all backed by the undivided responsibility of one of the world's largest manufacturers of Heating and Plumbing Equipment.

ARCOFLAME OIL BURNERS

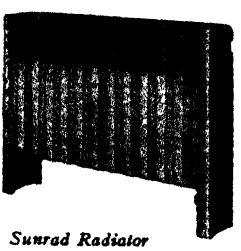


The Model "C" Arcoflame has a capacity of up to 3 gallons per hour. The Model "L" (not shown) from 3 to 7 gallons per hour. Both are highly efficient.

Arco Radiator

ARCO RADIATOR

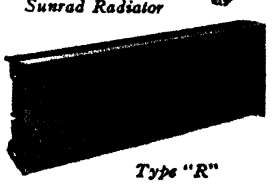
The modern, slim type radiator that occupies less space and gives more heat. It comes in four narrow widths and in four heights —19, 22, 25 and 32 inches.



Sunrad Radiator

SUNRAD RADIATOR

Installed recessed or free-standing. Requires no enclosure. Two sizes: 20 in. high x 5 in. wide = 2 sq ft, and 23 in. x 7½ in. = 3 sq ft.



Type "R"

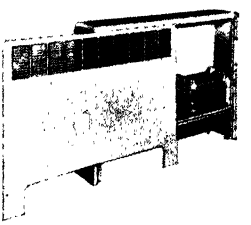
Type "RC"

BASE-BOARD RADIANT PANELS

Made to replace ordinary baseboards. Available in two styles: Radiant type 1.25 sq ft per lineal foot. Convertor type 2.08 sq ft.

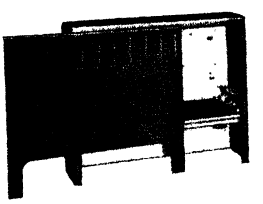
ARCO CAST IRON CONVECTOR

For convection heating. Available in four widths and in virtually any desired length.



ARCO MULTIFIN CONVECTOR

For all systems except one-pipe steam. Made in five widths. Non-ferrous.



BUDGET GAS FIRED WATER HEATER

Heats water automatically, stores it for instant use. Jacket finished in white enamel, black trim. Thrifty and dependable. Four sizes —15, 20, 30, and 40 gallons.

Budget Gas Fired

EXCELSO INDIRECT WATER HEATER

A complete line ranging from 30 to 2500 gal capacity.

No. 861 Hurivent Valve (for mains)

No. 800 Multiport Adjustable Valve (for radiators)

No. 999 Arco Packless Steam Radiator Valve

Crane Co.

BOILERS, RADIATORS, FURNACES, VALVES, FITTINGS, PIPE, WATER AND STEAM SPECIALTIES, CONTROLS AND PLUMBING MATERIALS

General Offices: 836 South Michigan Avenue, **Chicago 5, Illinois**

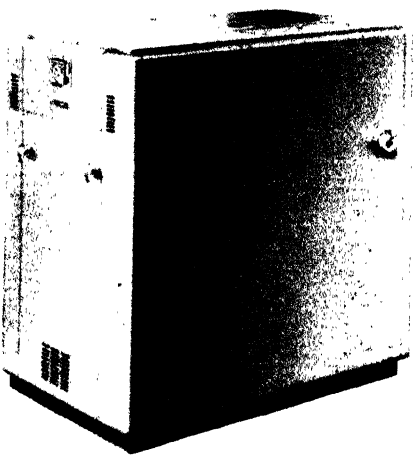
Nation-Wide Service Through Branches, Wholesalers, Plumbing and Heating Contractors

CRANE OFFERS EVERYTHING IN HOME HEATING

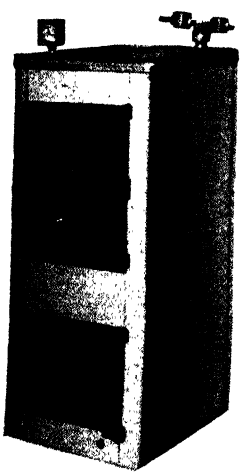
There's a Crane Boiler to fit any home—regardless of its size—whether coal, coke, oil or gas is the preferred fuel or whether the owner wants steam or hot water heating. These boilers are styled for beauty, dependability and simplicity, and they incorporate many new engineering features that assure greater fuel economy and operating efficiency.

Crane also builds boilers for many types of non-residential buildings. In addition, the Crane line includes everything else needed for heating systems—furnaces, stokers, oil burners, radiators, convectors, controls, water and steam specialties, pipe, valves and fittings.

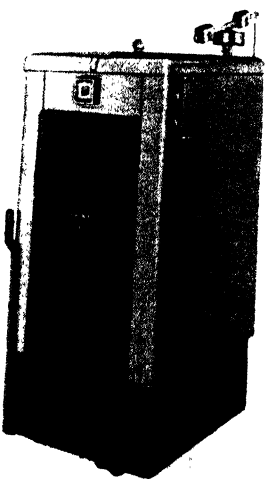
For full information on Crane Boilers and other heating equipment, consult your Crane Branch or Crane Wholesaler.



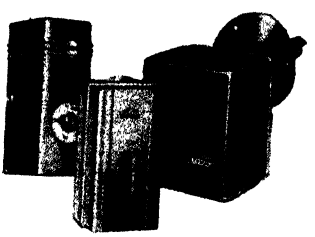
CRANE SIXTEEN BOILER—BURNER UNIT



CRANE FOURTEEN BOILER



CRANE TWENTY BOILER



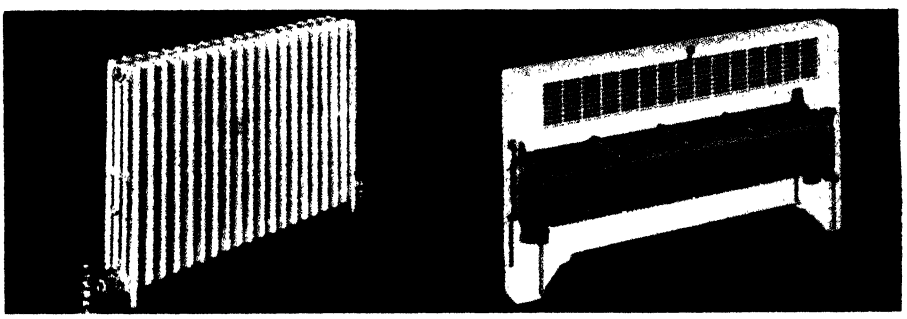
CONTROLS

The complete line of controls includes thermostats, stack switches, limit switches, aquastats, damper controls—everything necessary for a heating system.

COMING! CRANE RADIANT BASEBOARD HEATING

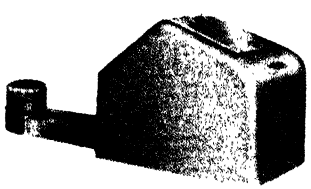
Steam or hot water is circulated through the baseboard panel — no radiators or grilles are necessary. Will give many advantages: more room space; more uniform distribution of heat; easier cleaning. Recommend it to customers who are planning new homes or remodeling.

CRANE RADIATORS AND CONVECTORS



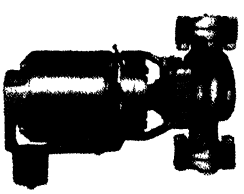
COMPAC RADIATORS: Slender in line—modern in design—give more heat —use less space. For free-standing or recessed installation, steam or hot water.

CONVECTORS: For attractive installations that harmonize perfectly with room decorations. Recessed or free-standing types for new construction or remodeling.



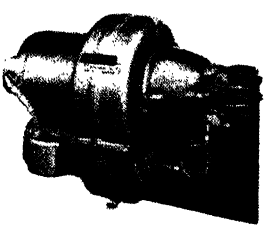
STOKERS

Newly designed and engineered. Assure uniform heating with minimum fuel consumption and minimum attention. Wide range of sizes.



WATER SPECIALTIES

Crane hot water specialties are made to suit every installation. They include water heaters, circulators and flow control valves—all top-quality equipment.



OIL BURNERS

Newly engineered. Crane oil burners provide heating comfort at low fuel costs. Simplified design and sturdy construction reduce maintenance to a minimum.

"100" Series

NATIONAL HEAT EXTRACTOR CAST IRON BOILERS. The distinguished family of National Heat Extractors was designed with an appreciation for the requirements of automatic heating. National Heat Extractors are provided with many features to insure high operating efficiency and maximum fuel economy. These include extended heating surface, multiple-flue section construction, effectively insulated jacket and doors and heat conserver baffles. Convertible from hand to automatic firing after installation and readily adaptable to any desired fuel or method of firing. Wide range of both storage and tankless domestic water heaters available.

NATIONAL OIL HEATING UNITS, cast iron or steel, provide complete "one package" equipment designed for maximum efficiency and top performance with this fuel. Complete automatic controls, prefabricated combustion chamber of proper proportions, quiet burner for rear firing and an attractive all-enclosing jacket.

NATIONAL GAS BOILERS are modern, compact and designed exclusively for gas firing. Cast iron sections for long life and dependability. Tapered flues, long zigzag fire travel and heavy insulation insure efficiency and economy.

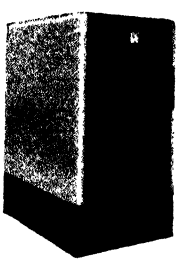
18"-23" Steel Boiler

NATIONAL STEEL BOILERS meet all the requirements of the *SBI* Testing and Rating Code and the *ASME* Boiler Construction Code. All are inspected and approved by a representative of the *Hartford Steam Boiler Inspection and Insurance Company.* The 18 in. and 23 in. Series RESIDENTIAL STEEL BOILERS are designed for smaller homes. The 26 in., 29 in., and 39 in. Series RESIDENTIAL STEEL BOILERS are designed specifically for large homes, apartments, and commercial installations. Can be furnished unjacketed, or with modernly styled heavily insulated jacket.

RESIDENTIAL STEEL BOILERS

Boiler Series	SBI Net Ratings, Sq Ft	
	Steam	Water
18" and 23"	275 to 700	440 to 1120
26", 29", and 39"	700 to 3000	1120 to 4800

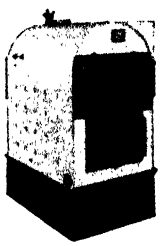


26"-29"-39" Steel Boiler

NATIONAL COMMERCIAL STEEL BOILERS are designed to supply the heating needs of larger buildings. Their firebox proportions conform with the recommendations of the *Stoker Manufacturers' Association.* Hand fired boilers may be converted to stoker, oil, or gas firing at any time after installation.

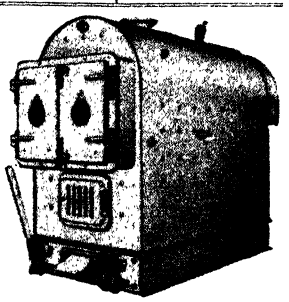
COMMERCIAL STEEL BOILERS

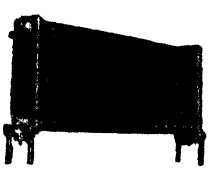
Boiler Type	SBI Net Ratings, Sq Ft	
	Steam	Water
Automatically fired	3000 to 35000	4800 to 56000
Hand fired	2500 to 29170	4000 to 46670



26"-29"-39" Steel Boiler Unjacketed

Commercial Steel Boiler

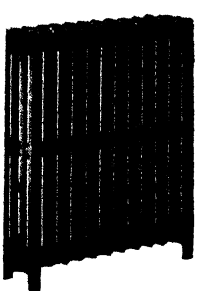




Aero Convector

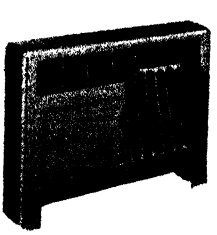
NATIONAL AERO CONVECTORS are of compact cast iron design with fins cast integral with tubes. Adaptable to any type of heating system and can be used with direct radiation.

NATIONAL ART RADIATORS blend inconspicuously with most decorative schemes. Compact proportions require minimum floor space. A wide variety of sizes and ratings can be furnished.



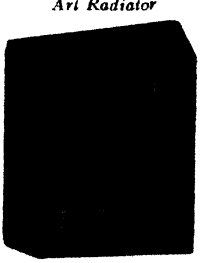
Art Radiator

NATIONAL CONVECTOR ENCLOSURES are made in several different types applicable to modern structural or decorative requirements. They were designed to develop maximum output of the convector.



Convector Enclosure

NATIONAL UNIT HEATERS are designed for quiet, economical operation with steam or hot water. Available in both Horizontal and Vertical delivery types in a number of sizes.



Unit Heater Horizontal Delivery

Spencer Heater

Division—The AVCO Manufacturing Corporation

Williamsport, Pa.

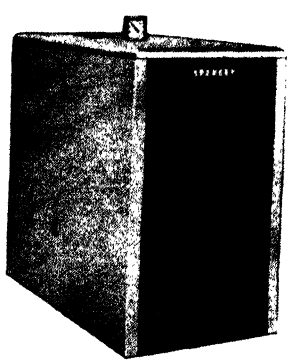
BINGHAMPTON	BALTIMORE			DETROIT	PORTLAND

Since 1888 Spencer has been manufacturing quality automatic magazine feed heaters—and has pioneered other outstanding developments in the heating industry. The Spencer line today includes a series of steel tubular boilers of proven design, quality and workmanship.

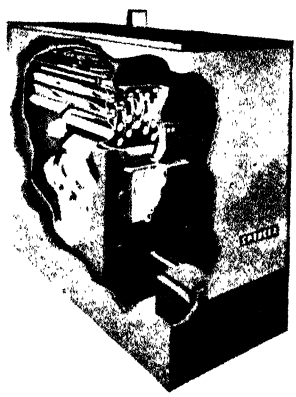
SPENCER STEEL HEATING BOILERS for Oil, Stoker or Hand-firing.

SPENCER SERIES "K" Net S.B.I. 320 to 550

A star performer in the Spencer line for small and medium homes for steam, vapor or hot water heating. Its beautiful two-tone jacket makes it easy to add another room in the basement. It is delivered with standard or extended jackets. A steel tubular heating boiler that can be oil or stoker-fired. Easily converted to a hand fired unit, it will give efficient, economical performance for many years. Here are a few reasons why the Spencer "K" performs so well: Insulated precision-ground doors —heavy duty uniform wall thickness steel tubes—square fire box and fire tube turbulators insure high temperature combustion —low stack loss.



Spencer Series "K"



Spencer Series "C"

SPENCER SERIES "C" Net S.B.I. 700 to 3000

The ideal boiler for homes and smaller commercial buildings. The "C" boiler's amazing economical efficient performance is the result of Spencer's 59 years' experience. It is fitted with beautiful standard or extended jackets. Its many exclusive Spencer features make it easy to install—easy to clean—a safe, practical boiler that gives long, trouble-free service. Spencer hot water heating service can be readily installed for year-round hot water. The "C" boiler is designed for oil or stoker firing but also available with specially designed grate equipment for hand firing.

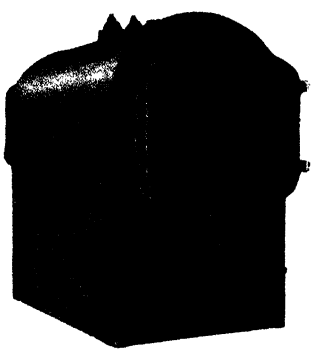
All Spencer "K" & "C" Series Boilers are manufactured in accordance with the *ASME Codes* and are fully approved by the *Steel Boiler Institute.*

SPENCER SERIES "A"
1800 to 42,500 Square Feet EDR Steam

For large homes, commercial buildings or apartments. The many features of the Spencer Series "A" are essentially the same for hand firing, oil, gas or stoker types.

The series "A" is of proven design—in use in thousands of installations. Spencer's peaked firebox design affords rapid natural circulation of boiler water and provides a self cleaning action. Maximum heating surface assures quick steaming with efficient low cost operation. All its internal units are easily accessible—easy to clean, keeping boiler at peak efficiency—resulting in economical performance. The "A" boiler has either rear or top smoke box outlet and you can readily install the Spencer year-round hot water system.

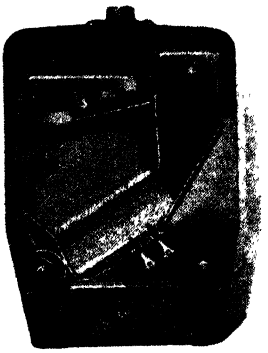
All sizes available with either mechanical (oil, gas or stoker) or hand fire bases. Smokeless Arch supplied on special order.



Spencer Series "A"

SPENCER SERIES L-2 L-3
Capacities 690 to 4510 EDR (Steam)

Designed for quick, economical heat with minimum service requirements for larger homes, apartments or churches. Fuel feeds by gravity, automatically, constantly—needs little attention in 24-hour period. No mechanical parts—burns No. 1 buckwheat and pea size anthracite at substantial saving.



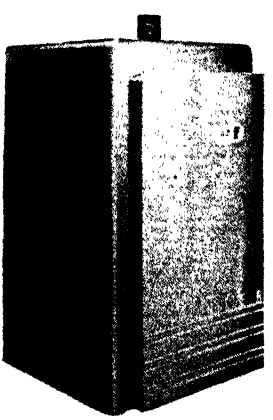
Spencer Series L-2

CAST IRON MAGAZINE FEED BOILERS

SPENCER SERIES "F"
From 290 to 740 EDR (Steam)

For the small home or building, you can't beat Spencer's "F" heater. Note clean design of Spencer's "F" series boiler. Jacket available in harmonious two-tone blue of highest quality steel . . . fully insulated. Its many features include easy accessibility for cleaning heating surfaces . . . no variance in combustion space and fire bed . . . no mechanical parts. The home owner really gets safe, trouble-free, economical performance with Spencer "F" heater.

The series "F" is one of the famous line of cast iron sectional magazine feed boilers especially designed to burn the small economical, buckwheat and pea size anthracite and coke fuels.



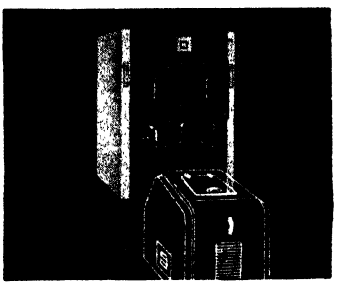
Spencer Series "F"

The H. B. Smith Company, Inc.

Westfield, Mass.

Branch Offices and Sales Representatives in Principal Cities

A complete line of modern cast iron sectional boilers for residential, commercial and industrial heating and for domestic hot water supply



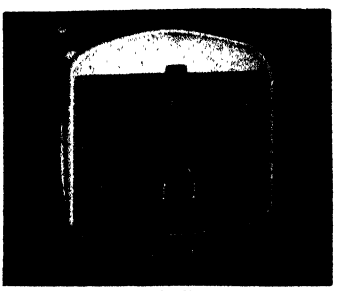
20 Mills

15-20-25 SMITH-MILLS BOILERS

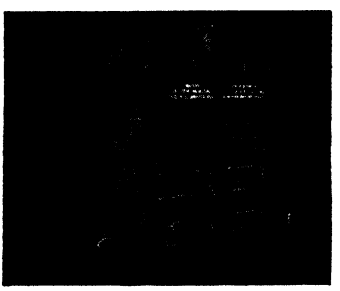
Capacities 200 sq ft to 2275 sq ft steam radiation. This complete line of modern push nipple boilers is available in models for oil, gas, stoker and hand firing. Provisions have been made for built-in domestic hot water heaters and controls.

MILLS WATER TUBE BOILERS
Series 24-34-44

Capacities 900 sq ft to 13,380 sq ft of steam radiation. Independent header type construction—tens of thousands of these famous Mills Boilers are installed in schools, hospitals, apartment houses, stores, and other commercial and public buildings. Models for hand and all types of automatic firing.



44 Mills



60 Smith

42 AND 60 SMITH BOILERS

May be used in batteries for heating loads up to and over 100,000 sq ft steam radiation. Many of these large units installed in industrial plants furnish steam for process requirements as well as for heating and domestic hot water.

SMITH HY-TEST BOILERS

Smith Hy-Test Boilers for hot water supply, are available in several models and many sizes for tank capacities to 20,000 gal. Constructed of the finest quality grey iron castings, these Hy-Test units are carefully tested at high pressures before shipment. The No. 17 series, for example, is tested at 350 lbs hydrostatic pressure—the highest test pressure of any cast iron boiler made.

17 HY-Test

Complete catalog information describing Smith boilers is filed in current issues of Sweet's "Architectural" and Domestic Engineering Catalog Directory

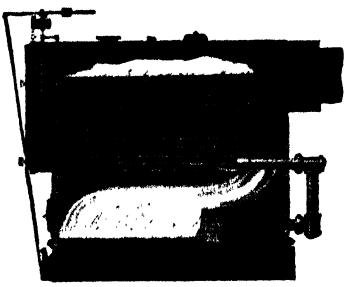
Pacific Steel Boiler DIVISION

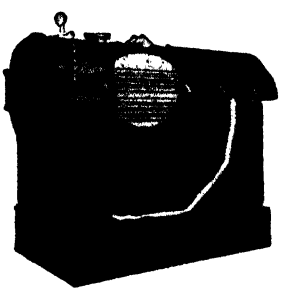
United States Radiator Corporation

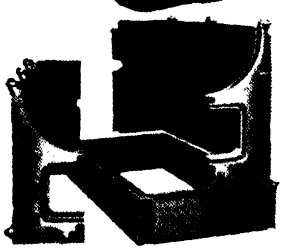
General Offices: **Detroit 31, Michigan**

Sales Offices in Principal Cities

A Complete Line of Low Pressure Steel Heating Boilers







All Pacific Boilers are built using the *A.S.M.E.* Boiler Code Standards as minimums, and rated in accordance with Steel Boiler Institute code.

DIRECT DRAFT AND SMOKELESS SERIES FOR COAL FIRING

Built in the following capacities for steam 2200 to 35,000 sq ft and in corresponding capacities for water.

All Pacific Boilers are built, inspected, and tested under the supervision of the Hartford Steam Boiler Inspection and Insurance Company.

HIGH FIRE BOX SERIES FOR MECHANICAL FIRING, STOKER, OIL OR GAS

Built in the following capacities for steam: 2680 to 56,830 sq ft and in corresponding capacities for water.

All Pacific Boilers are made of flange-quality steel, electrically welded—built to last.

PACIFIC THREE-PIECE CONSTRUCTION

All commercial sizes of Pacific Boilers are built in three sections—shell, firebox and base—and require minimum building opening. Where necessary, Pacific fireboxes can be split (as illustrated) to allow the boiler to be taken into the building in four sections. No cutting, no welding is required in assembling any Pacific Boiler.

PACIFIC RESIDENTIAL SERIES FOR COAL, STOKER, OIL OR GAS

Built in the following capacities for steam: 400 to 3000 sq ft and in corresponding capacities for water.

PACIFIC "*Plate Flue*" BOILER

For oil or gas—built in 4 sizes ranging from 400 to 900 sq ft steam and from 640 to 1440 sq ft water.

Descriptive Bulletins on Pacific Steel Heating Boilers will be mailed on request.

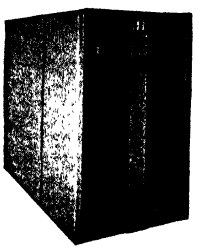
Manufacturing Division: **Michigan City, Ind. and Erie, Pa.**
General Offices: **641 W. Lake Street, Chicago 6, Ill.**
NEW YORK OFFICE: **501 Fifth Avenue**

Weil-McLain Boiler and Radiator service is made conveniently available through local stocks carried by Weil-McLain Distributors in most of the important distributing centers.

No. 68 Boiler for Automatic Firing

Boiler is completely jacketed and insulated. Has an integral front burner extension. Net I-B-R Ratings: Steam 390 to 690 sq ft, Water 625 to 1,100 sq ft.



No. 78 Boiler for Automatic Firing

Boiler has insulated enameled de luxe jacket. Front or rear jacket extension available. Net I-B-R Ratings: Steam 530 to 1,130 sq ft, Water 850 to 1,810 sq ft.

"RO Series" Boiler for Automatic Firing

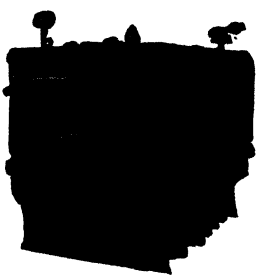
Jacketed and insulated round boiler for small homes. Connected Load Ratings: Steam 420 and 520 sq ft, Water 630 and 790 sq ft.

Nos. 57, 67, 77 All-Fuel Boilers

Conversion type boilers for hand or automatic firing. Connected Load Ratings: Steam 210 to 1000 sq ft, Water 340 to 1600 sq ft.

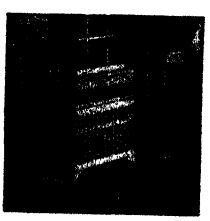
Round-Type Boiler

Unjacketed Round Boiler with corrugated heating surfaces for economical home heating. Connected Load Ratings: Steam 310 to 900 sq ft Water 490 to 1440 sq ft



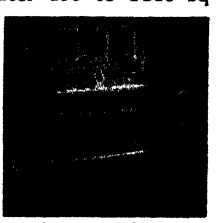
Square-Type Boilers

Sectional boilers for larger installations. Complete range of sizes. Connected Load Ratings: Steam 1,815 to 11,300 sq ft, Water 2,900 to 17,900 sq ft.



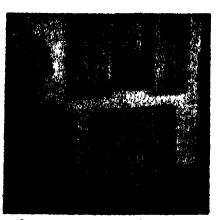
Raydiant "Concealed"

A Radiant convector type all cast-iron Radiator. Made in "Concealed," also Partially Recessed types.



Solray Radiator

Free standing all cast-iron Cabinet type Radiator with metal cover top. Available in three depths in 21, 24 and 27 in. heights.



Junior Radiator

Smaller Tubular type Radiation which conserves space. Available in 1¼ in. centers in 3, 4, 5 and 6 tube widths and 19 to 32 in. heights.

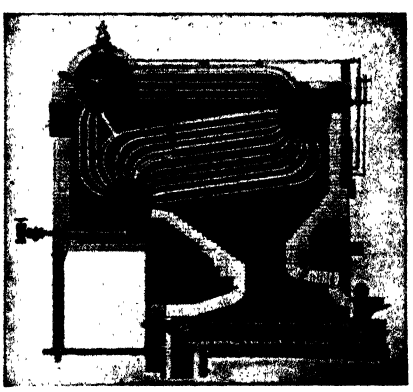
Branch Offices and Representatives in all Principal Cities

Type H Stirling Boiler

The Babcock & Wilcox Type H Stirling Boiler is a highly efficient unit built for moderate pressures at moderate prices. . . . and is designed to occupy minimum floor space and head room for the heating surface required.

This boiler is built in four classes and 36 sizes ranging from 691 to 6225 sq ft of heating surface, and can be designed for operation with any fuel and every method of firing.

The moderate price is due only to the simplicity of design, efficient production methods and superior shop equipment.



Type H Stirling Boiler with Babcock & Wilcox Chain-Grate Stoker

ADVANTAGES OF THE BABCOCK & WILCOX TYPE H STIRLING BOILER:

Unusual steaming capacity for the floor space and head-room required.

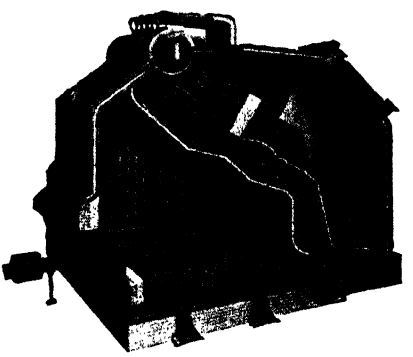
The choice of three locations for gas exit reduces cost of flues and breeching.

Distribution baffles make effective all of the heating surface.

Tube renewal is facilitated by correct tube spacing, and a tube removal door.

The boiler is supported by a structural-steel framework entirely independent of the brickwork.

A complete table of sizes and dimensions will be sent upon request. Simply ask for Bulletin G-8-C.



B&W Integral-Furnace Boiler, Type FF

Many of the advantageous features incorporated in large B&W central-station boilers are now available for the first time in the B&W Integral-Furnace Boiler, Type FF, which is offered in sizes ranging from 1353 to 6506 sq ft heating surface.

DISTINGUISHING FEATURES INCLUDE:

A completely water-cooled furnace. The construction provides water cooling for front and rear (or bridge) walls, as well as side walls and roof.

A furnace arrangement in which the primary combustion zone is followed by an open pass, thus making use of a principle of combustion that was first developed and used successfully in the B&W Open-Pass Boiler for central stations. This design insures mixing of the gases while at high temperatures, thereby aiding efficient and smokeless combustion.

Cyclone Steam Separators, which provide dry steam at high boiler-water concentrations independently of normal variations in water level, and increase circulation by eliminating steam from the water.

These, with related features, result in a boiler that is outstanding for economy of fuel and maintenance and for ease of operation. Write for Bulletin G-34.

The Bigelow Company

105 River Street, **New Haven 3, Connecticut**

MANUFACTURERS OF

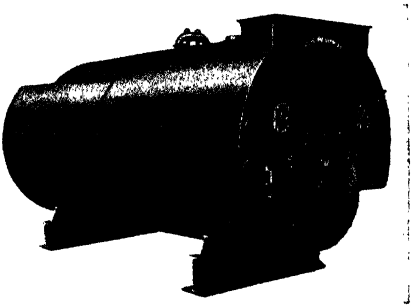
FIRE TUBE BOILERS **WATER TUBE BOILERS**

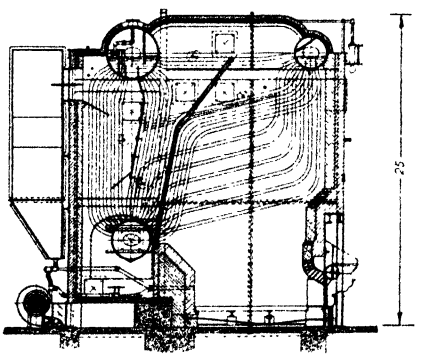
SALES REPRESENTATIVES IN PRINCIPAL CITIES

Catalog Furnished on Request

BIGELOW SCOTCH TYPE HEATING BOILER

A compact, self contained, highly efficient oil fired boiler that requires low head room and has low water line. All parts internally and externally are readily accessible. The boiler is of welded construction and contains no water leg or stay-bolted surfaces. Built in units with steam rating from 1,820 to 42,500 sq ft.



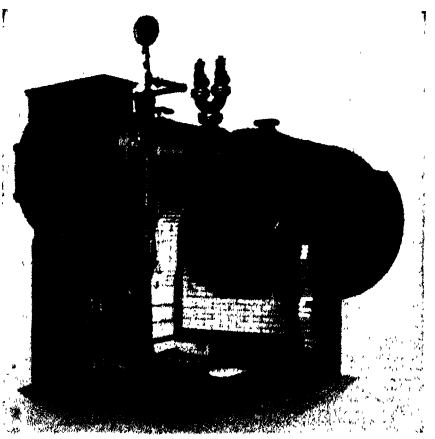


BIGELOW TYPE F WATER TUBE BOILER

Cut shows boiler equipped with spreader type stoker. The flexibility of design permits oil and other type stoker firing. Partial water wall surface is provided without extra headers, downcomers and circulating tubes. The Type F Steam Generating Unit is built in sizes ranging from 10,000 to 60,000 lb of steam per hour.

BIGELOW TWO-PASS BOILER

This boiler is designed to meet heating and power requirements, especially where space limitations prevail. The unit may be oil, stoker or hand fired. The elimination of special brick shapes and stay-bolts reduces the cost of maintenance to a minimum. The Two-Pass boiler is built in standard sizes from 25 hp to 250 hp.



The Brownell Company

ESTABLISHED 1855

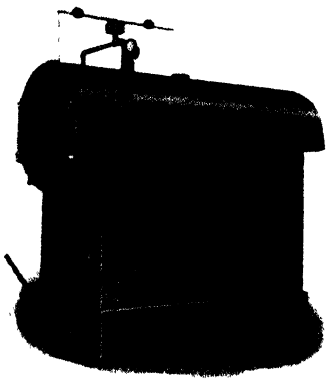
452 N. Findlay St.

Dayton 1, Ohio

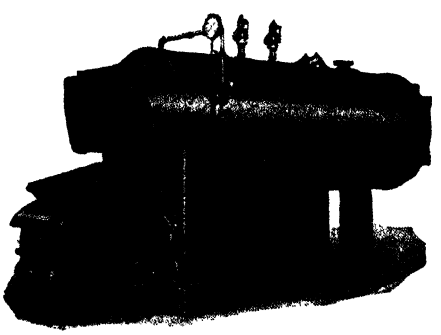
Manufacturers of

BROWNELL BOILERS, STOKERS, AND HEAT EXCHANGERS

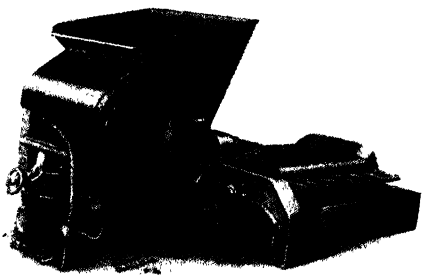
Representatives in All Principal Cities



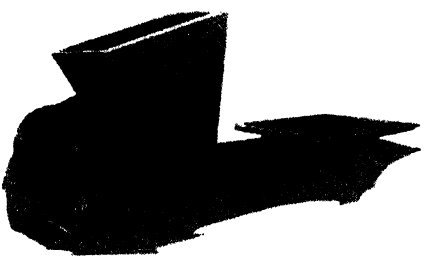
Welded Triple Pass Heating Boilers built in either high leg or low water line types. Hand fired ratings 500 to 35,500 sq ft steam, 800 to 56,800 sq ft water radiation. Stoker, Oil or Gas fired up to 43,100 sq ft steam or 69,000 sq ft water radiation. *A.S.M.E.* Code construction.



High or Low Pressure Double Pass Boiler with Type LR Stoker. Designed and manufactured as a matched unit steam generating plant. Furnished in working pressures from 15 to 150 lb and sizes up to 300 hp. For power, heating, and process steam. Steam ratings 3,600 to 42,500 sq ft. Water rating, 5,800 to 68,000 sq ft when used with stoker, oil, or gas. *A.S.M.E.* Code construction.



Type LR (Low Set) Underfeed Ram Type Stoker. Ideal where height of setting is limited. Sizes to 300 hp; "R" models up to 700 hp. Automatic air volume control. Can be furnished with Brownell exclusive, fully automatic intermittent coal feed control.



Type C Screw Feed Stoker, proved by years of service to be sturdy, reliable and efficient. Illustration shows dead plates; can also be furnished with dump plates in the larger sizes. 30-300 hp.

Heat Exchangers, Generators, Converters. Hourly capacities from 60 to 4,400 gal; storage capacities 25 to 1,904 gal.

The illustrations show only a part of the complete Brownell line. We shall gladly send literature describing Brownell equipment. Our field organization is ready to assist in problems of steam generation and heating.

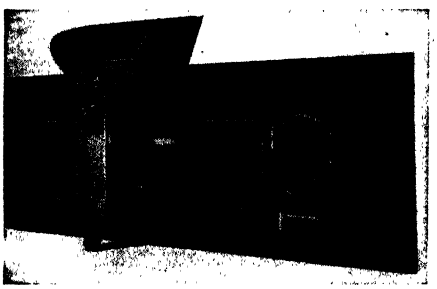
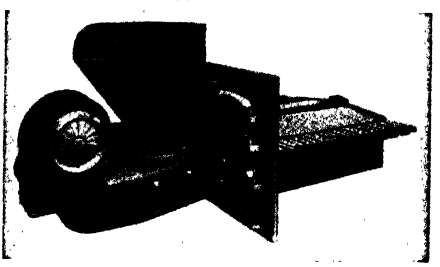
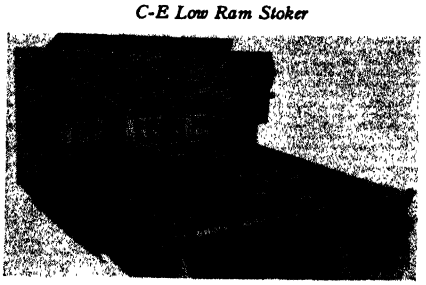
C-E Skelly Stoker



Type E Stoker



C-E Low Ram Stoker



C-E Spreader Stoker

C-E Skelly Stoker—A compact, self-contained unit with integral forced-draft fan, adapted to burn either anthracite or bituminous coal. Alternate fixed and moving grate bars assure lateral distribution of fuel Automatic control is standard equipment. Approximate application range—20 to 200 rated boiler hp.

Type E Stoker—A single-retort, underfeed stoker with an established reputation of many years' standing for dependable service. Designed to burn a variety of bituminous coals under boilers up to about 600 rated hp. Available with steam, mechanical or electro-hydraulic drive.

C-E Low Ram Stoker—A single-retort, stationary-grate underfeed stoker for burning bituminous coals under boilers in the upper size range of the C-E Skelly Stoker.

C-E Spreader Stoker—A simple, rugged overfeed stoker designed to burn a wide variety of coals. Fines are burned in suspension and the coarser coal on a grate which may be of either stationary, dumping or continuous discharge type. Rate of coal feed and air supply may be regulated over a wide range and are readily adaptable to automatic control. Applicable to boilers from about 100 boiler hp up.

C-E Multiple Retort Stoker—For burning bituminous and semi-bituminous coals under boilers up to the largest sizes.

C-E Traveling Grate and Chain Grate Stokers—Including both Coxe and Green types. Available with grate surfaces suitable for anthracite, coke breeze, lignite or bituminous coal, as required. Traveling grates are all forced-draft types; chain grates are either forced draft or natural draft types.

C-E Boilers—All fire tube and water tube types in sizes ranging from 25 hp up to the largest. Standard and special designs to suit all conditions of fuel, load and space. Included are all types formerly known by the trade names "Heine," "Walsh & Weidner," "Casey-Hedges," "Ladd" and "Nuway."

Separate Catalogs describing each of these products are available. A-331-E

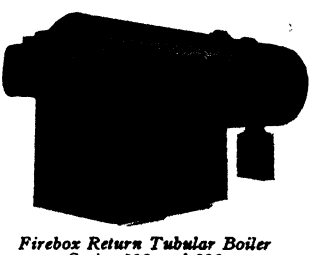
The Bison Compact Boiler Series 100 and 900

The F&T Bison Compact Welded Heating Boiler is more than just another boiler. It has been designed carefully so as to have a large furnace volume, the proper volume of water, just the right amount of steam liberating surface, the correct volume for steam storage and a balanced circulation. The result is a remarkably steady water line—**A Balanced Boiler.**

This boiler requires a minimum amount of floor space and is easy and inexpensive to install. It is reasonable as to first cost and economical in operation. Construction is in accordance with the *A.S.M.E.* Code for 15 lb working pressure and boilers are designed for hand firing with anthracite or bituminous coal or for mechanical firing with oil, gas or stoker. There are various sizes available from 1,800 to 35,000 sq ft of steam radiation, all ratings as required by the *Steel Heating Boiler Institute.*

The Bisonette Compact Boiler has the same characteristics as the larger Bison Compact Boiler. It has been designed for installation in large residences and small business establishments where the advantages inherent in a Steel boiler are desired.



Firebox Return Tubular Boiler Series 500 and 600

Firebox Return Tubular Heating Boilers are **Quality Boilers.** They are constructed to measure up to the high standards set by Heating Engineers and will give unfailing service under all conditions. Being economical to install and operate, they are highly favored by Architects and Engineers for heating Schools, Hospitals, etc.

There are two types of Firebox Boilers, the Up-Draft Type and the Down-Draft Type. Both types are made of welded or riveted construction for heating purposes at 15 lb working pressure and riveted, or, Class 1 fusion welded x-rayed and stress-relieved for power purposes at 100, 125 and 150 lb working pressure in accordance with the *A.S.M.E.* Code. Sizes from 4.500 to 35,000 sq ft of steam radiation, as rated by the *Steel Heating Boiler Institute,* are designed for hand firing with coal or for mechanical firing with oil, gas or stoker.

Scotch Wet Top Back Boilers are designed so that no refractory tile are required at the top of the rear combustion chamber. The steam space extends the entire length of the boiler and the furnace is entirely surrounded by water which permits immediate maximum heat transfer and absorption. This special design results in a boiler that is extremely efficient to operate and is maintained at a minimum cost.

The Scotch Wet Top Back Boiler is a self-contained unit. It can be moved easily and can be installed on two saddles. No expensive foundation or pit is required. No external brickwork is needed. Because of its short length, low height and low water line, this compact boiler unit can be installed in small spaces where there is lack of headroom and where no other type will fit.

Designed for oil, gas or mechanical firing, in accordance with the requirements of the *A.S.M.E.* Code for 15 lb working pressure, ratings of these boilers conform to *S.B.I.* Sizes range from 5160 to 42500 sq ft of steam radiation.

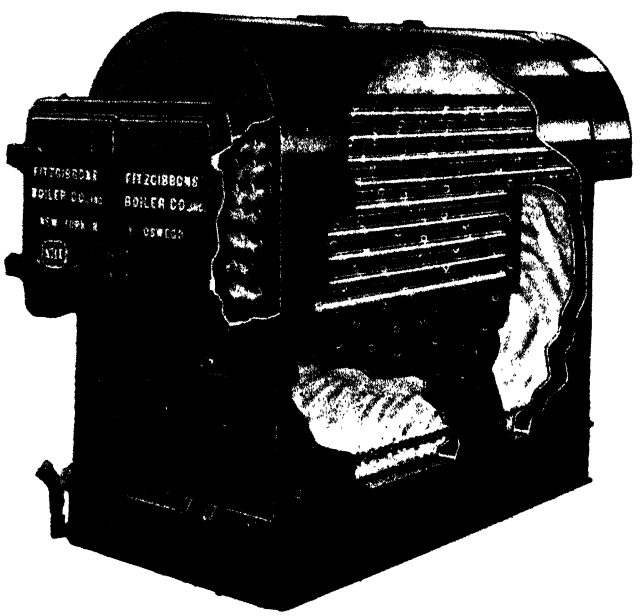
PRODUCTS—STEEL HEATING and POWER BOILERS for all fuels and all heating systems. Capacities to meet requirements of any building. Built and rated according to *A.S.M.E.* and *S.B.I.* Codes.—AIR CONDITIONERS for Direct-Fired installations in residences of all sizes.



FITZGIBBONS

"D" TYPE

Welded Steel

Firebox Boilers

For 15 lb W.S.P.

***A.S.M.E.* Built**

***S.B.I.* Rated**

Hartford Inspected

The boiler for apartments, office buildings, theatres, schools, hospitals—capacities from 1800 to 42,500 sq ft steam EDR.

Full and complete combustion is a feature of the Fitzgibbons "D" Type steel boiler. In the oil or gas fired type, the generous combustion area insures the liberation of every Btu.

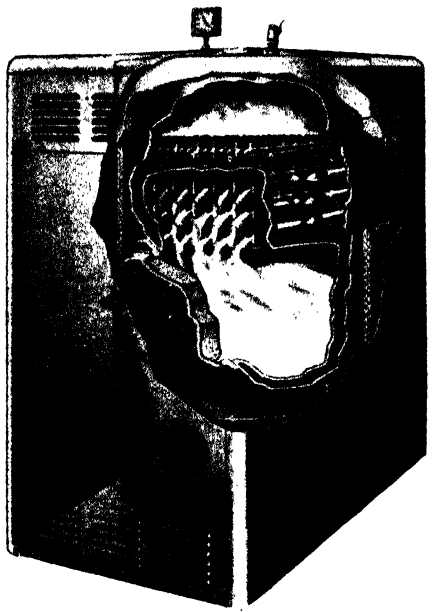
In the coal burning type, grate apertures and secondary air intake are correct for admitting the right amount of air. Flue gases make several passes over the length of the boiler.

Positive water circulation—a rapid continuous surging sweep induced by the concentration of heat at the crown sheet. This powerful circulation is further helped by the absence of convolutions or distorted forms which might impede it.

Ample domestic hot water is provided with no storage tank by the Fitzgibbons "Tanksaver."* Where a storage tank is used, the "Tankheater" may be furnished.

Hand-fired, Coal Type—1800 to 35,000 sq ft steam Oil, Gas, Stoker—2190 to 42,500 sq ft steam 18 sizes.

*Reg. U.S. Pat. Off.



FITZGIBBONS 400 SERIES
***A.S.M.E.* Built—*S.B.I.* Rated**
Hartford Inspected.
5 Sizes—320 to 900 sq ft steam net radiation load.

FITZGIBBONS "400" SERIES

the Steel Boiler for residences

A boiler that brings to the home every advantage of Fitzgibbons steel boiler construction. Electrically welded in a one-piece unit, it combines strength and durability with leak-proof, crack-proof construction.

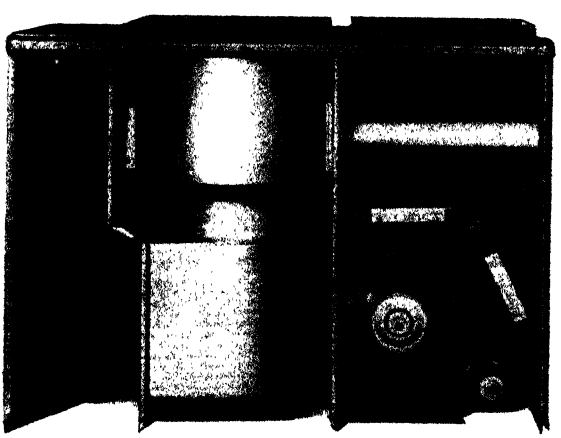
The 400 Series is a particularly quick heating boiler, giving immediate response to thermostat control. This reduces the periods of burner operation and is the reason for outstanding fuel savings and comfortable temperature uniformity enjoyed by the thousands of 400 Series heated homes. Abundant domestic hot water for kitchen, laundry and baths is provided by the Fitzgibbons Tanksaver* summer and winter, with no storage tank required.

This boiler is available in types for all mechanical firing methods, and for hand firing with coal, the latter type supplied with complete grate equipment.

*Reg. U.S. Pat. Off.

FITZGIBBONS "DIRECTAIRE"*

The winter air conditioner for residential comfort



FITZGIBBONS "DIRECTAIRE"
6 Sizes—65,000 to 200,000 Btu/hr.

With a notable degree of economy in fuel, Directaire winter air conditioner tempers the air in response to thermostatic action, humidifies the air automatically to the degree correct for comfort, cleans the air of dirt, dust and foreign matter, and circulates the air quietly, and without drafts. The Directaire is notable for fuel economy, due to the Fitzgibbons "Contra Flo" principle, in which the passage of air through the unit is opposed to the flow of combustion gases. A further advantage is the variable pitch pulley which increases blower capacity, for summer circulation of cool basement air.

Fitzgibbons "Weld-Seal" crack-proof construction, prevents all chance of combustion gas leakage into the air stream. Installation is quick and easy.

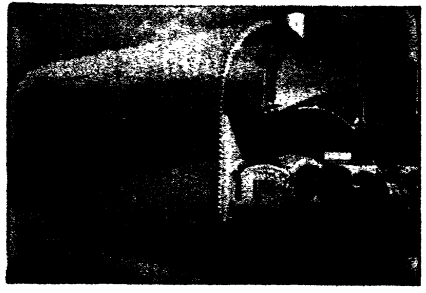
KEWANEE STEEL HEATING BOILERS

Kewanee offers a dependable line of Steel Boilers built for heating every size building with high efficiency burning any kind of fuel. Standard sizes and types of Kewanee Boilers are kept in stock ordinarily for immediate delivery.

Almost eighty years of intensive study and effort are back of Kewanee Boiler designs. They are all constructed in our extensively equipped factory at Kewanee, Illinois, in conformity with these Codes: American Society of Mechanical Engineers for construction, and for rating with the Steel Boiler Institute Simplified Practice. The Kewanee series include:



Firebox Boiler Portable Up-draft Type "400" and "500" Series, Hi-Pressure

HEAVY DUTY RIVETED FIREBOX TYPES: 1,380 ft to 42,500 ft. 10 to 304 Horsepower. Steam Working Pressures 100, 125 and 150 lbs. Single-pass tubes for rear smoke outlet; Two-pass tubes for front smoke outlet.

WELDED BOILERS: 2,200 ft to 42,500 ft. Direct Draft Type "C" with Corrugated Crown Sheet, rear Smoke outlet, and welded firebox two-pass for front Smoke outlet.

RESIDENCE STEEL BOLIERS: 225 ft to 3,000 ft. Square and Round Type "R" with and without Jackets and Hot Water Heating Coils for Storage Tank or Instantaneous flow.

Rated Capacity for Water Boiler is 60 per cent greater than Capacity for Steam Boiler.

Table for two series of Boilers lists maximum dimensions only.

KEWANEE TYPE "R" RESIDENCE BOILERS

Kewanee Type "R" Boilers are especially designed and constructed to meet all heating and hot water requirements for homes and small buildings. Every kind of solid fuel, coke, all grades of hard or soft coals and their briquette or treated forms are burned with excellent results. Also, any liquid fuel, oil, and natural or commercial gas can be used with high efficiency.

Standard jackets will be available for Round "R" and Square "R" Boilers. Hot Water Copper Coil may be ordered for Round and Square "R" Boilers, 55 to 720 gallons capacity for storage tank operation, also 135 to 700 gallons instantaneous flow.

KEWANEE STORAGE WATER HEATERS

Kewanee Storage Heaters—use exhaust or live steam. 15 standard Coil Elements in 29 standard size storage tanks. Capacities 95 to 2240 gals per hr.

KEWANEE SCOTCH MARINE BOILERS

Kewanee Scottie Junior for High Pressure Steam in small industrial usage. 6 sizes 6 to 30 hp at 100 lbs steam pressure.

Kewanee Welded Scotch Marine, Low Pressure Steam. 11 sizes, 5470 to 30360 sq ft, mechanically fired.

KEWANEE HI-TEST BOILER

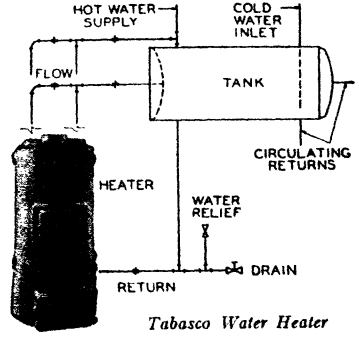
Kewanee Hi-Test Fusion Welded Series for High Pressure Steam in power or industrial process. 6 stock sizes, 50 to 150 hp, 125 and 150 lbs steam working pressure. All *A.S.M.E.* Code.

KEWANEE WATER HEATERS AND TANKS

All-Weld Water Heaters, Tabasco or Garbage Burning, 5 sizes to heat 165-700 gal 50 deg per hour. Extra Heavy W. P. 100 lb per sq in. 150 lb Test.

Water Heating Garbage Burner

Tanks 85 to 450 Gal



Tabasco Water Heater

The Titusville Iron Works Company

Division of Struthers Wells Corp.

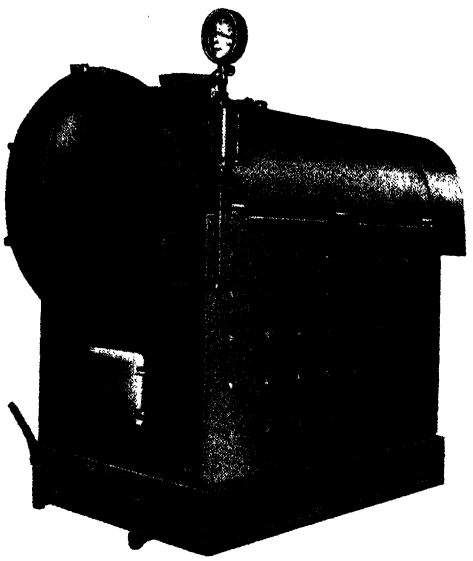
Titusville, Penna.

PLANTS AT TITUSVILLE, PA. and WARREN, PA.

Designers and Builders of Heating and Power Boilers for every purpose since 1860—Water Tube Boilers—Scotch Marine Boilers—Oil Country Units.

TITUSVILLE COMPACT STEEL HEATING BOILERS

19 sizes in Hand Fired, Mechanical Fired, using any type fuel. Constructed to *ASME* Code, Hartford Inspected *S.B.I.* rated.



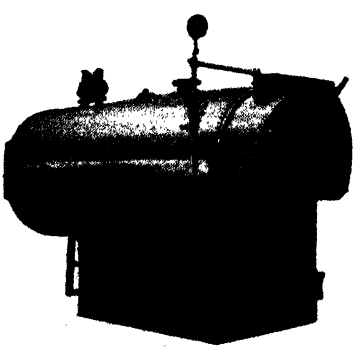
Working pressures — 15 lb Steam; 30 lb Hot Water. Extra large combustion chambers, two-piece construction, rear smoke box, full width flue doors—designed for new operating economy.

Hand Fired Coal, 1800 to 35,000 sq ft steam, 2880 to 56,000 sq ft Hot Water.

Mechanical fired 2190 to 42,500 sq ft Steam, 3500 to 68,000 sq ft Hot Water.

TITUSVILLE SERIES "R.P." PORTABLE FIREBOX BOILERS

13 sizes in Hand Fired, Mechanical Fired, using any type fuel Constructed to *ASME* Code, Hartford Inspected, *S.B.I.* rated.



An ideal "all around" boiler for high pressure steam generation. Two pass, 3 in. Firetubes, Front Smoke Outlet, 100, 125 lb working pressures.

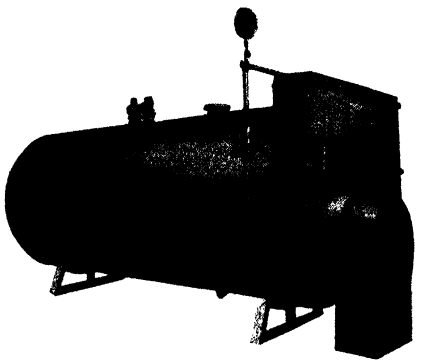
Hand Fired Coal 25 to 250 hp 3500 to 35,000 sq ft Steam Radiation.

Mechanical Fired 30 to 304 hp 4200 to 42,500 sq ft Steam Radiation.

The Titusville Iron Works Company

TITUSVILLE "SOH" LOW PRESSURE SCOTCH BOILERS

Mechanical Fired, Hand Fired, using any type fuel. Constructed to *ASME* Code. Hartford Inspected, *S.B.I.* rated.



Completely self contained, compact, low water line, low head room, no pit or brick base, 3 inch boiler tubes. Extra large steam volume and disengaging area.

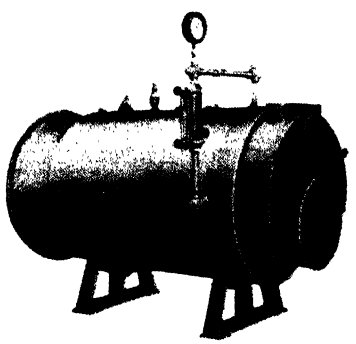
Hand Fired Coal 2366 to 33,950 sq ft Steam. 3786 to 54,320 sq ft Hot Water.

Stoker Fired Coal 3160 to 42,500 sq ft Steam. 5050 to 68,000 sq ft Hot Water.

Oil, Gas Fired 2190 to 42,500 sq ft Steam. 3510 to 68,000 sq ft Hot Water.

"WEE SCOTT" WELDED SCOTCH MARINE BOILERS

Mechanical Fired for Oil, Gas or Stoker. Constructed to *ASME* Code, Hartford Inspected, *S.B.I.* rated.

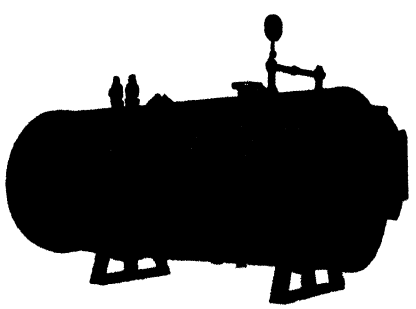


9.7 to 50 hp, 125 lb working pressure—due to extra large combustion volume and large flue areas—higher ratings than shown are available. Can be adapted to hand coal firing. Noted for economy, efficiency, easy installation, low maintenance costs.

Steam Rating 1650 to 8483 sq ft.

TITUSVILLE "SPO" HIGH PRESSURE SCOTCH MARINE BOILERS

Mechanical Fired, Hand Fired using any type fuel, constructed to *ASME* Code, Hartford Inspected *S.B.I.* rated.



All welded construction, working pressures 125 lb and 150 lb. Titusville Scotch Marine Boilers are the ultimate in economy and durability—the results of 86 years of progressive engineering and experience.

Hand Fired Coal 58 to 292 hp.

Mechanical Fired 60 to 300 hp.

The International Boiler Works Company

350 Birch St., **East Stroudsburg, Pa.**

SALES OFFICES IN PRINCIPAL CITIES

FOR years "Fuel-Saver" Boilers Type C have met the requirements for low cost heating in office and apartment buildings, hotels, schools, theatres, industrial plants, etc.

Their design and construction makes them especially suitable for modern heating requirements:

QUICK STEAMING

Due to rapid and positive internal water circulation.

MAXIMUM HEAT ABSORPTION

Due to effective distribution of heated gases.

EASE OF CLEANING

Due to accessibility of heating surfaces.

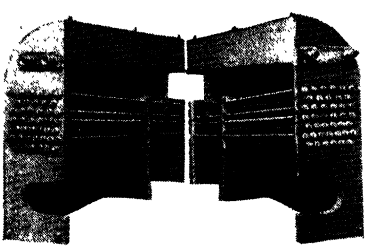
"FUEL-SAVER" Boilers have cut fuel costs in thousands of heating installations.

Complete range of standard sizes rated in accordance with *S.B.I.*-15 lb *A.S.M.E.* standard—for hand, stoker, oil or gas firing.

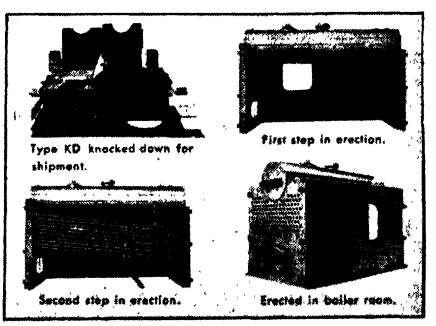
Type C twin section—a heating boiler in halves. For installation where Type C one piece cannot be carried through existing passages.

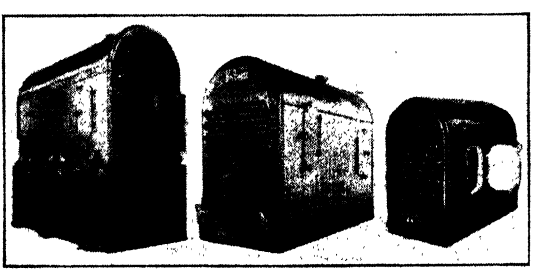
Type KD—knocked down—a heating boiler designed for shipment so that sections can be carried through a door or window. Eliminates expensive cutting or patching of building. Reduces time out when in need of steam.

Typical Type C Installation



Halves of twin section ready for bolting





Type CR water-tube power boiler for processing and power. 100-125-150 s.w.p. *A.S.M.E.* standard.

Complete range of sizes—10 to 300 hp for hand, stoker, oil or gas firing.

BOILER BUILDERS FOR 62 YEARS.

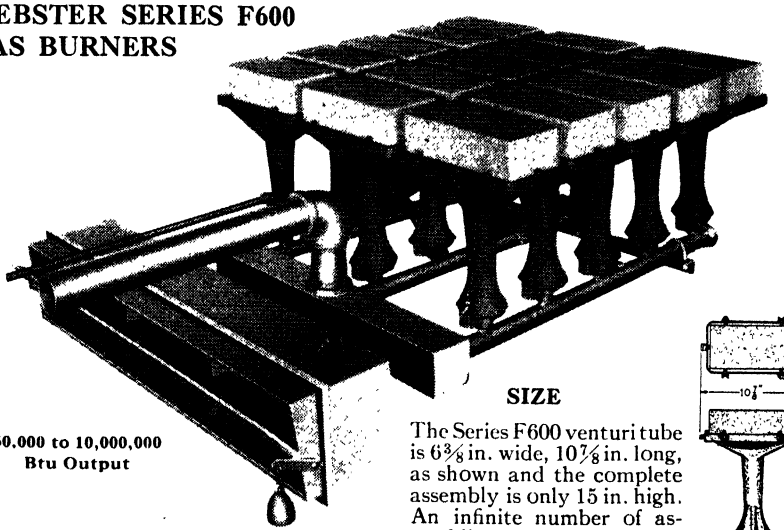
Division of

SURFACE COMBUSTION CORPORATION, TOLEDO, OHIO

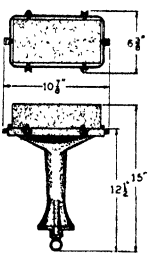
WEBSTER SERIES F600 GAS BURNERS



50,000 to 10,000,000 Btu Output

SIZE

The Series F600 venturi tube is 6⅜ in. wide, 10⅞ in. long, as shown and the complete assembly is only 15 in. high. An infinite number of assemblies are possible by proper arrangement of the individual tubes. For complete sizing information write for bulletin.



For Use in Any Steel Firebox or Sectional Boiler

Improved venturi and greater port area insure much higher capacities at lower pressures.

Unique baffles at the outlet of the mixing tube make possible perfectly even distribution of flame completely around the baffle brick. As a result the maximum flame length is greatly reduced.

Interchangeable grills with multiple ports can be varied to suit the combustion characteristics of various gases. The proper sizing of these grills prevents any possibility of flash back.

In addition to the above major improvements the F600 possesses the same desirable features that made the 600 so popular.

1. Simple installation requiring no expensive insulated combustion chamber and having no furnace radiation loss.
2. Extreme quietness due to low rate of combustion over a large area.
3. Flexibility from infinite number of possible combinations varying both size and shape to meet load and firebox conditions at various gas pressures.
4. High radiant transmission rate due to radiant temperature of the standard firebrick baffles on the top of the burner tubes.
5. Low draft loss because of ample secondary air openings.
6. Plain gas pilots of heat resistant material and of a design that will not allow flame to pull off.
7. Safety pilot applied in a cool zone in a manner that insures perfect direct ignition of the burner yet allowing the the thermal element to cool quickly upon flame failure.
8. Guaranteed vibrationless under all conditions.

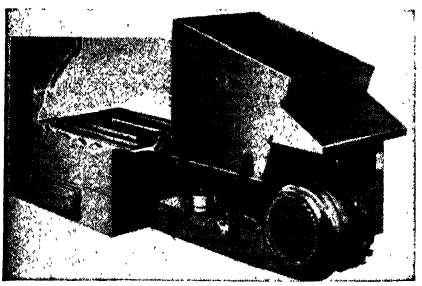
COMMERCIAL AND INDUSTRIAL STOKERS

STANDARD HOPPER MODELS

This series of stokers is the standard of value in equipment for automatically firing boilers ranging in size up to 350 hp. Available in a wide range of coal feeding capacities, lengths and grate arrangements, to fit varied requirements.



Commercial Installation—Hopper Model

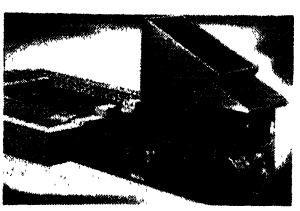
Hopper Model Iron Fireman in Operation in Horizontal Return Tubular Boiler

STANDARD COAL-FLOW MODELS

Commercial-Industrial Installation Coal-Flow model that carries coal direct from main bin or bunker to fire

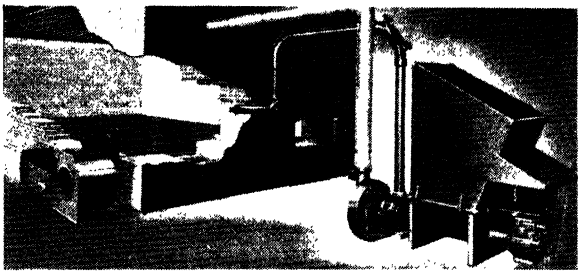
A heavy duty stoker which combines Iron Fireman's well known firing efficiency with the automatic conveying of coal direct from bunker to fire. An integral coal conveying mechanism eliminates the labor and expense of manual coal handling. The IRON FIREMAN COMMERCIAL-INDUSTRIAL COAL-FLOW stoker fires boilers developing up to 350 horsepower. PNEUMATIC SPREADER STOKERS also available in Coal-Flow models.

POWERAM STOKERS



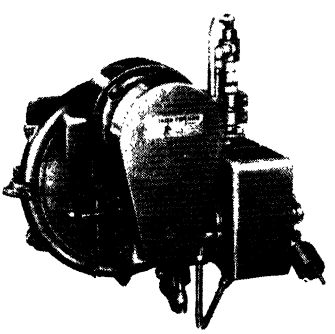
Combines ram-type coal distributor system in retort with free-running worm conveyor from coal supply, and has these advantages: Delivers the fuel to the fire bed in a loose, easily aerated condition; the reciprocating pusher blocks insure proper fuel distribution, and make possible the successful and efficient burning of many types of coal which otherwise are impractical to fire automatically with underfeed stokers. Designed for boilers developing up to 400 hp.

PNEUMATIC SPREADER STOKERS



As shown in the illustration above, the IRON FIREMAN PNEUMATIC SPREADER STOKER meters steam size coal from hopper or main coal bunker to transfer housing, where coal is picked up by pneumatic conveyer and delivered to furnace. The conveyor nozzle accurately spreads the larger particles of coal over the entire grate in a shallow, uniform fuel bed. The preheated fines burn in suspension, reducing the cinder carry-over and greatly improving the combustion efficiency and responsiveness, as compared with other stokers which do not preheat fuel. The conveying air provides the overfire air which is essential for efficient combustion. Entering at right angles to the flow of burning gases from the fuel bed, the conveying air produces *maximum turbulence; another requisite of efficient and smokeless combustion.* THE IRON FIREMAN PNEUMATIC SPREADER STOKER was designed to burn efficiently such economical fuels as the lower rank bituminous, and sub-bituminous coals and also lignite. It provides reliability of operation, physical adaptability, ease of operation, and low maintenance which is not afforded by other types of automatic coal burning systems. Pneumatic Spreader stokers are particularly adaptable to operation at high ratings, and as a result are greatly stepping up steam output in many plants throughout the United States and Canada. IRON FIREMAN PNEUMATIC SPREADER STOKERS are made in both hopper and Coal-Flow models; the latter carry coal direct from the bunker to the fire. Available in capacities up to 1000 hp per nozzle. Multiple units for larger boilers.

INDUSTRIAL OIL BURNER



Oil Volumeter accurately regulates oil regardless of its temperature or viscosity

This industrial oil burner brings new precision and dependability to the firing of high viscosity oils. Accurate adjustment of the fuel feed rate, eliminating pulsating fires and difficult "cold boiler room" starting, is achieved by a principle of multiple-piston feeding. This positive feed control produces a steady flame even when burner is throttled down to low capacity. Any fuel oil, from the lightest to the heaviest, will operate without need for special adjustments. Models available for manual, semi-automatic, or fully automatic operation. Control combinations can be provided to meet individual requirements. Available in capacities from 8 to 125 gph., to develop up to 425 hp.

RESIDENTIAL STOKERS, OIL AND GAS BURNERS—OIL AND COAL SELF-FIRING DOMESTIC BOILERS AND FURNACES—RESIDENTIAL GAS FURNACES.

Write for new general Catalog No. 1396, illustrating and describing the complete line of Iron Fireman automatic heating equipment for industrial, commercial and domestic use.

Aldrich Boiler-Burner Units—available in a range of 6 sizes for Hot Water Heating, Steam Heating, and Hot Water Supply—are designed for home, apartment, garage, club, restaurant, hotel, and factory installations. Gages, covers, and trim are furnished to suit model and type of unit ordered. Coils are factory-installed and tested in WC and SC models. Matched Aldrich Oil Burner furnished with each unit. Standard equipment includes full set of basic automatic controls.

Models Available

W—Water Boiler (universal tapping)

WC—Water Boiler (with coil)

S—Steam Boiler (universal tapping)

SC—Steam Boiler (with coil)

HSG—Hot Water Heater (galvanized, with dress jacket)

Models W, S, and HSG available in all sizes.

Models WC and SC come in 100, 150, 250, and 400 sizes only.

1. *Universal tapping on all models provides openings for necessary gages, valves, controls, 2 risers, 2 returns.*
2. *Built-in tankless heater is copper tube coil in WC or SC models. It provides adequate supply of hot water; no external storage tank or indirect heater is needed.*
3. *Correctly proportioned, seamless, steel fire tubes are easily cleaned; spirals inserted within tubes increase heating efficiency.*
4. *Main shell is heavy steel, welded to top and bottom plates. Entire assembly is tested under 150 lbs hydrostatic pressure.*
5. *A 2 in. thick blanket of rock wool insulation, between main shell and outer jacket, minimizes heat loss and reduces running time of burner.*
6. *Welded steel fire box is surrounded by water leg for high efficiency. Cast refractory lining has high resistance to chipping or deterioration.*

ALDRICH OIL BURNERS

Capacities from .75 gph to 19 gph

Models AX-BX-JU

Aldrich Oil Burners are designed for domestic or commercial installations on warm air, steam, or hot water systems. Capacities range from .75 to 19 gph in 3 sizes and 5 models. Model AX (illustrated) has interchangeable draft tube assemblies and air cones, thereby permitting quick change through 3 firing ranges. Capacities: AX-1, 0.75 to 1.35 gph; AX-2, 1.35 to 2 gph; AX-3, 2 to 5 gph. Model BX, for large homes or apartments, comes with two-stage pump and firing range of 4 to 9 gph. Model JU, a heavy-duty burner for commercial and industrial use, has a capacity of from 5 to 19 gph. It is equipped with a ¾ hp motor, duplex nozzles and ignition, a two-stage pump. All models feature a well-designed fan housing, steel draft tubes, large inspection openings. Aldrich Oil Burners and Boilers are U. L. approved.

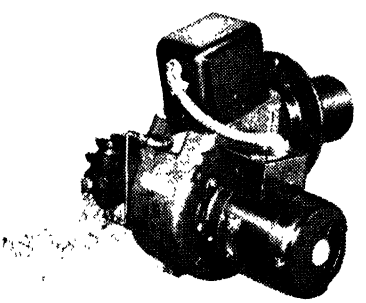
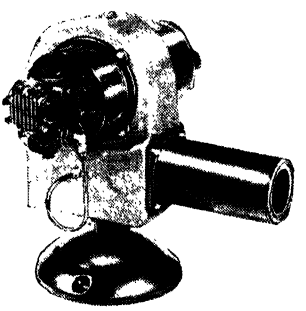
THE TRADE MARK OF QUALITY OIL BURNERS FOR 26 YEARS

PRESSURE TYPE OIL BURNER
Model 51



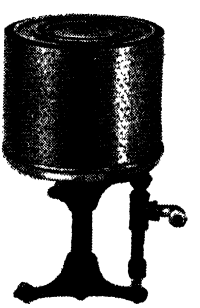
Here is the burner which meets every demand of the complete range of domestic heating needs. It combines beauty of design: excellence of engineering; precision production, to deliver guaranteed performance. The Model 51 mounts directly to the boiler by means of a flange, accurately machined for precise fit. Its 1/8th horse power motor insures trouble-free, amazingly quiet operation. It is attractively finished in the non-rusting, wear-resistant beauty of Hammerloid. Available in standard and odd cycles and voltages.

PRESSURE TYPE OIL BURNER
Model 52



The gun type oil burner has the famous ABC Oilairator mechanism that atomizes the fuel, mixes it with air, and delivers it with correct twist and velocity to insure complete combustion. The ABC nozzle combined with the proper choke and turbulator guarantees precise control and flexibility . . . guarantees a thoroughly satisfactory economical home heating unit. Capacity 0.6 to 6.0 gallons per hour.

RANGE BURNER



This ABC oil burner offers the advantages of all-steel construction, complete interchangeability of parts, and precision manufacture. Tight joints insure constant efficiency of the flame. Easy to clean . . . easy to operate . . . ideal for stoves, ranges, water heaters. Uses kerosene as a fuel.

Makers of . . .

Domestic Boiler and Furnace Units. Range Burners...Water Heaters...Special Products.

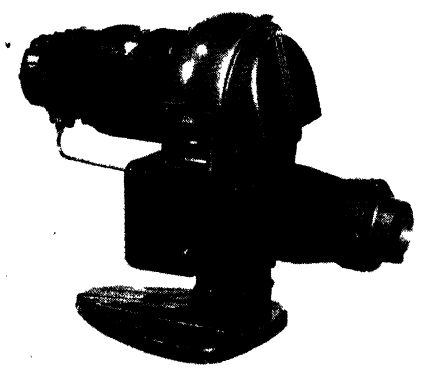
R. W. Beckett Corporation

Elyria, Ohio

Manufacturers of

Beckett Commodore Oil Burners

For all types of heating systems . . . steam, hot water, and warm air. For homes, apartments, business blocks, churches, schools and other applications.



Protected in the United States and Canada by 16 issued patents. Other patents pending.

Approved by Underwriters', and meets the specifications of the U. S. Dept. of Commerce, N. Y. C., Board of Stds. and Appeals, Canadian Stds. Ass'n.

Each time the Beckett COMMODORE starts operating, peak combustion efficiency is attained **immediately**. The air for combustion is violently rotated and mixed with atomized oil **before** the mixture is ignited resulting in a clean, quiet, uniform flame held in suspension.

The special **automatic air shutter** of the COMMODORE opens only to admit measured air for combustion while the burner operates. When the burner stops, the air shutter **closes**, preventing gravity air flow through the heating plant and up the chimney.

The complete power assembly of fuel unit, motor and fan is removable as a single unit. Electrode assembly and all current-carrying parts are enclosed in the air tube. Accurate center to center alignment of motor and pump shafts and **dynamic** balancing of all rotating parts assure vibrationless, noiseless operation.

Every Beckett COMMODORE Oil Burner is given an actual **test under fire** before shipment from the factory.

Size "H"—Full Automatic with dual gas-electric ignition for No. 6 oil—capacity 115 B.H.P.

Enterprise Rotary Oil Burners are designed for efficient utilization of No. 3 and No. 5 oils, and when furnished with electric pre-heaters for No. 6, or Bunker oils. Approved by the Underwriters' Laboratories, the sizes range from 12 to 330 boiler hp in the pump type and to 650 boiler hp for gravity feed or with independent pumpset. By addition of a multi-jet gas head in the burner front plate, standard Enterprise Oil Burners can be converted to a combination unit where natural, manufactured, or process gas is available.

Enterprise Burners are available with manual, semi-automatic and full-automatic controls, and low fire, two-position or modulating controls.

Enterprise engineers have developed many applications for these burners where heat is required for industrial processing. The burners are designed for firing high or low pressure boilers of all types for commercial and industrial uses.

One of the features of the Enterprise Burner is the V-Belt Drive which offers a wide range of burner flexibility and makes possible the use of standard and modern type motors. The Enterprise design features durability, simplicity, quiet and economical operation.

Watch for Early Announcement of New Enterprise Oil Burner Models.

S. T. Johnson Co.

Builders of Domestic and Commercial Oil Burners

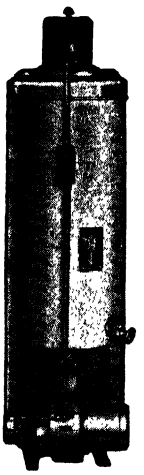
940 Arlington Ave., **Oakland 8, Calif.**

401 No. Broad St., **Philadelphia 8, Pa.**

Self-storage water heaters, separate burner units, burner-boiler units, conditioned air units, range burners and various specialized items comprise the line-up of Johnson light-oil Burners.

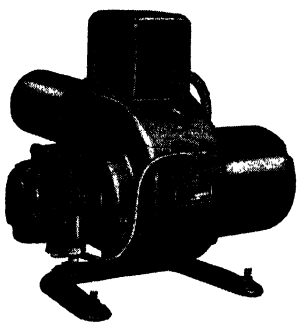
There is a wide range of sizes and capacities in each classification with which heating engineers and contractors can successfully meet every type of problem.

Every Johnson Burner is backed by an unbroken 44-year record of fine engineering and excellent craftsmanship.



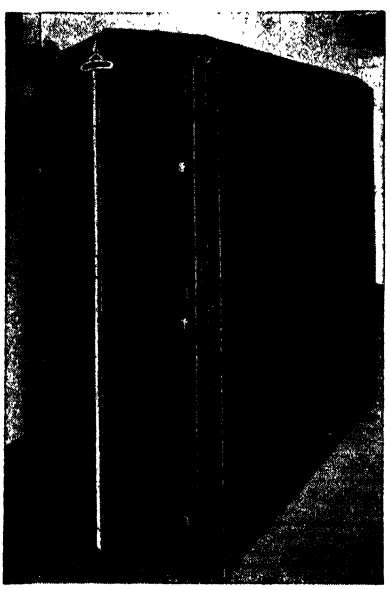
AQULUX WATER HEATERS →

Fully automatic, self-storage. Capacity: 100 to 540 gph.



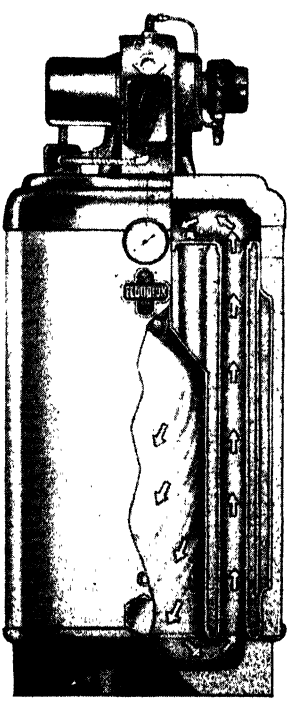
← **BANKHEAT BURNERS**

Fully automatic, pressure atomizing type. Sizes up to 20 gph.



← **SELECTAIR HEATERS**

Hot air, hot water or steam heat. 3 sizes. Bankheat Burners.



→ **ECONOLUX HEATERS**

Heat and hot water. Fully automatic Bankheat Burners.

S. T. Johnson Co.

Builders of Heavy-Duty Industrial Oil Burners

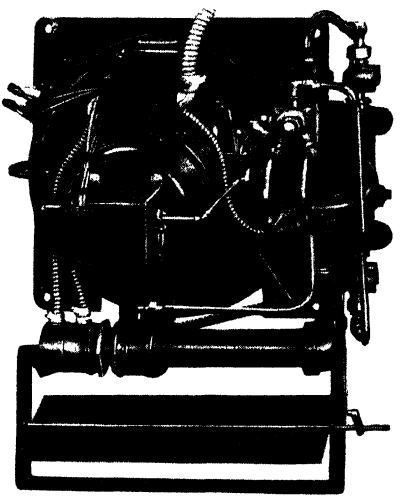
940 Arlington Ave., **Oakland 8, Calif.**

401 No. Broad St., **Philadelphia 8, Pa.**

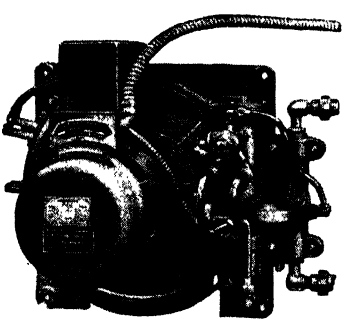
Johnson Industrial Burners are designed to operate on Heavy Oils which produce extra heat at low cost. They increase the capacity of equipment formerly fired with coal and produce desired steam pressures more quickly. Automatic regulation permits the boiler to operate with maximum efficiency at any specified steam pressure, without watching, care or attention, thus reducing labor costs.

They have been installed with marked success in hotels, hospitals, factories, office buildings and other large structures all over America because they provide heating engineers with a wide range of capacities and with every desired feature of economy, performance and automatic control.

In their design and in their construction, Johnson Burners represent the new and advanced engineering and building techniques backed by 44 years of practical experience.



TYPE 30 AVH
Fully automatic. Pre-heater type. Burns No. 6 Oil. Six sizes, 20 to 300 horse power output.



TYPE 30 AV
Fully automatic. Burns No. 5 Oil. Six sizes, 2 to 100 gph.

TYPE 28
Manual and semi-automatic. With or without built-in pumps. Burns No. 5 and No. 6 Oils. Seven sizes, 2 to 135 gph. Illustration shows burner swung away from fire-hole-plate for easy inspection.

Models P 20-A, P 21, P 22

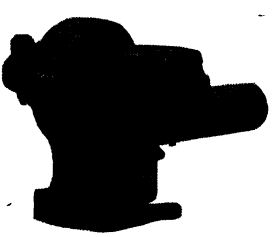
In domestic heating this group of Petro burners has wide and general application to steam, hot water, or warm air systems.

Burns No. 3 fuel oil (or lighter), heaviest and lowest priced fuel oil approved by Underwriters for domestic use. They are precision-built atomizing (or "gun" type) burners, with constant electric ignition for reliable, safe operation. May be installed with inside or outside fuel storage tanks without adding auxiliary pumping facilities. Order or inquiry should specify the type, size and rating of boiler or furnace to be fired, together with the total load.

Models P 12, P 13-A, P 13

Have wide application in heating large residences, stores, garages and other commercial buildings.

Approved for No. 3 (or lighter) fuel oil.



Petro P 13 Burner

Petro Boiler Units—both cast iron sectional and steel—in a range of five sizes covering normal domestic needs, and Petro Water Heaters and forced warm air furnaces are planned for production in late 1947. Information on this equipment available at that time. Send for catalog of Petro Domestic Oil Heating Equipment.

PETRO REG. U. S. PAT. OFF.

INDUSTRIAL AND COMMERCIAL OIL BURNING SYSTEMS

FOR AUTOMATIC . . . SEMI-AUTOMATIC . . . OR MANUAL OPERATION

For Unheated No. 5 or Lighter Oil

Model WA—Automatic ignition and operation with synchronized control of oil and air.

Model W-SA—Semi-automatic, *i.e.;* automatic variation of firing rate with manual ignition; or for manual variation and manual ignition.

For Heated Oils: Heavy No. 5, No. 6 (Bunker "C") oil

Model W-AH—Automatic ignition and operation with synchronized control of oil and air, and of oil heaters.

Model W-SAH—Semi-automatic with oil heaters, i.e.; automatic variation of firing rate with manual ignition; also available for manual variation and manual ignition.

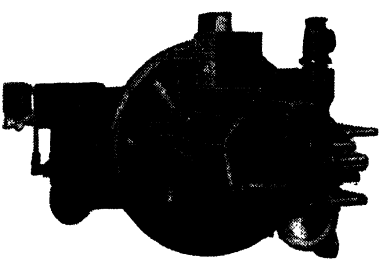
CAPACITIES

Model	Motor H.P.	Max. Gals. per Hour	Rated Cap. B.H.P.	Sq. Ft. C.I. Steam Rad.
W-2½	⅓	11	37	5,150
W-3	½	15	50	7,030
W-4	½	25	84	11,720
W-5	1	33	110	15,470
W-6	2	45	151	21,100
W-7	2	62	208	29,100
W-8	3	100	336	46,600
W-9	3	145	487	68,000

These burners are available for all electrical current characteristics.

PETRO'S THERMAL VISCOSITY CONTROL

The only dependable and accurate control of viscosity—and hence delivered combustion efficiency—is through the heat applied to the oil. Petro's Thermal Viscosity System controls this heat-application at its source. Has been used successfully for years, without any need for frequent manual adjustment.



Model W—Direct Driven, Rotary Cup Type Burner. Illustration Shows Modutrol Mounted on Burner.

This burner is a self-contained assembly of motor, fan, pump, rotary cup atomizer and all air and oil adjustment apparatus.

Interlocking air and oil control mechanism permits any minimum or maximum operation required within the burner's range of operation. Counter-flow Angular Air Vanes at nozzle increase air and oil turbulence and aid efficient combustion of heavy fuel oils.

Special oil adjustment valve meters oil to rotary cup, yet permits manual operation without disturbing permanent burner adjustment.

Removable rotary cup and nozzle permits changing shape of flame to suit requirements of any boiler and prevent flame impingement.

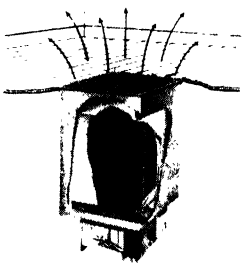
Natural Draft, Automatic, Vaporizing Burner

Natural draft vaporizing burner, specifically designed for low cost furnace oil and listed by the *Underwriters' Laboratories*. Cutaway model shown in typical conversion installation (with controls attached) is fully automatic, with electric ignition (no pilot light) and thermostatic control. Manually operated models, which do not require electricity, are also listed for low cost oil. Seven sizes: 1.45 qts to 2½ gal per hour.

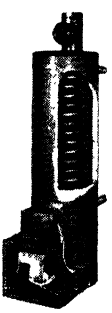


Fully Automatic Oil Burning Floor Furnace

These low cost units are factory assembled, including all controls, ready to hang in floor. Easy installation, no basement needed. Natural draft vaporizing burner, automatic operation, with electric ignition and thermostatic control. Inexpensive to operate. Listed by Underwriters' Laboratories for low cost furnace oil. Two sizes: No. **70-47**—47,250 Btu output (22 in. wide x 28 in. long x 44 in. high); No. **100-47**—75,000 Btu output (22 in. wide x 40 in. long x 45½ in. high).

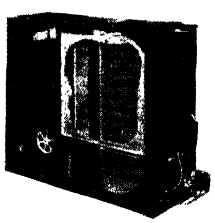
Utility Room Furnace

Ideal for modern homes without basement. Compact, fits neatly in small utility room or closet. Overall size: 20 in. wide x 32 in. deep x 73½ in. Very high efficiency. Two filters, 16 in. x 20 in. x 2 in.; 9 in. blower, 1000 cfm capacity at ¼ in. SP. Cold air return bottom or sides. 84,000 Btu output.



Coil Water Heater

For camps, auto courts, apartments or small hotels. Uses separate hot water storage tank. Also makes excellent boiler for hot water installations in home heating. Two sizes: No. 150—106,960 Btu output, 150 gph (80° rise); No. 250—160,440 Btu output, 250 gph (80° rise).

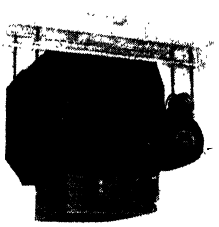


Winter Air Conditioner

Size A, 85,000 Btu output. Size B, 125,000 Btu output. Multivane blower, filters, vaporizing burner.

Ceiling Furnace

Industrial overhead heating saves floor space. Units are factory assembled, including vaporizing oil burner (no refractory brick saves much weight), thermostatic control, high capacity heat distributing blower with ¼ hp motor. Conforms to requirement of the Underwriters' Laboratories for use in garages. 140,000 Btu output.



A complete line of oil-fired small home heating units —plus special industrial units of moderate capacity.

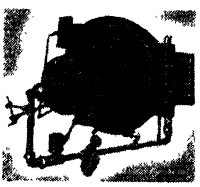
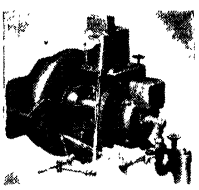
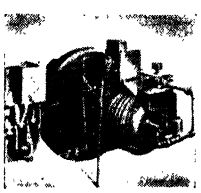
Products: **A complete line of Horizontal Rotary and Pressure Atomizing Oil Burners; Combination Oil-or-Gas Burners; Industrial Gas Burners; Oil Burning Water Heaters; Winter Air Conditioning Units, Commercial Ranges.**



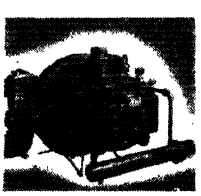
1 to 1000 hp Type AG, Manual, Semi-Auto.



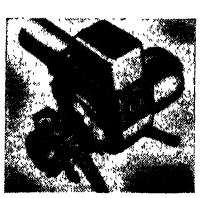
Semi-Automatic, Type AP-14, for No. 5 oil.



Fully Automatic Type AR-134, for No. 5 oil.



Fully Automatic Type AR-144, for No. 6 oil.



Fully Automatic Type JP, # 3 or lighter oil.

RAY HORIZONTAL ROTARY OIL BURNERS

Built in fully automatic, semi-automatic and manual types; in sizes from 1 to 1000 Boiler hp; to burn all grades of fuel oil.

Standard models include both direct and belt drives—the latter being recommended for use where other than 50 or 60 Cycles AC, or only DC is available. Types for straight electric or straight gas ignition; pump or gravity feeds. Direct drive types include a steam turbine driven model.

All fully automatic types for heavy oil incorporate the Ray Dual Pump and Reservoir, with the Ray VISCOSITY Valve, a patented, exclusive feature which automatically meters the correct amount of fuel at all times, regardless of changes in viscosity. All larger sizes employ dual ignition, for maximum reliability.

RAY PRESSURE ATOMIZING OIL BURNERS

Fully automatic, for No. 3 oil or lighter. AC or DC; capacities to 18 gal/hr.

RAY COMBINATION OIL-or-GAS BURNERS

Operate on any grade of fuel oil, any grade of natural or manufactured gas. Oil burner sizes to 1000 boiler hp; maximum gas capacity: 43,600 cu ft/hr. Changeover may easily be made in a few minutes.

RAY INDUSTRIAL GAS BURNERS

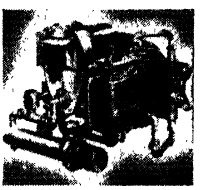
For gas pressures above 1 lb/sq in. May be used alone or in combination with a Ray Oil Burner. Built in eleven sizes; in capacities to 43,000,000 Btu/hr.

RAY WINTER AIR CONDITIONING UNITS

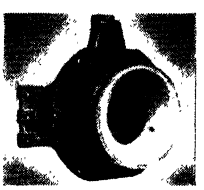
Built in four sizes, with input capacities of 140,000, 230,000, 350,000, 450,000 Btu.

RAY OIL WATER HEATERS

Two sizes. *Capacities:* 45 and 75 gal. *Maximum recovery rates:* 154 and 240 gph.

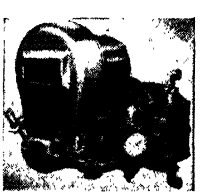


Belt Drive Automatic Type BR-141, # 6 oil.

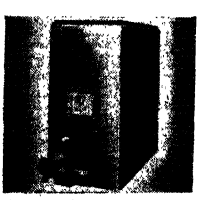


Gas Burner, Type HN, for high pressure gas.

Steam Turbine Drive, Type TG, all grades oil.



Small Capacity (¼ to 2½ gph) rotary burner.



Ray Oil Furnace, Winter Air Conditioning Unit.

TODD SHIPYARDS CORPORATION

81-16 45th Avenue, **Elmhurst, Queens, N. Y.**

NEW YORK, BROOKLYN, ROCHESTER, CHARLESTON, S. C., CHICAGO, BOSTON, WASHINGTON, DETROIT, GRAND RAPIDS, TAMPA, GALVESTON, MOBILE, NEW ORLEANS, LOS ANGELES, SAN FRANCISCO, SEATTLE, MONTREAL, TORONTO, BARRANQUILLA, BUENOS AIRES, LONDON. HOBOKEN, NEWARK, PHILADELPHIA, SPRINGFIELD, MASS., BALTIMORE,

THE TODD HEX-PRESS REGISTER in combination with the **TODD "VEE-CEE" VARIABLE CAPACITY BURNER** . . . makes possible increased combustion efficiency under almost any type of boiler of 100 hp. capacity or larger, operating at 50 lb. steam pressure or higher.

It provides equal efficiency under either forced or natural draft conditions. The Hex-Press Register assures the most intimate mixture of oil and air as well as quicker, more complete combustion . . . with minimum draft loss at high capacity . . . effecting great economy in maintenance and materially reducing fuel costs.

Through the exclusive "variable range" feature of the "Vee-Cee" Burner, practically unlimited firing range is assured . . . without change of burner tips, oil delivery pressure or angle of spray.

Constant steam pressure can be maintained regardless of demand . . . changing load requirements are met instantly under manual or fully automatic control.

COMBINATION GAS AND OIL BURNERS

For Natural or Refinery Gas and/or Fuel Oil. Available in wide range of capacities. Quickly adjustable for the combustion of either fuel alone, or both in combination. Of special value where fluctuating comparative costs of these fuels call for equipment suited to change-over without time-consuming structural changes.

Maintenance and operation are reduced to a minimum by compactness and simplicity of design . . . accessibility of all parts . . . rugged construction and positive overall efficiency.

Design features eliminate possibility of escaping gas due to structural distortion . . . prevent stratified combustion resulting from improper air distribution and high gas pressure.

Providing sufficient flexibility to care for varying loads, these units assure high furnace temperature and radiant heat transfer with low stack temperature . . . thorough mixture and optimum air-fuel ratio with utmost ease of adjustment.

ROTARY FUEL OIL BURNERS

For firing high or low pressure steam or hot water boilers of all types . . . in smaller factories and industrial plants, laundries, dryers and cleaners, office buildings, hotels, apartment houses. Also applicable to industrial ovens, kilns, etc., where furnace and general physical conditions permit.

Available with manual, semi-automatic or fully automatic control . . . in varying sizes and types . . . for burning light or heavy oil.

Horizontal atomizing cup is rotated by direct-connected electric motor, assuring constant firing as long as motor is in operation. Motors are of extra large frame size, air-cooled and built to withstand long, hard service. Positive air-oil interlocking device automatically shuts off oil supply following any burner stoppage.

Of rugged construction . . . with all parts easily accessible for cleaning or renewing . . . these burners provide a flexible capacity range, with complete and efficient combustion under widely fluctuating loads.

TODD MANUFACTURES: Mechanical Pressure Atomizing Oil Burners—VEE-CEE Variable Capacity Burners—Horizontal Rotary Oil Burners—Oil Burning Air Registers for Natural, Assisted, Induced or Forced Draft—Inside Mixing Steam Atomizing Oil Burners—Combination Gas and Oil Burners—Furnace Doors and Interior Castings for Converting Howden Type Furnace Fronts to oil firing—Oil Burning Galley Ranges—Oil Heating, Pumping and Straining Equipment—Heated Air Generators.

All installations of Todd Equipment are always *individually engineered* to fulfill specific requirements. *Send for descriptive literature.*

Todd engineers are always available for consultation and analysis of combustion problems—without obligation.

Williams Oil-O-Matic Division

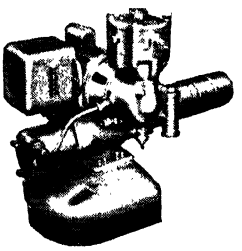
EUREKA WILLIAMS CORPORATION, BLOOMINGTON, ILLINOIS

WILLIAMS OIL-O-MATIC HEATING COOLING PRODUCTS

Manufacturers of Automatic and Manually Controlled Fuel Oil Burners

OIL BURNERS

Williams Oil-O-Matic Lo-Pressure burners are offered in 4 sizes ranging in capacity from ½ to 7 gallons of fuel oil per operating hour. Easily installed in any type heating plant. Patented Thrift Meter premeters oil to exactly meet heating plant needs. Wide, non-clogging orifice handles even the heaviest oils.



Williams Hi-Pressure precision-built burners are available for those who want high quality at minimum cost. 3 sizes with capacities from 1.00 to 7 gallons per hour.

How to Decide Size of Burner

For low pressure domestic boilers, 1 gal of fuel oil per hour (140,000 Btu) is required for approximately 300 sq ft of steam radiation or its equivalent, or for 480 sq ft of hot water radiation or its equivalent. 70,000 Btu when using hot air furnace ratings. 24 sq ft steam boiler heating surface (or 2.2 hp). For exact data, see Oil-O-Matic Installation and Service Manual.

Oil-O-Matic Lo-Pressure Burners Leg or Flange Mt.

Model	Oil Capacity		Motor		Atom. Pressure
	Min.	Max.	Hp	Rpm	
K-150	.50	1.50	1/10	1800	2 lbs
K-3	1.00	3.00	1/10	1800	2 lbs
K-4.5	1.35	4.50	1/5	1800	2½ lbs

Unit Steam Generator

PREFERRED UNIT STEAM GENERATORS

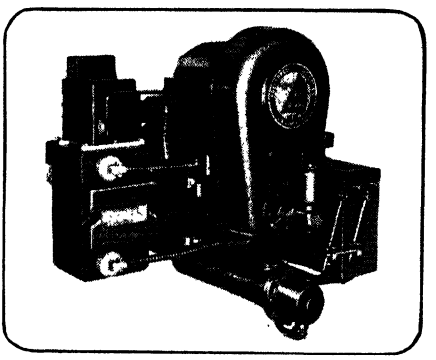
The Preferred Unit Steam Generator is a heavy duty, oil-fired, portable, automatic steam plant with all the equipment necessary to produce steam—economically—with a minimum overall thermal efficiency of 80 per cent.

Induced Draft — Induced or "pull through" draft requires only a small vent to the outside air—no large, expensive stack is necessary. Induced draft operation automatically controls air volume to meet the requirements of complete combustion and also eliminates the danger of forcing the products of combustion into the boiler room.

Heavy Oil Types—Preferred Unit Steam Generators are made in all sizes, up to and including 500 hp (pressures up to 200 lb psi) for use with the heavier grades of bunker oils, including the new catalytic residual oils—for either fully or semi-automatic operation.

Light Oil Types—For use with lighter oils, the Preferred Unit Steam Generator is made in all sizes up to and including 80 hp (pressures up to 200 lb psi).

For further details write for Bulletin No. 1000.



Oil Burner

PREFERRED OIL BURNERS

Preferred oil burners are made in both the horizontal rotary and pressure atomizing types. Each type is suitable for manual, semi-automatic or fully-automatic operation.

Horizontal Rotary Type—The rotary-cup burner is suitable for use with either light or heavy oil as well as the new catalytic residual Oils. A throttle control which includes the patented Voluvalve automatically delivers the correct mixture of oil and air for efficient combustion at all rates of firing, regardless of variation in temperature, pressure or viscosity of the oil.

The sizes range from 5 to 150 gph for residual oils (see Bulletin 175) and ⅛ to 3 gph for Diesel or lighter oils (see Bulletin 100).

Pressure Atomizing Type—Preferred pressure atomizing burners are designed to burn light oil only. Made in conversion models from 1 to 3 gph and unit steam generator models from 3 to 30 gph. (Bulletin in preparation)

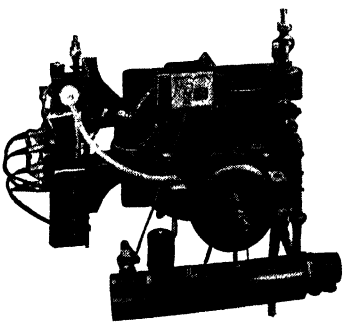
OIL-FIRED EQUIPMENT FOR INDUSTRY

HORIZONTAL ROTARY BURNERS



Model AHPM direct-drive fully automatic pump-type burner with full modulating system, for heating or process work. Uses No. 6 oil.

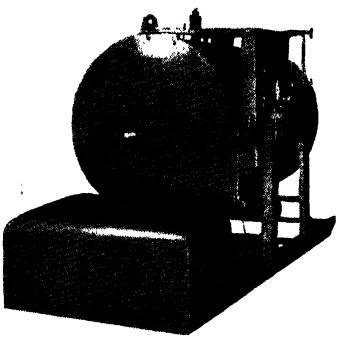
York-Shipley Horizontal Rotary Burners cover the range from 45 to 400 boiler hp, and are built in direct-drive and belt-drive types. Models are offered for use of fuel oils No. 1 through No. 6 (light distillate to most viscous bunker oils), for manual, semi-automatic, or full modulating control, with or without pumps.

The extremely wide range of models and sizes, high efficiency, and adaptability of this line assures easy selection of the *right* unit to fit *any* type or shape or make of boiler, with long life and low operating cost.

Three exclusive engineering developments provide *precision combustion* to an unparalleled degree: *The Iris Shutter*, which gives absolute control of burner air, causing metered volume of burner air to remain constant; *The Flame-Former*, which shapes the flame to fit combustion chambers of any type; and *The Automatic Torch Lighter*, a pressure-type igniter for smooth and positive automatic starting.

All York-Shipley Industrial products are sold, engineered and installed by local distributors who have been selected because of their knowledge of engineering and of equipment using heavy oils. These local distributors have well-trained staffs and will aid in solving any heating or power problems.

STEAM-PAK GENERATORS



Model SPL-30-3 low-pressure boiler for heating applications. A three-pass, downdraft, horizontal fire tube design. Uses No. 3 oil.

Steam-Pak Generators are built *both* for low-pressure heating load and for high-pressure process load, in sizes from 15 to 100 hp. Using fuel oils No. 3, 5, and 6, they require only a low-cost vent to remove products of combustion.

With about half the size, weight, and installation cost as compared to brick-set boilers of comparable capacity, Steam-Pak Generators require only four simple service connections, feature "one-man maintenance," are completely wired, piped, and pre-tested at the factory. Ready to operate when delivered.

The Steam-Pak Generator is an efficient unit, combining the oil burner and boiler in one package. It is designed to operate at peak efficiency through the entire firing range. This is accomplished with the Iris Shutter and modulating pump.

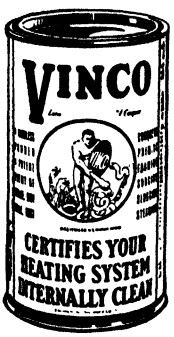
A COMPLETE LINE OF INDUSTRIAL COMMERCIAL AND RESIDENTIAL EQUIPMENT

York-Shipley, Inc. builds one of the widest range of oil-fired units. Beside the Horizontal Rotary Burners and Steam-Pak Generators for industrial and commercial use described here, we offer the famous *York-Heat* boiler-units, winter air conditioners, water heaters, vaporizing warm air furnaces and conversion burners.

The Vinco Company, Inc.

305 East 45th Street **New York 17, N. Y.**

Only a clean boiler can be an efficient boiler. A clean boiler means saving fuel, as well as safeguarding boiler metal.



Boiler Cleaner
3 and 5 lb. cans

A positively harmless insoluble powder cleaner for new, remodeled and old heating systems. A unique, scientifically processed compound on a special formula not to be confused with other powder boiler cleaners.

What Vinco Boiler Cleaner Does

VINCO removes oil, grease, scale, rust and dirt from the internal surfaces and from the boiler water *without the labor, expense, and uncertain results of blowing boilers over the top or of wasting returns.*

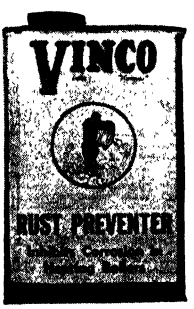
By this thorough cleaning Vinco prevents or cures foaming, priming, surging, and slow steaming.

How Vinco Boiler Cleaner Works

Each minute grain of VINCO powder adsorbs several times its own weight of oil, grease, rust and dirt. These larger grains of adsorbed impurities then settle and are drained through the bottom according to directions on each can.

Vinco Guarantees

1. VINCO contains no potash, lye, soda of any kind, oil, acid, or other harmful ingredients.
2. Purchase price is refunded if results are not as claimed when VINCO has been used according to directions.



Rust Preventer
1 qt. cans only

VINCO RUST PREVENTER

When used after VINCO Boiler Cleaner has removed oil, grease, rust, scale and dirt, it will add and keep the rust inhibiting factors at the optimal constant for a year or more. (Test kit below has complete instructions and chart.)

Vinco Field Test Kit No. 10

VINCO FIELD TEST KIT No. 10

for Testing and Treating Heating Boiler Waters

The kit enables the layman to make simple, rapid tests to diagnose and prescribe correct treatment of boiler waters right on the job.

A new time saving method that permits valid conclusions heretofore requiring complicated and often lengthy laboratory analysis and technique.

Each kit has sufficient material for complete tests on 100 jobs.

Refills cost about 2 cents for testing each job.

SPECIFICATIONS FOR COMPLETE VINCO TREATMENT OF NEW OR REMODELED STEAM, VAPOR, OR HOT WATER SYSTEMS

Do not use as a cleaning agent soda or any alkali, vinegar or any acid. Use Vinco.

1. AFTER THE SYSTEM IS TESTED AND TIGHT, USE THE PROPER QUANTITY OF VINCO LISTED.

After this first clean-out of any new or remodeled heating system, Vinco Boiler Cleaner need be used only if more piping, radiation, or another boiler is added to the original installation, or if the system is fouled by unwise cleaning or leak-sealing experiments.

2. After using Vinco Boiler Cleaner, Vinco Field Test Kit should be used to determine and apply the proper quantity of Vinco Rust Preventer. Vinco Rust Preventer should be applied annually or whenever the boiler water is drained for necessary repairs to the system.

SPECIFICATION FOR OLD HEATING SYSTEMS THAT DO NOT PERFORM PROPERLY

Diagnose and treat according to Vinco Field Test Kit. If a test kit is not available, consult table of quantities on this page and follow directions on Vinco cans.

SPECIFICATION FOR HOT WATER SYSTEMS

Use half quantities listed for treatment of steam systems to remove impurities. Then use test kit to determine proper quantity of Vinco Rust Preventer.

CONSULT THIS TABLE FOR NEW AND REMODELED HEATING SYSTEMS AND When a Vinco Field Test Kit No. 10 is not available if cleaning old heating systems.

QUANTITIES OF VINCO (IN POUNDS) REQUIRED FOR HEATING SYSTEMS

(Note that quantities are based on actual installed radiation, not on boiler capacity.)

Sq Ft of Radiation	For Steam or Vapor Systems, to prevent or cure priming or foaming. Also for Hot Water Heating Systems Maintained at approx. 200 F or above.	Annually, to remove rust scale, dirt and for Hot Water Systems below 200 F.

*Above 10100 sq ft use an additional pound Vinco for each additional 300 sq ft of actual installed radiation.

Soot-Off—1 lb. cans 60 and 100 lb. drums

VINCO SOOT-OFF

Safely and thoroughly removes the insulating blanket of soot on fire pot, flues and chimney. It also insures against external corrosion (caused by dampness and soot forming sulphuric acid during summer layoff.) No dangerous chemicals.

REMOVE SOOT WITH VINCO SOOT-OFF SEVERAL TIMES A YEAR

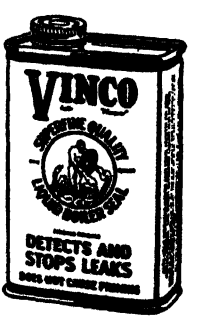
VINCO SUPERFINE LIQUID BOILER SEAL

A different liquid seal. Unique in that it does not induce priming and foaming. It has no unpleasant smell. Makes speedy and permanent repairs of boiler and heating system leaks. Fine to tighten up new jobs. Directions simple.

Quantities

Steam and Vapor Systems—Use 1 quart VINCO Liquid Boiler Seal to each 6 sq ft *grate* area.

Hot Water Systems—Use 2 quarts VINCO Liquid Boiler Seal to each 6 sq ft *grate* area.



Liquid Boiler Seal 1 qt. cans only

McDonnell & Miller, Inc.

Safety Devices for Steam and Hot Water Boilers and Liquid Level Controls

General Offices: Wrigley Building, **Chicago 11, Illinois**

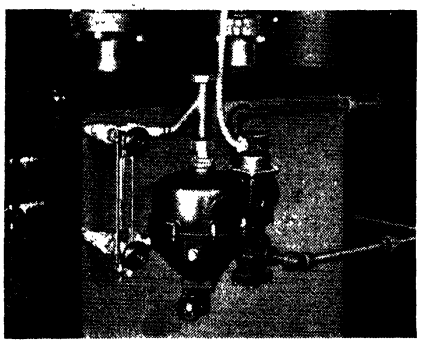
"Doing one thing well"

PRODUCTS:

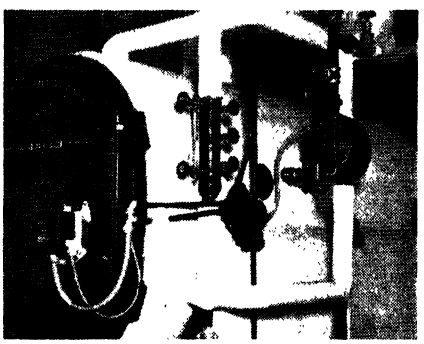
Boiler Water Feeders; Feeder Cut-off-Combinations; low Water Fuel Cut-offs; Pump Controls; Low Water Alarms; Humidifier Water Level Controls; Safety Relief Valves for hot water heating boilers and storage tanks; High and Low Oil Switches and Liquid Level Controllers for a wide range of services.

The service range and types of installations covering most common applications of McDonnell Boiler Water Level Controls are described here. For facts concerning protection of process boilers, or any special information, consult our engineering department.

McDonnell Combined Boiler Water Feeder and Low Water Cut-off



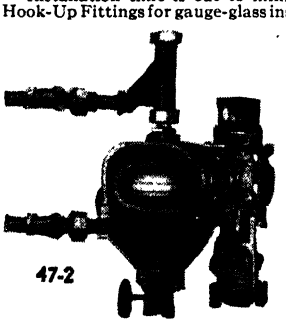
McDonnell No. 47-2 for heating boilers under *5000 sq ft capacity. Maximun steam pressure, 25 lbs.*



McDonnell No. 51-2 for heating boilers over *5000 sq ft capacity. Maximum steam pressure, 35 lbs.*

A typical installation of the McDonnell No. 47-2 Combined Boiler Water Feeder and Switch is illustrated above. The water feeder maintains safe level by feeding when water line drops. In case of foaming and priming or failure of water supply, causing water level to drop to ¼ in. in the water glass, low water switch comes into action. For automatically fired boilers switch may be wired to cut current to burner. For hand fired boilers switch may be wired to complete alarm bell circuit. Also furnished for hand fired boilers without switch—designated No. 47.

Installation time is cut to minimum by Quick-Hook-Up Fittings for gauge-glass installation. Valve mechanism is isolated from the heat of the float chamber. Large area straight-through blow-off valve is standard equipment.



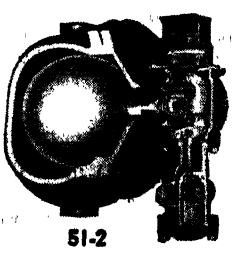
47-2

The McDonnell No. 2 Switch used in the No. 47-2 is Underwriters' approved. Electrical rating: a-c ¾ hp 110-220 V.; d-c 10 amp. 115 V.

The illustration above shows a typical installation of the McDonnell No. 51-2 Combined Boiler Water Feeder and Switch used for larger boilers. This combination functions the same as the No. 47-2, the feeder taking care of normal requirements and the switch safeguarding against emergencies by cutting off the burner in automatically fired boilers or completing a low water alarm circuit for hand fired installations. The feeder is also furnished for hand fired boilers (as No. 51) without low water cut-off and alarm switch.

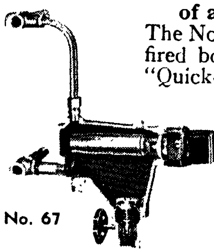
Basic features of the No. 51-2 are the same as in the No. 47-2, except that it is installed with 1 in. equalizing pipe instead of the McDonnell "Quick-Hook-Up" and has the larger feeding capacity required for larger boilers.

For boiler operating at pressures from 35 lb to 75 lb use the McDonnell No. 53-2 (with switch) or No. 53 (without switch). Electrical rating of switches used in No. 51-2 or 53-2 is the same as previously given for the No. 47-2.



51-2

McDonnell No. 67 Low Water Cut-off for automatically-fired steam boilers of any size. Maximum steam pressure, 25 lb



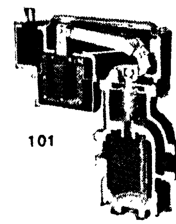
No. 67

The No. 67 takes care of low water cut-off requirements of automatically fired boilers with steam pressure below 25 lbs. It has the McDonnell "Quick-Hook-Up" for quick, easy and trouble-proof installation in the gauge glass tappings; deep sediment chamber with large quick-opening blow-off; packless, non-binding construction; adjustable terminal box to make wiring neat and easy; dependable, snap-action, twin switches.

One switch **closes** on small drop without stopping burner. It can be used to complete an alarm bell circuit, warning of approaching low water, or can be used to complete circuit to the McDonnell No. 101 Electric Water Feeder described below. Second switch cuts current to burner if water level drops to ¼ inch in gauge glass.

Underwriters' ratings for both switches: a-c ¾ hp, 110-220 V.; d-c ¼ hp, 115-230 V.

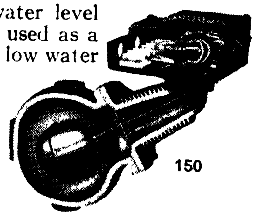
McDonnell No. 101 Electric Boiler Water Feeders for boilers up to 5000 sq ft capacity



101

The No. 101 is an electric water feeder for use with No. 67 Low Water Cut-off or with McDonnell "built-in" Low Water Cut offs which are standard equipment on many modern heating boilers. It converts the cut-off into a combination boiler water feeder and low water cut-off as described on the opposite page.

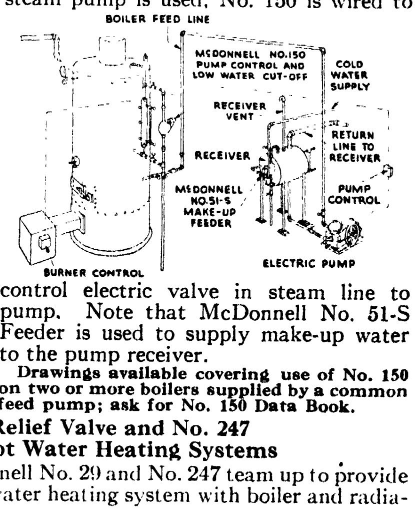
McDonnell No. 150 Pump Control, Low Water Cut-off and Alarm Switch for boilers of any size. Maximum steam pressure, 150 lb



150

This boiler water level control may be used as a pump control, a low water cut-off, a low water alarm switch, or for any combination of these functions. Electrical ratings are: a-c 1 hp, 110-220 V., d-c ¼ hp, 110-220 V, as pump control or cut-off; 1 amp. 110 V, a-c or d-c—as low water alarm. No. 150 has automatic reset low water cut-off switch but may be ordered with manual reset as No. 150-M.

A typical hook-up of the McDonnell No. 150, controlling an electric pump and providing low water cut-off, is shown opposite. When water level drops ¾ in. below normal, No. 150 starts pump and then stops it when normal water line has been restored. If emergency occurs and water level falls to arrow mark on body of control, cut-off switch stops burner. If steam pump is used, No. 150 is wired to



control electric valve in steam line to pump. Note that McDonnell No. 51-S Feeder is used to supply make-up water to the pump receiver.

Drawings available covering use of No. 150 on two or more boilers supplied by a common feed pump; ask for No. 150 Data Book.

McDonnell No. 29 Safety Relief Valve and No. 247 Float Operated Feeder for Hot Water Heating Systems

The drawing below illustrates how the McDonnell No. 29 and No. 247 team up to provide good operation as well as protection of a hot water heating system with boiler and radiation on the same level.

The No. 247 float operated feeder maintains the proper level above the high point in the supply main, eliminating the chance of separation of the water and loss of connected load.

The No. 29 Btu rated safety relief valve protects the boiler against excessive pressure when matched to the gross Btu output of the boiler.

This team of controls gives flexibility and protection to this type of system.

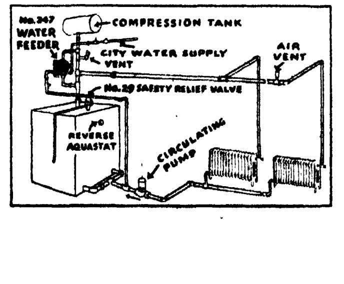
No. 247

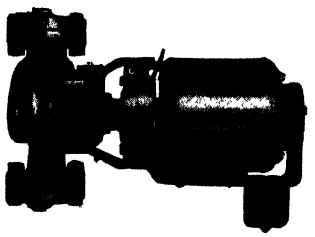


Bell and Gossett Company

Morton Grove, Illinois

HYDRO-FLO HOT WATER SYSTEMS AND SPECIALTIES

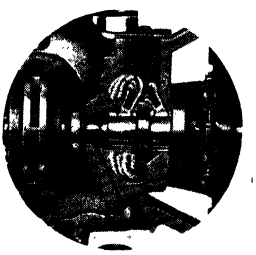
B & G Booster Pumps



The B & G Booster is the basic unit of a B & G *Hydro-Flo* Forced Hot Water Heating System. It is built as a horizontally driven unit for sound engineering reasons which have demonstrated their practical value in the thousands of installations now in operation. This construction makes possible many desirable and exclusive features.

For example, the patented water-tight Seal eliminates the need for a stuffing box. This Seal positively prevents entry of water into the bearings. The shaft is of highly polished, hardened machine steel and the close-fitted Impeller makes every revolution count by holding water slippage to a minimum.

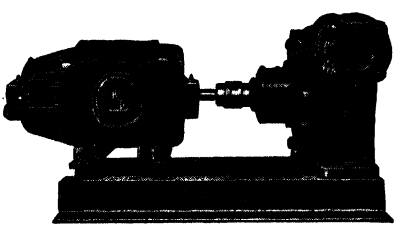
B & G Boosters have a genuine oil-circulating lubrication system—one of the greatest reasons for the quiet, dependable and economical operation of this pump. Oil is drawn up from the oil well by wool fibre wicking and dropped on the horizontal bearing surfaces. Medium grade motor oil is used and only a few drops at infrequent intervals required.

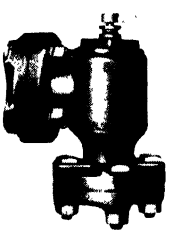


Oil Lubricated Bearings

B & G Universal Pumps ⟶

The B & G Universal Pump is designed for large forced hot water heating systems in apartment buildings, office buildings, factories, schools, etc. The installation can be operated as a large single zone or divided into several zones in which circulation of the pumped water in each circuit is controlled by a B & G Motorized Valve, operated by a zone thermostat.





B & G Angle Flo-Control ⟵ Valves

This valve, installed in the main, shuts off circulation to radiators when heat is not needed, permitting summer operation of a B & G Indirect Water Heater. It also helps maintain a uniform room temperature during the heating season.

B & G Motorized Valves ⟶

Thermostatically operated valves used for controlling boiler water flow through the individual circuits of zoned heating systems.

⟵ B & G Monoflo Fittings

B & G Monoflo Fittings permit the use of a *single* pipe main instead of the conventional flow and return lines. It is installed at the junction of the radiator risers to the single main and assures the diversion of the proper amount of heated water into each radiator. Savings in space, labor and materials are obviously effected.

SEE THE B & G HANDBOOK FOR COMPLETE DESIGNING DATA

HOT WATER SYSTEMS AND SPECIALTIES

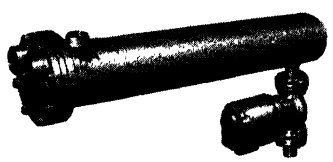
B & G Relief Valves

For relieving excess boiler pressures in hot water heating systems, and in the lines of service water systems. B & G Relief Valves have the design features which assure dependable service.

B & G Reducing Valves

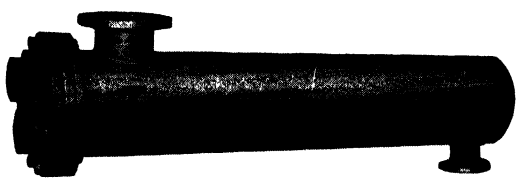
Fast operating valves for keeping hot water heating systems properly filled. Easily adjusted to meet varying building heights. Also high pressure reducing valves for protection of plumbing fixtures.

B & G Type "CWU" Radiation Heater



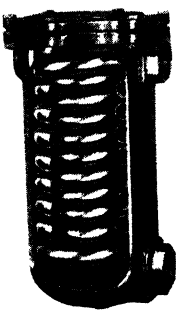
The B & G Radiation Heater is a "shell and tube" heat exchanger and is installed below the water line of a steam boiler. Hot boiler water is pumped by a B & G Booster through the shell, thereby heating the water for the heating system, which is pumped through the tubes of the Heater.

Pumping the water through both the heater and the heating system not only affords excellent temperature control, but also permits the use of much smaller pipe and fittings.



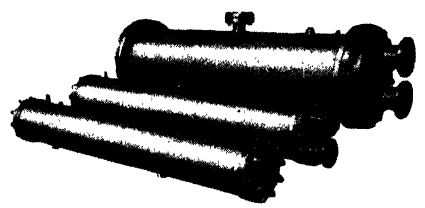
B & G Type "SU" Instantaneous Water Heaters

For heating water with steam. Ideal for industrial plants or wherever large volumes of hot water are required continuously for service water supply or process work. No storage tank required—the large heat transfer surface in these units heats water instantly as needed. Available in a wide range of capacities.



B & G Indirect Water Heaters

Any steam, vapor or hot water heating boiler can be equipped with a B & G Indirect Water Heater. With the proper electrical controls, the Heater will furnish an ample supply of hot water, *winter and summer*, at very low operating cost. Heater must be used with a storage tank of suitable capacity.

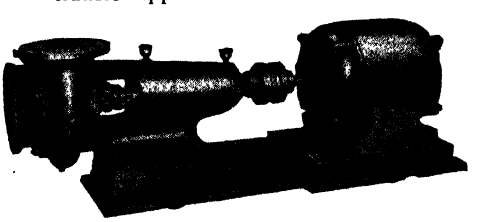


←≪ B & G Refrigeration Components

A very flexible line of direct expansion evaporators, condensers, liquid receivers, combination liquid receivers and subcoolers for refrigeration purposes are now available. Special alloys may be incorporated in the units for those critical heat transfer applications.

B & G Centrifugal Pumps ≫→

Design and construction based on years of experience in the industrial field. Rugged, compact units—built to stand up under the strain of continuous operation. Available with semi-open or enclosed impellers —motors flexible coupled or integral with pump. Send for Catalog.

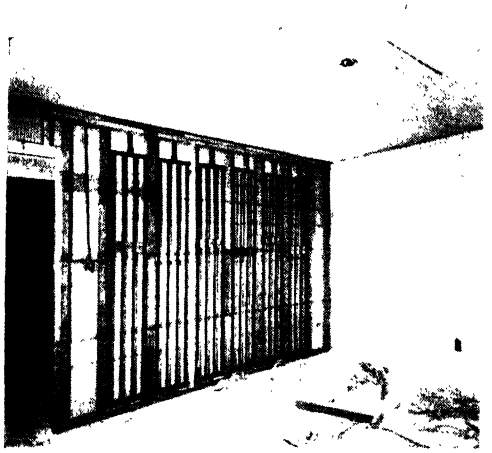


Pan-L-Heat Corporation

Manufacturers of **PAN-L-GRID** *for Radiant Heating*

2838 N. E. Columbia Blvd., **Portland 11, Oregon**

Factory Representatives in SEATTLE, WASH.; SPOKANE, WASH.; SALT LAKE CITY, UTAH; SAN FRANCISCO, CALIF.; LONG BEACH, CALIF.; AND PORTLAND, OREGON.



Inside Walls

Outside Walls

TYPICAL PAN-L-GRID INSTALLATIONS

4-7 or 4-6 Grids for 16 in. Stud and joist spacing.

3-7 for 12 in. stud and joist spacing.

4-10-2 and 4-10-3 developed for concrete installation.

Engineers, Architects and Contractors are specifying **PAN-L-GRIDS** because they are less costly and more applicable to installations for warm water heating systems.

PAN-L-GRIDS are being used with equal satisfaction in ceiling, wall or floor radiant heating and cooling systems.

Capacity ratings for each size of **PAN-L-GRIDS** have been determined by laboratory tests conducted by licensed Engineers. 8,000 PAN-L-GRIDS have been installed and are producing very satisfactory results based on these ratings. PAN-L-GRIDS are installed in various types of buildings and in climatic conditions ranging from design temperature of plus 30F. to minus 20F.

The **PAN-L-GRID** incorporates an orificing principle which insures equal distribution of flow through the grid.

PAN-L-GRIDS are BONDED for the users' protection. **PAN-L-GRIDS** are manufactured in sizes to fit standard building construction.

Tube—½ in. Standard Black Steel Butt-weld Pipe. Headers—1 in. Standard Black Steel Butt-weld Pipe. These sizes apply to the 6 ft and 7 ft models of the Grid. On the 10 ft Grid the tubes are either ½ in. or ¾ in. and the headers 1 in. or 1¼ in. respectively. The Grid is an all electric-weld unit furnished with standard ½ in., female I.P.S. screwed end connections. We can furnish all of these Grids in Byers genuine wrought iron pipe at a higher price if so desired by customer.

STANDARD GRID DIVISIONS

Grid Size	Nominal Length	Overall length	Overall Width	Overall Thickness	Shipping Weights
4 x 7′	7′–0″	7′–4″	1′–1¼	0′–1 5/16″	28 lb 10 oz
3 x 7′	7′–0″	7′–4″	0′–9¼″	0′–1 5/16″	20 lb 9 oz
4 x 6′	6′–0″	6′–4″	1′–1¼″	0′–1 5/16″	24 lb 11 oz
4 x 10′ x ½″	10′–0″	10′–4″	2′–2″	0′–1 5/16″	43 lb 10 oz
4 x 10′ x ¾″	10′–0″	10′–4″	3′–2½″	0′–1⅝″	59 lb 13 oz

Taco Heaters, Incorporated

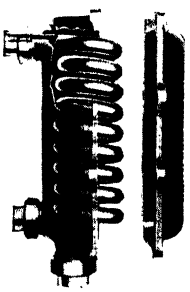
342 Madison Avenue, **New York 17, N. Y.**

TACO HEATERS OF CANADA, LTD., 24 Adelaide St., W., **Toronto**

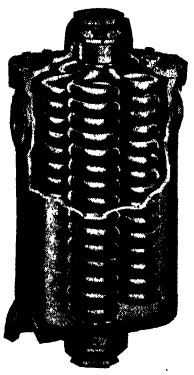
THERE is a storage or tankless, Biltin or external, type Taco indirect water Heater for every job.

Biltin Taco Heaters, which are standard equipment on leading heating boilers, are catalogued only in the boiler catalogs. For additional information on Biltin Tacos write boiler manufacturer or Taco.

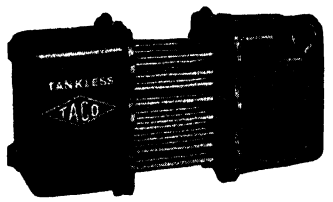
Complete catalog information on external Taco Heaters is also available for home, apartment house, hotel and housing projects.



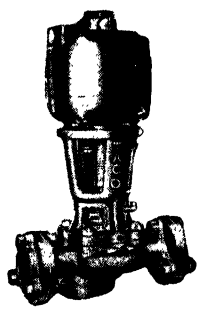
Domestic Tacos



Multi-coil Taco ←



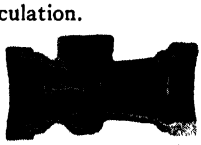
Tankless Taco Nos. 12, 14, 15, 18 and 23



"Taco-One" Venturi System

A forced circulating warm heating system using a single pipe main from boiler to radiators and back again. Small pipes and one pipe main make a neater job, reduce installation costs. Radiators can be placed above and below main. 85 per cent of residential jobs need only one circuit which requires no balancing valves. This revolutionary heating system is made possible by the Taco Venturi Fitting and remarkable Taco Hy-Duty Circulator.

Taco Venturi Fitting—Acts as a suction pump in which the only moving part is water. Water does the trick by producing a vacuum pull that draws water through each radiator, giving positive uniform circulation.



Taco Venturi Fitting (Cross Section)

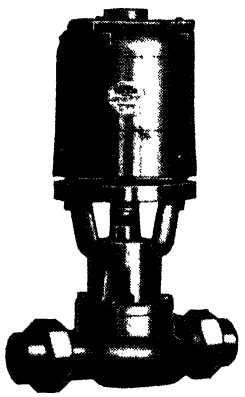
FORCED CIRCULATING THRUSH FLOW CONTROL SYSTEM OF HOT WATER HEATING AND HEATING SPECIALTIES

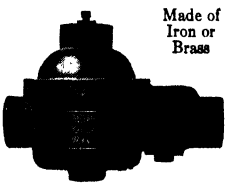


Patent Nos. 2,054,009, 2,111,441, 2,137,791, 2,207,183, 2,207,208, 2,257,867, 2,356,482 2,358,670

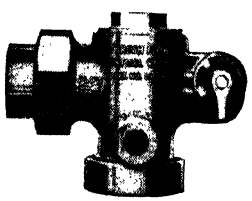
Flexible, economical of fuel, forced circulating Thrush Summer-Winter System of Hot Water Heat is the most satisfactory way to heat buildings. Thrush Systems, Water Circulators, Water Heaters, Pressure Relief and Pressure Reducing Valves and other fuel-saving heating specialties are available. Write today for information or engineering assistance.

THRUSH WATER CIRCULATORS

Five sizes, 1 in., 1¼ in., 1½ in., 2 in. and 3 in., for forced circulation in Hot Water Heating and Domestic Water Systems. Save fuel, insure uniform heating.



Made of Iron or Brass



Patent Reissue No. 19,873

THRUSH FLOW CONTROL VALVES

For use with Thrush Water Circulators

This patented valve prevents circulation when not required. Six sizes, 1 in., 1¼ in., 1½ in., 2 in., 2½ in. and 3 in. Work automatically by pressure head, generated by Thrush Circulator.

Number 4 Illustrated

THRUSH LOW PRESSURE WATER RELIEF VALVES

Protect heating boilers from excess pressures. Made in angle or straight types, of iron or brass, sizes ½ in., ¾ in. and 1 in. Unfailing dependability has been proved by over a quarter of a century of successful operation.

THRUSH PRESSURE REDUCING VALVES

Types for High and Low Pressures

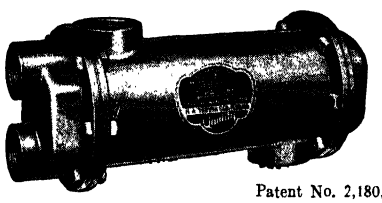
Sizes, ½ in., ¾ in. and 1 in. Low pressure reducing valves to reduce pressure of water entering heating system and maintain water supply in system automatically. High pressure reducing valves for protecting house plumbing and heating equipment from excessive city line pressures.

THRUSH AIR-TIGHT PRESSURE TANKS

An essential part of every hot water heating system. Conserves water and fuel, because the heated water expands into the Thrush Pressure Tank and returns to the system as it cools. Adds to the continued operating efficiency of the heating system over a long period of time.

THRUSH HIGH PRESSURE WATER RELIEF VALVES

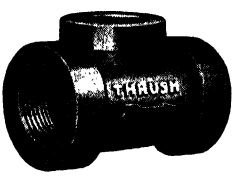
Protect water supply or range boilers and gas or electric water heaters from excess pressure and temperature (some types). Made in angle or straight types, of iron or brass, sizes, ½ in., ¾ in. and 1 in., for pressure relief only or combination pressure and temperature relief.



Patent No. 2,180,020

THRUSH WATER HEATERS

Highly efficient heat exchangers or converters. Sixteen sizes, for Hot Water or Steam. Pressure up to 150 lb water, 75 lb steam. Straight tubes readily cleanable. Provide Domestic Hot Water at low cost. Also used industrially for heating or cooling liquids.

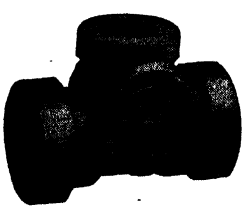


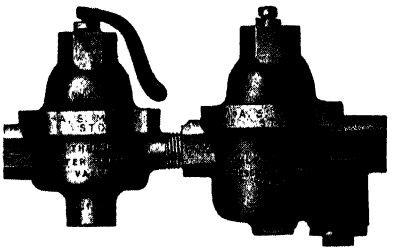
THRUSH SUPPLY TEES FOR ONE PIPE SYSTEMS NON-ADJUSTABLE

Assure positive diversion to radiators. Cast iron sizes, 1 in., 1¼ in., 1½ in. and 2 in., with branch outlets of ½ in., ¾ in. or 1 in. Also sweat copper sizes ¾ in., 1 in., 1¼ in. and 1½ in. all with ½ in. branch.

THRUSH ADJUSTABLE SUPPLY TEE FOR ONE PIPE SYSTEMS

Balances flow of water through each radiator, resulting in uniform heating. When branch flow is cut down, main flow is increased not retarded. Easily adjusted. Sizes in cast iron, 1 in., 1¼ in., 1½ in., and 2 in., with branch outlets of ½ in., ¾ in., and 1 in.

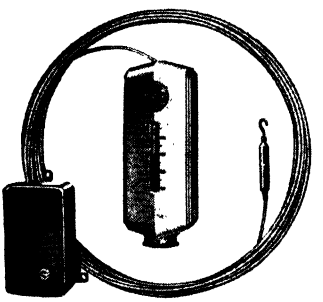




THRUSH DUAL CONTROL UNITS

Provide automatic pressure relief, reduce line pressure, automatically fill and maintain water supply in hot water heating system. Built-in strainer. Made in four types, brass or cast iron, ½ in. or ¾ in.

No. 201 THRUSH RADIANT HEAT CONTROL



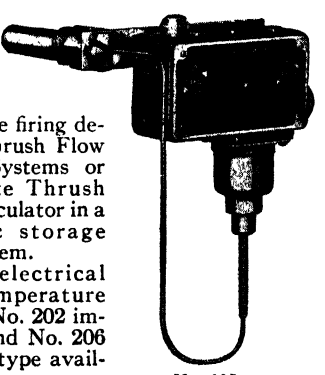
No. 200 *No. 201*

Automatically maintains room temperature within a fraction of a degree. Controls both room and water temperature in the radiators, compensating to prevent variation in room temperature or a lack of radiant heat. Requires No. 200 Thrush Relay Transformer for low voltage.

No. 205 THRUSH BOILER WATER TEMPERATURE CONTROL

No. 205 immersion control is used to operate the firing device of Thrush Flow Control Systems or to operate Thrush Water Circulator in a domestic storage water system.

Other electrical water temperature controls, No. 202 immersion and No. 206 clamp-on type available.



No. 205

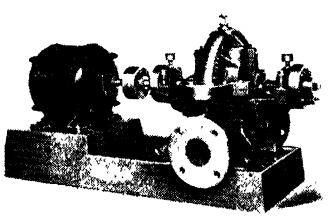
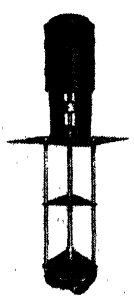
PRODUCTS—A Complete Line of Centrifugal Pumps For Use in All Types of Heating and Air Conditioning Installations. For Complete Information, Contact Your Nearest Buffalo Representative or Write Us.



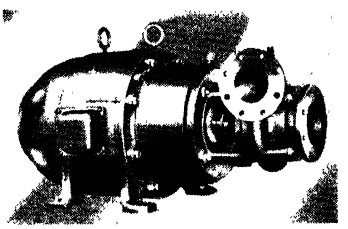
Buffalo Single-Stage Double Suction Pumps

Where installations require handling of 10 to 50,000 gpm, clear water, these pumps afford excellent service at low power cost and very little maintenance. They incorporate all accepted features of modern centrifugal pump design.



Buffalo Automatic Sump Pumps

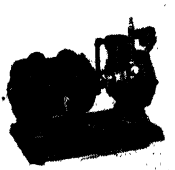
Distinct power savings are made possible with these Buffalo pumps, because their unusual efficiencies enable use of very small motors. A compact unit with ball bearing thrust and enclosed shaft.



Buffalo Close-Coupled Single Suction Pumps

Especially suited to handling hot water with low submergence on suction, these Buffalo pumps exert a high suction life. An important advantage in this type is its close coupling to the electric motor. This dispenses with bearings, assures permanent alignment and saves space. Easily serviced.

Buffalo Self-Priming Single and Double Suction Pumps



These centrifugal pumps provide a constant, positive prime without foot valves, with a primer under license from Nash Engineering Co. Featuring typical Buffalo design, the pumps have quiet, vibrationless rotors and fully accessible parts. Moving parts are above the liquid pumped.

Chicago Pump Company

2330 Wolfram Street **BRUnswick 4110** **Chicago 18**

PRODUCTS—Return Line Vacuum Heating and Boiler Feed Pumps, Condensation, House, Booster, Fire Pumps, Circulating, Brine, Sewage, Bilge, Sludge, Pneumatic and Tankless Water Supply Systems and Automatic Alternator for Duplex Sets of Pumps.

"CONDO-VAC"

Return Line Vacuum and Boiler Feed Pump for Heating Systems

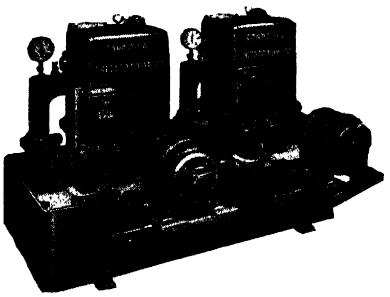


Fig. 2102—Duplex "Condo-Vacs" with Duplex Double Automatic Control

No vacuum on stuffing boxes, ample clearance in rotating member. It costs less to operate a "Condo-Vac." "Condo-Vac" reduces corrosion in piping and boiler to minimum—because pump does not take in air from atmosphere and entirely eliminates all air coming back from system. "Condo-Vac" is quiet, has a low inlet, entirely automatic, fool-proof, easy to maintain. *Ask for bulletin 270.*

Close-Coupled Pumps

Boiler Feed, Circulating, Tank Filling, Water Supply

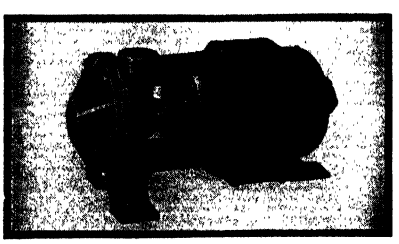

Fig. 2130—Close-Coupled, side suction pump

Capacities range from 3 to 600 Gpm against heads up to 189 ft. Motors from 1/6 to 20 Hp. Discharge 1 to 3 in. Closed and open type impellers. *Bulletin 108.*

"Sure-Return" Condensation Pump

for Low and Medium Pressure, and Systems up to 75,000 Sq Ft Radiation

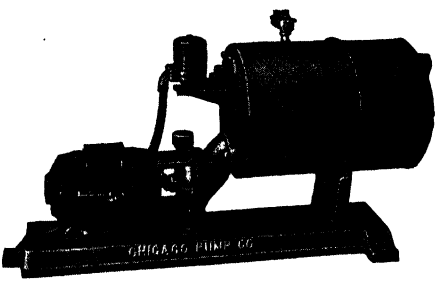

Fig. 1946

"Sure Return" Condensation Pumps and Receivers are built for systems up to 75,000 sq ft of direct radiation and for low and medium pressures. Built in either single or duplex units. Duplex units are alternated in their operation by the Automatic Alternator. *Complete data in Bulletin 250.*

Vertical Condensation Pumps

for Low and Medium Pressure for Systems from 500 to 100,000 Sq Ft Radiation

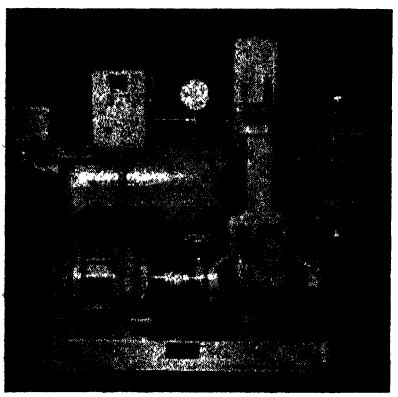
Fig. 1940 Vertical Condensation Pump

The vertical condensation pump is designed to receive returns from lowest radiation. The receiver is placed underground—an ordinary hole sufficing if necessary — and requires very little floor space. Unit is shipped complete, easy to install, assembled so as to prevent steam leaks. Special bearings will stand up under hot water for several years. A special float mechanism is guaranteed not to leak or stick in stuffing box. *Complete data and description in Bulletins 245, 253 and 255.*

The Nash Engineering Company

234 Wilson Road **South Norwalk, Conn., U. S. A.**

Sales and Service Offices in all Principal Cities

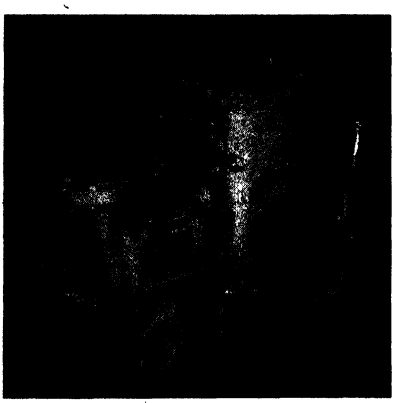


Return Line Vacuum Heating Pump

Standard with the heating industry for over eighteen years. Removes air and condensation from return lines of vacuum steam heating systems, discharging air to atmosphere and returning water to the boiler.

Two independent units are combined in a single casing—an air unit and a water unit. Impellers of both are mounted on the same shaft. Pump is bronze fitted throughout.

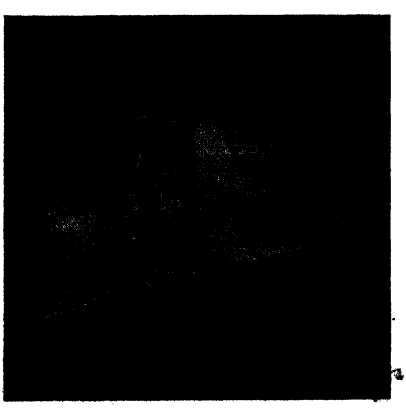
Supplied direct connected to standard electric motors, for belt drive, or for steam turbine drive. For continuous or automatic operation. Standard in capacities up to 300,000 sq ft E.D.R. Larger units special. Bulletins Nos. 307, 308, 309, and 310 on request.



Vapor Turbine Vacuum Heating Pump

Jennings Vapor Turbine Heating Pumps combine all advantages of the standard return line heating pump with a new type of drive, a specially designed low pressure turbine which operates directly on steam from the heating mains on any system, requiring a differential of only 5 in. of mercury, and returns that steam to the heating system with practically no heat loss.

This pump affords the safety and economy which goes with continuous condensation return and steady vacuum, and at no cost for electric current. Furnished standard in capacities up to 65,000 sq ft E.D.R. Larger units special. Bulletin No. 290 on request.



Condensation Pump and Receiver

Removes the condensation from radiators in return line steam heating systems, particularly radiators set below the boiler water line level, and pumps the condensation back to the boiler. Pump is bronze fitted with enclosed centrifugal impeller of improved design. By making the pump casing a part of the return tank, and bolting the motor base to the tank, floor space is conserved. The rectangular construction permits installation in a corner against the wall.

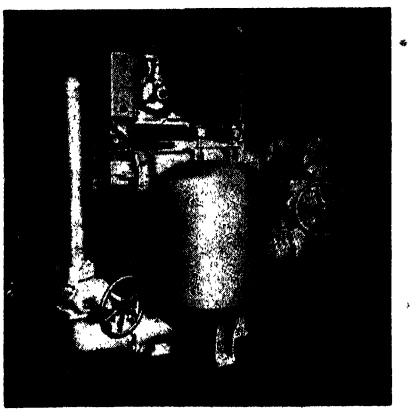
These pumps are furnished in standard sizes with capacities ranging from 1½ to 225 gpm of water. For serving up to 150,000 sq ft of equivalent direct radiation. Bulletin No. 319 on request.

The Nash Engineering Company

234 Wilson Road **South Norwalk, Conn., U. S. A.**

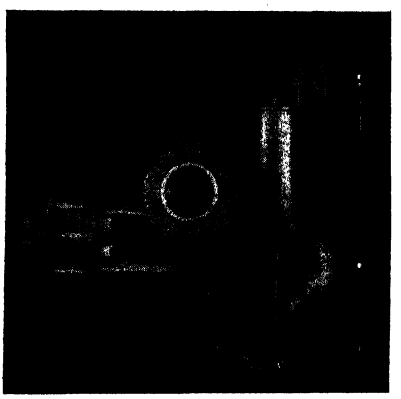
Sales and Service Offices in all Principal Cities

SEWAGE EJECTOR



For pumping unscreened sewage or drainage from basements below the street sewer level, handling crude sewage from low level districts, pumping effluent, sludge and other heavy liquids. The Jennings Sewage Ejector is of the pneumatic type. Air, compressed only to the pressure at which it is used, by a Nash Hytor Air Compressor, is motive power to pump the accumulated sewage from a pot to the sewer. There are no air storage tanks, reciprocating air compressors or screens, no air valves. Furnished in several standard sizes up to 1500 gpm against heads up to 100 ft. Bulletins on request.

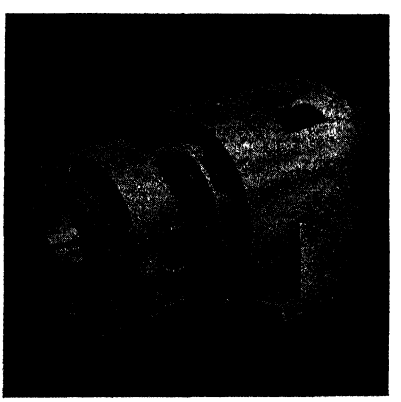
Suction Sump and Sewage Pumps



Jennings Sump Pumps are self-priming centrifugals for handling seepage water and liquids reasonably free from solids. Sewage Pumps are equipped with non-clog type impeller for liquids containing solids. Suction piping only is submerged. Centrifugal impeller and vacuum priming rotor are mounted on same shaft that carries rotor of the driving motor, forming a single moving element, rotating without metallic contact.

Will handle air or gas with liquid being pumped, and because of self-priming feature are installed entirely outside of pit, affording perfect accessibility for inspection or cleaning. Capacities to meet all requirements. Bulletins Nos. 159, 161, and 338 on request.

Air Compressor and Vacuum Pump



Nash Air Compressors operate on a unique and different principle. The one moving part rotates in casing without metallic contact. There is nothing to wear, and no internal lubrication.

Nash Compressors deliver absolutely clean air; ideal for agitation of liquids, pressure displacement, and handling gases. Vacuum pumps ideal for priming pumps, blood sucking pumps in hospitals, and wherever non-pulsating vacuum is required.

Pressure 75 lb or vacuum 27 in. of mercury. Furnished for any capacity; special for higher vacuums and pressures. Bulletins Nos. 282, 325, 331 and 337 on request.

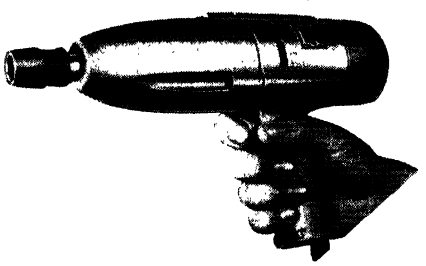
CENTRIFUGAL PUMPS

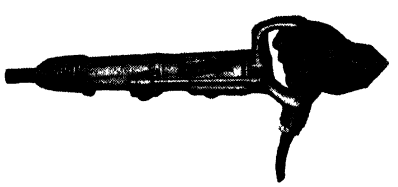
The MOTORPUMP is a compact, "package" unit, mounted integrally with motor on a rigid, oversize shaft and oversize bearings. It is highly adaptable to many services, needs no special foundation, and operates equally well in any position. It is available in several materials for pumping various liquids. Capacities from 10 to 1800 gpm, heads to 600 ft.

Other I-R pumps are offered for all hydraulic services, with any type of drive.



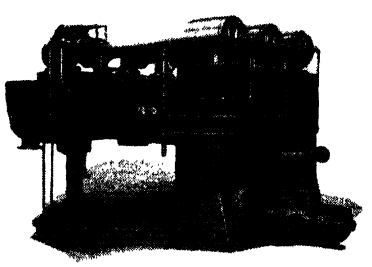
ALL PURPOSE PORTABLE TOOL

The 4U Electric Impact Tool is a lightweight, portable, tool for running and removing nuts, screws and studs, drilling, reaming, tapping, wire brushing, drilling brick and masonry, driving wood augers, hole-saw work, and the 101 jobs encountered in installation work. Plugs into any wall outlet. Capacities: ¼ in. drills, step-reaming to ½ in., running nuts to ⅜ in. thread size. 110 and 220 volts, 25 to 60 cycles universal motor.



LIGHT-WEIGHT JACKHAMER

The J-10 Jackhamer is the smallest of the self-rotating, rock-drill line, weighs 14 lbs. and is especially designed for maintenance and installation work. Its uses include drilling masonry for conduit, sprinkler hangers, foundation bolt holes, pipelines and drains as well as tearing out brickwork for doors and windows and similar demolition jobs. The J-10 is air-powered.



STEAM-JET REFRIGERATION

Where refrigeration is needed down to 35F, and a supply of steam is available, the I-R system of water-vapor refrigeration with Steam-Jet Coolers is offered. In this system water is the only refrigeration medium. It is cooled by direct evaporation in a high vacuum created by steam-jet booster ejectors. There are no moving parts, no vibration nor noise. Sizes run from 20 to 1200 tons of refrigeration and can be built to operate at any one of a wide range of pressures down to 2 lb per sq in.

I-R COMPRESSORS OF ALL TYPES AND SIZES

I-R Compressors are offered in all sizes and types from ½ to 3000 hp, in pressures from a few ounces to 15000 lbs, and in stationary or portable models. Air-cooled units range from ½ to 90 hp. I-R Water systems are available for industrial and domestic uses.

INTERNATIONAL HEATING & VENTILATING EXPOSITION
THE AIR CONDITIONING EXPOSITION

Permanent Address—Grand Central Palace, **New York 17, N. Y.**

EXPOSITIONS HELD

New York, 1948; Cleveland, 1947-1940; New York, 1938; Chicago, 1936; New York, 1934; Cleveland, 1932; Philadelphia, 1930.

1949 IN CHICAGO

The Ninth Air Conditioning Exposition will be held at the International Amphitheatre, Chicago, Ill., January 24 to 28, 1949. This promises to be one of the largest ever held and is in accordance with previously announced plans to hold the Exposition annually through 1950.

These Expositions continue to provide a valuable service to the industry by offering common meeting places where newest developments may be personally demonstrated and problems may be discussed with technical personnel. Every phase of air conditioning is covered—heating, cooling, piping, ventilation, humidification and dehumidification for industrial and commercial establishments as well as homes.

UNDER AUSPICES OF A.S.H.V.E.

These Expositions have been and will be held co-incident with the annual meetings of the American Society of Heating and Ventilating Engineers and under their auspices. Management is by International Exposition Company with permanent headquarters at Grand Central Palace, New York 17, N. Y.

EXHIBITORS

Comprise leading firms in each phase of the industry; number has varied from 150 to 400 exhibitors.

EXHIBITS

These range from and comprise all the types of articles discussed or advertised in this copy of THE A.S.H.V.E. GUIDE.

1. *The* COMBUSTION *Group:* Furnaces, burners (coal, oil and gas), grates, stokers, boilers, radiators (various types), refractories and auxiliaries.
2. *The* OIL BURNER *Group.*
3. *The* HYDRAULIC *Group:* Water feeders, water heaters, pumps, traps, valves, piping, fittings, expansion joints, pipe hangers, etc.
4. *The* STEAM HEATING *Group:* Vapor heating and steam specialties.
5. *The* HOT WATER HEATING *Group.*
6. *The* AIR *Group:* Warm Air furnaces and stoves, registers and grilles, cooling towers, air filters, motors, fans, blowers, conditioning equipment, ventilators (room and industrial types), unit heaters, etc.
7. *The* AIR CONDITIONING *Group:* Equipment which circulates and filters the air, in summer dehumidifies and cools; in winter heats and humidifies, and does all these in proper season for complete, all year-round air conditioning.
8. *The* CONTROL *Group:* Instruments of precision for indicating, controlling or recording temperature, pressure, volume, time, flow, draft or any other function to be measured.
9. *The* REFRIGERATING *Group:* Compressors, condensers, cooling apparatus, contingent apparatus and refrigerants.
10. *The* CENTRAL HEATING *Group:* Apparatus and materials especially designed or adapted to the uses of central heating and central heating station supplies.
11. *The* INSULATING *Group:* Structural insulators (refractory and cellulose materials), asbestos, magnesia clays and combinations thereof, pipe and conduit covering, etc., weather-stripping, etc.
12. *The* MISCELLANEOUS *Group:* Electric Heaters, boiler and pipe repair alloys, liquids and compounds, tools of all kinds, and equipment not specifically included in the above groups, but related thereto.
13. *The* MACHINERY AND GENERAL EQUIPMENT *Group.*
14. BOOKS AND PUBLICATIONS.

VISITOR ATTENDANCE

Attendance is by invitation and registration only, thereby presenting a selected audience. Included are contractors, dealers, jobbers, supply houses, home owners, industrial users, professional and service organizations, public utilities, real estate management concerns, etc. A detailed analysis of registered attendance is available on request. In 1948 at New York, there were 50,000 registered visitors.

Industrial Expositions in America lead the expositions of the world in style, business effectiveness, industrial influence and educational value. This Exposition stands among the leaders in Industrial Expositions in America. It is an educational institution which brings together the research developments and improvements in equipment and materials for use in heating, ventilating and air conditioning all types of buildings.

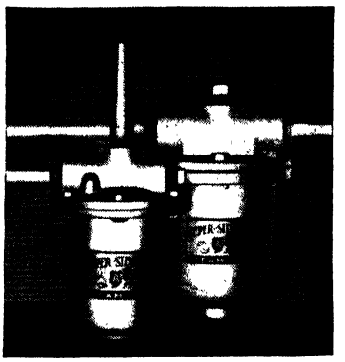
1942 West 96th Street, **Cleveland, Ohio**

Representatives in all principal cities

SUPER-SILVERTOP STEAM TRAPS

Are inverted bucket steam traps of an improved, thoroughly tested design. These steam traps automatically remove both condensate and air from the steam system—no manual operations are necessary.



Shows how trap is installed either as an elbow or straight in-line, using a minimum of fittings.

APPLICATIONS

Super-Silvertops are used on any steam-using equipment where it is desired to remove condensate and air automatically in order to produce maximum heating efficiency.

FEATURES

Simplified Piping—Connected either as an elbow or straight-in-line—only one nipple needed since the U-tube is inside the trap. Saves as much as three elbows, three nipples and 60 minutes of time, compared to other inverted bucket steam traps.

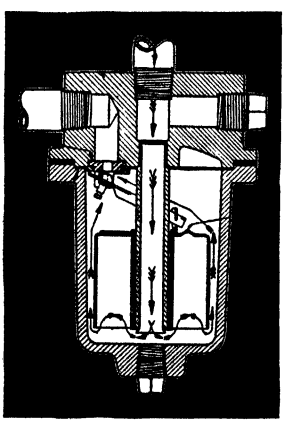
Precision Parts Alignment—The bucket does not swing free. It is controlled in true engineering fashion, guided on a hexagonal tube. This makes a knife-edge contact, eliminating almost all friction. The unusual guide arrangement keeps all parts in proper alignment and prevents the bucket from hitting the sidewalls of the case. Positive closing of the valve is insured.

Self-Cleaning—The reversing of the condensate flow on entering the trap produces a scrubbing action. This stirs up any sediment and dirt which is then carried away in the discharging condensate.

No Restricting Passages—Even in the smallest sizes there are no narrow cored passages to become clogged with scale.

Cannot Air-bind—As the air is automatically discharged ahead of the condenaste in each cycle of operation.

Vacuum or Pressure—These traps do not leak steam. No danger of vacuum being destroyed—trap is recommended for vacuum operation.



Materials: Case and head are of nickel semi-steel, bucket is copper, guide tube of admiralty bronze, valve and seat of special chrome alloy, all other parts of stainless steel. All interior parts can be furnished in stainless steel when so ordered.

INSTANT HEAT

Anderson Super-Silvertops can be equipped with Thermal Air Eliminators where instant heat is desired. **Other Anderson products are:** combination open float and thermostatic steam traps, float-type steam traps, air release valves, and pipeline strainers.

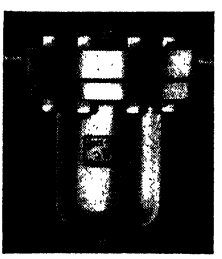
Capacities based on continuous flow. When ordering be sure to specify maximum steam pressure.
Note: Pipe sizes shown in **heavy type** are standard and traps will be shipped tapped standard unless otherwise specified. Pipe sizes shown in light type furnished at no additional, cost but only from Cleveland stock.



SUPER-SILVERTOP STEEL SERIES

. . . for higher pressures and temperatures —come complete. No need for extra, expensive fittings, no pipe to bend, and no labor cost for making up extra pipe joints. Installation may be straight-in-line or as an elbow. Only two threaded joints required in either installation. The case and head are made of steel; and the gasket joints are of the recess type, preventing any possibility of gasket blowouts; all interior parts are stainless steel, except the valve and seat which are special chrome alloy.

Barnes & Jones
INCORPORATED

129 Brookside Avenue **Boston 30, Mass.**

New York Office: 101 Park Avenue

Barnes & Jones Vapor and Vacuum Systems of Steam Heating; Modulation Valves; Adjustable-Orifice Radiator Valves; Packless Quick-Opening Radiator Valves; Thermostatic Radiator Traps; Thermostatic Trap Replacement Units; Condensators (Boiler Return Traps); Float and Thermostatic Traps; Strainers; Damper Regulators; Gages; Systems of Zone Control for Steam Heating. Complete Catalog on Request

Series K

The Series K valve is of the modulating type equipped with dial and pointer to indicate whether the valve is open or shut or in an intermediate position. Lever or wheel handle.

Series F

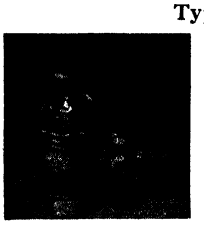
The Series F valve has no dial or pointer and is therefore furnished only with wheel handle or lock shield. Of same quality as Series K but lower priced.

Both Series K and Series F valves are quick opening, non-rising stems, renewable disc seats, of packless design. Made angle pattern in ½, ¾, 1 and 1¼ in. sizes; straightway (globe) pattern in ¾ and 1 in. sizes. For use in vapor or vacuum systems.

Capacities—Sq Ft E. D. R.

Size valve	½"	¾"	1"	1¼"
2 ounces pres.	25	50	90	160
8 ounces pres.	45	90	160	280

Type H



The Type H valve is of the adjustable orifice type so arranged that the dial indicates at all times the size of the radiator for which the valve is adjusted.

May be adjusted with steam on the system. Noiseless in operation.

Lever or wheel handle, unauthorized tampering virtually impossible. Made for pressure differentials of 1, 2, 3, 4 and 5 pounds, ¾ in. valve up to 100 sq ft. 1 in. valve over 100 sq ft.

Thermostatic Radiator Traps

The B & J precision made thermostatic trap contains the unique, patented cage unit which is a complete operating unit in itself. The cage assembly contains the double thermostatic element calibrated in the factory, and locked in correct adjustment with the trap seat, which is also an integral part of the cage unit. Suitable for pressures up to 15 lb.

Capacities—Sq Ft of E. D. R.

Size	No.	Pres. Diff.—Lbs. per Sq In.					
		⅛	¼	1	2	5	15
½	122	70	92	168	228	320	610

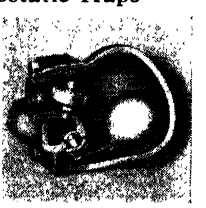
1	147	200	300	590	760	1200	2200

Medium and High Pressure traps suitable for pressures between 15 lb and 100 lb can be furnished.

Float and Thermostatic Traps



Made in five sizes for handling large and sudden loads of condensate that are greater and more variable than can be handled efficiently by thermostatic traps. Suitable for pressures up to 15 lb.

Capacities Lbs Water per Hour

Size	No.	Pres. Diff.—Lbs. per Sq In.				
		¼	½	2	5	15
¾	T41	70	100	200	210	230

2	T45	1775	2500	5000	5250	5750

Medium pressure F. & T. traps in ¾ in. and 1 in. sizes can be furnished for pressures up to 65 lb.

Barnes & Jones, Inc., manufactures a complete line of control systems operated either manually from a central station or automatically from an outdoor thermostat.

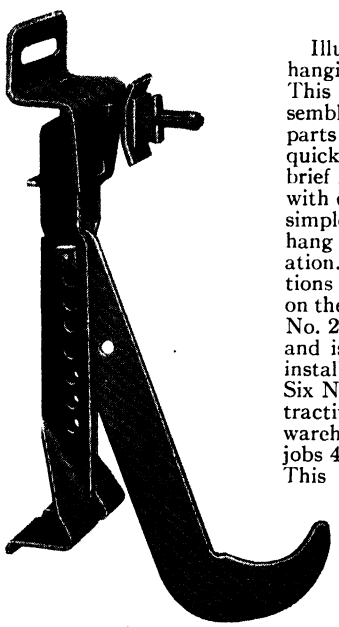
Carty & Moore Engineering Co.

Established 1919

511 West Larned Street **Detroit 26, Mich.**

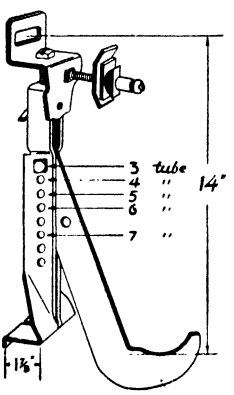
STEEL RADIATOR BRACKETS **STEEL CONCRETE INSERTS**

For over a quarter of a century Carty & Moore Brackets have been recognized by engineers and contractors as a superior product and there are nearly a million in use today. Specify them on your next job and watch labor costs drop because of quick and easy installation—they won't let you down!



MODEL NO. 22 BOTTOM HUNG RADIATOR BRACKETS

Illustrated is the No. 22 Universal Radiator Bracket for hanging all types of wall, tube or slender-tube radiation. This bracket is completely assembled when shipped and all parts are furnished, ready for quick and easy installation. A brief instruction card is enclosed with each bracket to explain the simple adjustments required to hang any particular type of radiation. Roughing-in specifications are shown by the drawing on the right. Because the Model No. 22 is completely assembled and is so simple to adjust, it cuts installation time to a minimum. Six No. 22's packaged in an attractively labeled carton for warehouse purposes—for specific jobs 40 brackets to a burlap bag. This bracket is also available with double hook and reinforced frame for double row wall radiation—specify No. 222.

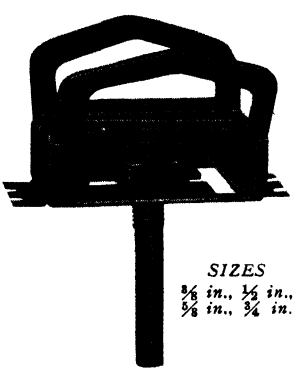


MODEL NO. 33 TOP HUNG BRACKETS

A completely assembled top hung hanger with 1¾ in. outset from the wall, especially approved for government jobs. Also available with 2⅞ in. outset for hospitals, institutions, etc. where frequent cleaning behind the radiator is required—specify No. 333. When ordering top hung brackets, specify model number and the type of radiation to be hung.

MODEL NO. 44 CONCRETE INSERTS

Carty & Moore No. 44 Concrete Inserts have long been used by leading heating contractors and are designed to meet the most exacting requirements. The C & M Insert is made of heavy gage pressed steel stampings and is strong and dependable. A long travel slot permits ample adjustment yet the nut cannot pull out and the wide wingspread allows the insert to become deeply imbedded in the concrete so it cannot tear out or loosen even under a heavy strain. Packed in nicely labeled cartons, 50, ⅜ in. or ½ in. to a box; 25, ⅝ in. or ¾ in. Sheets giving complete specifications will be sent on request.



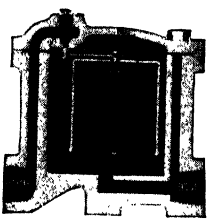
SIZES
⅜ in., ½ in., ⅝ in., ¾ in.

The Clark Manufacturing Company

1830 E. 38th St., **Cleveland 14, Ohio**

Established 1908

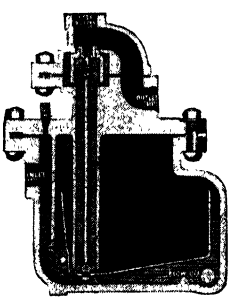
Clark, manufacturers of steam specialties for 39 years, produces a complete line of fluid controls. They are engineered for the jobs required of them, such as heating and air conditioning and wherever air, steam or gas is used.



(Series 70)

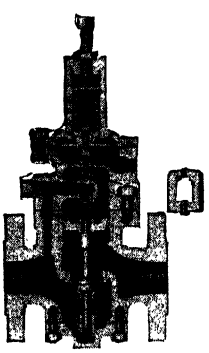
Inverted Bucket Traps are of three general sizes: (1) small, for general drainage service (2) for greater capacity (3) for high pressure and temperatures. The combination inverted bucket and blast type (Series 70-T) has a built-in thermal-by-pass to rapidly bring systems up to operating temperature by fast elimination of air and condensate.

The Clark Patented Bucket Venting Device provided in top of bucket furnishes the means of relieving the accumulated steam and air within the bucket.



(Series 80)

Open (Upright) Bucket Type used for general drainage—are available in Semi-Steel to 250 psi and Cast Steel to 400 psi. The discharge value is located at the top of the trap for easy inspection and can be replaced without removing trap from the line or breaking pipe connections.Th ey are equipped with "Clark-loy" ball type disc and seat.



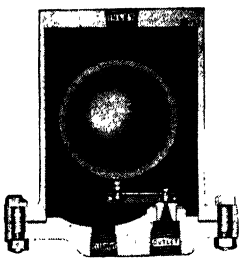
(Series "CRV")

"CRV" Pressure Regulator is integral pilot controlled—piston operated single seated type. It is suitable for operation at initial pressures and temperatures up to 250 psi and 450 F for cast semi-steel construction; 400 psi and 600 F for cast steel construction wherever steam, air or gas is used.

Steam Capacities (In Lbs. per Hour) of Clark "CRV" Regulators, at Various Initial Pressures

Initial Pressure	½ in.	¾ in.	1 in.	1¼ in.	1½ in	2 in.	2½ in.	3 in.
30	100	210	345	580	1000	1500	2500	4000
50	120	295	500	815	1120	2000	3500	5000
100	190	500	1000	1500	2500	4000	6000	8000
150	270	910	1180	2000	3500	5000	8000	10000
200	500	1500	1525	3000	4000	7000	10000	15000
250	560	2000	2200	3500	5000	8000	12000	20000

Air Traps—Automatically drains water from air lines, air receivers, drip pockets, aftercoolers, etc. Also adaptable for draining non-corrosive liquids from lines or equipment carrying vapors, such as steam and various kinds of gases.



No. 440

Separators—Effectively separates, collects and removes condensate and entrained moisture from lines conveying steam, air or other gases. This saves fuel. For there is more energy per pound in dry steam than in wet.

**The 800 series shown here are the screwed type. Information on the flanged and extra heavy models is available upon request.

Strainers—Both the "T" and "Y" can be installed in steam, air, water and other fluid lines to remove dirt, scale, grit from fluid flow, protecting working parts of control valves. There is no appreciable pressure drop because of the straight thru flow. The blow-off connection at the bottom permits easy removal of collected dirt. Screen area is considerably greater than that of the pipe.

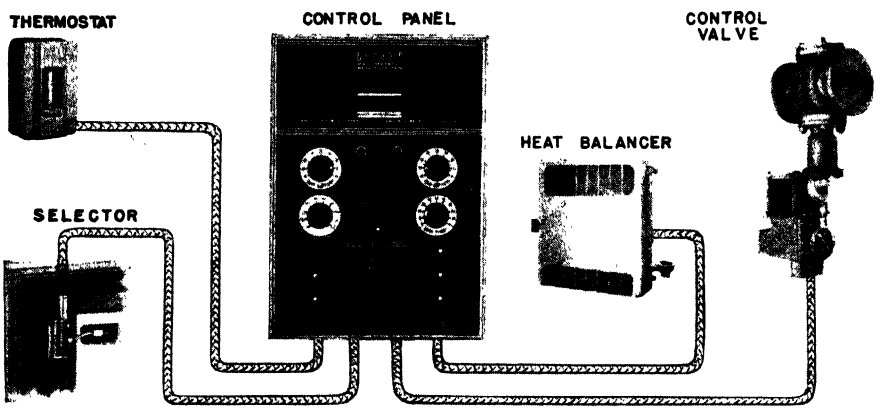
THE DUNHAM DIFFERENTIAL VACUUM HEATING SYSTEM

Fully Automatic

"Dunham Heating Service," as close to you as your telephone in most principal cities, see classified telephone directory. Expert heating engineers are available to architects and engineers for counsel at every one of these offices.



The Control Panel is the centralized operating station at which all control adjustments and settings are made and from which remote readings of room temperatures, control valve openings and percentage of heat output as measured by the Heat Balancer may be obtained. The Temperature Control Equipment appraises the heat demand of the building utilizing the resistance thermometer principle of operation. The Resistance Thermometers comprise coils of metal conductors whose electrical resistance varies with variations in their temperature connected in a Wheatstone Bridge circuit. Such temperature sensitive elements have no moving parts. All moving parts are contained in the Panel and in the Control Valve.

The basic control of the Differential Temperature Control Equipment balances the heat supply (measured by the Heat Balancer) with the heat demand (measured by the Selector). Compensating or limiting features are provided by the room Resistance Thermometer units. Since this room thermometer is not depended upon to perform the function of the conventional room thermostat, it is not as limited in its application. It can be used to register room temperatures from any location regardless of the type of occupancy of the room.

DUNHAM THERMOSTATIC TRAPS

For Operating Pressures up to 15 lb psi gage

The ½ in. trap is available in AP, RH, LH, SW, and vertical patterns. The ¾ in. in AP, SW only. The 1 in. in AP only.

Construction—Bodies, covers, nut and nipple are of brass, valves and seat are cast bronze. The trap is non-adjustable, permanent adjustment for correct operation is built into the element. The thermostatic elements for traps of the same size are interchangeable without adjustment. The disc is made from Monel Metal sheet. The cor-

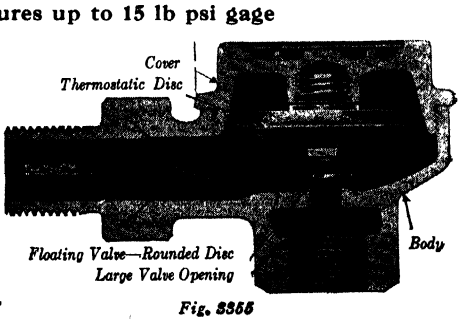


Fig. 8556

rugations are shaped to reduce hinge action at the rim of the disc and to distribute disc motion uniformly. The filling nozzle and the valve assembly are attached to their respective halves of the disc by threaded nuts making tight screwed joints which are further reinforced, locked and sealed by sweating with solder. The valve is flat and is attached to the disc by a ball swivel joint to insure its seating squarely and tightly. Valve opening is exceptionally large and the passage of water or dirt out of the trap is not obstructed by a guide as none is necessary with the Dunham design. Valve seat is raised slightly and rounded to minimize the depositing of incrustants.

DUNHAM THERMOSTATIC STEAM TRAPS—TYPE TH

For Working Pressures 25 Lb to 100 Lb

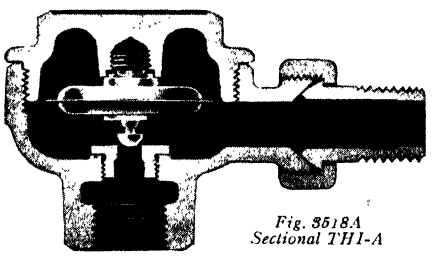

Fig. 3518A
Sectional TH1-A

Construction—Type TH traps are the thermostatic fluid expansion type.

The trap consists of two principle parts, a body with renewable valve seat and a cover containing the thermostatic element. Permanent adjustment for correct operation is built into the element. The covers may be removed from the trap body while hot without danger to the thermostatic element. The valve is swiveled to insure its seating tightly without causing localized stresses on the element. Body, cover, nut and nipple are of brass; valve and seat are of special heat treated stainless steel; thermostatic element is formed from monel metal sheet. Capacity lbs condensate per hour Type TH1A 1200 to 2600; Types TH2A and TH3A 1800 to 4500.

DUNHAM RADIATOR VALVES

"ORIFLEX" PACKLESS RADIATOR VALVE

Type 175 Oriflex self-contained adjustable orifice valve combines the conveniences of both lever and wheel handle valves. The adjustable orifice within the valve controls the steam flow. Oriflex eliminates the time consuming operations of disconnecting and re-connecting the valve in order to balance a system. Merely remove the handle, insert the key on the adjustment stem thus made accessible, adjust the orifice (calibrated guide surrounds stem) to the exact setting needed for perfect balance. Instead of being limited to orifices calibrated in steps of five square feet, Oriflex provides for adjustments in increments of one square foot.

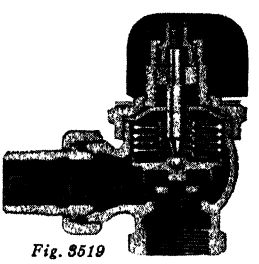

Fig. 3519

PACKLESS RADIATOR VALVE, SERIES 1140

Wheel Handle

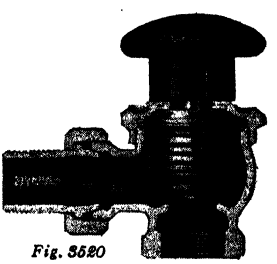

Fig. 3520

Suitable for all types of low pressure steam heating systems. The bellows construction, the non-rising stem, low bonnet, heat-resistant composition handle requiring less than one turn to open the valve fully, recommend this valve for services in which long-wearing quality, absolute tightness and attractive design are desired.

Bodies and bonnets are brass castings, rough finish. The valves are furnished with heavily constructed brass union nuts and nipples. The expansion member is the built-up type of bellows, fabricated from tinned phosphor bronze giving maximum resiliency and wear. The expansion member not only prevents leakage of steam, air and water, but also prevents steam, water and dirt from clogging and corroding the spindle nut and screw.

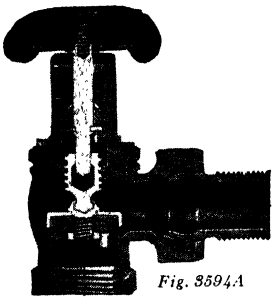

Fig. 3594A

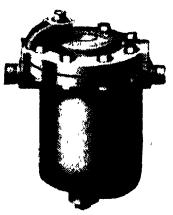
740 SERIES DUNHAM RADIATOR VALVE

(Spring Packed)

Designed for low pressure steam heating service. Bodies are brass castings, rough finish. The valves are equipped with heavily constructed brass union nuts and nipples. All pipe threads and tappings are carefully machined and checked to standard gages. Non-rising stem, requires less than one turn of handle to open the valve fully. Dial shows direction and amount of opening. Heavy steel spring keeps a constant pressure on a special graphited asbestos composition ring to maintain a tight seal around the valve stem.



DUNHAM INVERTED BUCKET TRAPS

Type OB For Operating Pressures up to 250 lb
Type OBS For Operating Pressures up to 150 lb

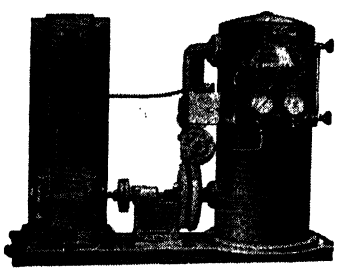
Type OB sizes are ½ in. to 1¼ in. inclusive, Type OBS made only ½ in. and ¾ in. sizes, right hand female tappings. Body and cover are of high test semi-steel castings and are provided with a plugged opening at the lowest point of the body. The valve and seat, which are renewable and interchangeable, are constructed of especially hardened, corrosion resisting steel. Bucket is formed from sheet copper. Cover cap screws are steel.

DUNHAM FLOAT AND THERMOSTATIC TRAPS

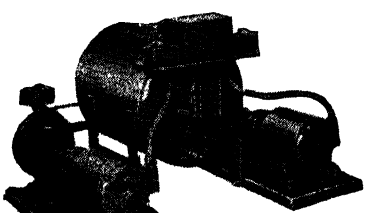
30 Series—For Operating Pressures up to 15 lb Gage

Trap is comprised of a cover and mechanism assembly and a body. Thermostatic disc and valve controls flow through a cored passage between the trap body and the discharge tapping for the release of air. The float is copper alloy. The float valve and seat are monel metal. Thermostatic elements are interchangeable. The trap body can be readily removed without disturbing piping connections to fully expose the working parts for inspection. Covers and disc Assemblies are interchangeable. Capacities, based on a rate of ¼ lb condensate per sq ft of EDR per hour, at a pressure difference between inlet and outlet of 2 lb gage, 800, 2000, 4800, 9600, 20000. Female right-hand threaded inlet and outlet. Connections ¾ in., 1 in., 1¼ in., 1½ in. and 2 in.

Dunham Closed Float Traps In Same Capacities



Type VR



DUNHAM PUMPS

Tested and Rated with A.S.H.V.E. Code.

Vacuum Pumps

Made in 9 sizes from 2500 to 65,000 EDR to be applied in accordance with EDR load, no allowance necessary for piping. Furnished as single or duplex units with a separate accumulator tank to take care of low returns. Each automatic pump has its own control panel wired through to motor. Selector switch on panel permits pump to operate on full vacuum and float control.

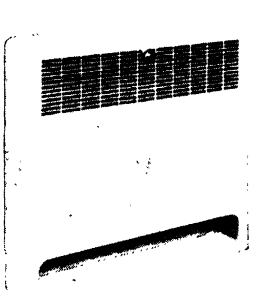
Pump and motor assembled on rigid cast iron base. Bronze fitted centrifugal pump has non-corrosive shaft. Enclosed type Impeller. Liberal size ball bearings.

Type CH-Model C, Single and Duplex—Capacities 2000 to 50,000 sq ft EDR discharge pressures 20 to 50 lbs; 60 cycle d.c. or a.c. 1750 rpm; 25 or 50 cycle a.c., 1450 rpm.

Type CHH-Model C, Single and Duplex—Capacities same as type CH. Discharge pressures 20, 30, 40, 50 and 70 lb. 60 cycle d.c. or a.c. 3450 rpm; 25 or 50 cycle a.c., 2850 rpm.

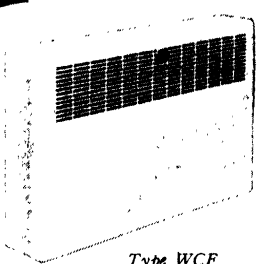
DUNHAM CABINET CONVECTORS
With Non-Ferrous Heating Element

Dunham Convectors can be used on steam or vapor, and gravity or forced hot-water heating systems. EDR capacities with 1 lb steam, 65° F entering air range from 12 to 108 sq ft EDR. Made in 4 in., 6 in., 8 in. and 10 in. widths; 20 in., 24 in., 32 in. enclosure heights; casing lengths from 18 in. to 64 in. Casings are constructed of No. 18 gage steel with removable fronts having rounded corners for pleasing appearance. The outlet grille consists of horizontal openings punched in the casing front. Dampers can be furnished when so ordered. Heating element is constructed of non-corrosive materials, copper or aluminum fins on seamless drawn, round copper tubes brazed to bronze headers. The tubes are expanded after assembly to assure intimate contact between fin and tube for permanent heat transfer. Heavy side plates protect the fins from damage. The elements are tested at a hydrostatic pressure of 400 lb per sq in. and are suitable for operation on 150 lb steam or water working pressure. Either end or top and bottom tapped headers (¾ in. I.P.S.) can be supplied.



Type FCF Convector

Heating Element



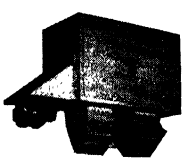
Type WCF Convector

DUNHAM UNIT HEATERS

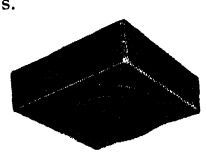
Types C and R are essentially industrial type units designed for heating large spaces. Type C, discharging large volumes of heated air downward to working levels, distributes heat evenly over large areas.

Type R—Wall Type

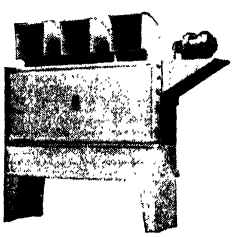
Type R—Ceiling Type



Type R—Inverted Wall Type



Type C—Built in various sizes up to 2000 sq ft EDR.



Type R—Floor Type with mixing damper also furnished with elongated nozzles

Type R is available in various types of mounting as shown. All units have belt driven centrifugal type fans using constant speed 1750 rpm motors. Complete heating element and complete fan and shaft assembly can be removed through either end of casing. Heating element is replaceable copper tube type.

Type V—Horizontal propeller fan type. Built in various sizes from 65 up to 1500 sq ft EDR.

DUNHAM AIR CONDITIONING UNIT

This single unit, when correctly installed, supplies heated air in winter and cooled and dehumidified air in the summer, with filtering, ventilation and circulation of air the year 'round. These combined services are rendered with a minimum requirement of space and a high functional efficiency which guarantees genuine satisfaction and genuine economy.

DUNHAM TYPE OTS HEATING ELEMENT

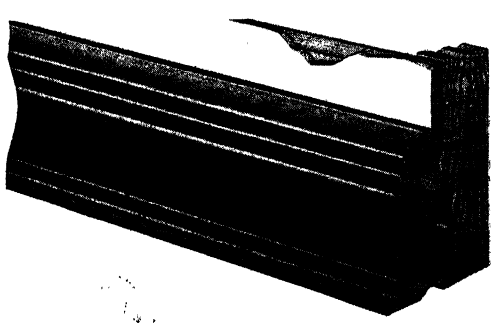
An extended surface heating element made of steel or copper. Light in weight, and has unusual heating capacity. Each element is made up of 1¼ in. pipe with heavy fins mechanically attached, eliminating the use of a solder bond without sacrifice of heat transfer. Each fin, when pressed on the pipe, interlocks with the preceding fin—forming an exceedingly tight and permanent mechanical joint. The complete unit is painted with heat-resisting zinc chromate black enamel. Lengths from 18 in. up to 144 in. can be supplied in 6 in. increments. Standard units are threaded at each end with standard pipe threads.

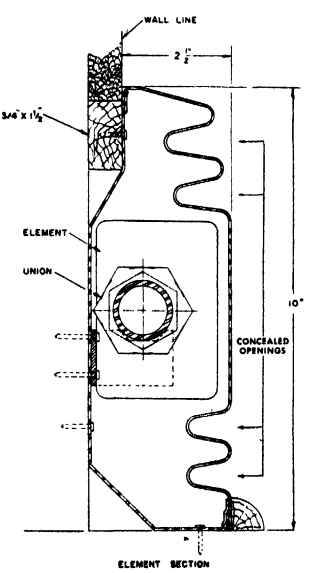
DUNHAM BASEBOARD

The Dunham Baseboard Simplicity Heating System is completely automatic. A room thermostat starts and stops the water circulator to provide just the right amount of heat. An aquastat starts and stops the heating device on the boiler to maintain a minimum water temperature and provide adequate hot water for washing, bathing and other domestic purposes. This automatic operation, plus the high efficiency and complete simplicity of the Dunham System, cuts installation and operation costs to a *fraction* of what you pay for old-fashioned heating systems.

Smart design and easy maintenance are combined in the Dunham Baseboard Simplicity Heating System. The specially engineered baseboard comes in an attractive style with completely hidden louvres to provide a decorative note that doesn't detract from the layout of your rooms as does an ordinary radiator heating system. It's easy to keep clean, too, because the Dunham Baseboard has no outside openings to catch dirt—and as it goes completely to the floor there is no hard-to-clean pocket of accumulated dust. The baseboard cover is easily removed and all parts are readily accessible. Attractive in appearance—easy to install—simple to operate and gives clean, comfortable, satisfying, healthful warmth . . . from wall to wall . . . from floor to ceiling.

This completely concealed heating system surrounds the entire house with a one inch pipe inside the outside walls (lengths of finned radiation are installed as required) to provide a wall of warmth, to keep out the cold. It wraps a house in a blanket of warmth. Designed and tested at odd moments during the long war years, an independent laboratory says, "Its performance was better in a basementless house than any other device that has been tested."





ELEMENT SECTION

William S. Haines & Company

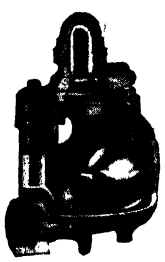
1010-12-14 Wood Street, **Philadelphia 7, Pa.**

Manufacturers of

EQUIPMENT FOR VAPOR AND VACUUM HEATING SYSTEMS

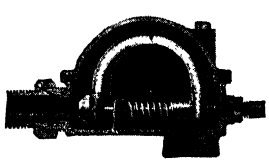
PRODUCTS—Haines Vento Radiator Traps, Medium Pressure and Blast Type Traps, Combined Float and Thermostatic Traps, Air Eliminators, High Pressure Thermostatic Traps, Boiler Return Traps, Radiator Valves.

HAINES F & T TRAPS



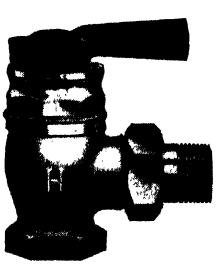
Designed to handle large quantities of condensation. For dripping steam mains, unit heaters, hot water generators. etc. Cannot become air bound as it has a thermostatically controlled air by pass. Sizes ¾ in., 1 in., 1¼ in. For pressures to 30 pounds.

HAINES MEDIUM PRESSURE TRAPS



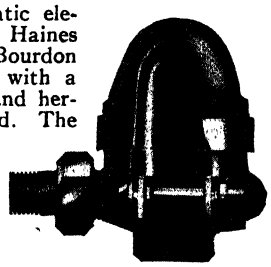
A ruggedly constructed bolted case trap. Ideal for hospital and kitchen equipment and all process work operating on pressure up to 100 pounds.

HAINES MODULATING VALVES



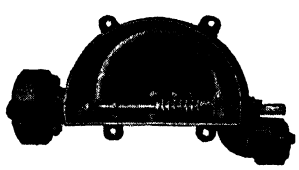
A packless valve assuring positive and leak proof performance. Completely opens or closes on less than a full turn of handle. Can be furnished with wheel or lever handle or lock-shield.

HAINES RADIATOR TRAPS



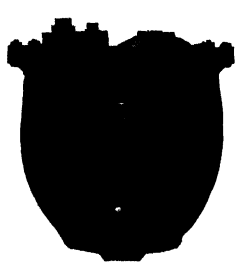
The thermostatic element in all Haines Traps is a Bourdon tube, charged with a volatile fluid and hermetically sealed. The expansion and contraction of the fluid, under varying temperatures, furnishes the operating power. The vertical seat of this trap prevents it from becoming inoperative from scale or other foreign matter.

HAINES HIGH PRESSURE TRAPS



For dripping high pressure mains, laundry equipment and all process fixtures with working pressures up to 125 pounds.

HAINES BOILER RETURN TRAPS



For vapor and atmospheric heating systems. Assures positive circulation by venting the air and returning the water of condensation to the boiler. Has no stuffing boxes or packed joints to leak air or water.

Each device is individually tested, factory adjusted and guaranteed.

Hoffman Specialty Company

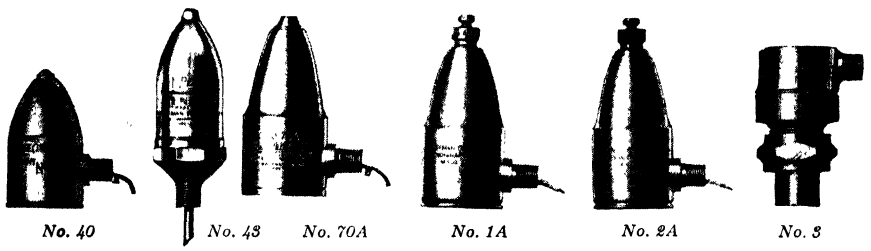
General Office and Factory

1001 York Street, **Indianapolis 7, Ind.**

Sales Representatives in Principal Cities

Manufacturers of Radiator Air Valves, Quick Vents and Air Eliminators for all types of Steam and Vacuum Heating Systems—Steam Traps of all kinds—Radiator Supply Valves—Vacuum and Condensation Pumps—and Hot Water Automatic Heat Control Systems.

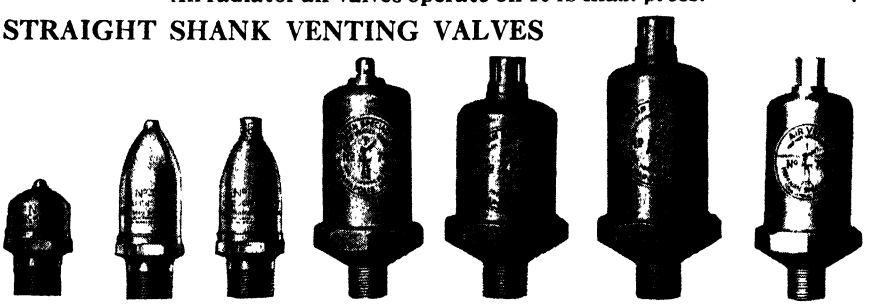
RADIATOR AIR VALVES FOR STEAM AND VACUUM SYSTEMS



No. 40 *No. 43* *No. 70A* *No. 1A* *No. 2A* *No. 3*

No. 40 Steam—Hoffman patented tongue syphon—⅛ in. connection—fixed port.
No. 41 and 43 Steam—Straight shank for convectors—telescopic syphon—⅛ and ¼ in. connections.
No. 70A Steam—Tongue Syphon—Non-adjustable, single port—⅛ in. connection.
No. 1A Steam—Tongue syphon—ADJUSTABLE air opening—⅛ in. connection.
No. 2A VACUUM—Tongue syphon—ADJUSTABLE air opening—⅛ in. connection.
No. 3 Steam—For Airline or PAUL systems—⅛ x ¼ in. conn.—union tailpiece.
All radiator air valves operate on 10 lb max. press.

STRAIGHT SHANK VENTING VALVES



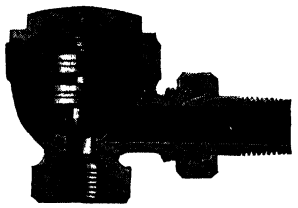
No. 4 *No. 4A* *No. 16A* *No. 74* *No. 75* *No. 76* *No. 79*

No. 4 Steam Mains—Will not close against water—25 lb press. ¾ in. connection.
No. 4A Steam Mains—Float closes against water—10 lb press. ¾ in. connection.
No. 16A VACUUM Mains—Float closes against water—10 lb press. ¾ in. connection.
No. 75 Steam Mains—Large systems—has float—10 lb press. ¾ in. connection.
No. 76 VACUUM Mains—Large systems—has float—10 lb press. ¾ in. connection.
No. 75A Steam Mains—Large systems at low pressure—has float—3 lb press. ¾ in. conn.
No. 76A VACUUM Mains—Large systems low pressure—has float—3 lb press. ¾ in. conn.
Nos. 74-75-75A-76-76A have cast iron bodies—others brass

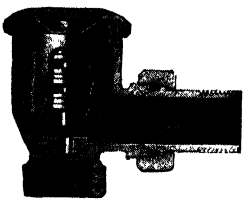
UNIT HEATER VENT VALVES

No. 74—Operates 0 to 35 lb. Vents all air at any pressure and whether rising or falling—can be used on steam mains—has cast iron body—¾ in. connection—finished in attractive Hoffman gray-green color.
No. 79—Hot Water Vent Valve—Positively removes air from piping of any hot water system. Max. pressure 75 lbs.—¾ in. connection at base and tapped at top for ¼ in. pipe connection.

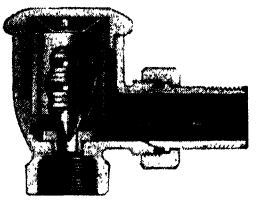
LOW, MEDIUM AND HIGH PRESSURE THERMOSTATIC TRAPS



Low Pressure



Medium Pressure



High Pressure

Low pressure traps have brass bodies, caps, and union nut and tail piece. 17C is made in Angle, Swivel and Vertical patterns. 8C is made in Angle and Straightway patterns. 9C is made in Angle pattern only. Thermostat and seat both renewable.

No. 17C Capacity 200 sq ft EDR 15 lb pressure ½ in. connection
No. 8C Capacity 400 sq ft EDR 25 lb pressure ¾ in. connection
No. 9C Capacity 700 sq ft EDR 25 lb pressure 1 in. connection

Medium Pressure Nos. 8 & 9 and High Pressure Nos. 8H & 9H have all bronze bodies and caps with union nut and tailpiece. Thermostats are 6 diaphragms of special non-corrosive metal. Thermostats and seats are renewable. ½ in. sizes are furnished in Angle, R.H., L.H., and Straightway patterns, others in Angle only. Medium Press. 50 lb limit. High Press. 125 lb.

Capacities—Lb Condensate per Hour—Working Pressure—Lb per Sq. In. Gage

Traps		5	15	25	50	Traps		25	50	100	125

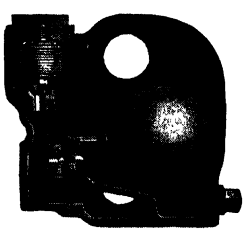
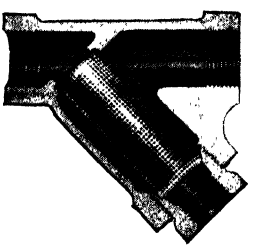
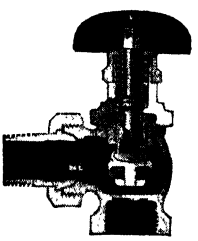
FLOAT TRAPS, DIRT STRAINERS AND SUPPLY VALVES





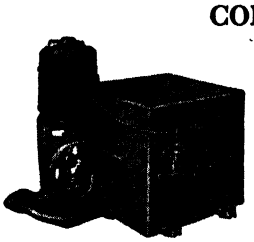


50 Series Float and Therm. Traps, are available in large capacities and four pressures, 15, 30, 60 and 125 lb. Used for venting and draining risers, steam mains, unit heaters, blast coils, etc. 50 Series Traps are made for easy servicing with all working parts mounted on cover. Remove four bolts to expose all parts. Pipe sizes are from ¾ in. to 2 in.

Radiator Supply Valves are made in sizes from ½ to 1½ in. in Angle and Straightway patterns. Brass bodies, union nut and tailpiece. No. 80 has reversible cone disc and bevelled seat. No. 85 is Modulating type. Both are packless.

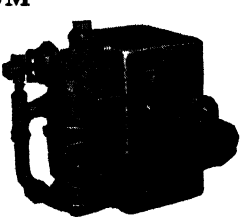
Hoffman Dirt Strainers are self-cleaning Y type. Brass strainer cylinders and cast iron body. Sizes ½ to 2 in. for 125 lb pressure. Should be used in line ahead of all float and thermostatic traps.

CONDENSATION AND VACUUM PUMPS



Condensation Pump

Hoffman-Economy pumps are available in varying capacities, D.C. and A.C. current, single, two, or three phase, and in pressures up to 200 lb. Also made in single and duplex units for different capacities and pressures.



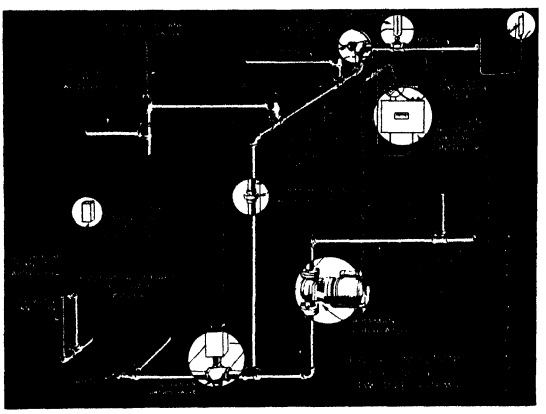
Vacuum Pump

HOFFMAN HOT WATER CONTROLLED HEAT

Especially Designed for Panel Heating

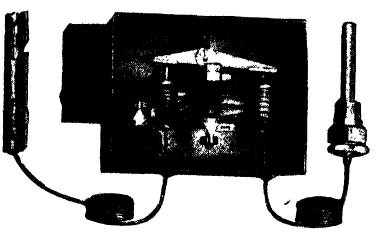
The Hoffman method vastly improves the ordinary forced hot water system by the application of *Continuous Circulation*. This method permits a smoothly modulated regulation of the heat supply. The Control Valve closes and the circulating stream by-passes the boiler as long as the heat requirements are satisfied.

When the circulating water begins to lose heat, the Control Valve is slowly opened by the Controller, permitting hot boiler water to enter the system. Thus, the delicate precision of the Hoffman Controller smoothly varies the temperature of the *continuously circulating* water so that the heat supply is always equalized with the heat loss and room temperature remains constant throughout all changes in the weather.



There is no type of building to which Hoffman Hot Water Controlled Heat cannot be applied. The system permits *zoning* of apartments, institutions, large residences and factories, thereby assuring a distribution of heat in direct relation to either personal temperature preference or to the functional activities of the building.

HEATING COMFORT IS ACHIEVED BY HOFFMAN SPECIALTIES



The Comfort Controller

The brain of the Hoffman system. It automatically maintains a constant comfort condition regardless of the outdoor temperature. Its accurate balancing mechanism electrically opens or closes the Hoffman Hot Water Control Valve as required.

Outdoor Temperature Anticipating Bulb

This Bulb transmits changes in the outdoor temperature to the balancing mechanism of the Comfort Controller.

Hot Water Temperature Bulb

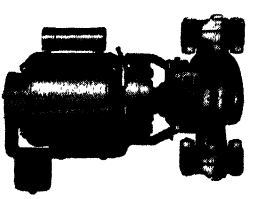
Accurately relays temperature changes of the supply main water to the balancing mechanism of the Hoffman Comfort Controller.

Hot Water Control Valve

Opens only sufficiently to supply the correct amount of water to maintain the proper water temperature being circulated through the system.

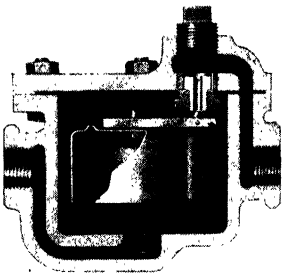
Balancing Orifice

A calibrated orifice used to balance the circuits through the boiler and through the Hoffman circulating pipe.



Hoffman Circulator

A centrifugal pump of prescribed capacity and low in power consumption. Usually installed in the return main and continuously circulates the water through the system. Continuous operation puts less strain and wear on the pump motor than intermittent operation as any engineer will attest.

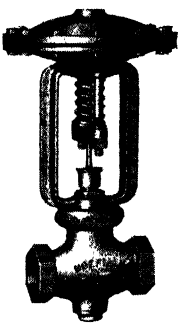


Series 600

HOFFMAN INVERTED BUCKET TRAPS

Working Pressures to 200 lbs

Simple mechanism assures high operating efficiency. Features include—straight-through pipe connection; simple seat adjustment; all working parts connected to bonnet and easily removed with it; stainless steel seat and pin.



Series 700

HOFFMAN PRESSURE REDUCING VALVES

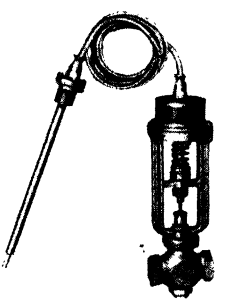
Series 710
Max. High Pressure.....250 psi.
Low Pressure Range....5 to 80 psi.

Series 700
Max. High Pressure.....200 psi.
Low Pressure Range....1 to 25 psi.

Choice of types specifically engineered for your needs—continuous service, or, for tight sealing against low pressure side when there is no demand—and with typical Hoffman features of design.

HOFFMAN TEMPERATURE REGULATORS

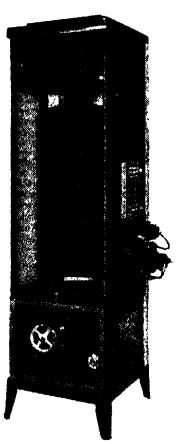
Series 1100– for steam pressure to 150 lb. per sq in. Standard temperature range—130F to 190F. Other ranges available from 80F to 250F. Self-motivated. Hydraulically formed bellows of selected material. Rugged all-bronze construction. For water heaters, convecters, fuel oil preheaters and other similar applications.



Series 1100

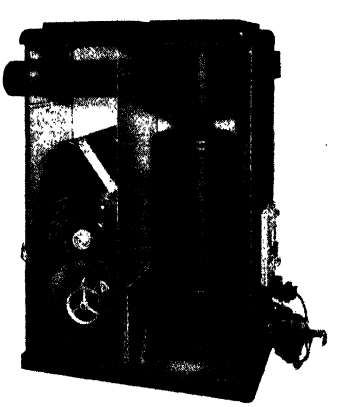
HOFFMAN CONTROLLED HEAT FURNACES

Warm Air—Vaporizing Oil Burner Type



(*Left*) HU-70 For Homes Without Basement

Capacity 70,000 Btu output at bonnet; mechanical draft two stage vaporizing burner; blower delivers 750 cfm; floor space 22½ x 22½ in.; height 81½ in.; shipping weight 408 lb.; assembled, with combination fan and limit control, all burner controls, thermostat, and draft regulator.



(*Right*) HB-75 Basement Unit

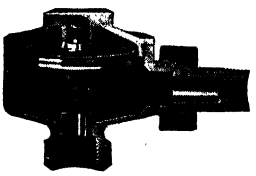
Capacity 75,000 Btu output at bonnet; mechanical draft two stage vaporizing burner; blower delivers 750 cfm; floor space 22 in. x 45 in.; 55 in. high; shipping weight 400 lb.; completely equipped.

ILLINOIS ENGINEERING COMPANY

General Offices
and Factory:
Chicago 8, Ill.

**Representatives
In Principal Cities**

Illinois Thermo Radiator Traps



Series G

Illinois Thermo Radiator Traps for vacuum, vapor and low pressure heating systems. Has cone type valve. Flushes thoroughly and seats perfectly at all times. Valve and seat are of hardened steel alloy. The duplex diaphragm is of special phosphor bronze. Scientific design and rugged construction assure flexibility and long life. These diaphragms have withstood over three million strokes on a breakdown test.

Ask for Bulletin.

Vapor Gauge

Vapair Vent Trap

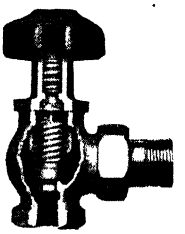
Boiler Return Trap

Illinois Selective Pressure Control Systems

Selective Controller

An entirely new and unique method of Steam Circulation Control . . . Heating Systems that set new standards in comfort, economy, simplicity and convenience of operation. Each system individually engineered to meet exact requirements. Recorded fuel savings, without sacrifice of comfort, warrant your investigation.

Illinois Radiator Supply Valve



Quick-opening, packless. Steam tight on 50 lb pressure. Large diameter of thread spool and machine cut threads make valve operation easy. Furnished in a complete line of sizes and patterns.

Illinois Vapor System

A two pipe low pressure steam circulating system which may be installed in any type of building, where the condensate can return to the boiler by gravity.

A sensitive damper regulator or other means of automatic control is used to control initial steam pressure above, at or below atmospheric pressure. Steam is regulated at the radiators by Illinois Packless Supply Valves. Condensate and air are discharged from the radiator through Illinois Thermostatic Radiator Traps. In the boiler room a Vapair Vent Trap and Boiler Return Trap are installed near the boiler. The vent trap eliminates air from the system and the Return Trap insures return of condensate to the boiler.

The system and the piping arrangement are simple. No metering orifices or vacuum pumps are needed. This system will be found suitable for many installations where low first cost and low operating cost are of prime importance. May be used with unit heaters or any type of radiation.

Illinois Float and Thermostatic Traps

Series G

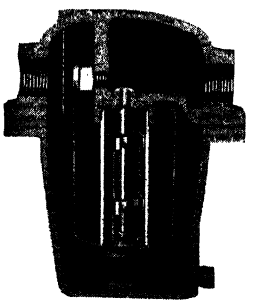
Unsurpassed for draining ventilating units, unit heaters, and for dripping mains and risers—wherever it is desirable quickly to vent air from the main as well as handle the water of condensation in quantity, whether hot or cold.

ILLINOIS ENGINEERING COMPANY

General Offices
and Factory:
Chicago 8, Ill.

Representatives
In Principal Cities

Illinois Steam Trap



Series 80

Valve and stem are separate from the bucket and operated only by the bucket at the extreme top and bottom of travel—result—*valve is always either full open or tight closed.* Provided with continuous thermostatic air vent. No wire drawing or cutting of valve and seat which are of hardened steel alloy.

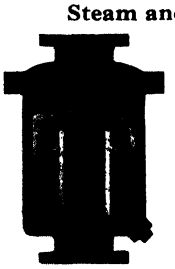
Illinois Thermostatic Traps for High Pressures

Series HG

Maximum working pressure 150 pounds. Used where neat appearance and compactness are desirable, as for trapping sterilizers or water stills in hospitals; steam jacketed kettles, coffee urns, warming tables and for process work. Also used extensively for air vents on blast type drying heaters. Multi-diaphragm of phosphor bronze. Heavy duty bronze body. Made in three sizes.

These traps are also furnished for medium pressures. *Write for literature.*

Steam and Oil Separators

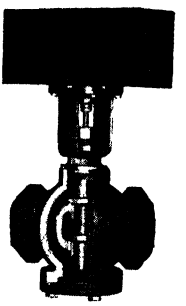


Vertical Steam Separators

Eclipse steam separators are made in both horizontal and vertical type, standard or extra heavy.

Eclipse oil separators are furnished in the horizontal type and have a removable baffle plate to facilitate cleaning of baffle and keeping the separator's efficiency at the highest point.

Illinois Motorized Valves (on and off)



Type ES

For automatic control of steam temperatures and pressures to prevent overheating and conserve steam; to control fluid levels; and to regulate flow in hot water heating systems. May be operated by any automatic contact device or by manual switches.

Furnished in three types.

Pressure Regulating Valve Semi-Steel Bodies, Bronze Trim

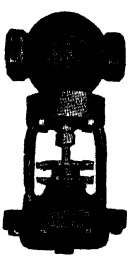


Fig. 121

Furnished in either single seat or double seat type as service requires, for the control of steam, air or gas. Control spring is completely enclosed, protecting it from dirt and rust. Valves are furnished with proper size diaphragm and proper length spring to give satisfactory service under all operating conditions. Furnished also in weight loaded type, Fig. 71.

Write for Bulletins.

Non-Return Valves

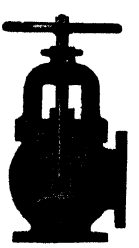

Fig. 260

Placed between boiler and header to prevent return of steam to boiler. Sensitive in operation. Extra heavy semi-steel bodies with bronze trim for 250 lbs steam working pressure. Bronze dash pot and water sealed pistons prevent valve sticking. Globe and angle patterns from 4 in. to 12 in.

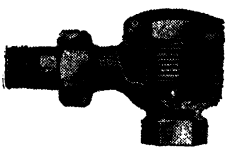
Sarco Company, Inc.

Empire State Bldg., **New York 1, N. Y.**

Branches in Principal Cities

SARCO CANADA LIMITED, 496 CHURCH ST., TORONTO 5, ONT.

PRODUCTS—A complete line of Specialties for Steam and forced hot water Heating Systems, and automatic control for same, combined with a competent engineering service to architects and heating engineers to assist them in providing modern heating.



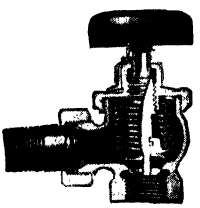
Radiator Trap, Type H

SARCO RADIATOR TRAPS

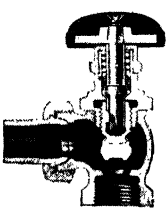
Type H is the standard radiator trap for vapor and vacuum systems. It is equipped with the well known Sarco heavy wall bellows, drawn from flat blanks and helically corrugated in our own plant. It operates noiselessly and positively at pressures from highest vacuum to 25 psi.

Body and cap are of cast brass, rough brass finish; self-aligning valve head and renewable seat of hard bronze; union connection on inlet.

Available in ½ in. and ¾ in. sizes, angle, straightway or corner offset patterns; also 1 in., angle style only. *Catalog No. HV-150.*



Type 45



Type SM

Radiator Valves

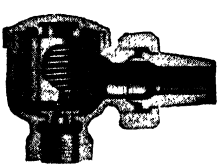
SARCO RADIATOR VALVES

Sarco offers two types of radiator valves. Where highest efficiency is desired, the bellows-packless valve, type 45, is recommended. The valve stem is sealed by a standard Sarco bellows. Leakage of air into the system under vacuum is impossible.

Modulating types with proportioning disc and indicating dial are available.

Type SM is of the "spring-packless" type, quick opening, non-rising stem. Also available for Hot Water Systems.

Bodies of all valves are cast brass, rough brass finish. Outlet fitted with union connection. Sizes ½ in. to 1½ in., with wheel handle or lock shield. *Catalog No. HV-150.*

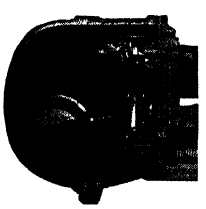


N-100 Medium Pressure Trap

SARCO N-100 TRAP

For high pressure radiators and heating coils in stationary and marine service, and for hospital and kitchen equipment. Has full length protecting shield and stainless steel valve head and seat. Sizes ⅜ in. to 1 in. pressures to 100 lb. *Catalog HV-190.*

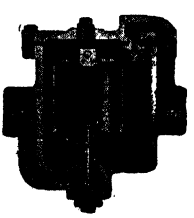
Also S-65 for pressures to 65 psi.



Float-Thermostatic Trap

SARCO FLOAT-THERMOSTATIC TRAPS

For dripping ends of mains and risers, and for stack or blast heaters, large unit heaters and hot water generators. Automatic thermostatic air vents built in. Available in six sizes with connections ¾ in. to 2 in. Pressures up to 200 psi. *Catalog HV-450.*



Inverted Bucket Trap

SARCO INVERTED BUCKET TRAPS

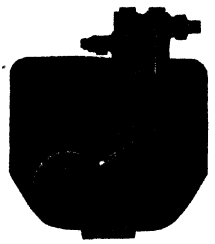
Are recommended for high pressure unit heaters and sometimes preferred for kitchen and laundry equipment. Strainers are built right into these sturdy traps. Seats and valves are stainless steel and renewable. Automatic air vents can be furnished for extra rapid removal of air. Available in sizes ½ in. to 2 in. for pressures up to 900 psi. *Catalog HV-350.*

SARCO ALTERNATING RECEIVER

A complete line of boiler return traps for vapor systems.

Returns water of condensation to boiler automatically, thereby assuring positive return of water under all pressure conditions.

Made in four sizes for up to 14,000 sq ft of radiation. *Catalog HV-165.*



Alternating Receiver

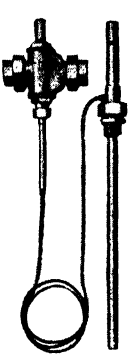
SARCO AIR ELIMINATORS

For venting air from vapor systems at one central point in the basement. Available in three sizes, for systems up to 15000 sq ft radiation. All are equipped with float valves to stop water escaping through the vent and with check valves to prevent ingress of air when system is under vacuum.

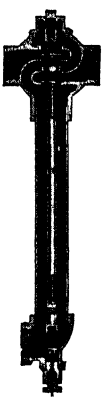
Also several types for hot water heating systems. *Catalog HV-170.*

SARCO SELF-CONTAINED TEMPERATURE REGULATORS

Sarco Temperature Regulators are simple, self-operated valves—the only self-contained units that use the irresistible force of liquid expansion. No stuffing boxes to leak, no auxiliary "power" required; all moving parts are *inside* the equipment. Here again—a type and size for every purpose—for steam, gas, oil, water or brine for temperatures ranging from 0 to 300° F. *Catalog HV-600.*



Type TR-21 Standard for hot water storage tanks, fan units, etc.



Water Blender Type MB

SARCO WATER BLENDERS AND TEMPERING VALVES

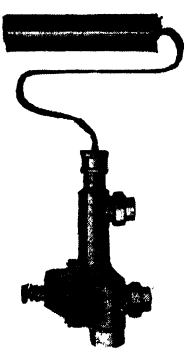
For mixing hot and cold water to deliver automatically water at any desired temperature. Two models are available, type MB for showers, wash basins, etc., and type DB, a tempering valve for use with submerged heating coils or tankless heaters. *Catalog HV-800.*

Water Blender Type DB

SARCOTHERM HOT WATER HEATING SYSTEM

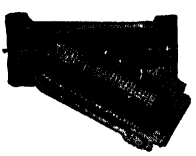
A simple, all-mechanical system for the control of radiator temperatures in direct relation to outside temperatures. Radiation is balanced by Sarcoflow fittings in the radiator outlets.

The Sarcotherm three-way valve recirculates a varying proportion of water around the boiler and back to the system as dictated by the thermostatic bulb outside the building. Write to Sarcotherm Controls, Inc., 280 Madison Ave., New York 16, N.Y. for *Catalog No. HV-1.*



Sarcotherm Weather Control Valve

SELF-CLEANING STRAINERS



For use in pipe lines carrying brine, steam, oil, gas, water, ammonia or air. Have large free screening area with minimum resistance to flow. Steam or air strainers can be cleaned by blowing through without disassembling. Made in cast iron, bronze or cast steel for pressures up to 500 psi, with brass, iron or monel screens. Available in sizes ¼ to 8 in. *Catalog No. HV-1200.*

THE COMPANY

Warren Webster & Company have specialized for almost sixty years in the field of steam circulation and steam distribution, particularly vacuum, vapor and low pressure steam heating of buildings, and medium pressure steam in industrial and process heating applications.

The specialized experience of the Company is available through engineers at the Home Office and through the Representatives listed above. These engineers are thoroughly conversant with methods and equipment to control steam distribution and heat transfer, assuring maximum heating effectiveness with minimum fuel or steam consumption. Webster Representatives are prepared to supply on request full technical, availability and price information on all Webster Systems and Products.

WEBSTER HEATING SYSTEMS

There is a type of Webster Heating System to meet practically every need and purpose. These include Webster Steam Heating Systems for larger buildings of almost every type, and Webster Baseboard Heating, a hot water system particularly suited for small residences and other small buildings.

Webster Steam Heating Systems are all low pressure, two-pipe systems of steam circulation in which steam is delivered to radiators and other heating surfaces through supply piping and water of condensation and air are removed through separate return piping. Webster Radiator Valves and Thermostatic Traps are installed respectively on the supply and discharge connection of each radiator. Webster thermostatic or float and thermostatic traps are provided to assure removal of water of condensation and air from the piping.

Webster Steam Heating Systems are available with vacuum return, or with open return (vented to the atmosphere) with either Condensation Pump or Boiler Return Trap and Vent Trap to return water to the boiler, or with Vent Trap alone where condensate is wasted to the sewer, or in appropriate small installations.

Webster Vacuum System—A conventional vacuum heating system in which the return mains are joined together and connected to the suction end of one or more vacuum pumps which remove air and water of condensation and assists circulation by maintaining a lower pressure in the return than in the supply piping.

Webster Type "R" System—A two-pipe, low pressure or vapor heating system in which water of condensation is returned to the boiler by gravity, prompt return being assured regardless of variations in boiler pressure through the operation of a Webster Boiler Return Trap and Vent Trap in combination. Boiler Return Trap Equipment is available in sizes to care for systems ranging from the smallest to 16,000 sq ft equivalent direct radiation. Where desired, or where gravity return is not possible, a Condensation Pump may be substituted for the Boiler Return Trap Combination.

Webster Type "V" System—Employs only a Webster Vent Trap. For installations of 1000 sq ft equivalent direct radiation or less in which the following requirements are fully met. Oil burner, stoker or gas burner installations with vaporstat having cut-in pressure of about ¼ lb and cut-out pressure of about ¾ lb (not pressurestat), lockswitch or protector relay and one or more key room thermostats. Vent Trap at ample height above water level. Burner or stoker should not have too great capacity. Boiler Protector, or at least a low water cut-out.

Webster Moderator Systems—These are all Webster Steam Heating Systems with vacuum or open return *to which are added* (a) accurately sized metering orifices in radiators and other heating surfaces to balance distribution and permit "partial filling" of all radiators practically simultaneously and at various rates of steam flow, (b) Automatic control by Outdoor Thermostat for variations in outdoor temperature, (c) Manual Variator to provide for convenient adjustments for heating up, reduced night heating, shut off, etc.

"J" Series Moderator Controls—In this series the Outdoor Thermostat and Variator position a motor-operated Steam Control Valve through an Electronic Differential Pressure Control Cabinet to produce continuous steam delivery and heating effect at the radiators with automatic variation in heating for changes in outdoor temperature and automatic adjustment to compensate for variations in steam supply pressure.

"EH" Series Moderator Controls—In this series the Outdoor Thermostat and Variator may control a motor-operated steam valve or directly control oil or gas burner or stoker through a cycling Control Cabinet. Steam delivery is intermittent but in short cycles so that heating effect is substantially continuous, particularly with cast iron radiation. "EH" Series Controls are also applicable to forced circulation hot water systems including Webster Baseboard Heating.

Webster Baseboard Heating—A patented forced circulation hot water heating system in which the heating element fits behind a specially built metal baseboard. Air enters at the floor line, passes over the finned heating element, is warmed and comes out of slots at the top of the baseboard. The heating element is a copper tube with copper fins running in a continuous loop around the exposed walls of the house—a separate loop for each floor.

Webster Baseboard Heating uses less material and less labor than conventional radiator heating systems, while providing all the advantages claimed for forced hot-water, plus radiant effect from warmed baseboards and walls, plus natural convected air movement essential to comfort. Temperatures vary less then 2 deg from floor to ceiling.

STEAM HEATING AND PROCESS SPECIALTIES

Radiator Valves—Choice of spring retained packing, Type BW-P or Sylphon Bellows Packless Series 600-S. ½ in., ¾ in., 1 in., 1½ in. sizes. In angle, right and left hand; straightway, with single or double union. Spring retained packing. For low pressure vapor and vacuum steam heating service.

Double Service Valve—¾ in. and 1 in. sizes. Incorporates Webster Thermostatic Trap and Webster Radiator Supply Valve in a single compact unit. Drips down-feed riser and serves as supply valve to radiator or convector. Saves six fittings and installation work.

Thermostatic Traps—Series "7" (diaphragm type) and Series "5" (bellows type) for radiators and drips. ½ in., ¾ in. and 1 in. sizes. There are six body models for the ½ in. size alone. Maximum pressure, 25 lbs per sq in. For low pressure vapor and vacuum steam heating service. Series "78" for process. ⅜ in., ½ in., ¾ in. and 1 in. sizes. Class 2 for pressures of 60 to 150 lbs. Used to discharge air and water from heating coils of any apparatus using steam at process pressures.

Heavy Duty or Drip Traps—Series "26" Float-and-Thermostatic for heating and air conditioning. Most used sizes: 00026, 0026, 026. Pressures up to 15 lbs per sq in. Made for the pressure and capacity conditions encountered at all drip points. Series "79" Float-and-Thermostatic for process. For pressures up to 150 lbs per sq in. For use where large volumes of hot condensate must be handled more quickly than is possible by thermostatic traps alone

Dirt Strainers—½ in. to 6 in. sizes. Maximum working pressure 150 lbs per sq in. Placed ahead of traps in return lines of steam-using equipment and steam heating systems to catch dirt and other particles, preventing them from impairing the tightness of the traps.

Boiler Protectors—One size, with ¾ in. connections with or without electrical cut-out switch. Maximum pressure 15 lbs per sq in. Maximum cold water main pressure, 150 lbs per sq in., minimum not less than 25 lbs per sq in. Prevents breakage in low pressure heating boilers when the water level becomes inadequate.

Vacuum Pump Governors—In sizes ¾ in. to 3 in. Standard valve furnished for pressures up to 150 lbs per sq in. Special valve available for higher pressures. Govern flow of steam to steam-driven vacuum pumps.

Suction Strainers—Maximum working pressures 15 lbs per sq in. Installed ahead of vacuum pump to prevent dirt from damaging pump.

Vacuum Breakers—Sizes ¾ in., 1 in. and 1¼ in. adjustable on job. Size ⅛ in. for radiators is factory adjusted. For automatic breaking of vacuum at predetermined setting in heating systems, feed water heaters, hot water generators, industrial pressure chambers, etc.

Expansion Joints—Crosshead or internally guided. In single slip and double slip models in most widely used pipe sizes. For pressures up to 200 lbs per sq in. For steam, hot water, hot oil, hot gas, and condensate return lines.

RADIATION AND HEATING SURFACE

Webster System Radiation—Nonferrous convector radiation. Each Webster System Radiator includes a complete enclosure of furniture steel with baked prime coat. Contained within the enclosure is a prefabricated unit, combining heating surface, valve, trap and union connections, shipped ready to connect to supply and return piping.

Webster System Radiation was first offered in 1932. From its introduction until withdrawal from the market because of war conditions, more than 1,000 installations were made.

Now, available in an improved design, using the same basic material, copper tubing and aluminum fins. Increased rigidity of the tubing and the development of a new method of manufacturing has produced a fin surface of unusual rigidity, free of expansion and contraction noises.

Webster Type WI Extended Surface Radiation—Covered by patents and patents pending. Completely non-ferrous, being made up of 1⅛ in. outside diameter .035 in. thick specially annealed copper tubing with rib-reinforced, square pressed aluminum fins and brass female couplings with 1 in. i.p.s. tapping. Available in five lengths from 2 to 6 ft inclusive. Can be used to advantage in many buildings with steam or hot water heating, particularly where floor space or vertical wall space is limited.

WEBSTER-NESBITT UNIT HEATERS

Are manufactured by John J. Nesbitt, Inc., Philadelphia 36, Pa., and are distributed solely through Warren Webster & Company, Camden, New Jersey. Designed to circulate large volumes of air at comparatively low temperatures, assuring quick heating.

Ratings of Webster-Nesbitt Unit Heaters are based on tests made in accordance with standard test code of Industrial Unit Heater Association and A.S.H.V.E.

PROPELLER FAN UNIT HEATERS

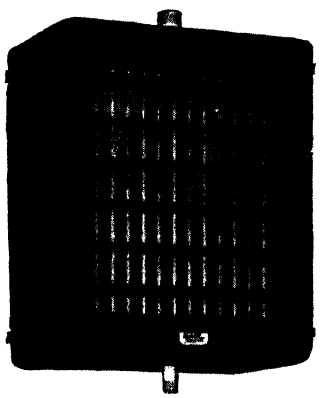

Fig. 11. Standard Propeller-Fan Type

Designed to incorporate four characteristics proved by wide experience to be essential to both proper application and satisfactory performance:

1.) *Selective range of sizes.* Manufactured in nine sizes. Heating capacities vary from 34,700 to 338,000 Btu per hour. Air deliveries from 470 to 4800 cfm.

2.) *Quiet Operation.* All fans have blades of exceptionally large areas and of a shape to impart a gradual acceleration to the air stream. Ample spacing is maintained between the fan and heating element. Motors are of sleeve bearing type and equipped with isolators.

3.) *Durable lightweight Heating Elements.* Extended fin-and-tube type, constructed of copper condensing tubes and plate-type aluminum fins.

4.) *Modern Casing Design.* Compact suspended type. Catalog W-N 126.

GIANT UNIT HEATERS

Sturdy blower-fan units for the economical heating of large areas.

Standard (Non-Thermadjust) Type. Used principally where heating is by recirculation only, and where constant heat output is desired during period of operation.

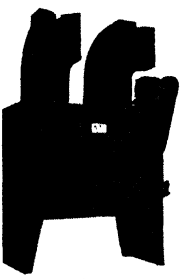

Fig. 12 Blower-Fan Type

Thermadjust Type. Employs dampers in front of casing and over face of heating element to provide mixing of unheated and heated air, producing heat output in accordance with requirements and continuous circulation of air volume.

Valve Controlled Type. Unit is of standard casing arrangement but equipped with Nesbitt Heating Surface with Steam-distributing Tubes which allows for automatic control of heat output.

Floor mounted, wall mounted, ceiling suspended, from 101,000 Btu, 3250 cfm, to 930,000 Btu, 15,200 cfm. Write for details. Catalog W-N 128.

LITTLE GIANT UNIT HEATERS

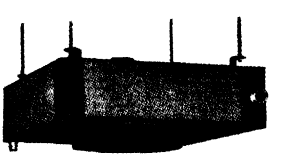

Fig. 13. "Little Giant" Down Blow Type

New, light compact draw-through high velocity down blow unit heaters. 122,000 Btu, 2370 cfm to 505,000 Btu, 10,080 cfm at basic rating of 2 lb steam and 60 deg entering air.

Down Blow Type. Generally used when the presence of cranes and other machinery requires that the unit and piping be located well above the floor level. Write for details. Catalog W-N 127.

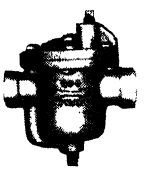
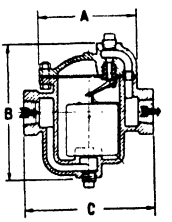
ARMSTRONG INVERTED BUCKET STEAM TRAPS

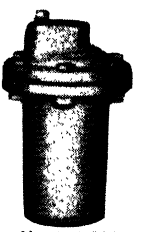
Armstrong offers a complete line of traps for draining low and medium pressure steam headers, pipe coil radiation, unit heaters, air conditioning equipment, process equipment, etc. Armstrong design and construction results in fast heating, uniformly high temperatures and long trap life with exceptionally low maintenance.

Automatic Air Discharge. Standard traps automatically discharge normal amounts of air along with condensate. Where large amounts of air must be vented quickly when steam is first turned on, Armstrong BLAST Traps with thermic bucket vents are recommended. Depending on size, air handling capacity ranges from 500 to 1500 cu ft free air per hour.

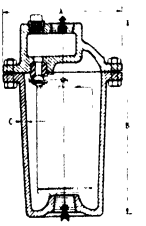


No. 800-813





No. 211-216



Side Inlet Traps		No. 800	No. 811	No. 812	No. 813

CAPACITIES, PRICES DIMENSIONS

Note that capacities of No. 811, 812 and 813 traps are the same as No. 211, 212 and 213 respectively. On most installations, the engineer therefore has a choice of side inlet—side outlet or bottom inlet—top outlet body styles.

Bottom Inlet Traps	No 211	No. 212	No. 213	No. 214	No. 215	No. 216
Pipe Connections	½"	½" or ¾"	½" or ¾"	1"	1" or 1¼"	1½" or 2"
List Price (Regular)	$ 9.25	$15.00	$20.75	$29.00	$38.00	$55.00
List Price (Blast Trap)	$10.75	$17.00	$22.75	$31.50	$40.50	$60.00
Telegraph Code (Regular)	Aspen	Birch	Walnut	Hemlock	Larch	Tamarack
Telegraph Code (Blast Trap)	Aspette	Birette	Walette	Hemlette	Larette	Tamrette
Height.....Dimension B	6⅜"	8"	10¼"	12½"	14"	16¾"
Diameter..... " A	4⅛"	5"	6⅜"	7½"	8½"	10 8/16"
Wall Thickness " C	5/16"	¼"	5/16"	⅜"	⅜"	7/16"
Diameter of Bolts	¼"	¼"	⅜"	⅜"	½"	½"
Number of Bolts	6	8	6	8	8	12
Weight	5½ lb	10½ lb	19 lb	32 lb	47 lb	80 lb
Maximum Pressure, lb	250	250	250	250	250	250

High Capacity, Compact Size. The high leverage of the patented free-floating lever makes it possible to open discharge orifices which are very large for over-all trap size.

Positive Action. The discharge valve is either wide open or closed tight. Fast opening and closing prevent wire-drawing.

Self-Cleaning. Swirling action of condensate during discharge carries dirt through trap. There are no dead spots for dirt to collect.

High Quality. 18-8 stainless interior parts. Valve and seat are chrome steel, hardened, ground and lapped. Low pressure trap parts same material and quality as those used for 1500 psi, 900° F.

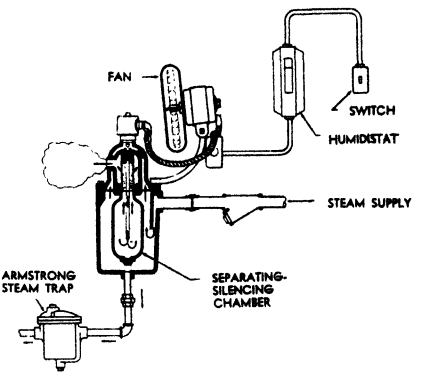
Armstrong Steam Trap Book. 36 pages of data on traps, selection, installation and maintenance. A usable handbook for any engineer dealing with traps. Free copy on request.

ARMSTRONG STEAM HUMIDIFIERS

For Stores, Offices, Hospitals, Factories, Laboratories

Operation. These units provide automatic, closely controlled humidification by introduction of steam directly into the atmosphere. Installation is comparable to that of unit heaters. Steam at 10 psi or less is required. A solenoid discharge valve on the humidifier is controlled by a sensitive humidistat. A fan mounted on the humidifier aids in steam dispersal, or a venturi nozzle can be supplied. Where an electric spark might represent an explosion hazard, compressed air operated models are available. In addition to the unit humidifier illustrated, there is a large model for installation in large air ducts and central heating systems. Capacities range from 31 to 630 lbs of steam per hour.

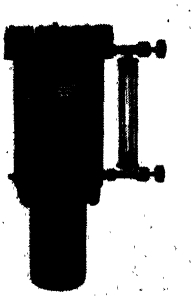
Advantages. Installation cost of Armstrong Humidifiers is as much as 80 per cent less than some types of equipment. The small C-2 unit lists at $120.00 complete with fan and motor, humidistat, strainer and steam trap. Operation, using steam at around $1.00 per ton, is economical. There is no extra load on the heating system. No dripping—any moisture in the steam is re-evaporated in the steam-jacketed separating chamber. Control is accurate within a few per cent R. H. There is almost no noise with open nozzle types.



Bulletin No. 177 gives complete data on required relative humidities, selection and installation of Armstrong Humidifiers. Available on request.

ARMSTRONG NON-CONDENSIBLE GAS PURGERS

Armstrong Purgers *automatically* remove air and other non-condensible gases from refrigerating systems, with minimium loss of refrigerant. Refrigerant gas is condensed in the cap of the purger, causing non-condensibles to separate out at the top from where they discharge through a needle valve. These purgers are suitable for systems from 12 to 1200 tons capacity —Ammonia, Freon, CO_2 and other refrigerants. Body is forged steel, interior parts stainless steel. List price is $200.00 BULLETIN NO. 173-A describes benefits of purging, gives complete data on installation and operation of Armstrong Purgers. Available on request.



All Armstrong products are sold on a basis of satisfaction guaranteed or your money back.

Jas. P. Marsh Corporation

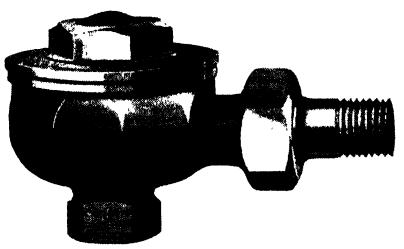
Dept. 5, **Skokie, Illinois**

Branches in Principal Cities

Marsh products include: Pressure, Vacuum and Compound Gauges; Dial Thermometers; Steam Traps; Vents; Packless Radiator Valves and other heating specialties.

Thermostatic Diaphragm Radiator Traps

These efficient traps are equipped with a phosphor bronze diaphragm, consisting of two wafers of tinned phosphor bronze, drawn and spun to perfection of temper.

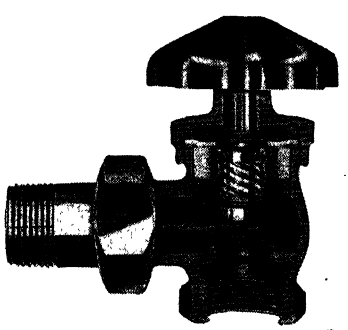


Thermostatic Diaphragm Radiator Trap

The wafers are spun together and soldered to form a seamless, sensitive, powerful expanding member—not easily fouled by dirt and foreign matter. Diaphragms are charged with a volatile fluid making them self-equalizing for use on pressures below atmosphere to 15 lbs gauge. Traps are factory adjusted.

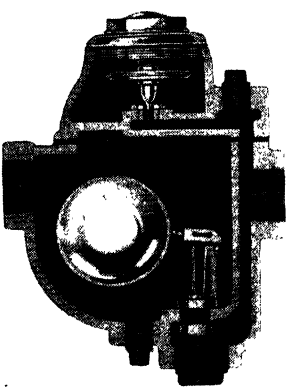
Packless Radiator Valves

Marsh all-metal packless valves are truly packless. These valves contain no packing to deteriorate, wear or crack, and are simple in design, with ample strength where strength is required. The principles upon which they are designed have been proved sound over many years of service. Valves operate easily—opening or closing tightly with less than one full turn. All valves are individually tested. Adaptable for use on hot water—forced or gravity systems—as well as all steam heating systems.



Packless Radiator Valve

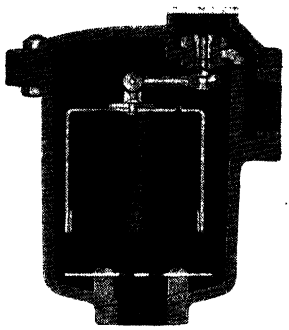
Marsh No. 12 Float and Thermostatic Traps



Float and Thermostatic Trap

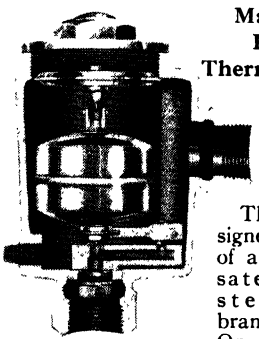
Marsh Heavy Duty Float and Thermostatic Traps are designed for removal of air and condensate from steam mains, branches, or risers, unit heaters, steam coils, etc. The size and weight of the trap permits installation in the piping without any other means of support. Condensation is discharged through a float operated valve located at the lowest point inside the trap body. Air vent is located in a by-pass in the cap or cover of the trap. Air passes through a passageway and out through the trap outlet. Construction permits removal of mechanism without disturbing the piping.

Marsh No. 500 Inverted Bucket Type Trap



This type is ideal for all types of hospital and kitchen equipment or similar service where a considerable volume of condensate is handled. The trap is self-venting, which, combined with the large water capacity assures unusually high efficiency in removing condensate, air and gases.

Marsh No. 17 Float and Thermostatic Trap

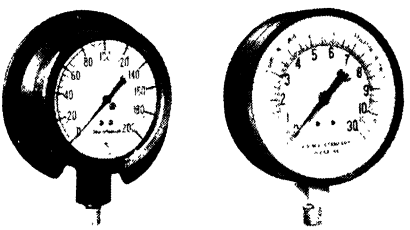


This trap is designed for removal of air and condensate from short steam mains, branches or risers. Operating characteristics adapt it for unit ventilators, unit heaters, and other equipment subjected to freezing temperatures when heating system is not in operation. Outlet discharge is water sealed at all times. Air vent is located in trap bonnet and air is normally discharged through a port directly to the outlet connection. A removable strainer protects mechanism. All working parts are made accessible by removing bonnet. The piping is all the support required for the No. 17 Trap.

Marsh Low Pressure Gauge

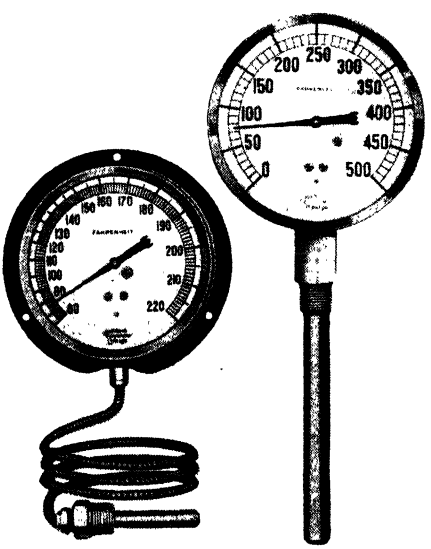
The Marsh *A.S.M.E.* standard, low pressure gauge will contribute to the economy and improve the operation of any type of steam boiler. It is finely built throughout and is available with the Marsh "Recalibrator" for quickly and easily resetting the hand to zero when the gauge is knocked out of adjustment.

Marsh Gauges include vacuum and compound types in a wide range of designs covering all services and pressures. Over 75 years of gauge manufacturing has reached its highest achievement in the Marsh "Mastergauge" for use where high pressures and temperatures are present and where maximum stamina and accuracy are essential.



Marsh Dial Thermometers

Have the same basic refinements found in Marsh Gauges. Typical Marsh Thermometers of bourdon tube type in self-contained and distant reading types are illustrated. They are available in either vapor tension or gas-filled types. Bimetallic types of dial thermometers are also available. Practically all temperature ranges up to 750° F. are covered. The "Recalibrator" is standard in all Marsh bourdon tube type thermometers. The Marsh line also includes recording thermometers.



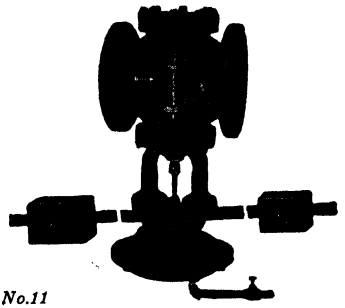
Ask for complete information covering any problem involving traps, vents, gauges, dial thermometers, packless valves, etc.

Mueller Steam Specialty Co., Inc.

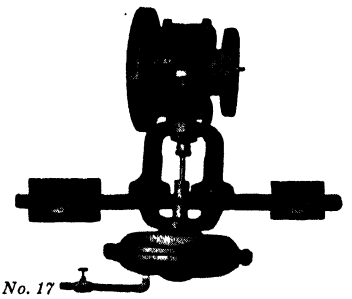
40-20 22nd Street, **Long Island City, N. Y.**

Steam, Water, Air, Oil and Gas Specialties for Heating and Power Plants

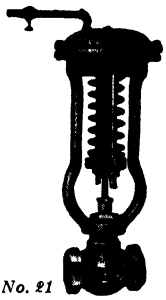
Pressure Reducing Valves—Straight Pattern and With Increased Outlet



No. 11



No. 17



No. 21

No. 11—For Vacuum, Vapor and Low Pressure Heating Systems. Initial Pressures, up to 200 lb; Reduced Pressures, 0 to 10 lb.

No. 17 and 21— For automatic control of reduced pressures on dead-end service, requiring a tight closing valve, such as tank heaters, kitchen utensils, sterilizing apparatus, laundry equipment, kettles, cookers, driers, etc. Initial Pressures up to 200 lb. Reduced Pressures 0 to 150 lb.

Constructed with full globe bodies. Center guide eliminates the wings on discs, and increases efficiency, assures minimum noise and prolongs the life of the seats and discs. Lever and weight operates on a steel roller bolt, assuring a most sensitive valve. Spring type furnished with special long springs for sensitive operation and wide ranges of reduced pressures.

No. 37

Water Pressure Reducing Valves

For controlling water pressures that require automatic and positive control of reduced pressures. Compact, and have full flow and renewable composition discs.

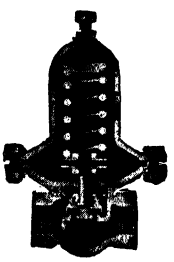
Standard and extra heavy weights suitable for all initial pressures and wide ranges of reduced pressures.

Diaphragm Operated Water Relief Valves

For relieving excessive pressure of hot or cold water, air, oil or gas.

Very sensitive, respond quickly.

Their construction is durable and compact, and accessible without disturbing pipe connections.



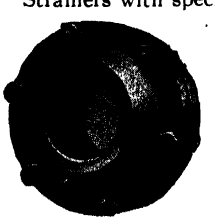
No. 63

Sediment Strainers for Steam, Water, Oil, Gas, Air, Etc.

For removing scale, cuttings, and other foreign matter from steam, water, air, oil and gas lines, or in connection with valves, pumps or other apparatus.

Furnished with iron bodies, plain or galvanized, with brass or copper mesh suitable for the service. Can be furnished all brass or nickel-plated iron or brass, or cast steel for extra high steam pressures, at additional cost.

Strainers with special mesh or of special metal furnished at a slight additional cost.



No. 125

Figures Nos. 145 and 165 Strainers have closed or open bottom baskets, so that the basket can be removed for cleaning, or all dirt and sediment can be blown out through bottom blow out connection.

No. 145

No. 165

CATALOG and BULLETINS covering our COMPLETE LINE gladly furnished on application.

Yarnall-Waring Company

Manufacturers of YARWAY Steam Specialties

133 Mermaid Ave., **Philadelphia 18, Pa.**

YARWAY IMPULSE STEAM TRAPS

Construction—The Yarway Impulse Steam Trap is unique in that there is only one moving part, the simple valve F. This trap is made of bar stock throughout, no castings used. For pressures up to 400 lb, body and bonnet of cold rolled steel, cadmium plated; cap of tobin bronze, valve and seat of heat treated stainless steel. For pressures 400 to 600 lb, trap is all stainless steel.

Operation—Movement of valve (F) is governed by changes in pressure in control chamber (K). At lower temperatures, condensate bypassing continuously through orifice in center of valve reduces chamber pressure below inlet pressure and valve opens, allowing free discharge of air and condensate through seat. As condensate approaches steam temperature, low chamber pressure causes vaporizing and the increased volume builds up pressure in control chamber, closing valve (F).

Other Advantages

Light Weight—Yarway traps need no support—½ in. trap weighs only 1⅜ lb. 2 in. trap weighs 8⅝ lb.

Small Size—Can be installed in cramped quarters—½ in. trap measures 2¼ in. long—2 in. trap, 4¾ in. long.

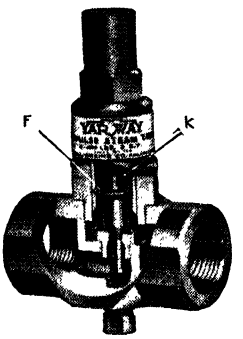
Will not air bind. *Require no priming.*

Insure quick heating.

Low Price—Often cheaper than repairing old traps.

Factory set to operate at all pressures up to 400 lb (or 600 lb) without change of valve seat.

Send for descriptive Bulletin T-1739.



List Prices, Weights and Dimensions

No. 60 Series—up to 400 lb and

No. 120 Series—up to 600 lb

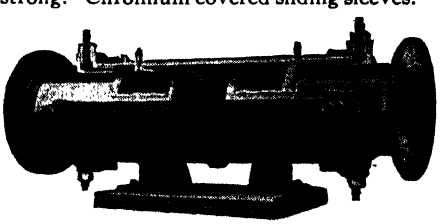
Size	Trap Complete	Weight Pounds	Length Inches
½" Nos. 60 or 120	$15.00	1¼	2⅝
¾" Nos. 61 or 121	22.00	2	3
1" Nos. 63 or 123	31.00	2½	3⅜
1¼" Nos. 64 or 124	48.00	4	3¾
1½" Nos. 66 or 126	68.00	5¾	4¼
2" Nos. 67 or 127	90.00	8½	4¾

Yarway Fine-Screen Strainers offer better protection against rust, scale and dirt for all steam equipment.

Made in ten standard sizes from ¼ in. to 3 in. Cadmium plated bodies. High grade Monel woven-wire screens. Many thousands in use. Write for Bulletin S-201.

YARWAY EXPANSION JOINTS

All-steel welded construction; light but strong. Chromium covered sliding sleeves.



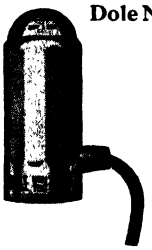
Cylinder guide and stuffing box integral, assuring perfect alignment. Internal limit stops. Gun-pakt and Gland-pakt types: Gun-pakt (illustrated) fitted with screw guns which permit addition of plastic packing while joint is under pressure. Sizes 2 in. to 24 in., single end or double end, flanged or welding ends; 150, 300 and 400 lb pressures. Also all-brass joints, ¾ in. to 2 in. For additional details send for Bulletin EJ-1911.

The Dole Valve Company

Main Offices and Factory: 1933 Carroll Avenue, **Chicago 12, Ill.**

THE ALL STAR LINE **Dole** AIR AND VACUUM VALVES

Selecting the right vent for a particular purpose is your assurance of the utmost efficiency and economy from one pipe steam heating systems. The Dole line covers every venting need and offers a complete choice for every purpose.



Dole No. 1A Vari-Vent Air Valve

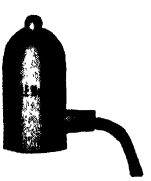
Modern gas, oil or stoker fired one pipe steam systems require QUICK venting. This radiator valve lets air escape twice as fast as ordinary valves and balances the flow of steam at the first "breath" of boiler pressure. Adjustable vari-vent feature gets air out of those "far away" radiators as quickly as those close to the boiler.

Dole No. 3 Air Valve

Vents radiators of hand fired gravity steam heating systems. Double shell construction provides separate passages for air and condensation—extra large float defeats spitting or water leakage. Complete venting assured at pressures up to 10 lbs.

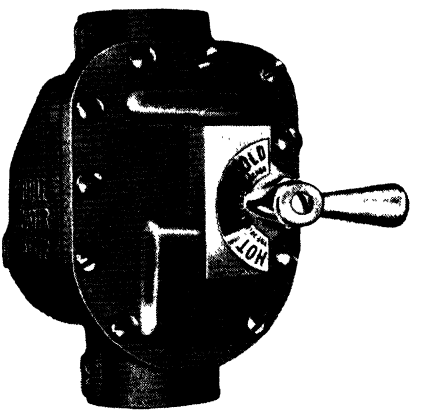
Dole No. 2B Vari-Vent Vacuum Valve

Adjustable radiator valve for "vacuumizing" and balancing gravity steam heating systems. Patented Dole bellows vacuum seal locks out air after it has been once expelled from the system. Easily adjusted vari-vent feature assists in equalizing steam flow to all radiators.



Dole No. 1933 Air Valve

Low cost valve for venting radiators of hand fired systems. Large float provides a seal against condensation to stop spitting.



Dole Water Mixer

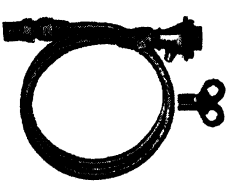
Specify Dole Water Mixers on all tankless heater installations. Dole Water Mixers will provide safer, tempered domestic hot water. Available in three sizes; ½ in., ¾ in. and 1 in. Adjustable temperature range controls domestic water to service from 125 to 175 deg F.

The use of a Dole Water Mixer increases the useable hot water of any tankless heater in that the draw through the heater is reduced, thus providing more time for heat absorption. The useable hot water is increased, too, because water at city temperatures is blended with the high temperature water discharged from a tankless heater.

Installation is accomplished easily and quickly at low cost.

Dole No. 14 Key Valve

Low cost venting device for concealed radiators and convectors of hot water heating systems. Protects panel fronts from rusty water stain.



Write The Dole Valve Company for complete catalog and handy selector chart which indicates the Dole Air or Vacuum Valve most suited for a particular need.

JENKINS CATALOG LISTS OVER 500 VALVES

Consult Jenkins Catalog for complete details on more than 500 different valves that cover practically all industrial plumbing and heating, and engineering requirements. Below is a brief list.

All-Iron Valves,—globe, angle, gate; **Angle Valves,**—bronze, steel, and iron body with bronze mounting or trimming.

Blow-Off or **Y Valves,**—bronze and iron.

Electrically Operated Valves, Gates, Globes, Angles, Fire Line Valves; Floor Stands; Foot Valves for gasoline service.

Gate Valves,—bronze, iron, steel; with solid wedge or double disc parallel seats; with removable bonnet and renewable bushing.

Globe Valves,—bronze, iron and steel; one piece and union bonnets; renewable and integral seats; rubber composition or metal discs and plugs.

Horizontal Check Valves,—bronze, iron and steel; **Hose Valves; Indicator Posts; Lock Shield Valves.**

Needle Valves; Non-Return Valves; Quick-Opening; Self-Closing Valves.

Radiator Valves; Rapid Action Valves; Regrinding Valves; bronze and iron body with bronze trimming; renewable plug seats and bevel seats of a special nickel alloy in globe, angle, check and swing check patterns.

Selclo Valves; Stop and Check Valves,—combination or automatic equalizing; Swing Check Valves,—bronze, iron and steel.

Stainless Steel Valves,—globe, angle, gate and check.

Underwriters' Pattern Valves, —check and gate; **Whistle Valves; Waterworks Valves.**

Carey PRODUCTS

The Philip Carey Mfg. Company

Lockland, Cincinnati 15, Ohio

Branches In All Principal Cities

CAREYDUCT is recommended wherever quietness, ease of installation, fire safety, fume resistance and good appearance are desirable or essential. Used in air conditioning systems widely before the war, Careyduct has proven itself on some of the largest governmental industrial and commercial installations in the country.

Write for engineering performance and installation data.

ACOUSTICAL. Careyduct is a natural sound absorber and non-conductor of sound. Quiets fan noise; won't pick up and "telegraph" other outside noises.

INSULATED. High-efficiency insulation assures delivery of hot or cold conditioned air to outlets with minimum change in temperature.

AIRTIGHT. Won't "breathe" or vibrate at high velocities. Slipjoint construction prevents leakage.

SAVES SPACE. Being 40% to 50% quieter than ordinary duct, Careyduct handles higher velocities, permitting the use of smaller sized ducts.

EASY TO INSTALL. Prefabricated Careyduct units are easy to install—particularly in tight places. Simple low cost fittings can be made in the shop or on the job.

FIREPROOF. Being 100% asbestos construction Careyduct won't smoulder or burn. Approved by *Underwriters' Laboratories, Inc.*

GOOD LOOKING. Surfaces are smooth and free from unsightly raised seams or joints. No stiffeners or braces. Blends well with modern interiors.

5 TYPES OF CAREYDUCT

Insulated and Acoustical Type. 100% asbestos construction—combines duct and insulation.

Key-lock Type. For high temperature applications up to 500 F. Impervious to water.

Single-wall Type. For heating and ventilating systems.

Reinforced Corner Type. Fabricated of Carey Firefoil or insulated sheathing. An ideal duct for large industrial installations.

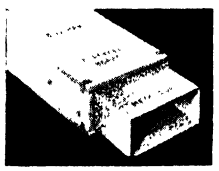
Asbestos-cement Type. Made of asbestos-cement wallboard in different thicknesses. Sizes: 23½ in. and up.

The Philip Carey Mfg. Company

Lockland, Cincinnati 15, Ohio

Branches In All Principal Cities

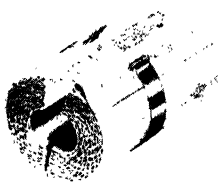
Carey PRODUCTS



CAREYCEL FOR AIR DUCTS

Uses: A fireproof, low cost, high efficiency asbestos board for insulating ducts and all types of air conditioning equipment.

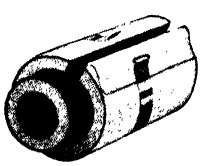
Description: Composed of 12 to 14 laminations of indented (not corrugated) asbestos felt per inch of thickness. Weight: approximately 1½ lb per board foot. Sheet Size: 36 in. x 36 in., or cut to order. Blocks: 6 in. x 36 in. Thickness: ½ in. up.



CAREYCEL FOR HEATING SYSTEMS

Uses: Pipe coverings and blocks for pipes, boilers, ovens and other apparatus where the temperature doesn't exceed 300 F.

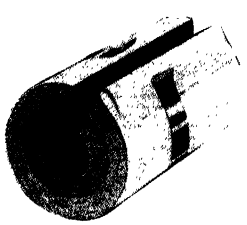
Description: Pipe covering sections 36 in. long by 1 in. thick, finished with cotton duck jacket and bands. Blocks: 6 in. x 36 in. Sheets: 36 in. x 36 in., or cut to order. Thickness: ½ in. up.



CAREY IMPERVO FOR COLD PIPES

Uses: A high efficiency insulation for cold or ice water pipes—keeps the water cold and prevents sweating.

Description: Laminated insulating felt with waterproof liner and jacket. 36 in. long in ½ in., ¾ in., double ½ in. and double ¾ in. thick sections, finished with cotton duck jackets and bands.



CAREY PROTECTO TO PREVENT FREEZING

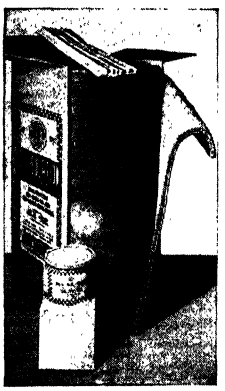
Uses: Designed especially to reduce the danger of freezing of exposed water pipes.

Description: Consists of an inner layer of hair felt, a waterproof felt liner and an outer layer of insulating felt. For severe conditions use two thicknesses. 36 in. long sections with cotton duck jacket and bands. One thickness only—approximately 1 in.

Grant Wilson, Inc.

141 West Jackson Blvd.
Chicago 4, Illinois

DUX-SULATION



Designed for efficient insulation of metal ducts in Heating, Ventilating and Air Conditioning equipment.

Dux-Sulation is composed of fine, flexible fibres fabricated into a strong felt with millions of dead air spaces, producing a thermal insulation efficiency of 70 per cent (K Factor .27 Btu). Saves 75 per cent of bare duct heat loss.

A heavy asbestos membrane is woven into the felt body below the surface, giving the protection of fire proof asbestos.

The outer surface is heavy woven fabric. A high sound deadening surface—absorbs 70 per cent of air borne noises—with low frictional resistance (F = 0.0001322).

Complete Package:—A flexible insulating blanket ½ in. and 1 in. thick. Comes complete with corner tape and adhesive for cementing on to sheet metal duct work. **Dux-Sulation** comes 36 in. wide in a roll containing 100 sq ft. Will not rot, chip or crack.

Surface Temperature of ½ in. Dux-Sulation applied to Metal Duct

Outside Duct Temperature	Room Temperature—Deg F			
	30	50	70	90
40° F	33	48	63	78
60° F	37	53	68	83
80° F	42	57	72	88
100° F	47	62	81	93
120° F	52	68	82	97
150° F	60	75	90	105

Dew Point Temperature—Deg F

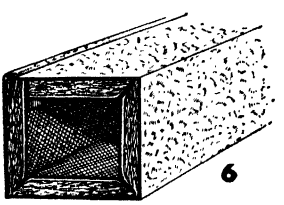
Relative Humidity	Room Temperature—Deg F (Dry Bulb)			
	30	50	70	90
20%	0	12	28	44
40%	10	27	45	64
60%	18	37	56	75
80%	25	44	64	84

Note: As determined through using the two Tables above, the Surface Temperature of the Dux-Sulation must be HIGHER than the DEW POINT to prevent condensation.

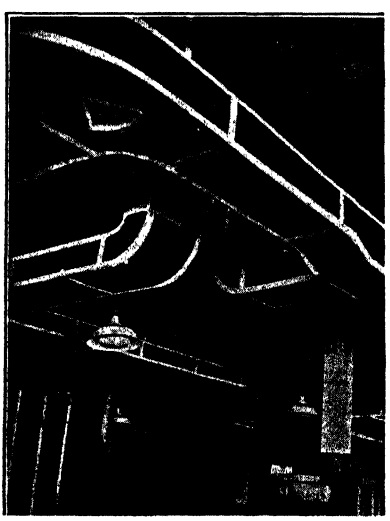
Asbestos Protected Dux-Sulation is applied to round pipes, rectangular ducts or irregular surfaces. It bends in any direction, even to very sharp and abrupt angles. The tape is applied to the corners and joints as illustrated.

Acoustical Values
70 Per Cent Reduction in Loudness

Frequency	Feet
1035	9.5
2048	9.7
4100	11.4
517	15.2
259	31.0
129	34.0



Dux-Sulation is also applied to the inside of ducts, as illustrated, for high sound absorption efficiency.



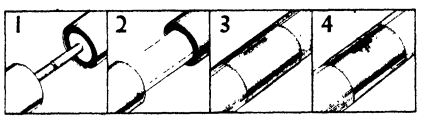
Durant Insulated Pipe Company

1015 Runnymede Street, P. O. Box 88

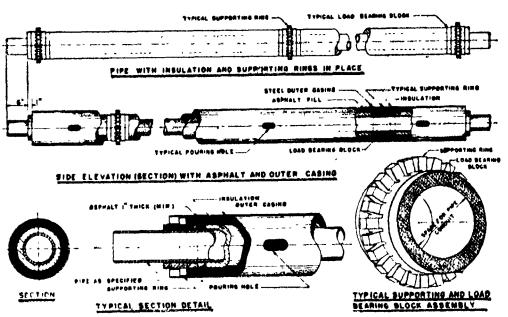
Palo Alto, California

TRADE-MARK
REG U S PATENT OFFICE

4 SIMPLE STEPS IN SEALING FIELD JOINTS



1. Field joint ready for inspection.
2. Joint covered with standard pipe insulation.
3. Special Durant joint casing in place ready for asphalt.
4. Asphalt poured in slot—to seal.



ADVANTAGES

- Completely waterproof.
- "Elimination" of electrolysis and corrosion.
- Requires no sub-drains.
- In multiple lines, individual Durant Pipes can be added, removed or replaced without disturbing others.
- Minimum trenching & field work.
- No rollers or pipe supports required.
- Tile or masonry protection not required.
- Lower field costs.
- Insulation protection is absolutely dependable.

CONSTRUCTION OF D.I.P.

The Durant Construction Principle involved consists of encasing the piping, or the insulation covering around the piping, with a heavy layer of High Melting-Point Non-Porous Asphalt. The asphalt is poured hot into a sheet metal form which is spaced concentrically around the pipe or insulation. For all underground conditions the thickness of the asphalt casing is one inch thick minimum for insulated piping. The insulation for all pipes carrying heat should be 85 per cent magnesia or Unibestos and for cold pipes either 85 per cent magnesia, Unibestos or moulded cork covering should be used. The thickness of the insulation will vary with the conditions of operation. See details in diagram illustration above.

Load bearing supports are provided within D.I.P. structure to prevent weight of pipe from resting on specified insulation. These load bearing supports are full circles slipped on between insulation sections at regular spacings during the fabrication of D.I.P. After covering and load bearing supports have been fitted to pipe, all joints are taped and sealed. A cylindrical jacket of heavy galvanized steel with a diameter large enough to provide a minimum 1 in. air space outside of the insulation, is placed concentrically around insulated pipe. This metal jacket has openings at regular intervals or a full length slot along the top. The insulated pipe is then ready to receive the asphalt protection which consists of a special grade of high-melting point asphalt heated to proper temperature and poured through openings in top of metal jacket.

INSTALLATION OF D.I.P.

Since the insulation and protection are factory-applied to D.I.P., field operations are limited to placing the pipe lengths into position, connecting them and then, after heat pressure tests, insulating and sealing the joints. In underground pipe systems, backfill can be made at once, and can be flooded with water to pack it. The system is completely waterproof as soon as the joints have been finished.

Foundations are practically never required for underground D.I.P. installations. The pipe needs merely to be placed on the bottom of the graded trench. Only comparatively narrow trenches are required and the individual lengths of D.I.P. can be readily lowered into the trench with rope slings. In the trench the pipe can be turned and slid into proper position and the exposed pipe ends provide plenty of clearance for workmen to connect and finish the joints.

H. W. Porter & Co.

INCORPORATED

Therm-O-Tile

REG. U.S. PAT. OFF.

817-G Frelinghuysen Ave., **Newark 5, New Jersey**

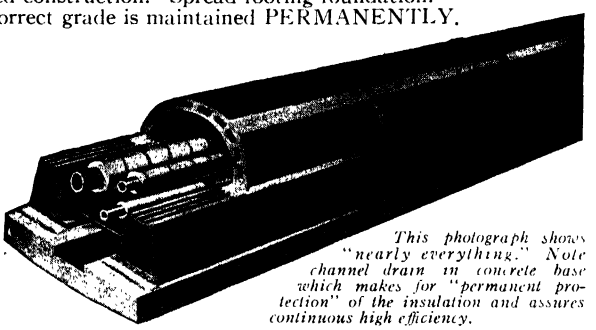
Permanent Protection and Insulation for Underground Pipe Lines

BALTIMORE, MD. CHARLOTTE, N. C. RICHMOND, VA.

Also sold and installed by Johns-Manville Construction Units in all principal cities.

This is what you get with Therm-O-Tile:-

1—Higher efficiency. Much better insulation. A truly DRY conduit.
2—Greater strength. Arched construction. Spread-footing foundation.
3—Long-lasting life. The correct grade is maintained PERMANENTLY.
4—No leakage. Positive sealing throughout.
5—Most convenient installation—on a concrete "sidewalk."
6—No condensation pockets at any time.
7—Greater economy.
8—Experienced engineering.
9—Competitive first cost, and definitely lower ultimate cost.



This photograph shows "nearly everything." Note channel drain in concrete base which makes for "permanent protection" of the insulation and assures continuous high efficiency.

THERM-O-TILE
STEAM CONDUIT SYSTEMS

"Long-Lasting"—Now that Therm-O-Tile has been on the market so many years, and its design is so well known by all leading heating and ventilating engineers, we again wish to emphasize the importance of "Permanent protection." It is not difficult to provide TEMPORARY protection and insulation for underground pipe lines. Threads and joints don't fail immediately, and foundations don't sag immediately, but unless the job is properly done in the first place it won't be long before water seeps in and ruins the insulation. So, watch out. With wet and spoiled insulation, efficiency drops drastically. Unless the conduit is built on a truly solid foundation there will be sagging and collection of water in pockets.

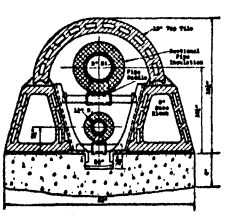
Ample Drainage, Always—In the Therm-O-Tile concrete base there is a drainage channel—clearly visible in photograph—which carries off all water that may enter the conduit from any source, thereby keeping the insulation PERMANENTLY dry. Drainage is entirely internal. The channel is accurately and PERMANENTLY sloped so that condensate or other pockets cannot form. Open to thorough inspection at any time at manholes. Amply large to keep the pipe space dry at all times.

"Spread Footing" Foundation—Positively preventing settling or sagging the Therm-O-Tile "Spread Footing" foundation base is a thick concrete slab poured directly in the trench bottom. Steel reinforced or placed on piles when installed over filled or boggy ground to insure PERMANENT protection.

Already Told—In previous issues of this GUIDE we gave details regarding the Tile Envelope which produces 27 different conduit cross sections. We told about the ideal accessibility of this conduit, its great strength, how it is water-proofed, and so on. For complete information ask for Bulletin 381.

Our Engineers Co-Operate—They have had exceptional experience in designing and installing steam conveying equipment for nearly every purpose.

Competitive in Cost—Despite the high efficiency, greater strength, dependability, and other outstanding features that are obtained in Therm-O-Tile, it is nevertheless competitive in total first cost. Final cost is much less, thanks to its permanence.



Single or Multiple Pipe Lines Using Sectional Pipe Insulation.

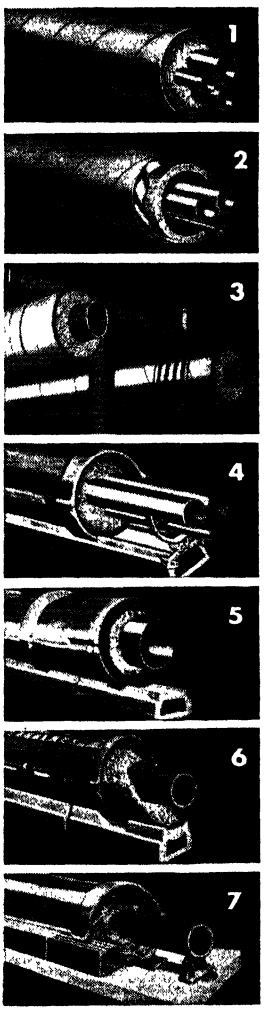
Showing a typical Therm-O-Tile piping arrangement when there are two pipe lines. Note the channel drain which "permanently protects" the insulation.

The Ric-wiL Company

INSULATED PIPE CONDUIT SYSTEMS

Union Commerce Bldg., Cleveland, Ohio • Agents in Principal Cities

There is a Ric-wiL insulated conduit system engineered to your specific needs—the transmission of steam, hot water, oil, hot or refrigerated process liquids—providing heat transfer with the lowest possible loss.



1. RIC-WIL INSULATED PIPE UNIT—SINGLE OR MULTIPLE PIPES

Prefabricated complete units with one or more pipes—in any specified combination—in helical corrugated conduit, coated and wrapped with asphalt saturated asbestos felt. 21-ft lengths for easy installation. Insulation is applied to any or all pipes in any thickness specified.

2. RIC-WIL INSULATED PIPE UNIT—FOR PROCESS LIQUIDS

An adaptation of the multiple system used where a steam or hot water line heats fluids in other lines. Pipes are insulated from the exterior but not from each other. Sizes and specifications as required—conduit same as for other insulated pipe units.

3. RIC-WIL FOILCLAD PIPE UNITS—FOR OVERHEAD LINES

Pipe and insulation are protected and waterproofed by a double coating of machine-applied, high temperature asphalt. Unit is then wrapped with asbestos felt and covered with a final spiral wrapping of copper or aluminum foil for maximum insulation and protection.

4. RIC-WIL STANDARD TILE CONDUIT—TYPE F

Vitrified glazed *A.S.T.M.* Standard Tile Housing—acid and waterproof—with foundation type base drain supporting weight of piping through correctly engineered pipe supports. Positive locked-in-place cement seals on sides and ends. For single or multiple pipes.

5. RIC-WIL SUPER TILE CONDUIT—TYPE F

Same advantages as Standard Tile but with walls approximately double thick for strength under heavy traffic or where overhead load is above normal. Will support concentrated static load of 6 tons per wheel under actual installation conditions. Base drain of extra-heavy tile.

6. RIC-WIL CAST IRON CONDUIT—TYPE F

Heavy reinforced cast iron conduit for use where underground pipe lines run close to or under railroad tracks. Durable, water-tight and vibration-proof. Positive locked-in-place cement seals on sides and ends with metal clamps for extra tightness.

7. RIC-WIL TILE CONDUIT—UNIVERSAL TYPE

Where installation conditions dictate the use of a concrete pad Ric-wiL Universal Tile is recommended. Side walls are double-cell vitrified trapezoidal block design. Arch may be Standard Tile, Super-Tile, or Cast Iron.

Ric-wiL accessories are available in all type systems; standard and special fittings, factory fabricated or field fabricated expansion devices, alignment guides, and anchors. Descriptive bulletins on request. ***Write:*** **The Ric-wiL Co., Dept. 278**

American 3 Way-Luxfer Prism Co.

431 S. Dearborn St., **Chicago-5, Ill.**

3-WAY Daylighting Products

26-20 Jackson Ave., **Long Island City,** N. Y.

AMERICAN GLASS BLOCK SKYLIGHTS

Light-Up—the AMERICAN *Way!*

American 3-Way Rooflights make use of Glass Blocks of special design and strength, manufactured by the proven process, incorporating designs on inner surfaces of plates, resulting in uniform even light distribution over wide areas, leaving top and bottom surfaces smooth for easy cleaning.

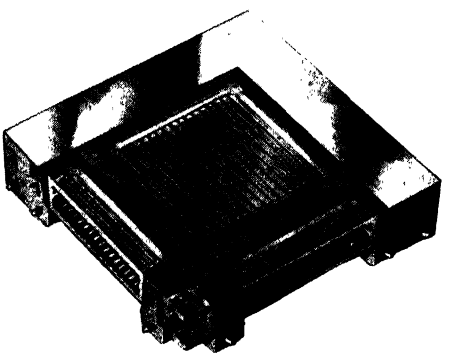
Glass Blocks are 9 in. x 9 in. x 2½ in. and spaced approximately 10⅝ in. on centers.

Low Heat Transfer

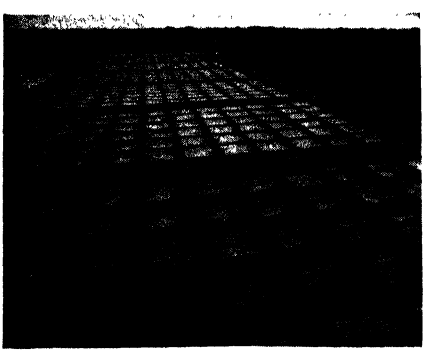
Tests conducted by methods suggested by the A.S.H.V.E. Code show that Glass Block Rooflights have about two and one-half times the insulating value of sheet metal skylights with no heat losses by "escape," since the construction is air-tight.

Solar Heat Transmission

Reduction in total solar heat gain as compared with ordinary windows is indicated by relative values given in Table 18 and Table 20 in Chapter 15.



Section of American Glass Block Skylight Showing Method of Block Application



American Glass Block Skylight

Triple Plates of Glass

Magnalite Diffusing Glass units may be attached to under side of glass block construction thus making for effective uniform light diffusion and even distribution; also very effective in condensation problems.

Insulated Construction

Construction of rigid reinforced concrete grids can be arranged with insulation materials sufficient to approximately equal the performance of the glass blocks.

Condensation

Due to the nature of the grid construction where insulation materials are employed with semi-vacuum glass blocks assemblies there is little or no tendency for condensation to form on the under side. Should relative high humidities or abnormal conditions exist, further insulation treatment can be provided.

Glass Block Assemblies for all off-vertical arrangements are available. Details will be furnished on request.

3-Way Glass Block Skylights may also be furnished without special insulation treatment in reinforced concrete grid construction.

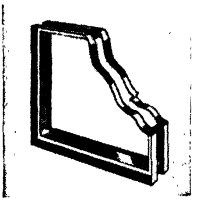
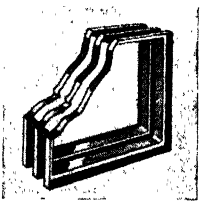
Libbey·Owens·Ford Glass Company

Nicholas Building, **Toledo 3, Ohio**



THERMOPANE*
Insulating Glass



L-O-F Thermopane is a transparent factory-fabricated insulating glass unit composed of two or more panes of glass separated by ¼ in. or ½ in. of dehydrated captive air, hermetically sealed at the edges in the factory with a metal-to-glass bond.

Thermopane is made in more than 60 standard sizes, all of which can be used vertically or horizontally. The glass is specially cleaned before the patented Bondermetric seal is applied. The layer of air inside the Thermopane units is scientifically cleaned, dried and hermetically sealed. The patented, metal-to-glass seal bonds the two or more panes of glass into one unit to prevent dirt and moisture from entering the air space.

Thermopane Reduces the coefficient of heat transmission; increases the room-side surface temperature, thus promoting radiant comfort and lowering the dew point; furnishes a control of light quantity and quality through combinations of various types of glass, and deadens sound transmission to some degree.

Thermopane Uses are many, but may be briefly summarized as below:

Double-glass Thermopane: Glazing of wood or metal windows, doors and window walls for practically any purpose in structures requiring heating or air conditioning.

Triple-glass Thermopane: Large stationary units such as insulated glass walls in homes, apartments, public and commercial buildings and in show windows for refrigerated display where temperature differential must be considered.

Quadruple-glass Thermopane: Engineered to meet low temperature and high humidity conditions.

Thermopane Units provide a high resistance to heat flow, varying with the number of panes and the thickness of the air space used. In summer the low heat transmission coefficient reduces the load on air conditioning systems. In winter it saves heat. The greater efficiency of Thermopane makes it possible to incorporate larger windows in houses and keep the cost of fuel constant. For example, a house could have 107 sq ft of Thermopane instead of 35 sq ft of single glazing and not lose any more heat. Thermopane permits the influx of solar heat in exterior glazing of buildings without a prohibitive compensating loss from conduction.

*Reg. U. S. Pat. Off.

The over-all heat transmission coefficient U varies with the ranges of temperature at which the coefficient is determined. For most practical heat loss calculations coefficient U can be the value determined at zero deg outside temperature, 70 deg inside temperature, 15 mph outside air velocity, 0.25 mph average inside air velocity. The following table gives such values from actual tests with glass sizes 30 in. x 30 in.

Number of Panes	Glass Thickness	U Value		
		Air Space		
		None	¼″	½″
Single Glass	⅛″ ¼″	1.16 1.15		
Double Thermopane (one air space)	⅛″ or ¼″		.65	.58
Triple Thermopane (two air spaces)	¼″		.47	.40

The Room Side Surface Temperature of Thermopane is considerably higher than that of single glazing. Usually radiators or registers are near glass areas in buildings to offset conducted heat loss from a room and radiant loss from the bodies of persons near cold glass areas. The higher glass surface temperature of Thermopane greatly reduces the amount of heat which must be supplied, permitting more flexibility in room design.

Another Important Benefit from Thermopane is the prevention of frost or condensation from forming on the room-side surface of a single pane of glass in winter due to higher room humidity. The absence of condensation on the room-side surface of glass is of considerable importance where clear visibility is a factor as in residences, all types of commercial or industrial buildings and refrigerated display spaces.

More Complete Information on Thermopane is available by writing to Libbey-Owens-Ford, or its district office nearest to you, and requesting technical data sheets prepared by Don Graf, a general booklet about the product, and a brochure which discusses Solar Housing.

Pittsburgh Corning Corporation

Room 500-8, 632 Duquesne Way **Pittsburgh 22, Pa.**

PC FOAMGLAS INSULATION

When installed according to our specifications for recommended applications, PC Foamglas retains its original insulating efficiency *permanently.*

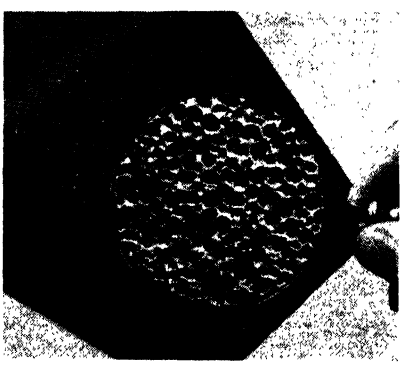
PC Foamglas is a cellular glass insulating material having unique characteristics. It is not a fiber, not a wool, not a board nor a batt. Consists of millions of glass enclosed air cells, in the form of big, rigid light-weight blocks.

Being glass, PC Foamglas is highly resistant to the fumes, acid atmospheres, vapors and other elements that so often cause deterioration of other insulating materials.

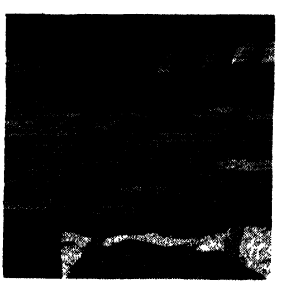
PC Foamglas has proved its ability to help maintain desired temperature levels and to minimize condensation--without maintenance, repairs or replacement--resulting in worthwhile economies. It is widely used in ductwork and core walls, on roofs and floors. As a pipe insulation, PC Foamglas can be used to insulate both hot and cold piping, indoors and outdoors. Note the illustrations of some typical applications.

When you are figuring on insulation, make sure that you have the latest information on PC Foamglas. Send for our booklets on wall, floor and roof insulation. They tell you what you want to know. Pittsburgh Corning Corporation also makes PC Glass Blocks.

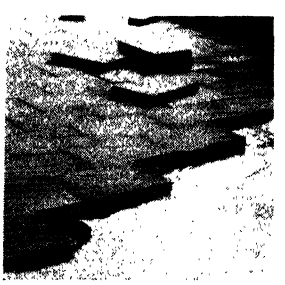
When you insulate with **PC Foamglas** you insulate for good



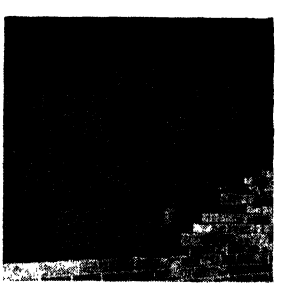
Here's the secret of permanent insulation. PC Foamglas is composed of tiny glass cells . . . millions of them. And these cells are filled with sealed-in air. PC Foamglas has the unique advantage of retaining *its original insulating value—permanently.*



This picture shows how PC Foamglas is applied to roofs. The Foamglas is laid on the roof deck, the specified number of plies of roofing felt are built up on the firm base which is provided by big solid blocks of PC Foamglas.



PC Foamglas, under the concrete cover-floor, prevents heat travel to and from this room. It helps to control temperature and minimizes condensation. Strong and rigid, PC Foamglas will support heavier than normal floor loads.



In core walls, PC Foamglas supports its own weight when laid between brick, tile, blocks and many other types of backing and facing. It helps control temperature and minimize condensation. It will not pack, rot or check.

Pittsburgh Corning Corporation

Room 702-8, 632 Duquesne Way, Pittsburgh 22, Pa.

PC GLASS BLOCKS

Distribution through Pittsburgh Plate Glass Company Warehouses in principal cities and by the W. P. Fuller Company on the Pacific Coast and by Hobbs Glass Ltd. in Canada. Also makers of PC Foamglas Insulation.

Glass Blocks allow the economical use of large glass areas, reduce heat loss in cold weather and materially aid air-conditioning. This is because each PC Glass Block contains a sealed-in dead-air space that is an effective retardant to heat transfer.

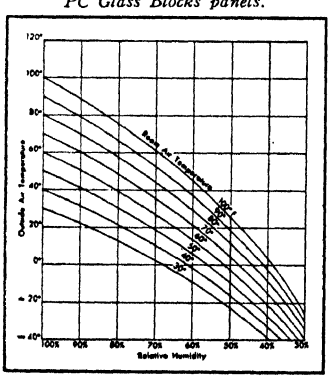
Thermal Insulation

Tests run by nationally recognized laboratories have established the value of glass blocks for insulation of light-transmitting areas. These tests have proved that with glass block panels, heat loss is slightly less than half that experienced with single-glazed windows. In computing heat losses through panels for most design purposes, it is recommended that a "*U*" value of 0.46 to 0.49 be used for all block sizes and face patterns. For complete data on heat transfer values see the section on heat transfer elsewhere in this Guide—page 136.

Surface Condensation

Due to high insulating value, condensation will not start forming on the room side of glass block panels until outside air has reached a temperature much lower than that necessary to produce condensation on single-glazed windows. The accompanying chart shows at what temperatures condensation will form..

Outdoor temperature required to produce Condensation on the room side surface of PC Glass Blocks panels.



For example, with inside air at 70°F and relative humidity at 40 per cent. condensation will not begin to form on the interior surfaces of a glass block panel until an outdoor temperature of −14 deg is reached. Under similar conditions with single-glazed sash, moisture will begin to form when the outdoor temperature reaches +33°F.

Solar Heat Gain

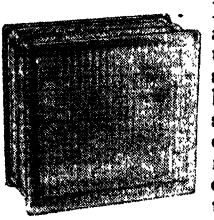
The use of glass blocks for light-transmitting areas results in a marked reduction in total solar heat gain as compared with ordinary windows. This factor is of considerable advantage in buildings that are properly air-conditioned, but does not eliminate the need for adequate ventilation or shading in non-air-conditioned rooms.

For data on solar heat gain through glass blocks see table 10 in the solar radiation section of this Guide—chapter 15. This table is for standard pattern glass blocks.

PC Glass Blocks Aid Air-Conditioning

Two of the chief aims of air-conditioning—temperature control and cleansing of air are aided by the use of PC Glass Blocks. Heat loss is less in winter—heat gain is less in summer. Ideal conditions are much more easily maintained without undue condensation. Solar heat transmission and radiation are reduced. Neither dirt nor drafts can filter in, for each panel is a tightly sealed unit.

Sizes and Shapes Available



PC Glass Blocks are available in ten attractive patterns, some of the patterns being designed for special control and direction of transmitted daylight. For complete information on the sizes and shapes of PC Glass Blocks, and for illustrations of the many patterns available, write the Pittsburgh Corning Corporation, Pittsburgh, Pa., or call the nearest Pittsburgh Plate Glass Company warehouse.

• • •

Additional technical data, including detailed figures on thermal insulation, solar heat gain, surface condensation, light transmission and construction data, will be furnished on request.

Owens-Illinois Glass Company

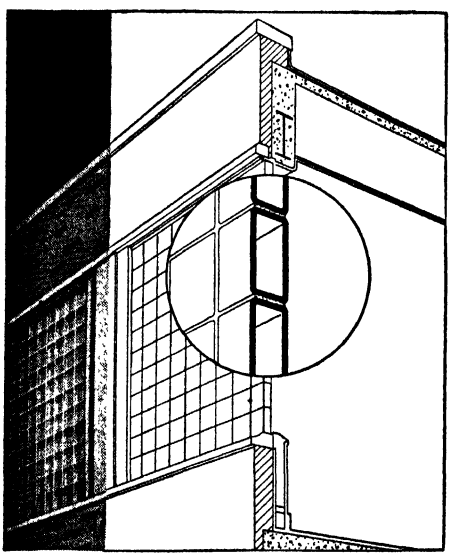
INSULUX PRODUCTS DIVISION, Toledo 1, Ohio

GLASS **INSULUX** BLOCK

Dealers in all principal cities

Insulux Glass Block Give Better Control of Interior Conditions

Insulux Glass Block are hollow, partially evacuated units, 3⅞ in. thick. Faces are smooth or ribbed. Solid panels of these block, laid in mortar, make a light-transmitting wall of high insulating value. Their proper use aids control of interior conditions to a point where initial and operating cost of heating or cooling equipment is reduced.



Conductivity

The *U* factor for ribbed glass block is 0.46; smooth face, 0.49. For design purposes, these factors may be used as constant for either 6 in., 8 in. or 12 in. block. See Chapter 6 of this volume for additional data.

This *U* factor is only 43 per cent of that of ordinary light-transmitting materials. The reason lies in the two heavy glass surfaces separated by partially-evacuated and hermetically sealed dead air space.

Surface Condensation

Because of the low overall air-to-air heat transfer, the room condensation point of a glass block panel is much lower than that of ordinary windows. This will permit higher humidities for both comfort air-conditioning and in industries where high humidity is part of the process. Glass block are not subject to deterioration caused by moisture.

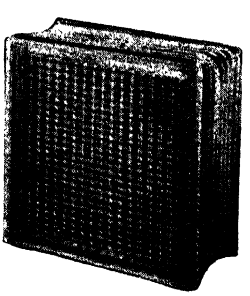
Infiltration

Insulux Glass Block are sealed in the building. They form a barrier against infiltration of dust, air and vapor. Winter drafts and summer vapor leakage are cut. Natural ventilation requirements can be met by installation of windows either inset in the panels or installed directly below the panels.

Solar Heat Gain

A comparative test showed 94 per cent more solar heat through steel sash than through glass block. However, as with sash, glass block transmit less solar heat when properly oriented and shaded. Data in Table 18, Chapter 15 of this GUIDE are for standard block. Other designs, such as the No-glare and Directional block afford further reduction. Data will be sent on request.

Design, Sizes, Erection



Insulux Glass Block is made in 10 face patterns for residential or industrial uses. Sizes are: 5¾ in. x 5¾ in., 7¾ in. x 7¾ in. and 11¾ in. x 11¾ in. All are 3⅞ in. thick. Blocks are erected by laying in mortar like any masonry material. *Complete technical data, description, etc., sent to you on request.*

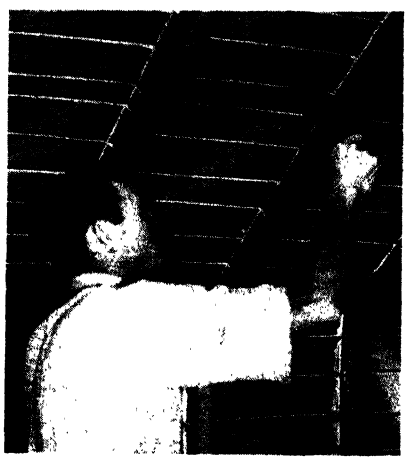
Ferro-Therm

Reg. U. S. Pat. Off.

STEEL INSULATION

FULLY PROTECTED BY U. S. AND FOREIGN PATENTS ISSUED AND PENDING



Installing Ferro-Therm

Ferro-Therm Steel Insulation, made from rigid steel sheets with a special alloy coating, reflects 90 per cent to 95 per cent of all radiant heat. This high reflectivity, combined with extremely low heat storage capacity, provides maximum insulating efficiency in a minimum overall thickness.

Saves Pay Space and Weight

In building construction, the general practice is to install one sheet of Ferro-Therm between roof rafters or over ceiling joists and between studs of exterior walls. In cold storage construction, the number of sheets of Ferro-Therm depends on the temperature to be maintained and the U value required. The k value of Ferro-Therm, based on tests, is listed in the Data Book of the *American Society of Refrigerating Engineers* as 0.226 Btu per (hr) (sq ft) (°F temperature difference). Laboratory tests and thousands of applications have demonstrated that a wall of Ferro-Therm will provide insulating efficiency equivalent to a wall of mass insulation approximately twice as thick.

Assures Rapid Pull Down of Temperature

The low heat storage capacity of Ferro-Therm is extremely important in achieving rapid pull down of temperature, and in saving refrigeration costs for the initial and each subsequent cooling of space. Specifically, the heat storage capacity of a single sheet of No. 38 gauge is 0.029 Btu per (hr) (sq ft) (°F temperature difference). This is approximately 1/16 of the heat storage capacity of 1 sq ft of 1 in. thickness corkboard.

Permanent, Fire-proof Insulation

Ferro-Therm construction eliminates trapping of moisture condensate, with subsequent deterioration of the construction. As it is all-metal, Ferro-Therm cannot be penetrated by rodents, vermin or termites, and is absolutely non-combustible. The value of Ferro-Therm for fire protection is apparent.

125° Below Zero Maintained in Altitude Test Chambers

Ferro-Therm has proved its superiority in buildings, cold storage rooms, refrigerated cabinets, locker rooms, dry ice containers, refrigerated railway car construction, ovens, high-temperature storage tanks—in fact, practically every type of application where high insulating efficiency with economies in space and weight are a requisite. The most notable demonstration of Ferro-Therm performance has been its selection for the insulation of altitude chambers for the testing of Army and Navy aviation equipment and personnel. In these chambers, temperatures as low as −125° F were maintained, with a temperature drop of +70° F to −70° F in 10 to 12 min.

Our catalog, giving data and installation details on Ferro-Therm, will be sent upon request.

PRODUCTS—Armstrong's Corkboard, Cork Covering, Mineral Wool Board—Foamglas*, Heat Insulations, Armstrong's Insulating Refractories, Cushiontone, Temlok**, Insulation Sundries.**

Corkboard

The thermal conductivity of Armstrong's Corkboard is 0.27 Btu per hour, per degree temperature difference, per inch thickness at 60°F mean temperature. It is furnished in rigid boards 12 in. x 36 in., 18 in. x 36 in., 24 in. x 36 in., and 36 in. x 36 in., in 1 in., 1½ in., 2 in., 3 in., 4 in., and 6 in. thicknesses. **Armstrong's Corkboard conforms in all details to Federal Specification HH-C-561b.**

Cork Covering

Armstrong's Cork Covering is made of pure cork in sizes to fit all standard pipe sizes. The inside surfaces of each piece are machined to assure an accurate fit, free from moisture-catching air pockets. Cork covering is rigid and will not sag. Thicknesses are: Light Duty (1.20 in. to 1.93 in.); Standard (1.70 in. to 3.00 in.); and Heavy Duty (2.63 in. to 4.00 in.).

Armstrong's Fitting Covers are rigid and are designed to fit accurately all types of standard ammonia and extra heavy fittings, screwed, flanged, and welded.

Mineral Wool Board

Armstrong's Mineral Wool Board equals or exceeds Federal Specification HH-M-371a for board or block form insulation; has low thermal conductivity; is moisture resistant, odorless; is easily handled and erected; possesses structural strength. Standard size 12 in. x 36 in.; thicknesses 1 in., 1½ in., 2 in., 3 in., 4 in.

Foamglas

Foamglas has a closed cellular structure which will not permit passage of air or moisture. It is efficient, moistureproof, fireproof, and offers effective, lasting insulation. This new type of insulation is made in standard 12 in. x 18 in. blocks; thicknesses 2 in., 3 in., 4 in., and 5 in. It may be used to insulate all types of low-temperature storage rooms.

Heat Insulation

The Armstrong Cork Co. distributes and offers contract service on a complete line of high temperature insulations. Included are: 85 per cent magnesia block and pipe covering; high temperature block and pipe covering; air cell block, sheet, and pipe covering; wool felt; hair felt; etc.

Engineering and Contract Service

All Armstrong offices and distributors maintain skilled erection crews. For aid in the solution of any technical problems involving insulation or acoustical treatment, and for literature and prices, get in touch with an Armstrong district office or distributor or the Armstrong Cork Co., Building Materials Division, Lancaster, Pennsylvania.

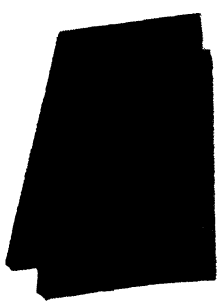
B-H No. 1 INSULATING CEMENT

A plastic insulation produced from high-temperature-resisting, nodulated B-H *black* Rockwool combined with high-grade, long-fibre asbestos and colloidal clay. Effective up to 1800 F; reclaimable up to 1200 F. Suitable for insulating large or small irregular surfaces, including those not suited to molded types of insulation. Contains a special *rust inhibitor* which prevents corrosion taking place between insulated surface and cement. Makes a secure bond on either hot or cold surfaces. Instantly adhesive, easy and economical to apply. When mixed with water to trowelable consistency, the nodules of B-H *black* Rockwool retain their physical properties; when dried out, the dead air cells in these nodules provide maximum insulating efficiency. Packed in strong 50-lb bags; can be stocked without breakage or loss.

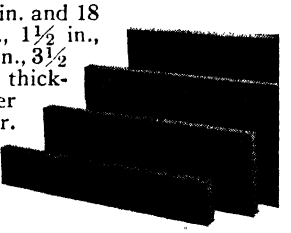
B-H KOLDBOARD



Effective from −150 to 300 F. Made from 100 per cent chemically stable B-H Rockwool fibres, felted and bonded together to form flat, semi-rigid blocks which do not disintegrate or break down structurally under severe service conditions. Koldboard will not support combustion nor smolder when flame is applied. Low moisture absorption: 0.68 per cent at relative humidity of 65 per cent at temperature of 75 F. Thermal conductivity: 0.29 Btu/sq ft/hr/F at a mean temperature of 70 F. Standard sizes: 18 in. and 36 in. long; 6 in., 12 in., 18 in., 24 in. wide; ½ in. to 4 in. thick; packed in high test fibre cartons.

B-H MONO-BLOCK

A one-block insulation effective over the full temperature range up to 1700 F. Fabricated of high-temperature-resisting B-H *black* Rockwool, felted by a special patented process. A strong, light-weight block, easily cut and fitted on irregular or flat surfaces. Low alkalinity factor insures stability under severe temperature conditions. Density—approx. 20 lb per cu ft. Standard sizes: 18 in. and 36 in. long; 6 in., 12 in. and 18 in. wide; 1 in., 1½ in., 2 in., 2½ in., 3 in., 3½ in. and 4 in. thicknesses. Other sizes to order. Packed in high-test cardboard cartons.

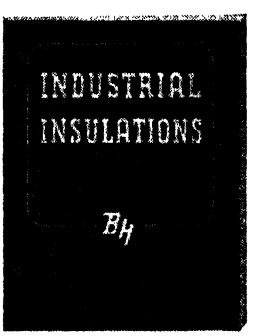


B-H DUCT SOUNDLINER

A rigid material felted of chemically stable Rockwool fibres. Provides an effective means of minimizing sound transmitted through the ducts, by installing it inside the ducts, also provides thermal insulation. Does not disintegrate nor support combustion. Easily cut and fitted around bends in the duct—attached with either bolts or specially prepared acoustical cement. Standard sizes: 24 in. x 36 in.; ½ in. or 1 in. thickness.

CATALOG ON REQUEST

We invite you to write for fully illustrated catalog giving more detailed specifications on these and other B-H Industrial Insulation Products of many types.



The Celotex Corporation

General Offices

120 South LaSalle Street, **Chicago 3**

CELOTEX

REG. U. S. PAT. OFF.

Celotex Cane Fibre Insulation products are made by felting the long, tough fibres of bagasse into strong, rigid boards. They are manufactured under the Ferox Process (patented) which effectively protects them from destruction by termites, fungus growth, and dry rot. They are integrally water-proofed which insures a non-hygroscopic insulation of low capillarity and enduring insulating efficiency.

Celotex Insulating Sheathing

An insulating, weather-resisting sheathing for use under any type of exterior. Surfaces and edges are moisture-proofed with a surface impregnation of asphalt.

Sizes: $^{25}/_{32}$ in. thick: 4 ft wide: 8 ft, 9 ft, 10 ft and 12 ft long.

Celotex Insulating Lath

Regular Insulating Lath—A cane fibre plaster base of high insulating efficiency. Surface provides a strong bond for plaster and the bevelled edges and shiplap joint provide additional reinforcement.

Size: 18 in. x 48 in.; thickness: $\frac{1}{2}$ in.

Celotex Roof Insulation

Regular Roof Insulation—A cane fibre product possessing superior insulating properties. It reduces roof heat transmission as shown by coefficients established in THE GUIDE; reduces roof movement due to contraction and expansion.

Size: 23 in. x 47 in.; thickness: $\frac{1}{2}$ in., 1 in., $1\frac{1}{2}$ in. and 2 in.

Cemesto

A completely fabricated fire and moisture resistant structural insulating wall unit. Consists of a Celotex cane fibre core surfaced on both sides with a $\frac{1}{8}$ in. layer of asbestos-cement board. The established low thermal conductivity of the Celotex core is maintained in the manufacture of Cemesto.

Sizes: 4 ft x 4 ft, 4 ft x 6 ft, 4 ft x 8 ft, 4 ft x 10 ft, 4 ft x 12 ft; thicknesses: $1\frac{1}{8}$ in., $1^{9}/_{16}$ in. and 2 in.

Celo-Siding

A weather-resistant, insulating, structural siding. Replaces wood or other sheathing materials and provides the exterior finish as well. Made of a Celotex cane fibre core that has been asphalt coated on all sides and edges. The weather side is additionally coated with a high grade asphalt into which mineral granules are firmly embedded.

Sizes: Thickness, $\frac{5}{8}$ in. and $\frac{7}{8}$ in.; $\frac{5}{8}$ in.—4 ft x 8 ft (square edges only); $\frac{7}{8}$ in.—2 ft x 8 ft tongue and groove (long edges only), and 4 ft x 8 ft, 4 ft x 10 ft (square edges only).

Celotex Rock Wool Products

Available in the following forms—Loose, Granulated, and Paper-backed Batts. Celotex Rock Wool is made from the clean fibres of molten rock. It is incombustible and integrally waterproofed.

Q-T Ductliner

An acoustical material designed especially for duct lining in air conditioning systems. Absorbs duct noises. Made of rock wool and a special binder. Designed to withstand air duct humidity conditions. Is fire resistant and will not smoulder or support combustion. Thermal conductivity of 0.30.

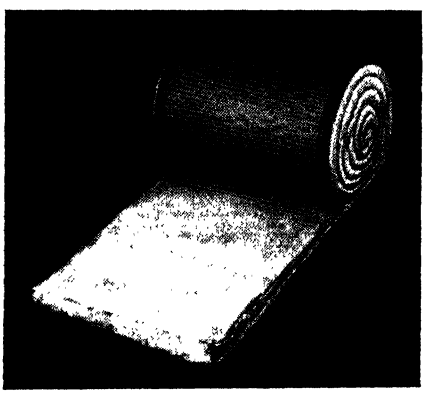
Douglas Co.

Waco, Texas

FLAME PROOF

FIRE-RESISTANT

HEAT Stopper Cotton Insulation



EFFICIENCY

The low thermal conductivity of Heat Stopper Insulation makes it ideally suited for all insulation requirements. **K factor: 0.24** Btu/hr/sq ft/ deg F/in. (See table.)

EASY TO INSTALL

Requires a minimum of labor and expense for installation. Unrolls like a rug. Complete flexibility insures uniform distribution in all odd shaped spaces. An easy one man job.

LIGHTWEIGHT

The fluffy lightness of Heat Stopper Insulation gives maximum protection with minimum load factor. **Density:** 7/8 lb/ cu ft.

NON-ABSORBENT

The natural wax-like coating on each of the cotton fibres, along with the aid of chemical treatment, makes Heat Stopper Insulation resistant to moisture.

FLAMEPROOF

Treated with a chemical formula for permanent fire-resistance. Effectively withstands 1800 deg blow torch test.

NON-IRRITATING TO THE SKIN

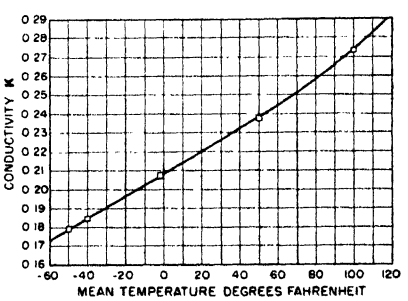
Heat Stopper Flameproof Cotton Insulation contains no splinter or needle like points to injure skin or breathing passages. Always clean and fresh, *has no odor.*

WILL NOT SETTLE OR PACK

Because of its natural resiliency, Heat Stopper Insulation will not pack down from vibration or age. If ever compressed for any reason, Heat Stopper quickly regains original thickness or better when exposed to air.

REPELS HOUSEHOLD PESTS

Heat Stopper Insulation will not harbor such household pests as insects, rats, mice, etc. Chemicals used in the tretament of Heat Stopper Insulation, although harmless to humans, is repulsive to household pests.



THERMAL CONDUCTIVITY OF 1" THICK HEAT-STOPPER INSULATION AT DENSITY OF 0.95 LBS. PER CUBIC FOOT

Heat Stopper Flameproof Cotton Insulation is available in a wide variety of widths and thicknesses to fit standard building requirements.

The Eagle-Picher Company

General Offices: American Building, **Cincinnati 1, Ohio**

Offices in Principal Cities

EAGLE-PICHER

A Remarkable Insulating Wool Made From Minerals

Years ago Eagle-Picher pioneered a method of fusing and fiberizing carefully selected minerals into a dark gray insulating wool. This mineral wool is chemically inert. Fibers are mechanically strong, extremely resilient and flexible. They withstand expansion and contraction without loss of efficiency even at elevated temperatures.

From this mineral wool, Eagle-Picher has fabricated a long list of insulating products to meet a wide range of temperatures and operating requirements.

H-2 Loose Wool

A clean fill insulation that is highly efficient for temperatures to 1200° F. Averages considerably lighter in weight than many rock and slag wools—goes farther. Fibers are soft and flexible. Eagle-Picher Insulation is as fireproof as the minerals from which it is made. Retains physical and chemical stability in presence of water. Packed in 40-lb bags.

7-B Granulated Wool

Another grade of fill insulation that has all the advantageous properties of Eagle H-2 Loose Wool. It consists of small pellets averaging ⅛ to ½ in. in size. For all fill jobs in irregular spaces. May be poured. Packed in 40-lb bags.

Low Temperature Felt

A highly efficient insulating material for subzero and low temperatures (to 400° F). Available in densities 6-lb to 8-lb per cu ft. Recommended for refrigerator rooms, trucks, refrigerators, stoves, etc. Sheds water. Extensively used in marine field.

Paper Backed Batts and Blankets

These light-weight, sturdily constructed batts and blankets are easy to apply. One side is protected with asphalt coated paper which serves as an approved vapor barrier. Strong tacking flanges. Quickly cut with knife or shears. Two thicknesses —Ful-Thik and Semi-Thik. For home use.

Super "66" Cement

A high-temperature insulating cement. Easy to apply and trowels to a smooth finish. Actively inhibits rust. Will stick on any clean, heated surface. Dry coverage 50-55 sq ft per 100 lb. 100 per cent reclaimable up to 1200° F. Packed in 50-lb bags.

Supertemp Blocks

An all-purpose high-temperature block insulation which will withstand elevated temperatures up to 1700° F without loss of efficiency or structural strength. Fibers are water-repellent. Light weight. Easily cut to fit irregularly shaped surfaces. Blocks withstand all normal vibration and abrasion encountered in use for which they are recommended. All standard sizes.

Insulseal

A protective coating for Industrial Insulation Blankets, Supertemp, "66" Cement and other kinds of heat insulation. Provides a permanent seal that safeguards insulation against air infiltration, moisture, water, fumes; also against vibration and abrasion. Does not support combustion.

For more complete specifications and technical data on these and other Eagle Insulating Products, see Sweet's Engineering or Power Plant catalogs.

Insul-Mastic Corporation of America

General Offices:

Oliver Bldg., Pittsburgh 22, Pa.

GILSONITE INSUL-MASTIC TYPE "D" INSULATION

One Single Application

INSULATES, DEADENS SOUND, RUSTPROOFS, WATERPROOFS
Steel, Copper, Tin, Galvanized Sheet Metal Ducts, Plates, Partitions, Buildings, etc.; Pipes, Pipe Lines; Oil Tanks, Water Tanks, etc.

One single application of Gilsonite Insul-Mastic Type "D" Insulation reduces the acoustic properties of metal plates, metal partitions, metal ducts, etc. It insulates against cold, reduces heat losses, is impervious to humidity conditions, and protects all surfaces over which it is applied against corrosion. It is chemically inert, and not subject to electrolysis.

Type "D" is waterproof throughout its entire mass, and is especially effective in preventing mildew and rot caused by condensation of moisture vapor on encased metal panels. The total moisture absorption when kept continually submerged in water, is only 3.2 per cent—too small to exert any practical effect.

A unique feature of Type "D" is that, without any form of mechanical attachment, it bonds perfectly with surfaces when applied at any angle from straight vertical to straight horizontal, including ceilings. Its bond is unaffected by extremes of heat or cold, and the material adheres tenaciously throughout its many year's life of full efficiency.

Type "D" is a highly viscous, semi-plastic material composed of from 65 per cent to 75 per cent granulated cork held in a matrix of genuine Gilsonite asphalt which surrounds each individual cork granule like a jacket. The total asphaltic base of Type "D" contains approximately 50 per cent washed select fine Gilsonite. Inert fillers of flake mica, asbestos fibre, etc., provide for prolonged efficient functioning.

Application of Type "D" is easily and rapidly made by spray under high air pressure, thereby assuring uniform thickness of covering over entire surfaces sprayed, regardless of "high" or "low" areas, angles, bolt or nail heads, or other surface irregularities. There are no joints or seams in a-sprayed-on application. (Type "D" can also be trowled.) The material dries in from 3 to 9 days depending upon weather, and reaches constant weight in about 18 days.

The density of Gilsonite Insul-Mastic Type "D" insulation is approximately 16 lb per cu ft when applied by spray and dried to constant weight. When applied by trowel, density varies according to the manner in which troweling is done; a fair average is 30 lb per cu ft when troweled by hand. The extremely low density (or high insulating value) of Type "D" obtained by spray application, is because that only by spraying can a large amount of desirable air cells be incorporated and retained in the mastic.

Quantities of Gilsonite Insul-Mastic Type Insulation required for different thicknesses, per 100 sq ft are approximately: ⅛ in.—12 gal; ¼ in.—20 gal; ⅜ in.—30 gal. When applied ¼ in. thick at the rate of 20 gal per 100 sq ft, the approximate weight of the applied material is 1½ lbs per sq ft. Shrinkage is negligible.

The thermal conductivity ("K" factor) of Gilsonite Insul-Mastic Type "D" Insulation, per sq ft per 1 in. thickness, is .36.

An application of Type "D" ¼ in. thick reduces heat flow through metal plates from 60 per cent to 65 per cent.

Gilsonite Insul-Mastic Type "D" retains its full functions of insulation and resistance to acids and akalies, throughout temperature ranges from 300 F to −30 F, but above 230 F, the coating becomes progressively more susceptible to injury by mechanical means. Down to −30 F, the material does not check, crack, scale, or lose its bond.

Type "D" has a black, tar colored finish and does not require any additional painting or other exterior surface treatment. If a bright surface is preferred, however, Insul-Mastic manufactures a gilsonite base aluminum paint which, by having the same base-binder as Type "D," is completely compatible with that material and which when sprayed over Type "D," will not discolor or run apart from it. The resulting combination has the added advantage of extremely high reflective properties. If a colored finish is desired for beautifying purposes, Vermont Slate granules may be sprayed over Type "D," while wet, in any color or blend of colors.

Type "D" is used as it comes from the drums. No pre-heating or other preparation of the material is necessary.

Catalog on request.

INSULITE

General Offices
500 Baker Arcade Bldg., **Minneapolis 2, Minnesota**

THIRTY-FOUR YEARS PROVEN DURABILITY

For 34 years engineers and architects have specified Insulite materials for structural uses, interior finish, low temperature duct lining, and for other thermal insulation and sound control work. Insulite materials have proved themselves practical through their performance on the job.

STRUCTURAL MATERIALS

Lok-Joint Lath—An insulating plaster base, fabricated from Graylite. Patented "Lok" firmly locks the sheets between supporting members. Thickness: ½ in. Size: 18 x 48 in.

Sealed Graylite Lok-Joint Lath—An insulating plaster base of Graylite, sealed on stud space side with an effective *moisture vapor barrier*. Has patented "Lok" on long edges. Same thickness and size as Graylite Lok-Joint Lath.

Bildrite Sheathing is an asphalt-containing wood fiber insulating board manufactured under an exclusive process which provides increased strength and moisture resistance. It is $^{25}/_{32}$ in. thick and has a gray-brown color. Thermal conductivity maximum: 0.36 Btu per inch thickness. Each sheet is marked to indicate proper nail spacing. Available in sizes 4 x 8 ft up to 4 x 12 ft with all edges square. Also available in 2 x 8 ft size with interlocking joint on long edges. Used as a structural sheathing board and as roof boarding.

Condensation Control—Where low outside temperatures and high inside humidities may occur, authorities recommend "sealing the warm side and venting the cold side" of the wall to prevent condensation. An adequate vapor barrier, Sealed Graylite Lok-Joint Lath, should be used on the warm (room) side of the wall thereby effectively reducing vapor transmission into the stud space. Bildrite Sheathing is designed to allow any surplus vapor in the stud space to "breathe" or be vented to the exterior air. If vapor is trapped within the stud space and cannot escape through the sheathing, destructive condensation may occur.

THE APPROVED INSULITE WALL OF PROTECTION

This construction consists of Bildrite Sheathing on the exterior of the frame work and Sealed Graylite Lok-Joint Lath on the interior. Transmission coefficient (U) is shown below.

	Interior Finish
Exterior Finish and Sheathing	No Insulation Between Studding
	Plaster (½ in.) on Sealed Graylite Lok-Joint Lath (½ in.)
Wood Siding, $^{25}/_{32}$ in. Bildrite Sheathing	0.15 Btu/sq ft./hr/°F

The above value is typical of results which can be obtained by utilizing Insulite materials in frame construction. For further (U) values refer to Chapter 6 pages 124 and 125.

Applying Bildrite Sheathing

Applying Lok-Joint Lath

INTERIOR FINISH MATERIALS

Graylite Building Board—An integrally treated asphalt containing wood fiber board of grayish brown color—burlap and linen textured surfaces. Thermal conductivity nominal 0.35 Btu per inch thickness. Furnished in thickness of ½ inch and sizes of 4 x 6 ft to 4 x 12 ft.

Smoothcote Interior Board—Factory Coated Insulating Board with smooth, finished surface one side, having 68 per cent light reflection. Furnished in ½ inch thickness only and in sizes of 4 x 6 ft to 4 x 12 ft.

Satincote Interior Board—Factory finished Insulating Board in colors light ivory and oyster white. Light reflection 80 per cent for the light ivory color. Requires no further decoration. Resistant to abrasion and washable. In ½ inch thickness and in sizes of 4 x 6 ft to 4 x 12 ft.

TileBoard—Available in Smoothcote and Satincote. TileBoard is furnished with the Lok-Grip Joint that permits concealed nailing and which together with the Lok-Pin (a flat diamond shaped metal dowel) definitely and mechanically safeguards against any falling units even though no face nailing is used.

Smoothcote and Satincote TileBoard available in ½ inch thickness and sizes of 12 x 12 inches to 16 x 32 inches.

Plank—Available in Smoothcote and Satincote. Plank has the Lok-Grip joint which permits concealed nailing and is beveled and beaded both long edges. Smoothcote and Satincote Plank furnished in ½ inch thickness, widths of 8 to 16 inches and lengths of 8 to 12 ft.

Acoustilite—A high efficiency acoustical material for sound control. Coefficient of sound absorption, at 512 cycles, is 0.79 when mounted on solid background and 0.80 when on furring strips. Noise reduction coefficient is 0.65 when mounted on solid background and 0.75 when on furring strips. Factory painted in buff, (light reflection 77 per cent) and in white (light reflection 80 per cent). Units have a butt joint and are beveled on four edges. Thickness, ¾ in.; sizes, 12x12 in. to 16x32 in.

Acoustilite or Fiberlite effectively quiet and control sound

Fiberlite—An efficient sound absorptive and decorative material. Coefficient of sound absorption, at 512 cycles, is 0.53 when mounted on a solid background and 0.72 when on furring strips. Noise reduction coefficient is 0.55 when mounted on solid background and 0.65 when on furring strips. Factory painted in buff (light reflection 77 per cent) and in white (light reflection 80 per cent). Units have a butt joint and are beveled on four edges. Thickness, ½ in.; sizes, 12x12 in. to 16x32 in.

HardBoard Products

HardBoard materials are tough, durable, grainless, pressed wood fiber boards with a hard, smooth surface. Available in a range of densities from 55 to 68 lb/cu ft. Thicknesses are from 1/10 to 5/16 in. and sizes of 4 x 2 ft to 4 x 12 ft.

Industrial Insulation

Industrial Insulation is a wood fiber board for use in all types of manufacturing industries producing items such as refrigerators, coolers, showcases, brooders, partitions and cabinets.

It can be cut-to-size and fabricated to customer's specifications. Three types of industrial board are available.

Lowdensite Industrial Board—A 10 to 14 lb density board with an average tensile strength of 100 lb/sq in. and an average conductivity of 0.30 Btu/hour /sq ft/F/inch thickness.

Ins-Lite Industrial Board—A 14 to 18 lb density board with an average tensile strength of 250 lb/sq in. and an average conductivity of 0.33 Btu/hour/sq ft/F /inch thickness.

Graylite Industrial Board—Differs from two above products in that it has an integral asphalt treatment which provides increased strength and moisture resistance as well as minimum thickness and linear expansion. A 16 to 20 lb density board with an average tensile strength of 350 lb/sq in. and an average conductivity of 0.35 Btu/hour/sq ft/F/inch thickness.

INSUL-WOOL THE QUALITY INSULATION

OKLAHOMA CITY, OKLA.

Insul-Wool is a non-mineral, fibrous insulation of the "fill" type—made of wood pulp, a natural insulation material. By the special "Insul-Wool" method, the wood pulp is converted into a loose fluffy substance which, when installed in a building, forms a soft heat-resisting blanket having millions of tiny air cells capable of resisting passage of either heat or cold.

UNIFORMITY OF PRODUCT

Only one grade of **Insul-Wool** is made and every "run" is tested at the factory to insure uniformity of product and unvarying high quality. It is free from grit, silicon particles, or "shot." **Insul-Wool** is distributed and installed only by specially trained men—direct factory representatives.

RESISTANT TO FIRE AND VERMIN

Insul-Wool's patented method of chemical treatment makes **Insul-Wool** thoroughly and permanently vermin and fire resistant.

ADVANTAGES OF INSUL-WOOL INSULATION

1. It is manufactured from wood pulp, a natural insulating material.
2. Chemical treatment makes **Insul-Wool** safe under all conditions and hazards.
3. Its light weight, 5/8 lb per square foot, 4 in. thick, adds very little load to the ceiling rafters.
4. **Insul-Wool** is a permanent type insulation which does not pack or settle and outlasts the building in which it is installed; this is backed by a Bonded Guarantee.
5. **Insul-Wool** does not attract moisture.
6. Cuts fuel costs up to 51 per cent and reduces Summer temperature up to 20° F in the home.
7. Meets U. S. Government requirements of Federal Construction with a thermal conductivity of 0.24 Btu per hour, per sq ft, per degree Fahrenheit, per inch thickness.

Analysis of Insul-Wool in Terms of Commercial Thickness

Material	Commercial Form	Comm'l. Thickness Inches	D. Wt. Per Cu. Ft.	C. Conductivity
INSUL-WOOL	Wood Fiber-Loose Type, permanently treated for vermin and fire.	1 4	2.5	0.24* 0.067**

Complete data on Insul-Wool Insulating Product will be sent upon request.

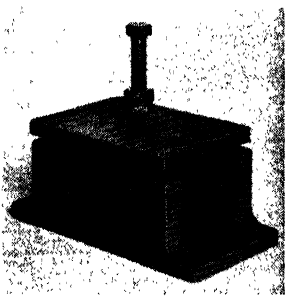
The Korfund Company, Inc.

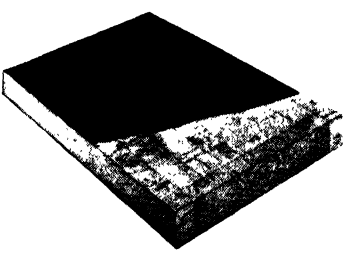
48-50 32nd Place

Long Island City 1, N. Y.

Representatives in KORFUND VIBRATION CONTROL **Principal Cities**

TYPE LK UNIVERSAL VIBRO-ISOLATORS are recommended for isolation of compressor and condensing units where almost perfect absorption of noise and vibration is required, as for instance on upper floors of office buildings, hospitals and hotels. These units absorb vibration in all directions and provide for both horizontal and vertical adjustment. Loading range 75-12,000 lb. Catalog LK-550.





KORFUND CORK PLATES provide a high degree of noise and vibration isolation when applied to compressors mounted on a slab of concrete. Since Cork Plates should be loaded to a minimum of 1,500 lb per sq ft, it is seldom necessary to cover the entire area of concrete. Instead, a number of Cork Plates of dimensions 8 in. x 8 in., or smaller, may be spaced under the concrete so that the load will be evenly distributed over the several plates. Bulletins Bc-13; Bc-22.

The TWIN RAIL FAN BASE is a development in fan and blower isolation which incorporates many new and exclusive features. Interchangeable prefabricated parts are used throughout. It is light in weight, yet has great rigidity to vertical and lateral stresses. The Twin Rail Base is easily assembled and installed, and is fully adjustable. Rubber-in-Shear, Cork, or Steel Spring Isolators are supplied, depending upon requirements. Catalog TR-800.

The Korfund Co., Inc., is exclusive national distributor of ARMSTRONG STANDARD DENSITY VIBRACORK in 2 in., 3 in., and 4 in. thicknesses, loading capacity 1500 to 4000 lb per sq ft.

Johns-Manville

Executive Offices: 22 East 40th Street, **New York 16, N. Y.**

Offices in All Large Cities

Johns-Manville Home Insulation

Johns-Manville Rock Wool Home Insulation is a light, fluffy mineral wool, highly efficient in heat-proofing practically any building, old or new. It is durable, rot-proof, fire-proof and odorless, and will not corrode or settle. Full stud thickness of this material will save up to 30 per cent on fuel in winter and help keep rooms up to 15 deg cooler in hottest weather. J-M Rock Wool Home Insulation is furnished in two forms: for new construction,

Applying J-M Super-Felt Type B batts in new home

in easily handled batts; for existing buildings, in nodulated form to be installed pneumatically.

For New Construction
J-M Super-Felt Type B Batts

Super-Felt Type B Home Insulation is furnished in pre-fabricated batts of uniform thickness and density, in both full stud thickness and semi-thick, in sizes 15 x 23 in. and 15 x 48 in., designed to fill completely the space between studs, joists and rafters on the usual 16 in. centers. The sturdy felted "wool" is strong enough to be handled rapidly without damage. The batts are backed with waterproof, vapor-resistant paper, extending on both the long sides in 1½ in. wide flanges, by which the batt is fastened in place and which also aid in sealing the joints. This backing protects against penetration of moisture from wet plaster and also resists infiltration of moisture vapor from the house into the wall.

As a further protection against moisture, the felted wool is also waterproofed.

Super-Felt may also be obtained in blanket form, in Thick, Medium and 1 in. thicknesses. The blankets have a waterproof vapor barrier paper on one side and a permeable kraft paper on the opposite side, cemented together along the long edges to form a strong nailing flange.

For Existing Homes and Buildings
Type A "Blown" Rock Wool

Type A Rock Wool is blown pneumatically into the spaces between studs in outer walls and between rafters or joists in roofs or attic floors. Insulation thickness in walls corresponds to stud depth, approximately 3⅝ in.; the density, approximately 5 to 8 lb per cu ft, assures maximum thermal efficiency. This type of insulation is installed only by Johns-Manville or by Approved J-M Home Insulation Contractors, who are equipped with the necessary apparatus and trained crews.

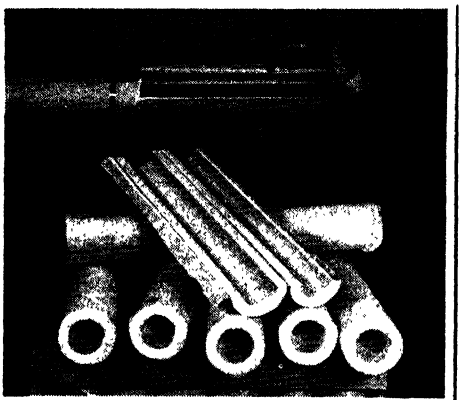
Write for Details

Complete information on all types of J-M Rock Wool Home Insulation will be furnished on request.

J-M Airacoustic Sheets for lining Air-Conditioning Ducts

J-M Airacoustic Sheets, for duct linings of air conditioning systems, are flameproof, highly sound-absorbent and moisture-resistant, with a surface which will not materially increase friction losses in the duct system. Write for Bulletin AC-23A.

Johns-Manville Pipe and Boiler Insulation



J-M 85% Magnesia Pipe Insulation

J-M Pre-Shrunk Asbestocel Pipe Insulation

Cellular type of insulation for pipes carrying low pressure steam or hot water.

Made up of alternate layers of plain and corrugated, specially-treated, moisture-resistant, asbestos paper. Three finishes: Glazed White for quick application, will not carry flame; asbestos paper; and regular canvas cover.

Furnished in 3-foot sections, in thicknesses of 2 to 8 plies, each ply approximately ¼ inch thick.*

J-M 85% Magnesia

Recommended as the most widely used insulation of the molded type for temperatures up to 600 F. Pipe insulation is furnished in sectional or segmental form for all commercial pipe sizes,* in thicknesses up to 3 in. Blocks are 3 in. by 18 in. and 6 in. by 36 in., flat or curved, from 1 in. to 4 in. thick. Minimum thickness for curved blocks, 1¼ in.

J-M Pre-Shrunk Wool Felt Pipe Insulation

Due to its dual-service liner—an asphalt-saturated felt—J-M Pre-Shrunk Wool Felt is equally effective and durable on either hot or cold water service piping. By the use of moisture-resistant felts, shrinkage troubles have been minimized.

Supplied in the regular canvas finish, it is furnished in 3-ft sections in thicknesses of ½ in., ¾ in., 1 in., Double ½ in., and Double ¾ in., for pipe sizes of ½ in. and larger.*

J-M Asbesto-Sponge Felted Pipe Insulation

Recommended on all high pressure steam piping at temperatures up to 700 F where insulation may be subjected to rough usage or where maximum efficiency and durability are desired. Furnished in 3-ft sections up to 3 in. thick, for all commercial pipe sizes.*

J-M Superex Combination

Superex Combination Insulation (an inner layer of high temperature Superex and an outer layer of 85% Magnesia) is recommended where temperatures exceed 600 F. Superex and Magnesia are both furnished in sectional and segmental pipe covering, and in block forms.

J-M Asbestocel Sheets and Blocks

Asbestocel Sheets and Blocks are used for insulating warm-air ducts, flues, heater casings and fan housings in ventilating systems. Temperature limit 300 F. Furnished 6 to 36 in. wide by 36 to 96 in. long, from ¼ in. to 4 in. thick.

J-M Rock Cork Sheets and Pipe Insulation

J-M Rock Cork is made of mineral wool and a moisture-proof binding ingredient molded into sheets for insulating refrigerated rooms, air conditioning and other low temperature equipment; and into sectional pipe insulation with an integral waterproof jacket, for all low temperature service. It is strong, durable, and will not support vermin. Because of its unusual moisture resistance, its high insulating efficiency is maintained in service.

Furnished in sheets 18 in. by 36 in., in 1, 1½, 2, 3 and 4 in. thicknesses; also 18 in. by 18 in. by 1 in. thick. In lagging form, for curved surfaces, supplied 18 in. long by 1½, 2, 3 and 4 in. thick, 2 to 6 in. wide, depending on diameter. In pipe covering form, in ice water, brine and heavy brine thicknesses, for all commercial pipe sizes.*

Details on Request

Write for complete information on any Johns-Manville insulating material.

*Also available in sections to fit straight runs of copper pipe or tubing with outside diameter ⅝ in. and larger.

Kimberly-Clark Corporation

Neenah, Wisconsin

KIMSUL INSULATION REG U. S. & CAN PAT OFF

KIMSUL* insulation . . .
a many-layer, wood fiber blanket with these 12 advantages:

A PRODUCT OF Kimberly Clark RESEARCH

1. Many-layer Construction. KIMSUL* insulation is scientifically designed on the many-layer principle. Dozens of layers create millions of tiny trapped-air cells, effectively shut heat in during winter, lock it out in summer.

2. Handy Compressed Package. KIMSUL comes compressed to 1/5th installed length. Reduces storage, shipping and handling charges.

3. Extra Width. The KIMSUL blanket is made extra wide to provide fully insulated fastening edges.

4. Flexibility. Fits in corners, tucks behind pipes, electrical wiring and other obstructions.

5. Excellent Caulking. Trimmed pieces make effective caulking around window and door frames.

6. PYROGARD† fire-resistant cover. Chemically treated to resist fire just as the inner layers of KIMSUL are treated.

7. Low "k" Factor. Thermal efficiency: 0.27 Btu/hr/sq ft/ deg F/in. (J. C. Peebles, Armour Institute).

8. Lasting Protection. KIMSUL is long-lived because of the materials from which it is made: wood fibers impregnated with asphalt.

9. Resists Fire, Moisture, Vermin and Fungi—Is Termite-Proof.

10. Non-Settling. Won't sag or settle. Rows of strong stitching, running the length of the blanket, hold KIMSUL at the proper density.

11. Light Weight . . . Easy To Install. 1,000 sq ft of Standard Thick KIMSUL weighs 115 lbs. Average density, including PYROGARD cover is 1.4 lbs per cu ft. A precut, prefabricated blanket, KIMSUL is easy for any one to install.

12. 3 Thicknessess . . . 4 Widths. KIMSUL blanket comes in Commercial Thick (about ½ in.), Standard Thick (about 1 in.) and Double Thick (about 2 in.) . . . giving choice of thicknesses to fit specific needs. Each thickness is available in four standard widths: 16 in., 20 in., 24 in., and 48 in.

*T.M. Reg. U.S. & Can. Pat. Off.
†Trademark

For easy measuring, trademarks are printed at approximately 2 ft intervals on expanded blanket.

KIMSUL can be cut to fit non-standard spaces. Just saw the KIMSUL roll as shown.

Clean, rapid and permanent installation in walls, ceilings or roofs. No sharp particles.

PERFORMANCE OF

KIMSUL INSULATED WALLS AND CEILINGS

Calculations apply to a one-story home in the Chicago area.
As shown in the table, almost any desired performance can be produced by insulating with KIMSUL. The economic thickness provides the best balance between insulation costs and resultant fuel savings.

		Surface Temperature (F)		Coal Consumption Reductions		
		Wall	Ceiling	Tons per Season	Tons Saved per Season	% Coal Saved
No Insulation....		60.0	52.0	12.1		
KIMSUL in Walls and Ceilings...	Commercial Thick.....	64.4	60.0	8.0	4.1	33.9
	Standard Thick.....	65.3	63.0	7.1	5.0	41.3

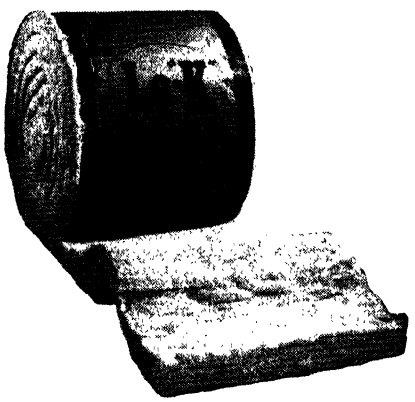
Flexible KIMSUL is easily applied to difficult positions.

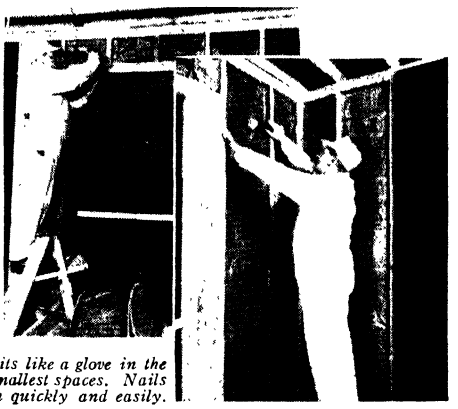
Lockport Cotton Batting Co.

Lockport, New York

FLAMEPROOFED **Lo-"K"** COTTON INSULATION

Fire proofed and manufactured under Department of Agriculture Specifications





Fits like a glove in the smallest spaces. Nails in quickly and easily.

Lo-"K" is made of processed American cotton of varying thicknesses, packaged in rolled form, *with* or *without* Kraft paper backing—an added moisture barrier.

Thermal Conductivity—The "k" value for cotton is 0.24 Btu/hr/sq ft/degree F/inch. (*See table.*)

Light Weight—Weight of 1 cu ft is ⅛ lb. (*See table.*)

Flame-Proofed—To comply with Department of Agriculture specifications to withstand a temperature of 1800° F. This flameproofing is accomplished by a process that Lockport has used exclusively for over 15 years.

Moisture-Resistant—Chemical treatment, combined with natural protective coating on cotton fibres, enables cotton to effectively resist moisture. Prevents rot and mildew.

Smooth Texture—Cotton contains none of the sharp particles that can harm workmen's hands during process of installation.

Flexible—Cotton batt may be expanded or contracted to fit any enclosure. It easily passes over and under pipes and wires.

Easy to Warehouse and Handle. Offers far more "compressibility." Requires one third the trucking and warehouse space of ordinary insulation.

Simple and Economical to Install. Saves from 25 to 40 per cent in time and labor costs.

Designed to Maintain Maximum Utility throughout the life of the structure. Resists all types of deterioration. Will not sag or settle.

Packaged in Rolled Form.

Thicknesses—inches: 1, 1½, 2, 3, 3⅝. Width—16, 20, 24 in. centers. Lengths: Standard from 12 ft up.

Available in Quantity—Lockport is establishing dealers in principal distributing centers. If your dealer doesn't happen to have Lo-"K" in stock, we invite your inquiry for prices and samples.

INSULATING VALUE OF VARIOUS INSULATORS[a]
The coefficients of conductivity (*k* value) are expressed in Btu per hour per square foot per degree Fahrenheit per 1 in. of thickness.

Type of Insulation	Wgt. per Cu Ft	*k*[b] Value
Cotton: Insulating Batt	.875	0.24
Rock Wool: Fibrous material made from rock	10.00	0.27
Mineral Wool: Fibrous material made from mineral slag	....	0.27
Glass Wool: Fibrous material made from glass slag	1.50	0.27
Rigid Insulation made from sugar cane fibre	13.50	0.33
Chemically treated wood fibre between layers of paper	3.62	0.25
Eel grass between layers of paper	3.40	0.25
Stitched and creped expanding fibrous blanket	1.50	0.27
Shavings: Various from planer	8.80	0.41
Corkboard: No binder added	7.00	0.27
Rigid insulation made from wood fibre	15.90	0.33
Rigid fibre board made from shredded wool and cement	24.20	0.46

[a] Compiled from Chapter 6.
[b] "*k*" indicates temperature conductivity.

Natural Cork—Cork in its natural state consists of minute hermetically sealed cells containing "dead" air. Approximately 200,000,000 cells per cubic inch. Cell walls are resinous, resilient, and impervious to the passage of air. There is no "free" air to conduct heat or moisture through the mass and no capillary attraction.

Mundet "Jointite" Corkboard

—for all low temperature insulation and for acoustical correction. Natural cork is ground into ¼ in. to ⅝ in. granules and compressed under heat in moulds to produce Mundet flat or shaped corkboard. Air spaces between granules are eliminated by the pressure and the milled resin in the cell walls cements the mass into a homogeneous structure retaining the properties of natural cork.

Mundet Corkboard meets U. S. Government Master Specifications. Its heat transmission is guaranteed not to exceed .29 Btu when tested in accordance with Bureau of Standards regulations. In actual cold storage practice, this figure may be safely reduced to .27 Btu. Sold in standard 12 in. x 36 in. sheet. Standard thicknesses, ½ in., 1 in., 1½ in., 2 in., 3 in., 4 in., 6 in.

Section of Mundet Moulded Cork Pipe Covering with Fitting. The pipe covering is made in sections 36 in. long, to fit all sizes of pipe.

Mundet "Jointite" Cork Pipe Covering

Shown below, with fitting cover. Protects all types of low temperature lines. Made in 3 thicknesses, with complete line of standard covers, suitable for pipes carrying sub-zero to 50 F temperature.

Mundet Cork Vibration Isolation

Machinery vibration encountered in heating and ventilating work is effectively controlled by the use of Mundet Natural Cork Isolation Mats. These consist of blocks of pure cork, held together within a rigid steel frame or bound with asphalt paper applied with hot asphalt top and bottom. Mundet steel bound mats are usually used under exposed mounts; asphalt paper bound mats under concrete foundations of the envelope type.

Engineering and Specification Service

Our engineering department is at the service of Architects and Engineers, to assist and advise in the preparation of specifications pertaining to cork. This service is available without obligation to any one who has a low temperature insulation or a vibration isolation problem. Our latest catalogue will be sent on request. It is replete with information and data of value to every specification writer whose field touches our products.

Mundet Contract Service

Covers the complete installation of our products, in accordance with best established practice. Divided responsibility is avoided. Materials and workmanship are guaranteed.

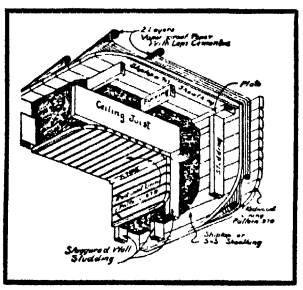
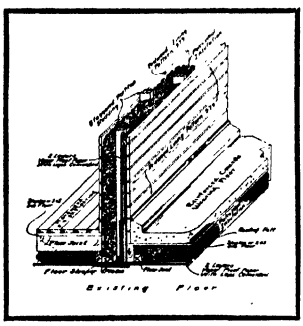
PALCO INSULATION WOOL

LOS ANGELES
CHICAGO
NEW YORK

FLAME PROOF SAFERIZED PROCESS



Typical Wall and Ceiling Wood Finish for Low Temperatures.



Accepted Partition Construction between Freezer and Cooler with Wood Finish Wall and Floor, and Concrete Chill Floor.

PALCO WOOL Provides Efficient Insulation

Constant low temperature control within extremely close ranges requires an insulation of high thermal efficiency. PALCO WOOL, with its low thermal conductivity of .255 Btu, has proved to be one of the most efficient types of insulation in use today throughout the United States and Canada. It has the quality of being entirely self-supporting within a wall. Because of its lasting resilience PALCO WOOL will not settle nor compact over an extended period. Permanence is further insured by its exceptional ability to withstand moisture and resist decay and deterioration. PALCO WOOL is inherently repellent to insects, vermin and pests. It is odorless itself, and will not absorb odors. Specially processed PALCO WOOL is additionally treated under an exclusive SAFERIZED process to make it flame-proof. Due to its permanent low cost, PALCO WOOL has proved exceedingly economical to use. Its high efficiency assures continued savings in operation and maintenance.

Check These 8 Proved Qualities of PALCO WOOL

1. High Thermal Efficiency
2. Economy
3. Durability
4. Non-Settlement
5. Odor-Proof
6. Vermin-Repellent
7. Moisture-Resistant
8. Fire-Resistant

ALFOL INSULATION

Manufactured by

Reflectal Corporation

155 East 44th Street

New York 17, N. Y.

HEAT INSULATION for ALL PURPOSES

Easy to Apply

Handy Package—250 Sq Ft of Insulation

Alfol Building Blanket—for all Types of Building Structures.

Alfol Building Blankets consist of spaced layers of Alfol Aluminum Foil Insulation attached along the edges to a liner sheet of heavy vapor proof paper.

Packaged in handy rolls of 250 sq ft each for use on 16 in., 20 in. or 24 in. centers. Weighs less than 1/10 lb per sq ft.

- **High Insulation Efficiency.**
- **Positive Vapor Barrier.**
- **Low Heat Storage Capacity.**
- **Negligible in Weight.**
- **Moisture Proof.**
- **Durable.**
- **Odorless and Clean.**
- **Easily Applied.**
- **Low Cost.**

Specifications

Description	Widths	Net Area per Roll	Net Weight per Roll
Type I.—1 Layer ALFOL	16"-24"	250 sq. ft.	17 lbs.
Type II.—2 Layers ALFOL	16"-20"-24"	250 sq. ft.	19 lbs.

See technical data in Table 1, Section C, Page 116, this volume.

A L S O

• ALFOL PREFABRICATED INSULATION PANELS

For Tanks, Towers, And All Types of Heated Equipment.

• ALFOL ASBESTOS

Alfol Aluminum Foil Insulation Laminated To Asbestos For Ovens, Ranges, Boiler Jackets, Hot Water Heaters, And All High Temperature Insulation Purposes.

• ALFOL JACKETING

Heavy Reinforced Paper Combined With Alfol Aluminum Foil. Provides Insulation And Vapor Barrier In One Convenient Form. For Refrigerator Cars, Trucks, Buses, Trailers, Etc.

Silvercote Products, Inc.

161 East Erie Street, **Chicago, Ill.**

SILVERCOTE Reflective INSULATION

SILVERCOTE INSULATION

Silvercote—A reflective insulation designed to retard the transfer of heat by a combination of heat reflective surfaces and air spaces, is manufactured in three forms to meet various insulation requirements.

Silvercote Fabric—A fabric reinforced insulation and vapor barrier consisting of two sheets of Silvercote paper laminated with specially prepared asphaltum and reinforced with an interlining of ½ in. mesh jute fabric imbedded in the lamination. The two exposed silver-like surfaces retain their high reflectivity to radiant heat under the most severe conditions encountered in the building construction, air conditioning and refrigeration fields. Silvercote Fabric weighs approximately 100 lb per thousand sq ft and is available in 500 sq ft rolls in standard widths of 26 in., 36 in., 49 in., and 52 in. Special widths up to 120 in. can be manufactured for industrial users.

Silvercote Duplex—A product similar to Silvercote Fabric except that the reinforcing fabric is omitted. Silvercote Duplex has the same insulating and vapor barrier values as Silvercote Fabric. Silvercote Duplex is available in standard widths of 26 in., 36 in., 49 in., and 52 in. in 500 and 1000 sq ft rolls. Weight: approximately 65 lb per thousand sq ft.

Silvercote Simplex—An economical reflective insulation designed for use where a vapor barrier is not called for. Silvercote Simplex is a single sheet of kraft paper coated on both sides with the Silvercote surface. Silvercote Simplex is available in 2000, 1000 and 500 sq ft rolls of 36 in. and 54 in. width. Weight: approximately 30 lb per thousand sq ft.

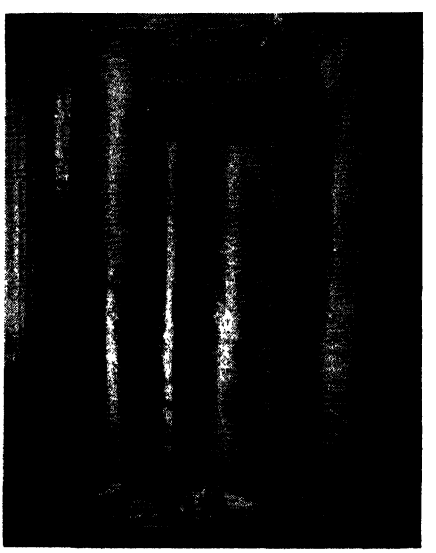
SILVERCOTE—HEAT AND WATER VAPOR BARRIER

Insulation Value—The thermal conductance of Silvercote Fabric dividing a 1½ in. vertical air space has been established by laboratory test as 0.23 Btu per hour per sq ft per deg F. The thermal conductance of Silvercote Fabric mounted in the center of a 1½ in. horizontal air space with heat flow in the upward direction is 0.26 Btu per hour per sq ft per degree F. With heat flow in the downward direction the thermal conductance is 0.16 Btu per hour per sq ft per degree F. The emissivity of Silvercote has been found by test to be 0.17. Copies of test reports on the conductance or emissivity of Silvercote are available upon request. Silvercote Duplex and Silvercote Simplex have the same insulation value as the Fabric.

Water Vapor Permeability—Silvercote Fabric and Silvercote Duplex each have a permeability to water vapor transmission of approximately 0.40 grains per hour per square foot per pound per square inch difference in vapor pressure. This is approximately ⅛ of the maximum allowable transmission for materials classed as vapor barriers.

ENGINEERING SERVICE

For complete specifications and engineering service address Silvercote Products, Inc., 161 East Erie Street, Chicago 11, Illinois.



Silvercote Fabric 36 in. wide applied over inside face of studs 16 in. on center. Excess 4 inch width in two stud spaces permits suitable vapor seal lap and forms sealed air space between Silvercote insulation and interior finish.

Wood Conversion Company

Dept. 220-8 First National Bank Building
St. Paul 1, Minnesota
NEW YORK CHICAGO

EFFICIENT INSULATION FOR EVERY NEED

For many years a leader in the insulation field, Wood Conversion Company manufactures a complete line of flexible, fiber and rigid insulation for all industrial and domestic purposes. This insulation is the product of scientific research, and is especially designed to embody the most desirable qualities for every use. Backed by the name of Weyerhaeuser, Wood Conversion Company insulation assures high efficiency and long, satisfactory service.

Balsam-Wool Sealed Blanket Insulation—A building insulation that is completely armored against the three major insulation enemies—wind, vibration and moisture. The Balsam-Wool mat is completely enclosed in tough waterproof liners which surround all four sides, with spacer flanges which assure positive application. Balsam-Wool will not settle or pack down within walls—is fire retardant and vermin-proofed.

K-25 Fiber—A clean, new wood fiber insulation with an amazingly low K factor. Shipped in compact bales, K-25 is easily processed on the job to create a lastingly effective insulation and is ideal for use in locker plants, cold storage plants, walk-in coolers, etc.

K-25 Fiber Pneumatic System—The modern, high-speed, automatic way to insulate domestic refrigerator cabinets and doors. Fluffed to proper low density in the manufacturer's plant, K-25 is blown into cabinets and doors under high pressure, forming a tightly felted insulating mat without joints, laminations or voids.

Tufflex—A soft, felted blanket material made from fleecy wood fiber, combines high insulating efficiency with toughness and exceptional resistance to heavy impact blows. Tufflex is light in weight and non-abrasive—will not tear or pull apart even when cut into narrow strips. Tufflex is available in rolls or sheets of various thicknesses and widths.

NU-WOOD STRUCTURAL INSULATION

Nu-Wood Interior Finish—A multiple-purpose wood fiber material available in tile, plank and board. Nu-Wood insulates, decorates and quiets noise. Nu-Wood's colors are soft and harmonious—will not fade. The Nu-Wood interior finish line includes Sta-lite, an insulating interior finish with more than 70 per cent light reflection.

Nu-Wood Insulating Lath—Used as a plaster base, assures strong, smooth, true walls and ceilings, free from cracks.

Nu-Wood Roof Insulation—Will fill all requirements of Federal specification LLL-N-321A. Furnished in any practical thickness.

United States Gypsum Company

General Offices: 300 W. Adams Street, **Chicago, Ill.**

INSULATION PRODUCTS

Batt **Decorative** **Structural**

RED TOP* INSULATION WOOL

Red Top Batt

RED TOP MINERAL WOOL BATTS

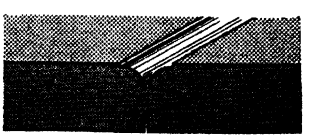
"k" Valve .27 Btu's

Made for standard (16 in. or 24 in. O.C.) framing in two thicknesses, Medium (Approx. 2 in.) and Thick (Approx. 3 in.). Lengths are either 24 in. or 48 in. Batts are provided with an efficient vapor barrier paper providing nailing flanges for easy application. Adequately packed to insure material will arrive at the job in good condition.

Decorative

Decorative

WEATHERWOOD* PLANK—Manufactured in widths of 8, 10, 12 and 16 inches and in lengths 6, 8, 10 and 12 feet—½ inch thick. The fitted edges (see cut) conceal nails and seal against dust and air infiltration. WEATHERWOOD Plank is made in Blendtex (gray and tan blends) and Hilite (ivory) colors. When combined in variations of shades and width, Weatherwood Plank produces maximum values in both insulation and decoration.



Tile and Plank Fitted Edge

*Reg. U. S. Pat. Off.

WEATHERWOOD TILE—Available in 12 x 12, 12 x 24, 16 x 16 and 16 x 32 inches in ½ and 1 inch thicknesses. Colors are Blendtex (gray and tan blends) and Hilite (ivory).

WEATHERWOOD PANELTILE—Hilite color available in 12 x 24 and 16 x 32 inches in ¾ inch thickness. Blentex colors available in 12 x 24 and 16 x 32 inches. Tile sizes 12 x 24 and 16 x 32 inches can be mill cross scored to represent ½ inch Tile Dimensions. All tile have fitted edges.

Structural

WEATHERWOOD SHEATHING—Asphalt coated. 2 feet x 8 feet x 25/32 inches thick, with tongue and grooved long edges for horizontal application. Also available in 4 x 8, 4 x 9, 4 x 10 and 4 x 12 feet in either ½ inch or 25/32 inches thickness with square edges for vertical application.

WEATHERWOOD BUILDING BOARD—4 feet wide, made in lengths 6, 7, 8, 9, 10 and 12 feet, ½, and 1 inch thick in either ivory or gray tan colors. Applied by nailing; effectively insulates, strengthens and decorates.

WEATHERWOOD INSULATING LATH—18 x 48 inches x ½ and ¾ inch thick with V joint on long edges. Gives an excellent plaster bond and also acts as a cushion for plaster with sound deadening qualities.

Heat Loss Factors

The heat loss factors shown on the opposite page indicate the comparative insulation value of various insulating treatments included in common construction systems.

NOTE: These figures apply to 1 story buildings. To get figures for 2 story homes add 20 per cent to the values below for the wall constructions and divide by one-half for floor and ceiling constructions It is important to use correct factor due to variations in the ratio of wall and window areas.

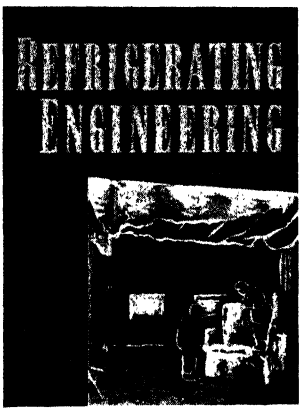
American Society of Refrigerating Engineers

40 West 40th Street, **New York 18, N. Y.**



The most rapidly growing magazine in the refrigeration field

LONG acknowledged the most authoritative periodical in the field, *Refrigerating Engineering* has added steadily to the practical value of its contents, and its number of readers has grown in proportion. A wide variety of material is presented, all from the viewpoint of its usefulness to the reader in his own business. This magazine is a must for men who keep in touch with all that is new and important in refrigeration and air conditioning. The annual subscription price is $3.

THE REFRIGERATING DATA BOOK

IS an essential tool in the refrigeration and air conditioning industries. It has been published biennially since 1932 and appears in two volumes, published alternately —the Basic volume, now in its fifth edition, a standard reference work which deals with refrigeration cycles, fundamental data, industrial, domestic, and commercial systems, and air conditioning; the Refrigeration Applications volume, consisting wholly of practical how-it-is-done chapters on all the known applications of refrigeration and air conditioning. The current edition is dated 1946. Either volume sells for $5.00 in the U. S.

REFRIGERATION ABSTRACTS

A JOURNAL devoted to abstracts of all worthwhile articles appearing on the subject of refrigeration and air conditioning theory and applications in more than 300 current publications throughout the world. Prepared by a staff of experts, it is invaluable for those engaged in research, design, or in exploration of unfamiliar fields. Five issues annually at $7.00. Subscriptions can be predated to include the January, 1946 issue. Additional information on request.

APPLICATION DATA BULLETINS

SOME 37 bulletins are available separately at reasonable prices for single copies or quantity orders and can also be had bound with a paper cover, the com plete set for $8.00.

The APPLICATION DATA Bulletins tell precisely how refrigeration is used in various fields, giving examples and specific information on the best practice up to date. Some of the subjects covered to date are: refrigeration of locker plants, fur storage, restaurants, liquids, apples and pears, skating rinks, butter and cheese making, milk plants, citrus fruits, beer dispensing, retail stores, wine making, load calculations, operation of ammonia machines, meat packing plants, etc.

CODES AND STANDARDS

THE ASRE further contributes to refrigeration progress by its participation in establishing codes and standards in the industry. Among the recent codes made available are: No. 14—Methods of Rating and Testing Mechanical Condensing Units; No. 21—Testing and Rating Milk Coolers; No. 22—Rating and Testing Water-cooled Refrigerant Condensers; No. 24—Rating and Testing Water and Brine Coolers.

MEMBERSHIP ACTIVITIES

IT is the policy of the ASRE to treat in its meetings current subjects touching upon all phases of the art of refrigeration. Membership is in several grades with dues from $7.50 to $15.00. Sections hold meetings in 27 principal cities. More detailed information will be sent if you wish.

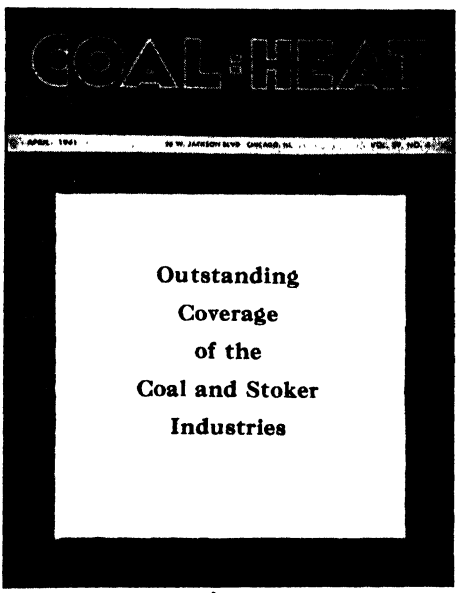
To keep apace with progress in refrigeration and air conditioning, read the publications and follow the activities of THE AMERICAN SOCIETY OF REFRIGERATING ENGINEERS, 40 West 40th St., New York 18, N. Y.

Coal-Heat

Published at

20 W. Jackson Blvd., **Chicago 4, Illinois**

Phone Wabash 9464



FOR information on the use and sale of stokers, coal and coal heating equipment, you can turn to COAL-HEAT with complete confidence.

Here is a magazine that appeals to every man concerned with the market, use and sale of solid fuel and modern heating equipment. Having long since recognized the importance of properly designed efficiently operated, properly maintained equipment to the successful use of coal, and therefore to the welfare of the coal industry, COAL-HEAT constantly emphasizes the significance of the "equipment factor" in heating merchandising.

It is only natural that COAL-HEAT was the first trade magazine to recognize and promote the small stoker; to introduce many new developments in coal-burning equipment to further fuel conservation; to support the use of dustless treatment; and to urge the sale of equipment by coal men.

COAL-HEAT has at its disposal an almost unlimited number of sources of authentic information on the topics it covers; its articles are written by the best informed men in the coal, stoker and heating industries. It enjoys quite a following, not only among the most progressive merchants in these industries, but among the industry's leading combustion and heating engineers. For years it has championed the importance of the fuel engineer to the coal and stoker industries, and each year prints many articles *for* and *by* fuel engineers.

COAL-HEAT's fundamental editorial policy is "to further the more satisfactory use and sale of coal and modern coal-burning equipment." It actively supports the application of scientific and engineering knowledge to the use of coal and coal-burning equipment. It covers both the merchandising and utilization of the coal, stokers and modern heating equipment.

With over a million stokers in use today, the importance of COAL-HEAT's field is clearly evident. It has been and is COAL-HEAT's job to supply coal and stoker men with the information they need to insure satisfaction for stoker users. The same is true with hand-fired heating plants and all kinds of household and commercial coal heating equipment.

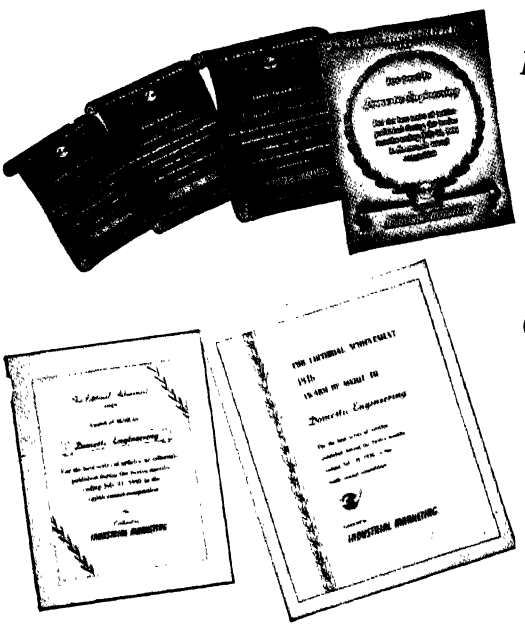
In addition to providing its readers with a basic and diversified editorial program, COAL-HEAT also publishes a number of books and booklets, manuals and reprints covering a wide range of subjects of interest to coal, stoker and heating men. Its series of heating guides for the consumer have proved particularly popular. These are available at small cost.

Subscription rates—**$2.00** a year; **$3.00** for two years in United States. Canadian and foreign rates $3.00 a year.

Advertising rates and other information will be furnished upon request.

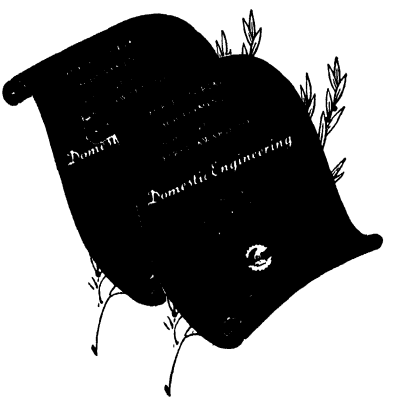
Domestic Engineering Publications

1900 Prairie Avenue, **Chicago 16, Illinois**

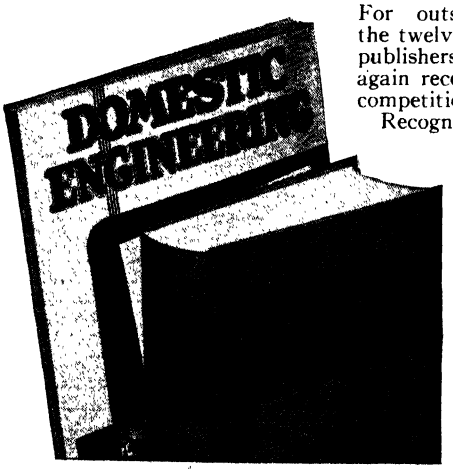


Again . . .
DOMESTIC ENGINEERING
Receives Awards for
Editorial Achievement

2 Awards in 1947!



8 TIMES A WINNER!



For outstanding editorial achievement during the twelve month period ending July 31, 1947, the publishers of DOMESTIC ENGINEERING have again received high honors in the annual editorial competition conducted by Industrial Marketing.

Recognition for two more of its many outstanding accomplishments thus has come again to an organization which has been amazingly consistent in the winning of these awards. 1939, 1942, 1943, 1944, 1945, 1946 and now 2 awards in 1947! 8 times these highly coveted honors have been accorded to DOMESTIC ENGINEERING in acknowledgment of its editorial excellence. Rarely has an honor so great been bestowed on one organization . . . seldom has such a degree of consistency been attained in the face of the keen competition offered by hundreds of the nation's leading business papers.

During its fifty-eight years of continuous publishing experience the DOMESTIC ENGINEERING organization has similarly demonstrated to the industries it serves, as well as to the nation as a whole, the high standard of its editorial accomplishments.

A. E. COBURN, *Editor*
ROBERT GRAY, *Business Manager*
ARTHUR G. WINKLER, *Advertising Manager*

OILHEATING is a vertical, integrated industry, selling through the same retail outlets: oilburners, oilfired heating and air conditioning equipment, and fueloil.

Starting about 16 years ago, this integration of fuel and the equipment to burn it has grown until in 1947 two-thirds of all oilheating equipment (including boilers, furnaces and accessories) sales were made by companies that also supply the fuel, and about three-fifths of all heating oil was sold by companies also selling oilheating equipment.

FUELOIL & OIL HEAT, the only publication actively covering both the equipment and fueloil interests of dealers, was organized in 1922. It is recognized as the dominant editorial and advertising source for all heating contractors, fueloil dealers, furnacemen and others who actively sell oilheating; also for the many manufacturers who cultivate this vast market for their products and services through our low-cost advertising space.

Oilheating Manufacturers

Oilburner manufacturers in 1947 had factory shipments of 993,000 domestic burners and oil-boilers or oil-furnaces, more than 67 per cent above the industry's previous peak of 492,593 in 1946. This was accomplished in a year of constant material shortages.

Approximately 300 manufacturers of domestic oilburners and integral units are now in production, with a dozen of these supplying about half of the total output.

Dealers

Largest outlets for oilburners and related equipment in 1947 continued to be those firms who specialized in (had largest dollar volume in) oilburners or fueloil, the two groups accounting for 74 per cent of all oilburner retail business. The balance was divided among coal companies, who have added fueloil departments and sold 7 per cent of the oilburners, general heating dealers and contractors, who sold 5 per cent of the oilburners, with the remaining 14 per cent sold by a variety of dealer types.

Chief purchaser of domestic oilburners was the homeowner who had been shoveling coal. Of all 1947 oilburner installations, 57 per cent replaced handfired coal in old homes, 31 per cent went into new homes, 7 per cent replaced old oilburners 5 per cent replaced coal stokers and 1 per cent replaced gas heating burners.

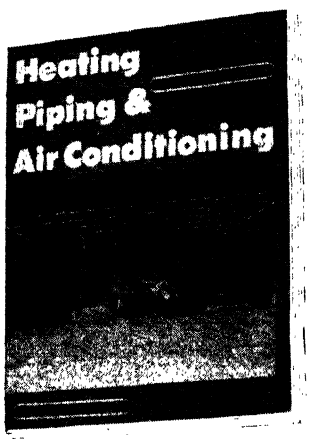
As the home building program got into full swing in 1947, dealers gave it much more attention than previously in the postwar period, since they had ample burners available above the numbers needed for the more profitable individual conversions from coal.

During the two and a half years since the war ended and restrictions on oilburning were lifted, the fueloil distributor has had a very strong gain in annual volume. At the close of 1947 the number of oilheated homes in the country was 57 per cent higher than the number when the war ended, and 27 per cent higher than at the end of 1946. In the oil industry, fueloil continues to expand in volume much faster than gasoline, and may soon become the principal petroleum product.

For a statistical picture of all phases of oilheating—wartime and postwar, send $1.00 for the January, 1948, Yearbook Issue and for a free copy of "Oilheating Tomorrow"—an 8-page statistical study.

KEENEY PUBLISHING COMPANY
6 North Michigan Avenue, **Chicago 2, Ill.**

Heating, Piping and Air Conditioning



This is the publication which carries the Journal of the A.S.H.V.E. in addition to its own regular editorial section. Its field is that of industry and large buildings. It is devoted to the design, installation, operation, and maintenance of heating, piping and air conditioning systems in such plants and buildings.

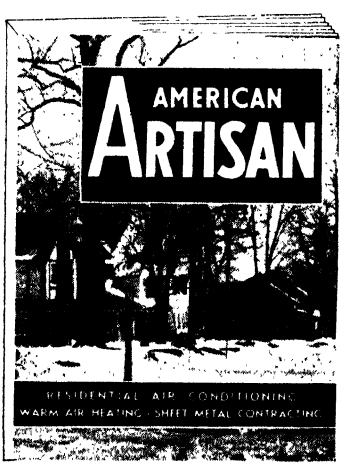
Each January issue includes a complete directory of commercial and industrial heating, piping, and air conditioning equipment, which lists all products, their trade names, and the manufacturers' addresses. It is the established buying and specifying guide of the industry.

H. P. & A. C. is read by consulting engineers and architects . . . contractors . . . and engineers in charge of heating, piping and air conditioning in industrial plants, and other large buildings, federal, state, and city governments, school boards, and public utilities. All A.S.H.V.E. members are subscribers.

Such coverage means, for the advertiser, consideration at all points in the selling of a heating, piping, or air conditioning product . . . consideration in its selection during the preparation of plans and specifications; in its actual purchase for installation; in its year-'round buying for operating and maintenance requirements. Without waste, the manufacturer of air conditioning products and equipment can reach through H. P. & A. C. those from whom he is seeking the necessary engineering acceptance. Write for our new booklet "A Quick Picture."

Member—A.B.P.—A.B.C. Subscription Prices—U.S. $3 per year.
Canada, Central and So. America—$4 per year. Elsewhere $6 per year.

American Artisan



AMERICAN ARTISAN covers the field of warm air heating, residential air conditioning, and sheet metal contracting. Its readers are warm air heating and sheet metal contractors, dealers, jobbers, manufacturers, and public utility companies.

A special section of each issue has been devoted to air conditioning since 1932, when it first became apparent that air conditioning for homes was to be along the lines of the central forced warm air heating system. As a result of the ready adaptability of this type of heating system to all air conditioning factors, hundreds of thousands of homes today have winter air conditioning—supplied through forced warm air heating with air cleaning and humidification. Cooling apparatus can be attached to these systems readily whenever year-'round air conditioning is desired.

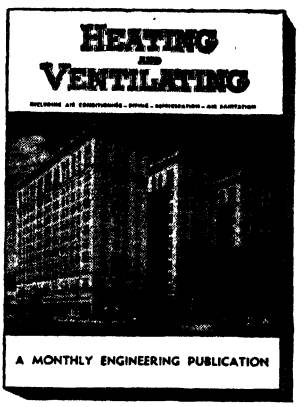
Each January issue includes a complete directory of warm air heating, air conditioning, and sheet metal products and equipment, which lists all products, their trade names, and the manufacturers' addresses.

The key man in the residential air conditioning picture is the warm air heating and sheet metal contractor—the one man experienced in "treating air" at a central place and getting it properly distributed. And the key publication—because it reaches these key men with an information service that has made it the recognized authority on residential air conditioning practice—is AMERICAN ARTISAN. For full information on this field, write for a copy of "A Quick Picture."

Member—A.B.P.—A.B.C. Subscription Prices—U.S. $3 per year.
Canada, Central and So. America—$4 per year. Elsewhere $6 per year.

HEATING — VENTILATING

AIR CONDITIONING - PIPING - HEATING - VENTILATION - REFRIGERATION



HEATING AND VENTILATING is a monthly publication read by engineers and contractors. These are the men who specify, install and maintain the mechanical equipment used in heating, ventilating, air conditioning and refrigeration systems of industrial, commercial and institutional buildings and residential projects. Its readers include also engineers and designers of the firms which manufacture this mechanical equipment.

The editorial content is edited to be of practical use to these engineers, and is prepared under the direction of field-experienced professional engineers.

Generally speaking, the emphasis is on practical rather than on theoretical considerations.

Each month an original Reference Data sheet is included for permanent use in a standard binder.

Special sections are published from time to time. These sections are devoted to subjects of timely interest, such as Heat Pump, Radiant Heating, Piping, Cooling Coils, Air Sanitation, Exhaust Hoods, Air Conditioning, etc. A comprehensive Buyers Directory is published each fall.

CIRCULATION

HEATING AND VENTILATING'S total distribution (A. B. C. Report, May, 1947)—classified as follows:

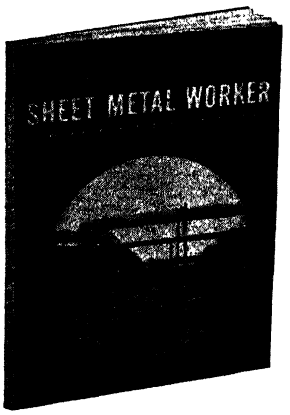
Consulting Engineers (388) and Architects (132) Engineers Employed by them (430)	950
Contractors (1,991) and Engineers Employed by Contractors (412)	2,403
Governments and School Boards and their Engineers	889
Public Utility Group	575
Industrial Firms, their Executives, Engineers and other Employees	2,005
Buildings, Real Estate Management Companies, their Engineers	677
Manufacturers of Air Conditioning, Heating, Piping and Ventilating Equipment, Their Officials and Employees (843) and Designing Engineers (227)	1,070
Manufacturers' Agents and Sales Engineering Firms (197) Sales Engineers and Salesmen (938)	1,135
Wholesalers (143) and Dealers (517)	660
Educational Institutions, Libraries, Technical Associations	458
Miscellaneous and Unclassified	324
	11,146
Field Staff, Correspondents, Exchanges, Advertisers, Advertising Agencies and Samples	589
TOTAL	11,735

Subscriptions to HEATING AND VENTILATING, 148 Lafayette St., New York 13, are $3.00 a year.

Sheet Metal Worker

Published by Edwin A. Scott Publishing Company

45 West 45th Street, **New York 19, N. Y.**



Subscription rates—$3.00 per year, U. S., Canada and Pan Amer. Foreign $4.00. Advertising rates on request.

THE January 1948 issue of SHEET METAL WORKER was its 74th Anniversary and Directory Number. It is the oldest publication in its field and is of vital importance to men interested in sheet metal work—air conditioning—warm-air heating and ventilation. Founded in 1874 and published to 1909 by David Williams Company; 1909 to 1920 by United Publishers Corp.; since 1920 by, the Edwin A. Scott Publishing Co.

Subscribers are mainly merchandising contractors purchasing practically all products and equipment which they fabricate, erect or install. Manufacturers, jobbers and distributors also subscribe.

The market has three main divisions:

(1) Equipment for resale in connection with erection or installation work.
(2) Materials for fabrication.
(3) Shop equipment and supplies.

Circulation: SHEET METAL WORKER is a member of the Audit Bureau of Circulations and the Associated Business Papers.

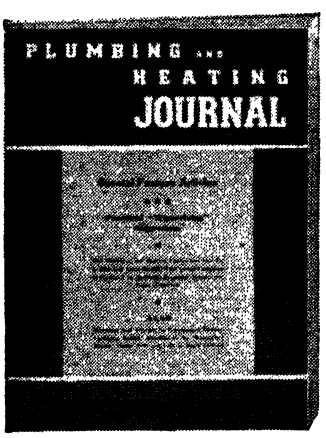
SHEET METAL WORKER also publishes books on heating, ventilating, sheet metal work, air conditioning, etc.

The Annual Issue published in January, contains a comprehensive and valuable Directory Section.

Plumbing and Heating Journal

Scott-Choate Publishing Co., Inc., *Publisher*

45 West 45th Street, **New York 19, N. Y.**



Subscription rates—$3.00 per year, U. S., Canada and Pan Amer. Foreign $4.00. Advertising rates on request.

PLUMBING and Heating Journal is edited to furnish a well-rounded, efficient service to the men engaged in the plumbing, heating, ventilating and air conditioning fields. It covers both the technical and business phases of their work.

It gives free technical service through a staff of practical engineers; expert merchandising assistance, and its technical and business articles are by men of recognized competence.

THE JOURNAL editorial department draws its news from scores of trained correspondents located at strategic points throughout the country.

This combination of the technical, business, news and other aspects of the industry enables THE JOURNAL to achieve a finely balanced magazine that gives the reader the type of information he wants and needs, in brief, compact form.

A department "With the Water Systems," informs the trade of the latest developments in the rural plumbing field and its increasing potentialities for the plumbing—heating contractor, especially with the recent extensions of rural electric lines throughout the country.

ENGINEERS OF HUMAN COMFORT

The Heating, Ventilating and Air Conditioning Engineer through his work and research brings to our homes, our offices and our factories, in both summer and winter, that climate best suited to our comfort and health, and he creates for our industries those atmospheric conditions which improve quality of product and speed production.

He is truly an *Engineer of Human Comfort* and a public benefactor.

It was in 1894 that a small group of nationally known engineers, educators, and manufacturers organized the A.S.H.V.E. for the express purpose of improving the art through the interchange of ideas and stimulation of scientific research and invention.

In 1894, it was agreed that the great art of heating and ventilating deserved and required recognition as an essential, distinctive and highly specialized division of modern engineering. These men realized the basic importance of heating and ventilating as the primary element in the well-being of civilized mankind, living and working mostly indoors.

These keen, alert, progressive men knew that the methods and equipment of their day could be improved even beyond their own vision if all the personalities striving for such improvement could be welded into one organized cooperative group, imbued with the same ideals and set toward the same goal. So they formed themselves into the nucleus of such an organization and called it THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

That the Charter Members had great faith in their enterprise is evident, although little did they dream that progress would be so rapid in their profession.

During the intervening years since that little group of 75 pioneers unfurled the banner of THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS—6065 of the real leaders of thought and action in heating, ventilating, and air conditioning have gathered about that standard and carried it proudly before them far along the way of real accomplishment. They may be identified among engineering groups by the distinctive emblem which was adopted by the Charter Members.

The record of the Society's accomplishments is a long and brilliant one, yet it must embrace but a small part of the real achievement which the Society has inspired both among its members and the many non-members whose work it has influenced. Rewarding the efforts of its founders, who gave unstintingly of their time and means, the Society has been tremendously effective in the advancement of the Art and Industry through its manifold activities.

FOUNDING OF THE A. S. H. V. E.

The organization of a Society of heating and ventilating engineers was first talked of by Hugh J. Barron and L. H. Hart in the early summer of 1894.

On August 2, 1894, a group of 15 men met at the office of *Heating and Ventilation*, 146 World Bldg., New York, and a committee of 5 was chosen to effect an organization.

The first meeting was called at 3:00 P.M., September 10, 1894, at the Broadway Central Hotel and temporary officers were elected: F. P. Smith, *Chairman*; and L. H. Hart, *Clerk*. The roll call showed that 75 persons had become Charter Members. It was voted that the name of the organization should be THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS and a Constitution and By-Laws were adopted. The following were elected to hold office until the 1st Annual Meeting, January 22-24, 1895: *President*, E. P. Bates, Syracuse, N. Y.; *First Vice-President*, W. M. Mackay, New York, N. Y.; *Second Vice-President*, W. F. Wolfe, Boston, Mass.; *Third Vice-President*, Chas. S. Onderdonk, Philadelphia, Pa.; *Treasurer*, Judson A. Goodrich, New York, N. Y.; *Secretary*, L. H. Hart, New York, N. Y.; *Board of Managers*, E. P. Smith, H. J. Barron, A. A. Cary, New York; James A. Harding, Vineyard Haven, Mass.; Henry Adams, Washington, D. C.; *Council on Membership*, Chas. W. Newton, Baltimore, Md.; R. C. Carpenter, Ithaca, N. Y.; Albert A. Cryer, New York; F. W. Foster, Boston; U. G. Scollay, Brooklyn, N. Y.

A. S. H. V. E. RESEARCH LABORATORY

Since 1919 THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS has maintained a permanent research staff and facilities devoted solely to the study of fundamental problems in the field of heating, ventilating and air conditioning. During the past quarter century much has been done to advance the art by establishing scientifically sound data which the engineer can apply in the design, operation, and maintenance of heating, ventilating, and air conditioning systems and equipment.

For twenty-five years the Society's Research Laboratory was located at the U. S. Bureau of Mines Building, Pittsburgh, Pa. The Laboratory was moved to Cleveland in 1944, and early in 1946 the Society purchased premises at 7218 Euclid Avenue. In addition to work at the Society's Laboratory, a substantial part of the research program has been carried on through the medium of cooperative agreements with leading educational institutions of the United States and Canada.

All research activities are planned and supervised by the Committee on Research of 15 elected members, assisted by various Technical Advisory Committees of the Society. The research activities are financed from Society funds, of which a portion comes from membership dues and from its publications, and these funds are amplified by contributions from friends in the industries engaged in the general field of heating, ventilating, and air conditioning.

THE GUIDE

A distinctly new service was inaugurated by the Society in 1922 when it established THE GUIDE. Now in 1948, as the 26th Edition of the HEATING VENTILATING AIR CONDITIONING GUIDE makes its appearance, it is notable that THE GUIDE has served effectively not only the membership but the entire profession and the allied industries, and has received world wide recognition as a reliable and authoritative compendium of useful heating, ventilating and air conditioning data.

Throughout the 26 years of its service THE GUIDE has become a reference book of unchallenged position in its special field of engineering. The intention of its founders, to provide an instrument of service containing reference material on the design and specification of heating, ventilating and air conditioning systems and containing essential and reliable information concerning modern equipment, has been carefully safeguarded by those responsible for the compilation of each edition.

During its quarter century of service THE GUIDE has progressed from a distribution of 5,000 copies to the present distribution of 18,000 and it has reached all parts of the world.

Throughout the years THE GUIDE has served a double purpose of providing the profession with a practical reference work and the advertiser with an effective medium for dissemination of catalog data.

1948
Roll of Membership

AMERICAN SOCIETY *of*
HEATING *and* VENTILATING ENGINEERS

Corrected to January 31, 1948

Published at the Headquarters of the Society
51 Madison Avenue, New York 10, N. Y.

Officers and Council

AMERICAN SOCIETY *of* HEATING *and* VENTILATING ENGINEERS

51 Madison Ave., New York 10, N. Y.

1947-48

President.....BALDWIN M. WOODS

First Vice-President.....G. L. TUVE

Second Vice-President.....A. E. STACEY, JR.

Treasurer.....J. F. COLLINS, JR.

Secretary.....A. V. HUTCHINSON

Technical Secretary.....CARL H. FLINK

Council

B. M. WOODS, *Chairman*

G. L. TUVE, *Vice-Chairman*

Three Years: M. W. BISHOP, CARL F. BOESTER, LEO HUNGERFORD, R. F. TAYLOR.

Two Years: E. G. CARRIER, F. W. HUTCHINSON, R. A. SHERMAN, M. S. WUNDERLICH.

One Year: W. A. DANIELSON, E. N. MCDONNELL, ALFRED J. OFFNER, H. R. ROTH, ERNEST SZEKELY, L. P. SAUNDERS, *Ex-Officio.*

Council Committees

Executive—B. M. Woods, *Chairman;* A. E. Stacey, Jr., G. L. Tuve, J. F. Collins, Jr. (*ex-officio*).

Finance—A. E. Stacey, Jr., *Chairman;* R. A. Sherman, Ernest Szekely, J. F. Collins, Jr. (*ex-officio*).

Meetings—G. L. Tuve, *Chairman;* E. G. Carrier, Leo Hungerford.

Membership—M. W. Bishop, *Chairman;* F. W. Hutchinson, H. R. Roth.

Standards—M. S. Wunderlich, *Chairman;* C. F. Boester, W. A. Danielson

Advisory Council

Alfred J. Offner, *Chairman;* Homer Addams, M. F. Blankin, W. H. Carrier, S. E. Dibble, S. H. Downs, W. H. Driscoll, E. O. Eastwood, W. L. Fleisher, H. P. Gant, F. E. Giesecke, E. Holt Gurney, L. A. Harding, H. M. Hart, C. V. Haynes, E. Vernon Hill, M. D., John Howatt, D. D. Kimball, G. L. Larson, S. R. Lewis, J. F. McIntire, F. B. Rowley, A. C. Willard and C.-E. A. Winslow.

Special Committees

Admission and Advancement: E. L. Crosby, *Chairman;* E. R. Queer (*two years*), T. F. Rockwell (*three years*).

ASHVE Code for Testing Heavy Duty Furnaces: E. K. Campbell, *Chairman;* Bowen Campbell, R. S. Dill, F. A. Kitchen, A. P. Kratz, W. J. MaGirl, B. F. McLouth, F. L. Meyer, F. J. Nunlist, A. A. Olson, B. B. Reilly, Dr. H. J. Rose, H. A. Soper.

Business and Financial Policies: E. N. McDonnell, *Chairman;* M. F. Blankin, J. F. Collins, Jr., L. E. Seeley, A. E. Stacey, Jr.

Chapter Relations: R. F. Taylor, *Chairman;* F. T. Ball, W. G. Boales, C. S. Koehler, J. Donald Kroeker, F. A. Leser, H. King McCain, G. W. F. Myers, D. L. Taze.

Constitution and By-Laws: S. H. Downs, *Chairman;* John James, H. E. Sproull.

F. Paul Anderson Award: G. L. Tuve, *Chairman;* C. M. Ashley, F. E. Giesecke, F. C. McIntosh, D. W. Nelson.

Guide Publication: R. S. Dill, *Chairman;* R. L. Byers, R. P. Cook, R. C. Cross, B. H. Jennings, C. F. Kayan, W. M. Wallace, II, W. N. Witheridge, C. P. Yaglou, Cyril Tasker, *Ex-Officio.*

History Committee: John F. Collins, Jr., *Chairman;* Homer Addams, E. K. Campbell, W. H. Carrier, W. H. Driscoll, W. L. Fleisher, S. R. Lewis, F. C. McIntosh, G. D. Winans.

Nominating: Neil H. Peterson, San Francisco, Calif., *Chairman;* J. E. Haines, Minneapolis, Minn., *Secretary;* H. E. Adams, South Norwalk, Conn.; A. W. Edwards, Cincinnati, Ohio; C. Rollins Gardner, Dallas, Texas; John James, Cleveland, Ohio; L. F. Kent, Atlanta, Ga.; A. S. Morgan, Toronto, Ont., Canada; C. H. Pesterfield, East Lansing, Mich.; J. R. Vernon, Milwaukee, Wis.; E. C. Willey, Corvallis, Ore.

Alternates: Leo Garneau, Montreal, Que., Canada, and L. T. Mart, Kansas City, Mo.

Promotion of Research: J. E. Haines, *Chairman;* A. J. Hess, J. B. Hewett, F. A. Leser, C. E. Price.

Publication: J. C. Fitts, *Chairman;* John A. Goff (*two years*), John James (*three years*).

To Cooperate with Other Professional Societies: G. D. Winans, *Chairman;* James Holt, A. P. Kratz.

Chapter Delegates Committee

Delegate	*Alternate*	*Chapter*
H. King McCain	L. L. Barnes	Atlanta
H. K. Ormsby, Jr.	C. M. Ashley	Central New York

*Member of Committee on Research.

Officers of Local Chapters, 1947-48

Atlanta

Headquarters, Atlanta, Ga.

Meets: First Friday in Month

President, H. KING MCCAIN
615 Trust Co. of Georgia Bldg.

Secretary, LEO SUDDERTH, JR.
306 Bona Allen Bldg., Atlanta 3

Central New York

Headquarters, Syracuse, N. Y.

President, H. G. STRONG
300 S. Geddes St., Syracuse 1

Secretary, G. F. KEANE
316 Haddonfield Dr., DeWitt, N. Y.

Central Ohio

Headquarters, Columbus, Ohio

Meets: Third Monday in Month

President, R. B. BRENEMAN
1282 Edgehill Rd., Columbus 8

Secretary, E. A. NORMAN, JR.
1150 Chesapeake Ave., Columbus

Cincinnati

Headquarters, Cincinnati, Ohio

Meets: First Tuesday in Month

President, H. K. JENNINGS
1639 Union Trust Bldg., Cincinnati 2

Secretary, K. B. LITTLE
832 Temple Bar Bldg., Cincinnati 2

Connecticut

Headquarters, New Haven, Conn.

President, S. R. OSBORNE
Waterbury 91

Secretary, WINFIELD ROEDER
405 Temple St., New Haven

Delta

Headquarters, New Orleans, La.

Meets: Second Tuesday in Month

President, J. S. BURKE
317 Baronne St., New Orleans 9

Secretary, R. B. GUEST
827 Dryades St., New Orleans 13

Golden Gate

Headquarters, San Francisco, Calif.

Meets: First Wednesday in Month

President, F. W. KOLB
598 Monadnock Bldg., San Francisco 5

Secretary, K. F. BALDWIN, JR.
419 Kentucky Ave., Berkeley 7

Illinois

Headquarters, Chicago, Ill.

Meets: Second Monday in Month

President, W. A. KUECHENBERG
1714 Sheffield Ave., Chicago 14

Secretary, G. W. BORNQUIST
629 W. Washington Blvd., Chicago 6

Officers and List of Chapters, 1947-48—(*Continued*)

Indiana

Headquarters, Indianapolis, Ind.
Meets: Fourth Friday in Month
President, I. W. COTTON
1035 N. Pennsylvania St., Indianapolis 4
Secretary, W. R. FENSTERMAKER
215 E. New York St., Indianapolis 4

Iowa

Headquarters, Des Moines, Ia.
Meets: Second Tuesday in Month
President, C. A. WHEELER
1217 Grand Ave., Des Moines
Secretary, D. E. WELLS
304 Home Federal Bldg., Des Moines 9

Kansas City

Headquarters, Kansas City, Mo.
Meets: First Monday in Month
President, P. C. LEFFEL
3323 Main St., Kansas City 2
Secretary, HENRY NOTTBERG, JR.
914 Campbell, Kansas City

Manitoba

Headquarters, Winnipeg, Man., Canada
Meets: Third Thursday in Month
President, D. S. SWAIN
1186 Downing St., Winnipeg
Secretary, A. W. MOSS
26 Ferndale Ave., Norwood, Manitoba

Massachusetts

Headquarters, Boston, Mass.
Meets: Third Tuesday in Month
President, ADOLPH EHRENZELLER
329 Washington St., Dorchester 21
Secretary, R. T. KERN
51 Claflin St., Leominster

Memphis

Headquarters, Memphis, Tenn.
Meets: First Monday in Month
President, N. C. LEDBETTER
22 S. Cooper St., Memphis 4
Secretary, A. T. BEVIL
1521 Waverly Ave., Memphis 6

Michigan

Headquarters, Detroit, Mich.
Meets: First Monday after 10th of Month
President, A. E. KNIBB
1003 Maryland Ave., Detroit 30
Secretary, L. A. BURCH
5853 Hamilton Ave., Detroit 2

Minnesota

Headquarters, Minneapolis, Minn.
Meets: First Monday in Month
President, L. C. GROSS
5324 Oaklawn Ave., Minneapolis 10
Secretary, L. J. KRAUSE
2753 4th Avenue S., Minneapolis 8

Montreal

Headquarters, Montreal, Que., Canada
Meets: Third Monday in Month
President, T. H. WORTHINGTON
405 Beaubien St. W., Montreal, Que.
Secretary, S. W. SALTER
910 New Birks Bldg., Montreal

Nebraska

Headquarters, Omaha, Neb.
Meets: Second Tuesday in Month
President, VERNE SIMMONDS
2416 Vane St., Omaha
Secretary, G. W. COLBURN
106 N. 15th St., Omaha 2

New York

Headquarters, New York, N. Y.
Meets: Third Monday in Month
President, M. C. GIANNINI
New York University, New York 53
Secretary, CARL H. FLINK
Room 3000, 51 Madison Ave., New York 10

North Carolina

Headquarters, Durham, N. C.
Meets: Quarterly
President, E. S. DEWITT
1211 Commercial Bank Bldg., Charlotte
Secretary, R. M. WARREN, JR.
1001 N. Church St., Charlotte 1

North Texas

Headquarters, Dallas, Tex.
Meets: Third Monday in Month
President, C. R. GARDNER
1000 St. Louis St., Dallas 1
Secretary, G. A. LINSKIE
3124 Milton St., Dallas 5

Northern Ohio

Headquarters, Cleveland, Ohio
Meets: Second Monday in Month
President, JOHN JAMES
3170 W. 106th St., Cleveland 11
Secretary, W. M. ROWE
1302 Swetland Bldg., Cleveland 15

Oklahoma

Headquarters, Oklahoma City, Okla.
Meets: Second Monday in Month
President, W. W. FRANKFURT
519 Apco Tower, Oklahoma City
Secretary, J. H. SPAAN, JR.
1303 N. Klein, Oklahoma City 6

Ontario

Headquarters, Toronto, Ont., Canada
Meets: First Monday in Month
President, D. A. STOTT
195 Spadina Ave., Toronto
Secretary, H. R. ROTH
57 Bloor St., W., Toronto, Ont.

Officers and List of Chapters, 1947-48—(*Concluded*)

Oregon

Headquarters, Portland, Ore.
Meets: Thursday after First Tuesday in Month
President, C. W. BRISSENDEN
Electric Bldg., Portland 5
Secretary, L. G. WILLIAMS
Box 304, Gladstone

Pacific Northwest

Headquarters, Seattle, Wash.
Meets: Second Tuesday in Month
President, E. H. LANGDON
72 Vine St., Seattle
Secretary, E. J. ROSEN
10238 18th Ave., S. W., Seattle 66

Philadelphia

Headquarters, Philadelphia, Pa.
Meets: Second Thursday in Month
President, E. H. DAFTER
12 S. 12th St., Philadelphia 7
Secretary, E. K. WAGNER
2240 N. Broad St., Philadelphia 32

Pittsburgh

Headquarters, Pittsburgh, Pa.
Meets: Second Monday in Month
President, D. W. LOUCKS
435 Sixth Ave., Pittsburgh 19
Secretary, E. H. RIESMEYER, JR.
231-33 Water St., Pittsburgh 22

Rocky Mountain

Headquarters, Denver, Colo.
Meets: First Wednesday in Month
President, J. F. MOHAN
2229 Blake St., Denver 2
Secretary, H. C. KUGELER
2365 Ash St., Denver 7

St. Louis

Headquarters, St. Louis, Mo.
Meets: First Tuesday in Month
President, J. H. CARTER
710 Key West Ave., Webster Groves 19
Secretary, J. S. ROSEBROUGH
1014 Arcade Bldg., St. Louis 1

South Texas

Headquarters, Houston, Tex.
Meets: Third Friday in Month
President, D. M. MILLS
Gray and Crawford, Houston 3
Secretary, L. L. LADEWIG
Box 1188, Houston 1

Southern California

Headquarters, Los Angeles, Calif.
Meets: Third Wednesday in Month
President, R. A. LOWE
6381 Hollywood Blvd., Los Angeles 28
Secretary, JOHN L. BLAKE
1700 S. Bedford St., Los Angeles 35

Southwest Texas

Headquarters, San Antonio, Tex.
President, F. C. BENHAM, JR.
702 S. Flores St., San Antonio
Secretary, L. S. PAWKETT
810 Insurance Bldg., San Antonio 5

Utah

Headquarters, Salt Lake City, Utah
Meets: First Wednesday in Month
President, E. V. GRITTON
2470 S. 15th, Salt Lake City 5
Secretary, C. E. FERGUSON
838 Garfield Ave., Salt Lake City

Virginia

Headquarters, Norfolk, Va.
President, R. C. THOMAS
819 Westover Ave., Norfolk 7
Secretary, J. F. REYNOLDS
Gatling and Marble Ave., Norfolk 2

Washington, D. C.

Headquarters, Washington, D. C.
Meets: Second Wednesday in Month
President, H. H. HILL
438 Woodward Bldg., Washington 5
Secretary, J. G. MUIRHEID
2013 New Hampshire Ave., N.W., Washington 9

Western Michigan

Headquarters, Grand Rapids, Mich.
Meets: Second Monday in Month
President, FRANK HARBIN, JR.
280 E. 6th St., Holland
Secretary, W. C. DEROO
500 E. 8th St., Holland

Western New York

Headquarters, Buffalo, N. Y.
Meets: Second Monday in Month
President, G. E. ADEMA
39 W. Balcom St., Buffalo 9
Secretary, J. H. BRYCE
88 E. Girard Blvd., Kenmore

Wisconsin

Headquarters, Milwaukee, Wis.
Meets: Third Monday in Month
President, J. R. VERNON
507 E. Michigan St., Milwaukee 2
Secretary, B. M. KLUGE
1817 S. 66th St., Milwaukee 14

Student Branch
Texas A. & M. College

Headquarters, College Station, Tex.
Meets: Third Thursday in Month
President, G. H. JACKSON
225 W. Nevada St., El Paso
Secretary, T. V. BURNS, JR.
P. O. Box 1651, College Station

Roll of Membership

AMERICAN SOCIETY *of* HEATING *and* VENTILATING ENGINEERS

1948

(Corrected to January 31, 1948)

HONORARY MEMBERS

CARRIER, WILLIS H. (1944) (M 1913), (Presidential Member), Syracuse, N. Y.
FIELDNER, A. C. (1944) Washington, D. C.

BALDWIN, WM. J. (1915) New York, N. Y. (Deceased May 7, 1924).
BILLINGS, DR. J. S. (1896) New York, N. Y. (Deceased March 10, 1913).
BOLTON, REGINALD PELHAM (1897), (Presidential Member), New York, N. Y. (Deceased February 18, 1942).
BRECKENRIDGE, L. P. (1920), North Ferrisburg, Vt. (Deceased August 22, 1940).
GORMLY, JOHN (Charter Member), Norristown, Pa. (Deceased January 31, 1929).
NEWTON, C. W. (Charter Member), Baltimore, Md. (Deceased August 6, 1920).
HOOD, O. P. (1929), Washington, D. C. (Deceased April 22, 1937).
JELLETT, STEWART A. (Charter Member), (Presidential Member), Philadelphia, Pa. (Deceased April 5, 1935).

LIST OF MEMBERS
Arranged Alphabetically

(*Asterisk indicates authorship of papers; • indicates address for mail)

(*M* **1923**; *A* **1918**; *J* **1916**) indicates, Election as Member 1923; Associate 1918; Junior 1916.
(**Pres. 1923**) indicates, Elected President in 1923 and is now a Presidential Member.

A

ABBOTT, Furman S. (*M* 1943) Chief Engr., W. H. Wheeler, Inc., 7 East 47th St., New York, N. Y., and • 80 Afterglow Ave., Montclair, N. J.

ABBOTT, Thomas J. (*M* 1938) Vice-Pres., • George C. Abbott, Ltd., 52 Shaftesbury Ave., and 294 Oriole Pkwy., Toronto, Ont., Canada.

ABENDROTH, Harold F. (*A* 1947) Sales Engr., • Temperature Control, 710 Commercial National Bank Bldg., Peoria 1, and 201 Ehrett St., Creve, Ill.

ABRAMS, Abraham (*M* 1927; *J* 1924) Cons. Engr., 112 Bon Air Ave., New Rochelle, N. Y.

ABRAMSON, Ralph J. (*A* 1938) Mech. Engr., 1834 Pratt Ave., Chicago 26, Ill.

ACHENBACH, Paul R.* (*M* 1942) Asst. Chief, Htg. & Air Cond. Section, • National Bureau of Standards, Connecticut Ave. and Van Ness St., Washington, D. C., and 1912 N. Randolph St., Arlington, Va.

ACHESON, L. K. (*M* 1944) Laboratory Coordinator, The Hoover Co., and • 816 Portage St., North Canton, Ohio.

ACHEY, Harry S. (*J* 1947) Assoc., C. E. Mills, 801 James Bldg., Chattanooga, Tenn., and • 1109 S. Crest Rd., Rossville, Ga.

ACHEY, H. Norwood (*A* 1947) Owner, Norwood Achey Co., and • John Ross Rd., Rossville, Ga.

ACKER, Charles B. (*M* 1946) Mech. Engr., • Yonge & Hart, Archts., 614 Blount Bldg., and 2025 North 11th Ave., Pensacola, Fla.

ACKERMANN, Reynold H. (*M* 1943) Engr., Charles S. Leopold, Cons. Engr., 213 Broad St., Philadelphia, and • 267 Cooper Ave., Lansdowne, Pa.

ADAIR, James S. (*A* 1941; *J* 1940) Owner, • James S. Adair, Sales Engrs., 306 Pere Marquette Bldg., New Orleans, and 715 Phosphor Ave., New Orleans 20, La.

ADAM, Ray W. (*A* 1938) Owner • W. A. Adam Co., 8810 Grinnell Ave., Detroit 13, and 951 E. Grand Blvd., Detroit, Mich.

ADAMS, Chester Z. (*M* 1939) Owner and Mgr., • Chet Adams Co., Box 1356, 209½ Bellemeade St., and 207 E. Avondale Dr., Greensboro, N. C.

ADAMS, Eugene E. (*A* 1938) Sales Engr., • Garden City Fan Co., Room 1508 A, 55 West 42nd St., New York 18, and 35-46–79th St., Jackson Heights, N. Y.

ADAMS, Eugene F. (*M* 1941) Mech. Engr., • Peter Kiewit Sons' Co., P. O. Box 739, and 276 Wai Nani Way, Honolulu, T. H.

ADAMS, Frank L. (*M* 1939) Htg. and Air Cond. Engr., • P. O. Box 840, Denver 1, and 1185 Grape St., Denver 7, Colo.

ADAMS, George F. (*M* 1944) Engr., • Midwest Plumbing & Heating Co., 2450 Blake St., Denver, and 3301 Jay St., Wheat Ridge, Colo.

ADAMS, Harold E. (*M* 1930) Chief Engr., • The Nash Engineering Co., South Norwalk, and Merrill Heights, Norwalk, Conn.

ADAMS, Neil D. (*M* 1929), (Council 1938-40) Supt., • Franklin Heating Station, 220 Second Ave., S. W., and R. F. D. No. 2, Elne-Dell, Rochester, Minn.

ADAMS, Octavius C. (*A* 1944) Sales Engr., Owner, • Adams Heating Equipment Co., 41 East 42nd St., Room 314, New York 17, and 32-20 93rd St., Jackson Heights, N. Y.

ADAMS, Robert B. (*A* 1946) Chief Power Plant Engr., Nordberg Manufacturing Co., 3073 S. Chase Ave., and • 2855 South 46th St., Milwaukee 7, Wis.

ADAMS, Robert Russell (*A* 1947) Supvr., Gilson Manufacturing Co., Ltd., Guelph and • 245 Kennedy Rd., Toronto 13, Ont., Canada.

ADAMS, Thomas K. (*M* 1946) Mgr., Htg. and Vent. Dept., • Reunert & Lenz, Ltd., P. O. Box 1092, and Halford Ave., Highlands N. Etn., Johannesburg, South Africa.

ADAMS, William J. (*A* 1945) Estimator, • 3911 W. North Ave., Chicago 47, and 1718 Nordica Ave., Chicago 35, Ill.

ADAMSON, L. C. (*A* 1945) Owner, • Air Conditioning & Heating Service Co., 3922 Troost, Kansas City 4, and 1920 East 71st Terrace, Kansas City, Mo.

ADDAMS, Homer (*Charter Member*; *Life Member*) (*Presidential Member*), (Pres., 1924; 1st Vice-Pres., 1923; Treas., 1915-22; Council, 1915-25) Chm., Board of Directors, Fitzgibbons Boiler Co., Inc., 101 Park Ave., New York 17, N. Y.

ADDAMS, Paul K. (*M* 1943) Pres., • Fitzgibbons Boiler Co., Inc., 101 Park Ave., New York 17, and 465 West 23rd St., New York 11, N. Y.

ADDIE, George R. (*M* 1945) Managing Dir., J. G. Wagstaff, Ltd., Alma Iron Works, Dukinfield, Cheshire, and • Mottram House, Mottram in Longdendale, Nr. Manchester, England.

ADDINGTON, Harold M. (*M* 1939) Leading Designer, Chemical Mfr., Nemours Bldg., Rm. 13524, and • 504 Delaware Ave., Wilmington, Del.

ADDINGTON, Herbert B. (*M* 1938) Cons. Engr., • Myers, Fuller and Addington, 21 East 40th St., New York 16, and 699 Ocean Ave., Brooklyn 26, N. Y.

ADEMA, George E. (*M* 1939) Prop., • N. M. Adema & Son, 39 W. Balcom St., Buffalo 9, and 299 Deerhurst Pkwy., Kenmore 17, N. Y.

ADLAM, T. Napier (*M* 1932) Vice-Pres. and Gen. Mgr., Sarco Manufacturing Corp., Empire State Bldg., Fifth Ave. and 34th St., New York, N. Y., and • 124 Forest Hill Rd., West Orange, N. J.

AEBERLY, John J. (*M* 1928), (Council, 1937-39) Chief of Bureau of Htg., Vtg. and Indus. Sanitation, City of Chicago, Room 702, City Hall, Chicago 2, and • 6225 N. Newcastle Ave., Chicago 31, Ill.

AHEARN, William J. (*M* 1929) 331 Newbury St., Boston, and • 131 Windermere Rd., Auburndale 66, Mass.

AHLFF, Albert A. (*M* 1923; *A* 1918) Sales, Rust-Oleum Corp., Evanston, Ill., and • 18 Heatherbrook Lane, Kirkwood 22, Mo.

AHLRICHS, Herman (*A* 1947) Owner, H. Ahlrichs Plumbing and Heating Co., and • 7 South 16th St., New Hyde Park, L. I., N. Y.

AIKEN, Hector H. (*A* 1947) Instructor, Mech. Engrg., • University of Arizona, and Rt. 6, Box 734, Tucson, Ariz.

AIKIN, A. A. (*M* 1945) Sales Engr., A A A Engineering Sales Co., and • Maplewood Manor, Lansing, Mich.

AIKIN, Frank W. (*A* 1945) Pres. and Treas., • Northern Controlled Heat Co., Inc., 557 Factory Square, and 126 Ward St., Watertown, N. Y.

AINSWORTH, Samuel E. (*A* 1939) Partner, • Roche Newton & Co., Box 1049, and 1524-25th St., Lubbock, Texas.

AITKEN, Milton Lawrence (*M* 1945) Gen. Mgr., Propellair, Inc., Div. of Robbins & Myers, Inc., and • 99 Broadmoor Blvd., Springfield, Ohio.

AITKEN, Thomas (*A* 1946) Owner, Aitken Co., 470 S. Nelson Rd., Columbus, and • 6422 Havens Corner Rd., Black Lick, Ohio.

AKERLOW, R. W. (*A* 1944) Sales Engr., • The Starns Roger Manufacturing Co., 1720 California St., and 935 S. Elizabeth St., Denver, Colo.

AKERMAN, Joseph R. (*M* 1946) Instructor in Mech. Engr., University of Wisconsin, M. E. Dept., and • 322 Karen Ct., Madison, Wis.

AKERS, George W. (*M* 1929) Pres., George W. Akers Co., 16525 Woodward Ave., Detroit 3, and • 1184 W. Tienken Rd., R. F. D. 2, Rochester, Mich.

ALBERT, William J. (*A* 1945) Air Cond. and Refrig. Designer, Stewart A. Jellett & Co., 1200 Locust St., Philadelphia, Pa., and • 665 Randolph St., Camden, N. J.

ALBRIGHT, C. Barton (*A* 1945) Owner, • C. Barton Albright, Engr., 114 Liberty St., New York, and 264 Rushmore Ave., Westbury Downs, L. I., N. Y.

ALBRIGHT, Joseph C. (*M* 1946) Cons. Engr., Davison Chemical Corp., Baltimore 3, Md., and • 107 Dartmouth Rd., Bala Cynwyd, Pa.

ALEXANDER, Granville P. (*M* 1944) Secy., • Htg., Piping & Air Cond. Contractors Philadelphia Assn., 328 Chestnut St., Room 208, Philadelphia 6, and Montgomery Ct., Apt. J-33, Narberth, Pa.

ALEXANDER, Hugh V. (*M* 1943) Branch Mgr., • Johnson Service Co., 922 Architects Bldg., Indianapolis 4, and 5700 Kingsley Dr., Indianapolis 5, Ind.

ALEXANDER, John L. (*A* 1944) Owner, • Charles H. Alexander & Son Co., 2746 Elmwood Dr. S.E., Grand Rapids 6, Mich.

ALEXANDER, John W. (*M* 1945) Design Engr., Office of the Supervising Architect, Public Buildings Administration, Washington 25, D. C., and • 403 Prince George St., Laurel, Md.

ALEXANDER, Keith O. (*M* 1943) Sales Engr., • Neil H. Peterson Co., 1129 Folsom St., San Francisco 3, and 454 Mastick Ave., San Bruno, Calif.

ALEXANDER, Samuel W. (*M* 1935) Pres., S. W. Alexander Co., Ltd., 182 Main St., and • 124 Kingsmount Park Rd., Toronto, Ont., Canada.

ALFAGEME, Braulio (*M* 1946) Almagro 1, Madrid, Spain.

ALFERY, Henry F. (*M* 1938) Pres., • Erie Manufacturing Co., 300 N. Eighth St., Milwaukee 3, and 1819 W. Center St., Milwaukee 6, Wis.

ALFSEN, Nikolai (*M* 1933) Civil Engr., Alfsen & Gunderson, Prinsensgt, 2B, and • Utsiktsveien 22, Stabekk, Oslo, Norway.

ALGER, Irving G., Jr. (*A* 1947) Mech. Engr., G. M. Simonson, 625 Market St., San Francisco 5, and • 2417 Taraval St., San Francisco 16, Calif.

ALGREN, A. B.* (*M* 1930) Assoc. Prof., Htg., Vent., and Air Cond., Engrg. Experiment Station, University of Minnesota, and • 5109-17th Ave. S., Minneapolis, Minn.

ALLAN, James E. (*M* 1946) Principal, • Hunt & Allan, 914 Main St., Cincinnati 2, and 2830 Harrison Ave., Cincinnati 11, Ohio.

ALLAN, William (*A* 1938) Pres., • Allan Engineering Co., 724 E. Mason St., Milwaukee 2, and 2735 N. Farwell Ave., Milwaukee 11, Wis.

ALLCORN, Luther H., Jr. (*A* 1946) Design Engr., The Bahnson Co., and • 2425 Elizabeth Ave., Winston-Salem 7, N. C.

ALLEN, Abraham B. (*A* 1945) Office Mgr., Oil Burning Engineers, Inc., 3146 W. Chicago Ave., Chicago 22, and • 2233 Birchwood Ave., Wilmette, Ill.

ALLEN, Arnold G. (*A* 1946) Sales Engr., • A. G. Allen Co., Liberty Bldg., Kentucky and Capitol Aves., Indianapolis, and Milroy, Ind.

ALLEN, A. Walter (*M* 1936) Sales Engr., Pease Foundry Co., Ltd., 227-235 Victoria St., Toronto, and • 151 Glen Ave., Ottawa, Ont., Canada.

ALLEN, Charles G. (*A* 1946) Engrg. and Dvlpt., Bryant Heater Co., 17825 St. Clair, Cleveland, and • 1212 Irene, Lynhurst, Ohio.

ALLEN, DeWitt M. (*M* 1936) • Allen & Ralston Co., Room 101, B. M. A. Bldg., 215 Pershing Rd., Kansas City 8, and 39 West 70th Terrace, Kansas City 5, Mo.

ALLEN, Edward C. (*S* 1948) Student, A. & M. College of Texas, • Box 2082 College Station, and 1906 Chestnut St., Houston, Texas.

ALLEN, Frank C. (*M* 1944) Mech. Engr., U. S. Bureau of Reclamation, U. S. Customhouse, Denver, and • 4467 King St., Denver 11, Colo.

ALLEN, George W. (*A* 1945) Steamfitter, Belsmith Air Conditioning & Refrigeration Co., 10 Stewart St., Las Vegas, and • Box 955, Henderson, Nev.

ALLEN, J. Lloyd (*M* 1944) Partner, • Allen & Kelley, Archts., 333 N. Pennsylvania, and 5699 N. Delaware, Indianapolis, Ind.

ALLEN, Michael H. P. (*M* 1946) Dir. and Gen. Mgr., • Bell's Asbestos & Engineering (Africa) Ltd., P. O. Box 4378, and 214 Killarney Ct., Johannesburg, South Africa.

ALLEN, Robert C., Jr. (*A* 1947) Branch Mgr., • General Controls Co., 4055 Broadway, Kansas City 2, and 8005 Spring Lane, Rt. 7, Kansas City, Mo.

ALLEN, Robert F. (*J* 1946) Engr., • Carrier Corp., 710 N. Harwood St., Dallas, Texas, and 83 Willow Ave., Larchmont, N. Y.

ALLEN, Raynold W. (*A* 1947) Mgr., Htg. Dept., • Atlas Supply Co., 236 S. Liberty St., and 422 Avalon Rd., Winston-Salem, N. C.

ALLEN, Roy H. (*A* 1946) Owner, • Allen Copper Coil Mfg. Co., Aqua Heating Co., 400 E. Pine St., Seattle 22, and 615 East 50th St., Seattle, Wash.

ALLEN, S. Rushmore (*M* 1947) Sales Engr., • American Blower Corp., 438 Woodward Bldg., Washington 5, D. C., and 3905 Fifth St. N., Arlington, Va.

ALLEN, William T. (*A* 1947) Supt. of Htg., Dept. of National Defence, Royal Canadian Engrs., Wolseley Barracks, and • 155 Chesley Ave., London, Ont., Canada.

ALLEN, William W. (*A* 1936) Pres., American Coolair Corp., Box 2300, Jacksonville, Fla.

ALLISON, H. H. (*A* 1946) Mech. Engr., • United Rexall Co., 355 S. Broadway, and 1106 Masselin Ave., Los Angeles, Calif.

ALLISON, John H. (*A* 1945) Sales Engr., E. J. Deckman Co., 1502 Oliver Bldg., Pittsburgh 22, and ● 601 Sherwood Rd., Pittsburgh 21, Pa.

ALLISON, Robert E. (*A* 1941) Owner ● American Sheet Metal Co., 601 First Ave., Dallas 10, and 7069 Fairdale, Dallas, Texas.

ALLISON, William F. (*A* 1947) Sr. Engr., E. A. Berman Co., 268 Northampton St., Boston, and ● 348 Webster St., Rockland, Mass.

ALLONIER, Howard R. (*A* 1936) Dist. Mgr., ● J. J. Nesbitt, Inc., 101 N. High St., Columbus 15, and Shawnee Hills, R. D. 1, Powell, Ohio.

ALLSHOUSE, Irvin P. (*A* 1946) 1922 Des Plaines Ave., Des Plaines, Ill.

ALLSOP, Rowland P. (*A* 1940; *J* 1934) Cons. Engr., ● 1221 Bay St., Toronto, Ont., and Stop 21 Kingston Rd., Scarboro Bluffs, Ont., Canada.

ALMERT, Harold (*A* 1944) Cons. Engr., 1605 York Ave., New York, and ● 519 East 86th St., Apt. 6-B, New York 28, N. Y.

ALSCHULER, John H. (*A* 1946) Designer, Parkins & Will, 309 W. Jackson Blvd., Chicago, and ● 1099 Merrill Ave., Hubbard Woods, Ill.

ALT, Harold L.* (*M* 1913) Basic Mech. Design Engr., Voorhees, Walker, Foley & Smith, 101 Park Ave., New York 16, and ● 115-27–225th St., St. Albans 11, N. Y.

ALTEMUELLER, George F. (*A* 1940) Utility Officer, Veterans Administration Hospital, Manhattan Beach, Brooklyn, and ● 2624 East 27th St., Brooklyn 29, N. Y.

ALVAREZ, Joaquin (*A* 1946; *J* 1942) Engr., Export Sales Div., ● Frick Company, Inc., and 118 W. Third St., Waynesboro, Pa

ALYEA, Harold W. (*M* 1944) Design and Dvlpt. Engr., ● Johnson Service Co., 507 E. Michigan St., Milwaukee, and 919 Arcadian Ave., Waukesha, Wis.

AMBROSE, Alfred H. (*J* 1943; *S* 1941) Treas., H. R. Ambrose & Sons, Inc., 46 Pleasent St., and ● 30 Central St., Woodstock, Vt.

AMBROSE, Eugene R. (*M* 1940) Air Cond. Engr., American Gas & Electric Service Corp., 30 Church St., New York 7, N. Y., and ● 412 Walnut St., Roselle Park, N. J.

AMEZAGA, Miguel F. (*M* 1946) Vice-Pres., ● Compania Electric de Cuba, Apartado 2284, and Calle 36 No. 59 Miramar, Havana, Cuba.

AMINOFF, Eugen (*A* 1947) Managing Dir., ● Varme & Sanitetsaktiebolaget Ido, Box 3110, Stockholm 3, and Wartavagen 4, Stockholm, Sweden.

AMMERMAN, A. S., Jr. (*M* 1944; *A* 1941; *J* 1937) Dist. Mgr., ● Aerofin Corp., 111 W. Washington St., Chicago 2, and 132 N. Wolf Rd., Des Plaines, Ill.

AMMERMAN, Charles R. (*Life Member*; *M* 1916) Pres., ● Ammerman, Davis & Stout, Inc., 912-23 K. of P. Bldg., and 4716 Rockwood Ave., Indianapolis, Ind.

AMMONS, Staron E. (*S* 1947) Student. ● Box 4388, College Station, and 212 13th Ave. N., Texas City, Texas.

AMPHLETT, A. L. M. (*A* 1947) Engr., ● Mingledorff's Inc., 735 Broad St., Box 638, and 1012 Carolina Ave., Augusta, Ga.

AMUNDSON, Carl H. (*M* 1944) Branch Mgr., ● Herman Nelson Corp., 759 N. Milwaukee, St., Milwaukee 11, and 609 North 115th St., Wauwatosa, Wis.

ANDEREGG, R. H. (*M* 1920) Vice-Pres. and Chief Engr., The Trane Co., and ● 450 Losey Ct., La Crosse, Wis.

ANDERSON, Carl G. (*M* 1942) Asst. Chief Engr., Union Special Machine Co., 400 N. Franklin St., Chicago, and ● 171 Perry St., Elgin, Ill.

ANDERSON, Carl O. (*M* 1944) Htg. and Vent. Engr., Board of Education, Room 536–228 N. LaSalle St., Chicago 1, and ● 900 N. Rush St., Chicago 11, Ill.

ANDERSON, Carroll S. (*M* 1920) Dist. Mgr. ● American Blower Corp., 1105 Architects Bldg., Los Angeles 13, and 4267 Holly Knoll Dr., Hollywood 27, Calif.

ANDERSON, David B. (*A* 1939; *J* 1936; *S* 1933) Wood Conversion Co., First National Bank Bldg., and ● 1999 Pinehurst Ave., St. Paul 5, Minn.

ANDERSON, Edward R. (*J* 1946) Appl. Engr., ● Westinghouse Electric Corp., Sturtevant Div., 1408 Walnut St., Des Moines 8, Ia., and 1932 N. Moreland Ave., Indianapolis 8, Ind.

ANDERSON, Edwin C. (*A* 1944) Owner, ● Edwin C. Anderson Co., 1863 Wazee St., Denver 2, and 1623 Adams St., Denver 6, Colo.

ANDERSON, Edwin J. (*A* 1939) Mfrs. Agent, ● Chicago Pump Co., 14 Smith St., Detroit 2, and 274 Lenox, Detroit 15, Mich.

ANDERSON, Edwin L. (*M* 1941) Chief Engr., Sun Chemical Corp., 100 Sixth Ave., New York 13, N. Y., and ● 63 Oakridge Rd., Verona, N. J.

ANDERSON, Einar (*A* 1940) Gen. Sales Mgr., Vulcan Iron & Engineering Ltd., Sutherland and Maple St., and ● 152 Bannerman Ave., Winnipeg, Man., Canada.

ANDERSON, Erik A. (*A* 1947) Asst. Dist Engr., Westinghouse Electric Corp., Sturtevant Div., 901 Walton Bldg., Atlanta, and ● 1121 Winburn Dr., East Point, Ga.

ANDERSON, George A. (*A* 1946) Chief Engr., William Adams Engineers, 3911 North Ave., Chicago 47, and ● 3030 Sheffield Ave., Chicago 14, Ill.

ANDERSON, George A. M. (*M* 1947; *A* 1939; *J* 1933) Pres., ● King Ventilating Co., and 717 S. Cedar, Owatonna, Minn.

ANDERSON, George E. (*S* 1946) Student, University of Minnesota, and ● 36 Melbourne Ave. S.E., Minneapolis 14, Minn.

ANDERSON, Granville W. (*A* 1943) Service Engr. ● Koppers Coal Division, 1217 Ford Bldg., Detroit 26, and 5096 Burns Ave., Detroit 13, Mich.

ANDERSON, Harvey E. (*A* 1944) Partner, ● Anderson & Litwack Co., Ventilating Contractors, 514-516 S. Laflin St., Chicago 7, and 460 Fair Ave., Elmhurst, Ill.

ANDERSON, James T. (*J* 1947) Instructor, ● Michigan State College, Engineering Division, and Bldg. 706, Cherry Lane, Apt. 108, East Lansing, Mich.

ANDERSON, N. B. (*A* 1945) Mgr., ● Lamar Supply Co., 3100 Lamar Ave., Houston, and 2910 Chartres, Houston 4, Texas.

ANDERSON, Raymond O. (*A* 1947) Research Coordinator, Minneapolis-Honeywell Regulator Co., 2835 Nicollet Ave., Minneapolis 8, and ● 3025 East 50th, Minneapolis 6, Minn.

ANDERSON, Robert B. (*A* 1944) Owner, R. B. Anderson Heating Contr. & Engr., 1377 W. Alameda, Denver, Colo.

ANDERSON, Robert V. (*A* 1945) Div. Sales Mgr., Lennox Furnace Co., Inc., 400 N. Midler Ave., Syracuse, N. Y., and ● 306 N. Confederate Ave., Sandston, Va.

ANDERSON, Sydney, Jr. (*A* 1943) Dir., Natl. Acct. Sales, ● Chrysler Corp., Airtemp Div., Dayton, Ohio, and 8503 Irvington Ave., Bethesda, Md.

ANDERSON, William S., Jr. (*M* 1945) Partner, Axeman-Anderson Assocs., 233 West St., and ● 1332 Sheridan St., Williamsport, Pa.

ANDERSON, William T., Jr. (*M* 1946) Dir. of Research, ● Hanovia Chemical & Manufacturing Co., Chestnut St. and N. J. R. R. Ave., Newark 5, and 19 Bowdoin St., Maplewood, N. J.

ANDREAS, Charles A. (*A* 1946) Asst. Chief Mech. Engr., ● U. S. Army Air Force Proving Ground, Climatic Hangar, Eglin Field, and Valparaiso, Fla.

ANDREW, Gordon J. (*J* 1947) Htg. & Indus. Engr., W. T. Andrew Co., 15815 Hamilton Ave., Detroit 3, and ● 9959 Sussex Ave., Detroit 27, Mich.

ANDREWS, William G. (*A* 1941) Pres. & Gen. Mgr., ● Southern Refrigeration Corp., 1750 S. Jefferson St., P. O. Box 1095, and 2215 S. Jefferson St., Roanoke, Va.

ANDREWS, William R. (*M* 1942) Asst. Mgr., ● Ross Engineering of Canada, Ltd., 425 River St., Sect. "A" Verdun, Montreal 19, and 3770 Cote St. Catherine Rd., Montreal, Que., Canada.

ANDREWS, W. M. (*M* 1941) Partner, ● Lockwood & Andrews, Cons. Engrs., 904 Union National Bank Bldg., and 2333 Sunset, Houston, Texas.

ANGELL, Lawrence D. (*M* 1944) Minneapolis-Honeywell Regulator Co., New York, and ● 450 East 16th St., Brooklyn, N. Y.

ANGELO, Herbert G. (*A* 1944) Htg. and Vent., 4805 Washington, Denver 16, and ● 1225 East 14th Ave., Apt. 28, Denver, Colo.

ANGERMEYER, Albert H. (*A* 1936) Owner, ● Plumbing & Heating, 119 N. Commercial St., and 245 Webster St., Neenah, Wis.

ANGLIN, T. G. (*A* 1947) Cons. Engr., ● T. G. Anglin Engineering Co., Ltd., Room 703 Dominion Square Bldg., Montreal, and 540 Prince Albert, Montreal 6, Que., Canada.

ANGUS, Donald L. (*J* 1946) Engr., H. H. Angus, Cons. Engr., 1221 Bay St., and ● 102 St. Hubert Ave., Toronto, Ont., Canada.

ANGUS, Frank M. (*M* 1937) Owner, Texas Refrigeration & Engineering Co., 4030 Swiss Ave., Dallas 4, and ● 5134 Ridgedale, Dallas, Texas.

ANGUS, Harry H.* (*M* 1918), (Council, 1927-29), Consulting Engr., 1221 Bay St., and ● 34 Farnham Ave., Toronto, Ont., Canada.

ANIK, Bernard (*S* 1946) Student, Mech. Engrg. Dept., ● Purdue University, West Lafayette, Ind., and 3464 Knox Pl., New York, N. Y.

ANNABEL, Cecil H. (*A* 1946) Owner, ● Belsmith Co., P. O. Box 1568, and 10 Stewart St., Las Vegas, Nev.

ANOFF, S. M. (*J* 1940) Dept. Mgr., Albert Pick Co., Inc., 2159 Pershing Rd., and ● 5048 Marine Dr., Apt. A-5, Chicago 40, Ill.

ANSPACHER, T. H. (*M* 1939; *J* 1936) Dist. Mgr., ● Buffalo Forge Co., Tower Petroleum Bldg., Dallas 1, and 4512 Arcady St., Dallas, Texas.

ANTHES, Lawrence L. (*A* 1935) Pres., ● Anthes-Imperial Ltd., 30 Jefferson Ave., and 119 Dowling Ave., Toronto, Ont., Canada.

ANTHONY, William R. (*J* 1948) Partner, ● Anthony Co., 2220-19th St., and 2501-32nd St., Lubbock, Texas.

ANWAY, H. Wilbur (*M* 1943) Research Physicist, ● Wood Conversion Co., Arch St., and 1012 Prospect Ave., Cloquet, Minn.

APPELT, Joseph E. (*M* 1945) Mgr., The Trane Co., 1200 Godfrey S.W., Grand Rapids, and ● Green Ridge Dr., R. R. 1, Comstock Park, Mich.

APT, Sanford R. (*M* 1935) Mech. Engr., Parsons, Brinckerhoff, Hogan & Macdonald, 142 Maiden Lane, New York 7, and ● 36-39–205th St., Bayside, L. I., N. Y.

ARANDA, Arturo (*A* 1946) Engr., ● Dept. de Hidraulica-Morande, Institute of Inter-American Affairs, Casilla 9182, and Rosas 3114-F, Santiago, Chile.

ARAR, Raymond M. (*S* 1948) Student, University of Michigan, and ● 714 East University St., Ann Arbor, Mich.

ARCHAMBAULT, Joseph A. (*A* 1939) Mgr., Sales Office, ● C. A. Dunham Co., Ltd., Room 201-3, 6 Wellington N., and 55A Council St., Sherbrooke, Que., Canada.

ARCHER, David M. (*M* 1934) Sales Repr., ● Sarco Co., Inc., 143 Federal St., Boston 10, and 10 Harding Ave., Braintree, Mass.

ARCHER, William J. (*M* 1945) 175–19th Ave., San Francisco 21, Calif.

ARENBERG, Milton K. (*A* 1920) Pres., Robert Barclay, Inc., 122 N. Peoria St., Chicago, and ● 1415 Wildwood Lane, Highland Park, Ill.

ARGUE, Edgar J. (*A* 1935) Sales Engr., Anthes Foundry, Ltd., Saskatchewan Ave., and ● 773 McMillan Ave., Winnipeg, Man., Canada.

ARMBRUSTER, Frank T. W. (*M* 1936) Service Engr., American Radiator & Standard Sanitary Corp., 73 E. Naghten St., Columbus, and ● 105 First Ave., Waverly, Ohio.

ARMISTEAD, William C. (*M* 1937) Sales Engr., ● 153 Second Ave. N., Nashville 3, and Granny White Pike, Brentwood, Tenn.

ARMISTEAD, William C., Jr. (*S* 1947) Student, Vanderbilt University and ● 153 Second Ave. N., Nashville, Tenn.

ARMSPACH, Otto W. (*M* 1919) Dist. Chief Engr., Carrier Corp., 405 Lexington Ave., New York 17, and ● N. 2, Stratford Rd., Scarsdale, N. Y.

ARMSTRONG, Charles E. (*M* 1939) Regis. Mech. Engr., 624 N.E. Hazelfern Pl., Portland 13, Ore.

ARMSTRONG, Roy E. (*A* 1947) Bldg. Chief Engr., ● Humble Oil & Rerfrig. Co., Room 105 Humble Bldg., Houston, and 2912 Austin St., Houston 4, Texas.

ARNDT, Heinrich W. (*A* 1944) Owner, ● The Hobby Shop, Masonic Building Lobby No. 2, and 2007 Central Ave., Augusta, Ga.

ARNDT, Marquard H. (*M* 1947) Chief, Data & Control Branch, Atomic Energy Commission and ● 1434 Johnston Ave., Richland, Wash.

ARNOLD, C. J. (*A* 1946) Engr., Mental Deficiency Colony, and ● 3 Hensol Villas, Nr. Pontyclun, Glamorgan, South Wales, Great Britain.

ARNOLD, Jonah S. (*J* 1947) Designer ● Stuart-Aire Inc., 413 Greenwich St., New York, and 47 Harrison Ave., Brooklyn 11, N. Y.

ARNOLD, Richard S. (*M* 1944) Dist. Chief Engr., ● Carrier Corp., 300 Ivy St. N.E., Atlanta 3, and 2195 E. Lake Rd., Atlanta, Ga.

ARNOLD, Robert S. L. (*M* 1944; *A* 1920; *J* 1922) Owner, Robert Arnold Co., 602 Otis Bldg., Philadelphia 2, and ● Sherwood Lane, Wallingford, Pa.

ARNOLD, Thomas L. (*A* 1945) Mgr., ● Vulcan Radiator Co., 26 Francis Ave., Hartford 6, and 59 Beverly Rd., West Hartford 7, Conn.

ARONOFF, Melvin S. (*J* 1947) Design Engr., ● Herman Blum, Cons. Engr., 2812 Fairmount St., and 2926 Park Row, Dallas, Texas.

ARONSON, Henry H. (*A* 1939) Sales Engr., Dole Valve Co., Chicago, and ● Warrenville, Ill.

ARROWSMITH, John O. (*M* 1934) Supt. of Works, ● Canadian Kodak Co., Ltd., and 9 Humberview Rd., Toronto 9, Ont., Canada.

ARTHUR, John M., Jr. (*M* 1923) Div. Mgr., ● Kansas City Power & Light Co., 1330 Baltimore Ave., Kansas City 10, Mo., and 3311 State Ave., Kansas City, Kans.

ARTRAN, Carlyle (*A* 1945) Pres., ● Industrial Air Conditioning Corp., 3030 Fierro St., Los Angeles 41, and 2334 Birkdale St., Los Angeles 31, Calif.

ARVIDSON, Ernest R. (*M* 1943) Electrical Engrg. Draftsman, Carbide and Carbon Chemicals Corp., South Charleston, and ● 2820 Kanawha Terrace, St. Albans, W. Va.

ARZET, Fred A. (*A* 1944) Sales Engr., U. S. Radiator Corp., 309 East 19th St., Indianapolis, and ● 3704 N. Emerson Ave., Indianapolis 1, Ind.

ASBURY, Edgar M. (*A* 1946) Sales Engr., ● Armstrong Cork Co., 841 Electric Bldg., Houston, Texas.

ASH, Norman B. (*A* 1945) Pres., Braniff Engineering Co., 2908 Northwest 12th St., Oklahoma City, Okla.

ASH, Robert S. (*A* 1943; *J* 1940) Buyer, Montgomery Ward & Co., 29th Ave., & East 14th St., Oakland, and ● 8080 Earl St., Oakland 5, Calif.

ASHCRAFT, J. P. (*A* 1943) Owner, J. P. Ashcraft Co., and ● 2826 Fondren Dr., Dallas 5, Texas.

ASHLEY, Carlyle M.* (*M* 1931), (Council, 1943-46), Chief Dvlpt. Engr., ● Carrier Corp., 300 S. Geddes St., Syracuse 1, and 22 Lynacres Blvd., Fayetteville, N. Y.

ASHLEY, Edward E. (*M* 1912) Cons. Engr., Partner, Edward E. Ashley, Cons. Engr., ● 10 East 40th St., New York 16, N. Y., and 193 Middlesex Rd., Noroton Heights, Conn.

ASHLEY, Ronald D. (*M* 1944) Partner, ● United Equipment Co., 337 S. High St., Columbus 15, and 141 S. Southampton Ave., Columbus 4, Ohio.

ASHTON, Jed L. (*A* 1944) Owner, Ashton Heating & Air Conditioning, 163 Motor Ave., Salt Lake City 1, and ● 2686 Alden St., Salt Lake City 5, Utah.

ASKER, Gunnar C. F. (*A* 1948) Chief Engr., ● Dry Air Products Corp., 726 Jackson Pl. N.W., and 4530 Lowell St. N.W., Washington, D. C.

ATHERTON, Alfred E. (*A* 1937) Dir., ● A. E. Atherton & Sons, Pty., Ltd., 383 Latrobe St., Melbourne, and 129 Esplanade, Elwood, Vic., Australia.

ATHERTON, Russell C. (*M* 1945) Mech. Engr., M. J. Daly & Sons, Inc., 541 Bank St., Waterbury, and ● 74 Essex Ave., Waterbury 49, Conn.

ATKINS, George E. (*M* 1941) Cons. Engr., 1308 Hobart Bldg., San Francisco, and ● 64 Oak Ridge Rd., Berkeley, Calif.

ATKINS, Oren H. (*A* 1946) Designing Engr., United Electric Co., Louisville Ave., Monroe, and ● 302 Filhoil Ave., West Monroe, La.

ATKINS, Thomas J. (*M* 1945) Electrostatic Air Cleaning Engr., Westinghouse Electric Corp., Philadelphia, and ● 276 Henley Rd., Philadelphia 31, Pa.

ATKINSON, Robert P. (*S* 1948) Grad. Student, University of Minnesota, Minneapolis 14, and ● 4518 Upton Ave. N., Minneapolis 12, Minn.

ATKINSON, Russell R. (*A* 1946) Plbg. and Htg. Dept., Central Supply Co., 838 S.W. First St., Portland, and • 1631 S.W. Yamhill St., Portland 5, Ore.

ATKINSON, William J. (*A* 1946) Dept. Mgr., • Winnipeg Supply & Fuel Co., Ltd., 812 Boyd Bldg., and 758 Clifton St., Winnipeg, Man., Canada.

ATLAS, Sidney F. (*J* 1946) Owner, • Atlas Air Conditioning Co., 2915 Rusk Ave., Houston, Texas.

ATTEBERRY, Clark (*M* 1947) Owner & Mgr., Atteberry's Heating & Sheet Metal Works, P. O. Box 453, Mercedes, Texas.

ATWATER, Harry A. (*M* 1945) Chief Engr., Combustion Equipment Co., 1820 Cherry St., Kansas City 8, and • 641 West 67th St., Kansas City 5, Mo.

AUERBACH, Leonard F. (*A* 1947) Dir. of Sales, • Temperature Equipment Corp., 4505 Euclid Ave., Cleveland, and 1844 Forest Hills Blvd., East Cleveland 12, Ohio.

AUGUSTERFER, Raymond J. (*M* 1948) Treas., Ambrose-Augusterfer Corp., 247 E. Ashmead St., Philadelphia 44, Pa.

AUSLANDER, George (*M* 1946) Pres., • National Combustion Co., Inc., 101 Park Ave., New York 17, and Harbor Rd., Hewlett Harbor, L. I., N. Y.

AUSTIN, William H. (*A* 1943; *J* 1940; *S* 1937) Engr., Cox Engineering Co., 621-7 Putnam Ave., Cambridge 39, and • 1095 Hyde Park Ave., Hyde Park 36, Mass.

AVERA, A. F. (*M* 1944) Chief Engr., • Dallas Air Conditioning Co., 2809 Canton St., and 5810 Lewis, Dallas, Texas.

AVERA, William W. (*J* 1946) Engr., • The Bahnson Co., 1001 S. Marshall St., and Room 431, Y.M.C.A., Winston-Salem, N. C.

AVERY, Edward G. (*M* 1947) Sales Engr., • Sarco Co. Inc., 53 W. Jackson Blvd., Chicago 4, and 10535 S. Hale Ave., Chicago 43, Ill.

AVERY, Lester T. (*M* 1934), (Council, 1944-46), Pres., • Avery Engineering Co., 1906 Euclid Ave., Cleveland 15, and 21149 Colby Rd., Shaker Heights, Cleveland 22, Ohio.

AVILES, Alonso (*A* 1946) Owner, • P. O. Box 874, and 115 Wayside Dr., Nogales, Ariz.

AXEMAN, James E. (*M* 1932; *A* 1931; *J* 1925) • Axeman-Anderson Assocs., 233 West St., Williamsport 3, and 1328 Woodmont Ave., Williamsport, Pa.

AXTHELM, Fred G. (*A* 1945) Sales Engr., Front Rank Furnace Co., 2500 Ohio Ave., St. Louis 4, and • 648 N. Forest Ave., Webster Groves 19, Mo.

AYRES, James M.* (*S* 1946) Student, University of California, Berkeley, and • 2411 Bowditch Ave., Berkeley 4, Calif.

AYRES, Robert O. (*A* 1946) Owner, Ayres & Co., P. O. Box 672, Houston 1, Texas.

B

BABCOCK, Dan (*M* 1945) Plant Engr., Allison Div., General Motors Corp., Indianapolis, and • 6511 Riverview Dr., Indianapolis 5, Ind.

BABCOCK, Paul R. (*M* 1941) Cons. Engr., G. M. Simonson, 625 Market St., San Francisco, and • 328-24th St., Oakland 12, Calif.

BACHMANN, Arthur J. (*A* 1948; *J* 1940; *S* 1939) Service Mechanic, Minneapolis-Honeywell Regulator Co., 221 Fourth Ave., New York, and • 129 Brooklyn Ave., Westbury, L. I., N. Y.

BACHMANN, William L. (*M* 1947) Engr., • Tucker & Rice, Inc., 11 Garden St., Worcester, and Main St., East Brookfield, Mass.

BACKSTROM, Russell E.* (*A* 1931; *J* 1928) Mgr., Indus. Dept., • Wood Conversion Co., First National Bank Bldg., St. Paul 1, and 1655 Hillcrest Ave., St. Paul 5, Minn.

BACON, Earl (*A* 1946) Mgr., M. F. Fischer & Son, 203 Fredericksburg Rd., and • 1802 Clower St., San Antonio, Texas.

BACON, William H., Jr. (*A* 1942) Automotive Engr., Tide Water Associated Oil Co., East 22nd St., Bayonne, and • 217 Baker Ave., Westfield, N. J.

BADGETT, W. Howard* (*M* 1937; *J* 1932) Lt. Col., Asst. Mgr., College Constr. Program, • A. & M. College of Texas, Box 235 Faculty Exchange, and 204 Pershing Ave., College Station, Texas.

BADHNI, J. (*M* 1946) Prop., Badhni, Engineering & Trading Co., 38 Avenue Ferdowsi, Teheran, Iran.

BAECHLIN, Alfred C., Jr. (*M* 1942) Gen. Sales Mgr., Northern Air Conditioning Corp., 21 Central Ave., Newark, N. J., and • 2033 North 40th St., Rt. 10, Box 716 M, Phoenix, Ariz.

BAGGALEY, Walter (*M* 1938) Advisory Equip. Engr., Research Div., • The Austin Co., 16112 Euclid Ave., Cleveland 12, and 3390 Glencairn Rd., Shaker Heights 22, Ohio.

BAGHI, A. R. Mir (*A* 1946) Service Engr., Anglo Iranian Oil Co., 115 Bawarda N., Abadan, Iran.

BAHNSON, Agnew H., Jr. (*A* 1945) Vice-Pres., The Bahnson Co., 1001 S. Marshall St., Winston-Salem, N. C.

BAILEY, Albert E. (*A* 1947) Branch Engr., Frigidaire Sales Corp., P. O. Box No. 900, Roanoke 5, and • 1602 Westover Ave., Roanoke 15, Va.

BAILEY, Charles F. (*A* 1947; *J* 1939) Gen. Mgr., • Lorenzo Bailey & Co., and Windsor, Va.

BAILEY, Frank T. (*A* 1947) Vice-Pres. & Gen. Mgr., • Register & Grille Manufacturing Co., Inc., 70 Berry St., Brooklyn 11, N. Y., and 16 Cambridge Rd., Verona, N. J.

BAILEY, Frederick A., Jr. (*A* 1939) Prop., • Bailey's, 130 King St., Charleston 5, and 70 Warren St., Charleston, S. C.

BAILEY, Fred N. (*M* 1947) Industrial Engr., Harris Pump & Supply Co., and • 902 Agnew Rd., Pittsburgh 27, Pa.

BAILEY, George G. (*A* 1947) Htg. & Vent. Engr., Boynton Cole, 1873 Piedmont Rd., and • 3041 W. Roxboro Rd., Atlanta, Ga.

BAILEY, J. L. (*A* 1940) Asst. Chief Engr., Parks-Cramer Co., Box 946, Charlotte, N. C.

BAILEY, Murray G. (*A* 1946) Sales, • C. A. Dunham Co., Ltd., 1139 Bay St., and 598 Sherbourne St., Toronto, Ont., Canada.

BAIN, Lawrence F. (*A* 1944) Constr. Supt., Narowetz Heating & Ventilating Co., 1722 W. Washington Blvd., and • 3324 N. Laramie Ave., Chicago, Ill.

BAIRD, Alexander D. G. (*A* 1944) Pres., • A. G. Baird, Ltd., 25 Ritchie Ave., Toronto, and Linden Rd., Scarborough Bluff, P. O. Scarborough, Ont., Canada.

BAIRD, Floyd E. (*M* 1940) Owner, • 314 Palmer Bldg., Atlanta 3, and 900 Church St., Marietta, Ga.

BAK, Stanley J. (*J* 1947) Sales Engr., The Crosbie Co., 2039 K St. N.W., Washington, and • 2410-20th St. N.W., Washington 9, D. C.

BAKER, Clyde H. (*M* 1945) Htg., Vent. and Plbg. Engr., Snyder & McLean, 2214 Penobscot Bldg., Detroit, and • 15444 Vaughan St., Detroit 23, Mich.

BAKER, Donald L. (*M* 1947; *A* 1940) Service Specialist, Carrier Corp., Syracuse, and • Otisco Lake, Marietta, N. Y.

BAKER, Edward L. (*A* 1945) Mgr., • Burbidge Coal Co., 311 S. Main St., Salt Lake City 1, and 1533 Glen Arbor, Salt Lake City 5, Utah.

BAKER, Harland E. (*A* 1946; *J* 1945) Partner, Baker & English, 1360 W. Ninth St., and • 3786 Freemont Rd., South Euclid 21, Ohio.

BAKER, Harold S. (*A* 1937) Sales, Westinghouse Electric Supply, and • P. O. Box 822, Fresno, Calif.

BAKER, Harry L., Jr. (*A* 1943; *J* 1935) Georgia Tech Research Institute, Georgia School of Technology, Research Bldg., Atlanta, Ga.

BAKER, Henry A. (*M* 1945) Vice-Pres., W. B. Connor Engineering Corp., 114 East 32nd St., New York, and • 145-53-17th Rd., Whitestone, N. Y.

BAKER, Henry E. (*M* 1946) Supt. of Engrg. Services, Messrs. Kirklees, Ltd., Tottington, and • 11 Newcombe Rd., Holcombe Brook, Bury, Lancashire, England.

BAKER, I. C. (*M* 1921) Vice-Pres., • Chrysler Corp., Airtemp Div., 1119 Leo St., Dayton 1, and 252 E. Monteray Ave., Dayton 9, Ohio.

BAKER, James (*M* 1944) Owner, • Ross & Greig Registered, 738 Notre Dame St. W., and 5715 Darlington Ave., Montreal, Que., Canada.

BAKER, John G. (*M* 1947) Chief Engr., Viking Manufacturing Corp., 1747 Chester Ave., and • 1279 West 102nd St., Cleveland, Ohio.

BAKER, John T. (*A* 1948) Htg.-Vtg. Engr., Magney, Tusler & Setter, 202 Foshay Tower, Minneapolis, and • 2612 Dupont Ave. S., Minneapolis 8, Minn.

BAKER, L. P. (*A* 1945) Engr., Kendall Baker & Co. Ltd., 365 Yonge St., Toronto, Ont., Canada.

BAKER, Merl (*S* 1946) Instructional Staff & Student, • Purdue University, Mech. Engrg. Bldg., West Lafayette, Ind., and Butler Rd., Hopkinsville, Ky.

BAKER, Roland H. (*M* 1928; *A* 1924) Pres., R. H. Baker Co., and • Elkins, N. H.

BAKER, Russell A. (*A* 1946) Branch Mgr., • Minneapolis-Honeywell Regulator Co., 121 W. Onondaga St., and 310 Carlton Rd., Syracuse, N. Y.

BAKER, T. A. (*M* 1942) Vice-Pres., • Baker Specialty & Supply Co., 701 Erie Ave., and 2205 E. Broadway, Logansport, Ind.

BAKER, Thomas (*M* 1938) Vice-Pres., Chief Engr., Herbert Keller Corp. 179 Ellison St., Paterson, N. J., and • 660 East 242nd St., New York, N. Y.

BAKER, William H., Jr. (*A* 1935) Asst. Mgr., Pittsburgh Sales Office, American Radiator & Standard Sanitary Corp., 102 Sixth St., Pittsburgh, Pa.

BAKKO, Reuben (*A* 1944) Air Conditioning Co. of So. Calif., 1003 Santa Fe Ave., Los Angeles 21, and • 212 W. Avenue 42, Los Angeles 31, Calif.

BAKSA, Stephen (*A* 1947) Plant Engr., • Johnson & Johnson, Walnut Ave., Cranford, and 28 Pulaski Ave., Carteret, N. J.

BALCH, Robert M., Jr. (*A* 1944) Sales Mgr., Apartment Controls Div., • Minneapolis-Honeywell Regulator Co., and 402 W. Minnehaha Pkwy., Minneapolis, Minn.

BALDWIN, C. W. (*M* 1947; *A* 1945) Vent. Engr., • U. S. Rubber Co., 1230 Avenue of the Americas, New York 20, and Clay, N. Y.

BALDWIN, Karl F., Jr. (*M* 1947; *A* 1941; *J* 1938) Mech. Engr., Clyde E. Bentley, 1441 Franklin St., Oakland, and • 419 Kentucky Ave., Berkeley 7, Calif.

BALDWIN, Ralph T. (*A* 1948) Treas., • E. C. Powers & Son, Inc., 135 Arch St., and 5936 Lansdowne Ave., Philadelphia, Pa.

BALL, F. T. (*A* 1940) • The Canadian Fairbanks-Morse Co., Ltd., 10255–104th St., and 11034–126th St., Edmonton, Alta., Canada.

BALL, William (*A* 1936) Pres., • Interstate Heating & Plumbing Co., 521 Southwest Blvd., Kansas City, Mo., and 1026 Shawnee Rd., Kansas City, Kans.

BALLAGH, A. Bruce (*A* 1946; *J* 1943) Sales Engr., • B. F. Sturtevant Co. of Canada, Ltd., 19 Melinda St., and 2405 Queen St. E., Toronto, Ont., Canada,.

BALLANTYNE, George L. (*A* 1936) Mgr., Htg. Dept., • Crane, Ltd., 1170 Beaver Hall Sq., Montreal, and 140 Ballantyne Ave. S., Montreal West, Que., Canada.

BALLMAN, William H. (*M* 1937) Prod. Mgr., • Holly Hill Fruit Products, Inc., Davenport, and 510 Revere St., Orlando, Fla.

BALSAM, Charles P. (*M* 1932) Gen. Mgr., • National Home Equipment Co., 50 Church St., New York 7, and 324 Fourth St., Brooklyn, N. Y.

BALSTER, Joseph A. (*A* 1947) Chief Engr., Cafritz Co., 1404 K Street N.W., and • 5520 Sherrier Pl. N.W., Washington, D. C.

BAMOND, Manuel J. (*M* 1942) Branch Office Mgr., • Temperature Control Equipment, 403 N. Desplaines St., Chicago 10, and 5859 Winthrop Ave., Chicago 40, Ill.

BANACH, Casimer J. (*A* 1946; *J* 1939) Engr., Chicago Fan & Fin Coil Co., 1937 W. Walnut St., Chicago 12, and • 819 N. Mozart Ave., Chicago 22, Ill.

BAND, Jack P. (*A* 1944) Mech. Engr., Giffels & Vallet, Inc., 1000 Marquette Bldg., Detroit 26, and • P. O. Box 2032, Detroit 31, Mich.

BANKS, John B. (*A* 1942) Branch Mgr., • Minneapolis-Honeywell Regulator Co., 122 N.E. Broadway, Portland 12, and 4615 Northeast 40th Ave., Portland 11, Ore.

BANKSTON, Clayton V. (*A* 1945) Dist. Sales Mgr., • Industries Sales Corp., 2927 Jackson Ave., and 29 San Jose Ave., New Orleans, La.

BANOWSKY, A. B. (*M* 1938) Mgr., Retail Div., Payne Furnace Co., P. O. Box 990, Beverly Hills, and • 2652 Glendon Ave., Los Angeles 34, Calif.

BAPPLER, Charles T. (*A* 1948) Regional Sales Mgr., McQuay, Inc., 122 East 42nd St., New York, and • 91-17 48th Ave., Elmhurst, N. Y.

BARBECK, Chester A. (*A* 1947) Sales Engr., • Matthews Engineering Co., 2122 Olive St., and 4616 Bowser Ave., Dallas, Texas.

BARBECK, William R. (*M* 1947) Partner, • Rodgers-Barbeck Co., 2021 Cedar Springs, and 3301 Greenbrier Dr., Dallas, Texas.

BARBER, Richard C. (*J* 1945) U. S. Naval Gun Factory, Washington, D. C., and • 4100 33rd St., Mt. Rainier, Md.

BARBIERI, Patrick J. (*A* 1943; *J* 1936; *S* 1933) Air Cond. Engr., • Armo Cooling & Ventilating Co., Inc., 30 West 15th St., New York, and 2237 Belmont Ave., Bronx, N. Y.

BARD, William S. (*M* 1946) General Mgr., F. D. Ramsey & Co., Inc., 504 Washington St., and • 1315 Michigan Ave., La Porte, Ind.

BARDO, Frederick J., Jr. (*A* 1947) Designer, Beman & Candee, Cons. Engr., Buffalo, and • 364 Walton Dr., Snyder 21, N. Y.

BAREITHER, Harlan D. (*S* 1947) Grad. Student, University of Illinois, and • 608 South Race, Urbana, Ill.

BARFUS, Louis (*M* 1946) Vice-Pres., • Sarcotherm Controls, Inc., 280 Madison Ave., New York 16, and 2775 East 16th St., Brooklyn, N. Y.

BARKER, M. Stanley (*A* 1943) Chief Engr., Carrier Engineering, Ltd., 30 Bloor St. W., and • 686 Eglington Ave. E., Toronto, Ont., Canada.

BARKLEY, Kenneth L. (*M* 1946) Designing Draftsman, • Ecusta Paper Corp., Box 200, Spindale, and 7 W. Jordan St., Brevard, N. C.

BARLOW, F. John (*A* 1945; *J* 1943) Chief Prod. Engr., Western Condensing Co., 935 E. John St., Appleton, Wis.

BARMANN, Paul V. (*M* 1946) Pres., • Lydick-Barmann Co., 505 Commerce St., and 1134 Clara St., Fort Worth, Texas.

BARNARD, M. Everett (*A* 1936) Dist. Mgr., Indus. Htg. Dept., • Carrier Corp., 12 South 12th St., Philadelphia 7, and 6730 Crittenden St., Philadelphia 19, Pa.

BARNARD, William B. (*S* 1948) Student, Purdue University, and • 712 Northwestern, West Lafayette, Ind.

BARNES, Arthur F. (*M* 1938) Owner & Mgr., Texas Engineering Co., 4607 Montrose, Houston 6, and • 3015 Jarrard St., Houston 5, Texas.

BARNES, Arthur R. (*M* 1937) Engr., • U. S. Supply Co., 1315 West 12th St., and 326 East 70th Terrace, Kansas City, Mo.

BARNES, Charles A. (*M* 1944) Engr., Metal Fabricators, 465 Bishop St. N.W., • P. O. Box 4304, Atlanta 2, and 947 Katherwood Dr. S.W. Atlanta, Ga.

BARNES, Hugh S. (*A* 1947; *J* 1940) Metal Fabricators, Inc., P. O. Box 3232, Charlotte 3, N. C.

BARNES, John C. (*A* 1944) Branch Mgr., • National Radiator Co., 401 N. Broad St., Philadelphia 8, and 143 Golf View Rd., Merion Golf Manor, Ardmore, Pa.

BARNES, John G., Jr. (*M* 1947) Engr., • Natkin & Co., 1924 Oak St., and 404 Huntington Rd., Kansas City 2, Mo.

BARNES, Lewis L. (*M* 1943; *A* 1942; *J* 1937) Chief Engr., Carrier Atlanta Corp., 306 Peachtree St., and • 3865 Wieuca Terrace, Atlanta, Ga.

BARNES, Raymond W. (*M* 1939) Cons. Engr., 631 Moore Bldg., San Antonio 5, and • 1208 N. Main Ave., San Antonio 2, Texas.

BARNES, Walter E. (*M* 1933) Pres., Barnes & Jones, Inc., 128 Brookside Ave., Jamaica Plain 30, Boston, and • 7 Woodlawn Ave., Wellesley Hills 82, Mass.

BARNES, Willis L. (*A* 1946) Sales Engr., • The H. L. Thompson Co., 414 Esperson Bldg., Houston 2, and 410 Marshall St., Houston, Texas.

BARNETT, Harry (*M* 1942) Dist. Mgr., • Zephyr Laundry Machinery Co., Box 1125, and Briarcliff Hotel, Atlanta, Ga.

BARNETT, Robert E. (*A* 1944) Structural Engr., Toltz King & Day, and • Grand Hotel, St. Paul, Minn.

BARNEY, William E. (*M* 1936) Mgr., Engr., • Hydraulic-Press Brick Co., South Park, and 7606 Hemlock Rd., Independence, Ohio.

BARNUM, Willis E., Jr. (*M* 1933; *J* 1930) Sales Engr., • Westerlin & Campbell Co., 5924 Second, Detroit 2, and 17106 Magnolia Pkwy., Detroit 19, Mich.

BARON, Arnold E. (*S* 1947) Student, Texas A. & M. College, College Station, and ●4500 Belclaire, Dallas, Texas.

BARR, George W. (*Life Member*), (*M* 1905), (Board of Governors, 1910), Dist. Mgr., ●Aerofin Corp., 2030 Land Title Bldg., Philadelphia 10, and Woods End, Villa Nova, Pa.

BARRETT, Campbell M. (*A* 1941) Mech. Inspector of Mines, Province of Ontario, Parliament Bldgs., Toronto, and ●93 Ramsey Rd., Leaside, Ont., Canada.

BARRY, James, Jr. (*M* 1946) Vice-Pres., Elliott & Barry Engineering Co., 4060 W. Pine Blvd., St. Louis 8, Mo.

BARRY, Wilfred W. (*A* 1945) Partner, ●Barry & Kemper, 12873 Fort Rd., and 10132–142nd St., Edmonton, Alta., Canada.

BARSHA, Nicholas B. (*A* 1947) Chief Engr., Airtherm Manufacturing Co., 700 S. Spring Ave., St. Louis 10, and ●207 Newell Dr., Ferguson, Mo.

BARTELS, Charles J. (*M* 1942) Owner, ●Automatic Stoker & Engineering Co., 207-8 Richardson Bldg., and 1416 Washington Ave., Parkersburg, W. Va.

BARTELS, Everett M. (*M* 1946; *A* 1941; *J* 1939) Supvsr. of Mech. Equip., ●Independent School District, 629 Third St., Des Moines 9, and 1104 E. Douglas, Des Moines 16, Iowa.

BARTH, Herbert E. (*M* 1920) Vice-Pres., ●American Blower Corp., P. O. Box 58, Roosevelt Park Annex, Detroit 32, and 15 East Kirby Ave., Detroit 2, Mich.

BARTH, John W. (*A* 1943; *J* 1939) 326 Olive Ave., Long Beach 12, Calif.

BARTHELMESS, Richard (*M* 1944) Mgr., ●Richard Barthelmess Sales Co., 1054 W. Adams St., Jacksonville 4, and 1711 Challen Ave., Jacksonville 5, Fla.

BARTLETT, Amos C.* (*M* 1940) Mgr., Htg. and Vent. Section, ●Westinghouse Electric Corp., Sturtevant Div., Hyde Park, and 22 Weston Ave., Braintree 84, Mass.

BARTLETT, C. Edwin (*M* 1922) Pres., ●Bartlett & Co., Inc., 201 South 42nd St., Philadelphia 4, and 3111 W. Coulter St., Philadelphia 26, Pa.

BARTLETT, George M. (*A* 1947) Mgr. of Heating Dept. & Sales Engr., W.E. Wesson, 100 Eagle St., Waterbury, and ●28 Wilmot Rd., Hamden, Conn.

BARTON, Fred C. (*M* 1943) Partner, ●Shuttleworth Conditioned Air, 117 E. Michigan St., and 1950 N. Olney St., Indianapolis, Ind.

BARTON, Jay (*M* 1937) Partner, Barton Engineering Co., 416 Stephenson Bldg., Detroit, Mich., and ●808 Holgate Ave., Defiance, Ohio.

BARTON, Kenneth L. (*M* 1945) Indus. Engr., ●The Foxboro Co., 420 Lexington Ave., Room 1643, New York 17, and 103 Ramsey Ave., Yonkers 2, N. Y.

BASSEVITCH, Abraham (*A* 1945) Design Engr., Meyer, Strong & Jones, 101 Park Ave., New York, and ●3002 West 28th St., Brooklyn 24, N. Y.

BASTEDO, Albert E. (*M* 1919) Vice-Pres. and Treas., ●Burnham Boiler Corp., 2 Main St., Irvington, and 55 Burnside Dr., Hastings-on Hudson 6, N. Y.

BATEMAN, William Hamilton (*A* 1944) Partner, ●Keystone Sales Co., 547 Lincoln Ave., P. O. Box 4201, Bellevue Station, and 1011 California Ave., Avalon, Pittsburgh 2, Pa.

BATES, John H. (*A* 1947; *J* 1941; *S* 1939) U. S. Army, and ●1313 W. Lehigh, Philadelphia, Pa.

BATTAN, S. W. (*M* 1940) Pres., ●Perma-Temp Products, Inc., 838 E. Federal St., Camden, N. J., and Hillcrest Hotel, Stenton Ave., Bethlehem Pike, Whitemarsh, Philadelphia, Pa.

BAUER, Albert E. (*M* 1935) Mgr., Special Prod. Div., Stainless & Steel Products Co., 1000 Berry Ave., St. Paul 4, and ●59 S. Victoria St., St. Paul 5, Minn.

BAUER, Jean (*J* 1946) ●Ventilator A. G., Staefa, and Basel, Switzerland.

BAUER, John (*M* 1946) Mgr. ●Bauer Heating & Plumbing Co., 627 Avenue A, and 924 Fourth Ave., Plattsmouth, Nebr.

BAUER, Ray F. (*M* 1945) Engr., ●434 N. Rock Island, and 225 N. Rutan, Wichita, Kans.

BAUM, Albert L. (*M* 1916) Partner, ●Jaros, Baum & Bolles, 415 Lexington Ave., New York 17, and 600 West 111th St., New York 25, N. Y.

BAUMAN, Carl S. (*M* 1948) Exec. Engr., Tex-Air Conditioning Co., ●1201 Jones St., and 910 Collier St., Fort Worth, Texas.

BAUMANN, Arnold W. (*M* 1948) Chief Engr., Arthur Harris & Co., 212 N. Aberdeen, and ●40 E. Oak, Chicago, Ill.

BAUMGARDNER, C. M. (*M* 1928) Exec., Vice-Pres., ●U. S. Radiator Corp., 300 Buhl Bldg., Detroit 31, Mich., and 416 Cumnor Rd., Kenilworth, Ill.

BAUTTS, Ray A. (*M* 1945) Asst. Mgr. Gas Dept., ●Arkansas Power & Light Co., 112 W. Washington Ave. (Box 812), and 1005 W. Oak St., Jonesboro, Ark.

BAWDEN, Leslie A. (*A* 1945) Midland Area Engr., Spirax Manufacturing Co., Ltd., Beechmont, Cheltenham, Gloucester, and ●38 Windsor Rd., Evesham, Worcestershire, England.

BAXTER, A. G. (*M* 1944) Htg. Engr., ●Enterprise Foundry Co., Ltd., Sackville, N. B., and 28 Clarence St., Amherst, Nova Scotia, Canada.

BAXTER, Henry A. (*A* 1944) Gen. Mgr., ●W. H. Cunningham & Hill, Ltd., 269-271 Richmond St. W., and 93 Castlewood Rd., Toronto, Ont., Canada.

BAXTER, William E. (*A* 1939) Pres., ●W. E. Baxter, Ltd., 2200 Hingston Ave., Montreal, and 89-51st Ave., Lachine, Que., Canada.

BAY, Charles H (*A* 1938) Sales Repr., ●The Detroit Edison Co., 2000 Second Ave., Detroit, and Woodward Ave., Bloomfield Hills, Mich.

BAYLESS, Robert L., Jr. (*A* 1946) Owner and Mgr., ●Valley Sheet Metal Co., 230 N. Ninth St., and 367 Orme Ave., Phoenix, Ariz.

BAZILLE, Clarence H. (*M* 1944) Cons. Engr., ●Clarence H. Bazille, Room 726, Pacific Bldg., 821 Market St., San Francisco 3, and Hotel Gotham, San Francisco 1, Calif.

BAZZONI, Joseph P. (*M* 1946; *A* 1942) Mech. Engr., Shaw, Metz & Dolio, 208 S. LaSalle, Chicago, and ●Rt. 2, Ottawa, Ill.

BEACH, Albert F., Jr. (*M* 1944) Appl. Engr., Carrier Corp., 405 Lexington Ave., New York, N. Y., and ●214 Columbia Ave., Cranford, N. J.

BEACH, Milton W. (*A* 1947) Sales Engr., M. W. Beach Sales & Engineering, 519 Main St., Cincinnati 2, and ●309 W. McMillan St., Cincinnati 19, Ohio.

BEACH, Ralph L. (*M* 1942) Dist. Engr., York Corp., 412 Houston St. N.E., P. O. Box 2210, Atlanta, and ●131 Clarion Ave., Decatur, Ga.

BEAGHEN, George W. (*A* 1944) Field Engr., ●American Blower Corp., 50 West 40th St., New York 18, and 146 Seventh Ave., Pelham, N. Y.

BEAIRD, Benjamin J. (*M* 1945) Chief Engr. and Estimator, Charles G. Heyne & Co., 2002 Rothwell, and ●1621 Kipling, Houston, Texas.

BEALS, Dowell E. (*M* 1941; *J* 1940) Owner, ●Beals Plumbing & Heating Co., 315 West 13th St., and 4001 Calmont St., Fort Worth, Texas.

BEAM, Lucien H. (*A* 1946) Supvsr. of Utility Operations, Fairchild Aircraft, Hagerstown, Md., and ●Route 4, Waynesboro, Pa.

BEAN, George S. (*A* 1935) Mgr., Stoker Div., ●North Western-Hanna Fuel Co., 2196 University Ave., St. Paul 4, and 4949-16th Ave., Minneapolis, Minn.

BEAN, Thomas H., Jr. (*M* 1944) Cons. Engr., 813 Hidalgo St., New Orleans 19, La.

BEARDEN, John D. (*A* 1946) Engr., ●Hall-Neal Furnace Co., 1324 N. Capitol Ave., and 145 E. Hoefgen St., Indianapolis, Ind.

BEARG, Milton J. (*M* 1944) Air Cond. Engr., Sanderson & Porter, 52 William St., New York 5, and ●192-39 Hollis Ave., Hollis 7, L. I., N. Y.

BEARMAN, Alexander A. (*M* 1937) Engr., ●20th Century-Fox Film Corp., 444 West 56th St., New York 19, and 3111 Broadway, New York 27, N. Y.

BEARSE, Allen H., Jr. (*A* 1945) Partner, ●Barrows Coal Co., 35 Main St., and 56 Western Ave., Brattleboro, Vt.

BEATTIE, James (*A* 1940) Owner, James Beattie, 7327 Tiremon, Detroit 4, and ●17215 Greenlawn Ave., Detroit 21, Mich.

BEATTY, John W. (*J* 1944; *S* 1941) Htg. Engr., ●Beatty Hardware Co., 118-120 Main St., and 612 State St., Beardstown, Ill.

BEATY, Stanford W. (*A* 1947) Air Cond. Engr., ●Arkansas Natural Gas Corp., P. O. Box 1734, Shreveport 4, and 3238 Southern Ave., Shreveport, La.

BEAUCHAMP, John H. (*A* 1945) Owner-Mgr., • Heating & Refrigeration Maintenance Co., 3913 S. Main St., and 1005 Isabella, Apt. 33, Houston 4, Texas.

BEAURRIENNE, Auguste* (*Life Member*; *M* 1912) Engr. Expert, 25 Rue des Marguettes, Paris XII, and • 18 Rue Petit Val, Sucy en Brie, Seine et Oise, France.

BEAVERS, G. R. (*M* 1929) c/o Margison and Babcock, Cons. Engrs., Indus. Designers, 119 Isabella St., Toronto, and • c/o 4, Earl St., Toronto 5, Ont., Canada.

BECHIR, Nicholas V. (*M* 1946) Asst., Refrig. Dept., • Volkart Brothers, 8 Clive St., and 21 Humayan Ct., Calcutta, India.

BECHTOL, J. J. (*A* 1942; *J* 1937) Engr., Estimator, L. E. Stevens Co., 626 Broadway, Cincinnati 2, and • 1282 Quebec Rd., Cincinnati 5, Ohio.

BECKER, C. S. (*M* 1939) Mech. Engr., • American Blower Corp., Room 1504, 228 N. LaSalle St., Chicago 1, and 514 S. Dunton Ave., Arlington Heights, Ill.

BECKER, George E. (*A* 1943) Secy.-Treas., Sales and Service, • Frigid Refrigerator Service, 3232 Olive, St. Louis 3, and 5329 Delor St., St. Louis, Mo.

BECKER, Philip F. (*M* 1947) Elec. Engr., Board of Transportation, 250 Hudson St., New York 13, and • 161 East 206th St., New York 58, N. Y.

BECKER, Sidney J. (*A* 1947; *J* 1944) Engr., • J. Becker, Inc., 6355 Park Ave., and 4804 Cote Des Neiges, Apt. 31, Montreal, Que., Canada.

BECKWITH, F. J. (*M* 1940) Htg. and Vent. Engr., Henley & Beckwith, 2628 Pearl St., and • R. F. D. 1, Box 250, Jacksonville, Fla.

BECRAFT, Edwin R. (*A* 1947) Export Director, The Trane Co., and • 1907 Adams St., La Crosse, Wis.

BEDARD, Earl L. (*A* 1946) Chief Engr., • Aldrich Mfg. Co., and Wyoming, Ill.

BEEBE, F. E. W. (*Life Member*; *A* 1915) Retired, 20 Denman Pl., Elizabeth 3, N. J.

BEECRAFT, Gerald A. (*A* 1946) Partner, • Atlas Air Conditioning Co., 22450 Fenkell Ave., Detroit 23, and 24320 Union Ave., Dearborn, Mich.

BEERS, Louis N. (*A* 1942) Sales Engr., Nicolai's Tucson Pipe Works, 416 W. Davis, and • 2745 N. Martin, Tucson, Ariz.

BEERS, Vance A. (*A* 1946) Htg. Dept., Marshall-Wells Co., 1420 N.W. Lovejoy, and • 3849 N. Kiska, Apt. 10 Portland, Ore.

BEERY, Clinton E.* (*M* 1936) Pres., Heat & Fuel Engineering Co., Inc., 1454 Hood Ave., Chicago, Ill.

BEERY, Vernon L. (*A* 1944) Sales Engr., Consolidated Industries, Inc., Lafayette, Ind.

BEGGS, Philip B. (*A* 1946) Partner, • Paul W. Beggs & Son, 665 Folsom St., San Francisco 7, and 1322-32nd Ave., San Francisco 22, Calif.

BEGGS, William E. (*M* 1927) Owner, W. E. Beggs Co., 234 Ninth Ave. N., and • 2580 W. Viewpoint Way, Seattle, Wash.

BEGOON, George F. (*A* 1945) Vice Pres., • The Thermix Corp., First National Bank Bldg., and 55 Orchard Drive, Greenwich, Conn.

BEIGHEL, H. A. (*A* 1927) Owner, • Allegheny Engineering Co., 503 Columbia Bldg., Pittsburgh, and 207 Puritan Rd., Rosslyn Farms, Carnegie, Pa.

BEINEKE, Robert C. (*A* 1947) Engr., • Fosdick & Hilmer, Consulting Engrs., 1703 Union Trust Bldg., Cincinnati 2, and 3745 Boudinot Ave., Cincinnati 11, Ohio.

BEIRN, John B. (*A* 1945) Sales Engr., American Radiator & Standard Sanitary Corp., 1617 Penna. Blvd., Pittsburgh, Pa., and • 9517 Ventnor Ave., Margate, N. J.

BEISEL, Karl E. (*J* 1944) Naval Archt., Norfolk Naval Shipyard, and • 20 Lawrence Circle, Apt. K-5, Portsmouth, Va.

BEITZELL, Albert E. (*A* 1933; *J* 1930) Vice-Pres., Combustioneer Corp., 409 Tenth St. S.W., Washington, D. C., and • 6701 N. Delfield St., Chevy Chase 15, Md.

BEKESHUS, J. Herbert (*M* 1945) Pres., • Pioneer Oil Heat, Inc., 229 River St., and 1503 Massachusetts Ave., Troy, N. Y.

BELANGER, William (*M* 1944) Owner, Southeastern Supply Co., 390 N. Front St., New Bedford, Mass.

BELDEN, Albert G., Jr. (*M* 1944) Pres., • Belden Co., 15 South 13th St., and 2700 Wilson Dr., Terre Haute, Ind.

BELFORD, Louis B. (*A* 1940) Eastern Supvsr., Air Cond. Control Div., • Minneapolis-Honeywell Regulator Co., 221 Fourth Ave., New York 3, and 295 Murray Ave., Larchmont, N. Y.

BELINE, Martin B. (*M* 1944) Gen. Sales Mgr., Wm. Bornstein & Son, Inc., Second & Kennedy Sts. N.W., Washington 11, D. C., and • 201 W. Bradley Lane, Chevy Chase, Md.

BELING, Earl H.* (*M* 1936; *A* 1930; *J* 1925) Owner, Chief Engr., • Beling Engineering Co., 1407 Seventh Ave., and 2428-13th St., Moline, Ill.

BELL, D. G. (*A* 1946) Chief Engr., • Robb and Rowley United Inc., 314 S. Harwood, Dallas 1, and 9714 Rockbrook, Dallas 9, Texas.

BELL, E. Floyd (*M* 1933) Pres., • Bell & Eiss, Inc., 2102 Foshay Tower, Minneapolis 2, and 5224 Oak Lawn Ave., Minneapolis, Minn.

BELL, John A. (*A* 1944) Field Engr., Furnasman Manufacturing Co., Ltd., Pembina Highway, and • 1117 "B" Grosvenor Ave., Winnipeg, Man., Canada.

BELL, Sydney R. (*M* 1939) Principal, • Sydney R. Bell & Assocs., Cons. Engrs., 374 Little Collins St., and 12 Queens Rd., Melbourne, Australia.

BELL, Thomas H. (*A* 1944) Engr. and Supt. of Constr., Columbus Heating & Ventilating Co., 182 N. Yale Ave., and • 296 S. Eureka Ave., Columbus, Ohio.

FENN, Charles V. (*M* 1945) Branch Mgr., • Carrier Corp., 300 Ivy St. N.E., Atlanta 3, and 124 Vidal Blvd., Decatur, Ga.

FENNER, Everett M. (*M* 1946) Owner and Chief Engr., Scientific Engineering Co., 22 Hobson Ave., Centredale 11, R. I.

FENNER, Walter M. (*A* 1945) Engr.-Secy.-Treas., Central Mill & Plumbing Supply Corp., 46 E. Swan St., and • 1012 Studer Ave., Columbus, Ohio.

FENSTERMAKER, S. E. (*M* 1909) Partner, • S. E. Fenstermaker & Co., 937 Architects & Builders Bldg., Indianapolis 4, and R. R. No. 1, Carmel, Ind.

FENSTERMAKER, Sidney, Jr. (*M* 1945; *J* 1943) S. E. Fenstermaker & Co., 937 Architects & Builders Bldg., Indianapolis 4, and Box 433, R. R. 16, Indianapolis, Ind.

FENSTERMAKER, Ward R. (*A* 1948; *J* 1944) Sales Engr., • John J. Nesbitt, Inc., 215 E. New York St., and 4525 Marcy Lane, Apt. 246, Indianapolis, Ind.

FERDERBER, Murray B., M.D.* (*M* 1938) Physician, 5722 Fifth Ave., Pittsburgh, Pa.

FEREDAY, Maurice (*A* 1946) Owner, • Fereday Plumbing & Heating, 156 S. Third Ave., and 1352 E. Bonneville, Pocatello, Idaho.

FERGESTAD, Marvin L. (*M* 1938; *J* 1935) Pres., • Insulation Engineers, Inc., 2120 Lyndale Ave. S., Minneapolis 5, and 2736 Joppa, Minneapolis 16, Minn.

FERGUSON, Clemon E. (*M* 1944) Owner-Mgr., Clem E. Ferguson Co., 838 Garfield Ave., Salt Lake City, Utah.

FERGUSON, Ralph R. (*M* 1934; *A* 1927; *J* 1925) Mgr., Air Cond. Dept., American Blower Corp., 50 West 40th St., New York, N. Y., and • 77 Edgewood Ave., West Orange, N. J.

FERGUSON, Wallace N. (*A* 1946) Htg. Engr., • Canadian Industries, Ltd., 1155 Beaver Hall Sq., Room 130, Montreal, and 3472 Shuter St. Apt. 2, Montreal 18, Que., Canada.

FERRARA, Anthony L. (*A* 1944) Partner, • Standard Heating Co., 410 W. Lake St., Minneapolis 8, and 443 Buchanan St. N.E., Minneapolis, Minn.

FERRARINI, Joseph (*A* 1947) Engr., Conversions & Surveys, Inc., 90 Broad St., New York 4, N. Y., and • 1721 Queens Lane No. 105, Arlington, Va.

FERRETTI, Julius J. (*A* 1944) New York Mgr., • U. S. Air Conditioning Corp., 420 Lexington Ave., New York 17, and 1814 West 12th St., Brooklyn, N. Y.

FERRIS, Allan F. (*M* 1945) Partner, • Ferris & Hamig, Cons. Engrs., 1706 Olive St., St. Louis 3, and 5078A Wells Ave., St. Louis 13, Mo.

FERRIS, Arthur L. (*A* 1941) Repr., Hart & Cooley Manufacturing Co., 103 Douglas Ave., Toronto, Ont., Canada.

FERRIS, Donald McKenzie (*M* 1944) Mech. Engr., • The Budd Co., 12141 E. Charlevoix, Detroit 14, and 736 Chicago Blvd., Detroit 2, Mich.

FETSCHER, John J. (*M* 1944) Engr., • U. S. Rubber Co., 1230 Ave. of the Americas, New York 20, and 221 Beach 123rd St., Rockaway Park, N. Y.

FICARRA, Francis X. (*A* 1946) Parsons, Brinckerhoff, Hogan & MacDonald, 120 Wall St., New York, and • 665 Ocean Pkwy., Brooklyn 30, N. Y.

FIDELIUS, Walter R. (*M* 1936) Asst. Chief Engr., Optimus Equipment Co., Matawan, and • 335 Broad St., Red Bank, N. J.

FIEDLER, Harry W. (*M* 1923) Owner, • Air Conditioning Utilities, 8 West 40th St., New York, and 16 Dobbs Terrace, Scarsdale, N. Y.

FIELD, Erlund (*A* 1947) Vice-Pres., • Whitty Company, Inc., 86 Western Ave., Boston, and 86 Concord Rd., Weston, Mass.

FIELD, Eugene, Jr. (*S* 1946) Student, Texas A. & M. College, College Station, and • 200 S. Congress, Bryan, Texas.

FIELDNER, A. C.* (*Honorary Member*) Chief, Fuels and Explosives Branch, • Bureau of Mines, U. S. Department of the Interior, Washington 25, and Cosmos Club, Washington, D. C.

FIFE, Charles M. (*A* 1947) Mgr., Electric Home Bureau, • West Penn Power Co., P. O. Box 1736, Pittsburgh 30, and 7919 Union St., Swissvale 18, Pa.

FIFE, G. Donald (*M* 1937; *A* 1931; *J* 1929) Engr., Aerofin Corp., 11 West 42nd St., New York 17, N. Y., and • 20 Ridge Rd., Cos Cob, Conn.

FINCH, Lloyd (*A* 1946) Archt., • 21 C. P. R. Office Bldg., and 1448 Wellington Crescent, Winnipeg, Man., Canada.

FINE, Arthur T. (*A* 1946) Owner and Mgr., • Hartford Oil Heating Co., 161 S. Whitney St., and 94 Warrenton Ave., Hartford 5, Conn.

FINE, Maurice E. (*M* 1948) Chief Mech. Engr., Harold H. Hermann & Assoc. Inc., 701 Enquirer Bldg., Cincinnati 2, and • 2805 Digby Ave., Cincinnati 20, Ohio.

FINK, Robert C. (*M* 1946) Mgr., Industrialaire Co., 1600 Hutchison Ave., and • 2000 Club Rd., Charlotte, N. C.

FINLAY, Alvin E. (*M* 1942) Htg. Engr., Portland Gas & Coke Co., 132 N.W. Flanders St., Portland 9, and • 4919 Northeast 13th Ave., Portland 11, Ore.

FINN, Charles W. (*M* 1944) Pres. and Gen. Mgr., • The Pyramid Co., 320 Eighth Ave. N., Seattle 9, and 529 North 137 St., Seattle, Wash.

FINNELL, Edgar C. (*A* 1948). • Minneapolis-Honeywell Regulator Co., 420 N. Fifth St., and 4520 30th Ave. S., Minneapolis, Minn.

FINNEY, Brandon (*M* 1937) Htg. Engr., Brandon Finney & Assocs., and • 1620 N. Fuller Ave., Hollywood 46, Calif.

FISCHER, Carl S. (*M* 1944) Secy.-Treas., • Fischer Heating & Plumbing Co., 367 Adams Ave., and 1800 Autumn, Memphis, Tenn.

FISCHER, Frank P. (*A* 1940) Owner, • Frank P. Fischer Engineering Co., 342 S. Diamond St., New Orleans, and 1820 Audubon St., New Orleans 18, La.

FISCHER, Fred C. (*A* 1947) Vice-Pres., • Sink & Edwards, 621 E. Ohio St., and 514 N. Dequincy St., Indianapolis, Ind.

FISCHER, William F. (*M* 1947) Asst. Supt., • Edison Marquette Co., 72 W. Adams St., Room 1122, Chicago 3, and 388 Chestnut St., Winnetka, Ill.

FISHER, Albert E. (*A* 1945) Partner, • Kerr Machinery Co., 608 Kerr Bldg., Detroit 26, and 572 Lakeland Ave., Grosse Pointe, Mich.

FISHER, Bert P. (*A* 1943) Owner, • Southern Furnace & Supply Co., P. O. Box 92, Houston 1, and 6528 Rutgers St., Houston 5, Texas.

FISHER, Ernest F. (*M* 1947) Pres., • Faraday Engineering Co., Glenville, Pa.

FISHER, Stanley L. V. (*A* 1946) Trane Company of Canada, Ltd., 4 Mowat Ave., Toronto, and • 43 Nealon Ave., Toronto 6, Ont., Canada.

FITCH, Wilbur R. (*A* 1945) 39 Lewis Rd., Belmont, Mass.

FITTS, Joseph C. (*M* 1930) Secy., • Heating, Piping and Air Conditioning Contractors National Assn., Room 1401, 1250 Avenue of the Americas, New York 20, N. Y., and 215 Kenilworth Rd., Ridgewood, N. J.

FITZ, Jean Chandler (*M* 1938) Precipitator Specialist, Raytheon Manufacturing Co., 60 East 42nd St., New York, and • 405 Webster Ave., New Rochelle, N. Y.

FITZGERALD, Frank R. (*A* 1946) Sales Engr., Minneapolis-Honeywell Regulator Co., 2840 E. Olympic Blvd., Los Angeles, and • 733 W. Enloe St., El Monte, Calif.

FITZGERALD, Matthew J. (*M* 1934) Pres., Standard Asbestos Manufacturing Co., 820 W. Lake St., Chicago, and • 1117 N. Linden Ave., Oak Park, Ill.

FITZGERALD, William E. (*A* 1943; *J* 1936; *S* 1935) Pres., • Fitzgerald Plumbing & Heating Co., Inc., 939 Louisiana Ave., Shreveport, and 1905 Gilbert St., Shreveport 9, La.

FITZSIMONS, J. P. (*M* 1941; *A* 1940; *J* 1934; *S* 1932) Mgr., • Trane Company of Canada, Ltd., 905 Railway Exchange Bldg., 637 Craig St. W., Montreal, and 6091 Terredonne Ave., N. G. D., Montreal, Que., Canada.

FITZSIMONS, Robert H. (*A* 1946) Dist. Mgr., • Trane Company of Canada, Ltd., 63 John St. S., and 63 London St. S., Hamilton, Ont., Canada.

FLAGG, Louis F. (*A* 1947) Sales Engr., Minneapolis-Honeywell Regulator Co., 1919 K St. N.W., Washington, D. C., and • 318 Holly Ave., Takoma Park 12, Md.

FLAGG, William J. (*A* 1947) Chief Engr., • Ohlssons Cape Breweries Ltd., P. O. Box 12, Claremont Cape Point, South Africa.

FLANAGAN, James B. (*A* 1939) Mgr., • Warden King, Ltd., 2104 Bennett St., and 4243 Westhill Ave., N. D. G., Montreal, Que., Canada.

FLANIGAN, William P. (*M* 1948; *J* 1944) Vice-Pres., Lloyd E. Mitchell, Inc., 4650 Reisterstown Rd., and • 5508 Greenleaf Rd., Baltimore, Md.

FLARSHEIM, Clarence A. (*M* 1947; *A* 1940; *J* 1933) Owner, • Clarence A. Flarsheim, 338 Board of Trade Bldg., 10th and Wyandotte, Kansas City 6, and 4415 Roanoke Pkwy., Kansas City 2, Mo.

FLECK, William R. (*A* 1947) Mgr. & Partner, • M & T Furnace Co., 10500 Lorain Ave., and 3054 West 103rd St., Cleveland 11, Ohio.

FLEISHER, Walter L.* (*Life Member*; *M* 1914), (*Presidential Member*), (Pres., 1941; 1st Vice-Pres., 1940; 2nd Vice-Pres., 1939), (Council, 1936-42) Pres., • Air & Refrigeration Corp., 475 Fifth Ave., New York 17, and Saw Mill Farm, New City, N. Y.

FLEISHER, Walter L., Jr. (*A* 1947; *J* 1945) Mance Corp., 400 W. Broadway, New York 12, N. Y.

FLEMING, Clarence L. (*A* 1947) Owner & Operator, • Fleming Refrigeration Co., 805-A M & M Bldg., and 6830 Japonica, Houston, Texas.

FLEMING, James G. (*A* 1946) Sales Engr., Douglas Engineering Co., Ltd., 139 Arlington Ave., Toronto, Ont., Canada.

FLEMING, Paul B. (*M* 1941) Cons. Engr., • Room 406, 1900 Euclid Ave., Cleveland 15, and 20859 Erie Rd., Rocky River, Ohio.

FLETCHER, Saxton W. (*M* 1945) Pres., • J. O. Ross Engineering Corp., 350 Madison Ave., New York 18, and 880 North St., White Plains, N. Y.

FLETTRICH, Harold L. (*A* 1945) Owner, 2314 Iberville St., and • 5828 Catina St., New Orleans, La.

FLINK, Carl H. (*M* 1923) Tech. Secy., • American Society of Heating and Ventilating Engineers, 51 Madison Ave., New York 10, and 166 Summit Ave., Mt. Vernon, N. Y.

FLINN, George S. (*M* 1947; *A* 1946) Air Cond. Engr., J. J. Nolan & Co., 78 Washington, and • 490 Greer, Memphis, Tenn.

FLINN, J. D. (*M* 1943) Partner, • Flinn & Thorpe, Engrs., 119 Madison Ave., and 1516 Vollintine Ave., Memphis, Tenn.

FLINT, Coll T. (*M* 1919) Sales Mgr., The H. B. Smith Co., Inc., 104 Hanover St., Boston, and • 8 Searle Ave., Brookline, Mass.

FLOCKE, Kenneth N. (*A* 1946; *J* 1940) Chief Indus. Hygiene Engr., Oregon State Industrial Accident Commission, c/o Oregon State Board of Health, 1022 Southwest 11th Ave., Portland 5, and • Apt. 24, 1515 N. Ainsworth St., Portland 11, Ore.

FLOETER, Elliott G., Jr. (*A* 1946) Sales Engr., • Way Engineering Co., P. O. Box 8066, Houston 4, and 2706 Albans Rd., Houston, Texas.

FLORETH, John J. (*M* 1939) Gen. Sales Mgr., Westerlin & Campbell Co., 185 N. Wabash Ave., Chicago 1, and • 924 S. Crescent Ave., Park Ridge, Ill.

FLY, E. Paul (*A* 1947; *J* 1942) Vice-Pres., Geo. M. Fly & Sons, 1706 Church St., Nashville 3, and • Kimbark Dr., 3, Nashville 5, Tenn.

FOGG, Joseph H. (*A* 1942; *J* 1940) Naval Archt., U. S. Maritime Commission, Dept. of Commerce Bldg., Washington, D. C., and • 217 E. Bellefonte Ave., Alexandria, Va.

FOLEY, John J. (*A* 1938) Pres., • Universal Refrigeration, Ltd., 593 Adelaide St. W., and 176 Cortleigh Blvd., Toronto, Ont., Canada.

FOLSOM, Rolfe A. (*M* 1938) Owner, The Interlocking Block Co., P. O. Box 387, San Jose 3, and • 316 Crest Dr., San Jose 12, Calif.

FOOTE, Avery G. (*M* 1943) Regional Commercial Sales Mgr., • Frigidaire Division, General Motors Corp., 1355 Market St., San Francisco 3, and 365 Vermont Ave., Berkeley 7, Calif.

FOOTE, Earle E. (*M* 1936) Gen. Supt., Consumers Central Heating Co., 108 East 11th St., and Rt. 12, Box 501A, Tacoma, Wash.

FORAN, Laverne E. (*J* 1948) Mech. Engr., • Chicago Steel Furnace Co., 9326 S. Anthony, Chicago 17, and 1200 E. Madison Park, Chicago 15, Ill.

FORDERBRUGEN, Kevin J. (*A* 1941; *J* 1938), Chief Engr., • Minnesota Valley Natural Gas Co., and 1202 S. Minnesota St., St. Peter, Minn.

FOREST, Leo (*A* 1947) Owner, Godin Sheet Metal Works Reg'd., 547 de Lasalle, Montreal, and • Co. Rouville St., Hilaire, Que., Canada.

FORFAR, D. M. (*M* 1917) Mech. Engr., • Grinnell Co., Inc., 240 Seventh Ave. S., and 4817 Emerson Ave. S., Minneapolis, Minn.

FORRESTER, Charles O. (*A* 1945) Mech. Engr., Federal Public Housing Authority, 801 Georgia Savings Bank Bldg., and • 278-12th St. N.E., Atlanta, Ga.

FORRESTER, Norman J. (*A* 1936) Mgr., Contract Div., The Garth Co., 750 Belair Ave., and • 23 Nelson Ave., Montreal West, Que., Canada.

FORSBERG, William (*M* 1919) Secy., The Hopson & Chapin Manufacturing Co., 231 State St., New London, Conn.

FORSLUND, Oliver A. (*M* 1936) Owner, Forslund Pump & Machinery Co., 1717-19 Main St., Kansas City 8, and • 108th St. and State Line, Kansas City 5, Mo.

FORSYTH, Stuart L. (*M* 1944) Mgr., Elec. Htg. for Homes, Westinghouse Electric Corp., 5915 Green St., Emeryville 8, Calif.

FOSS, Benjamin S., Jr. (*A* 1944) Texas Repr., • The Lewin-Mathes Co., 711 Construction Bldg., Dallas 1, and "Halfway Hill," Rt. 7, Dallas, Texas.

FOSS, Edwin R. (*A* 1936) Dist. Mgr., • The Powers Regulator Co., 142 Spring St. N.W., Atlanta 3, and 257 Bolling Rd. N.E., Atlanta, Ga.

FOSTER, Charles (*Life Member*; *M* 1923) Cons. Engr., • 316 Medical Arts Bldg., Duluth 2, and 2831 E. First St., Duluth, Minn.

FOULDS, P. A. L. (*Life Member*; *M* 1916) Cons. Engr., 72 Whitin Ave., Rever 51, Mass.

FOULGER, Sid W. (*A* 1946) Partner, • Thermal Engineering Co., P. O. Box 446, Salt Lake City, and Kaysville, Utah.

FOWLES, Harry H. (*A* 1940; *J* 1934) Engr. and Estimator, L. P. Bail, 45 Riverside St., Lewiston, and • 154 Field Ave., Auburn, Me.

FOX, Ernest (*M* 1935) Htg. Engr., • C. A. Dunham Co., Ltd., 1139 Bay St., Toronto, and 531 Rushton Rd., Toronto, Ont., Canada.

FOX, Ernest C. (*M* 1944) Vice-Pres., • Hager-Fox Heating & Refrigeration Co., 1125 S. Pennsylvania Ave., and 928 W. Michigan Ave., Lansing, Mich.

FOX, Francis J. (*A* 1945) Owner, • Gas Heat Engineering Co., 345 E. Lake St., Minneapolis 8, and 3501-11th Ave. S., Minneapolis 7, Minn.

FOX, John H. (*M* 1935) Sales Mgr., • Minneapolis-Honeywell Regulator Co., Ltd., Vanderhoff Ave., Toronto 12, and 37 Macdonell Ave., Toronto 3, Ont., Canada.

FOX, Winford L. (*A* 1944) Engr., U. S. Machine Corp., Lebanon, and • 1912 N. Meridian St., Indianapolis 2, Ind.

FOXHALL, William B. (*A* 1946) Assoc. Editor, Heating & Ventilating, 148 Lafayette St., New York, and • 35-15-84th St., Jackson Heights, N. Y.

FRAMBACH, Frederick S. (*M* 1946) Engr., The Bahnson Co., Winston-Salem, N. C., and • 703 Embree Crescent, Westfield, N. J.

FRANCK, Peter (*A* 1947; *J* 1938) Armo Cooling & Ventilating Co., 30 West 15th St., New York 11, and • 59 Bradley Rd., Scarsdale, N. Y.

FRANK, George D. (*M* 1945) Mgr., Indus. Div., York-Shipley, Inc., and • R. D. 5, York, Pa.

FRANK, John M. (*M* 1918; *A* 1912) Pres., • Ilg Electric Ventilating Co., 2850 N. Crawford Ave., Chicago, and 1152 Chatfield Rd., Hubbard Woods, Ill.

FRANK, Milton S. (*J* 1948) Chem. Engr., • Neil H. Peterson Co., 1129 Folsom St., and 860 Bush St., Apt. 2, San Francisco, Calif.

FRANKEL, Gilbert S. (*M* 1926) Mgr., Federal and Marine Dept., Buffalo Forge Co., 310 Woodward Bldg., Washington 5, D. C., and • 5800 Kirkside Dr., Chevy Chase 15, Md.

FRANKENFELD, Henry V. (*A* 1947) • National Plumbing & Heating, 4004 N. Fourth St., Albuquerque, New Mexico, and 1521 N. Western, Oklahoma City, Okla

FRANKFURT, W. W. (*M* 1943) Cons. Engr., • Coston & Frankfurt, Archts. & Engrs., 519 Apco Tower, and 1524 Northwest 38th St., Oklahoma City, Okla.

FRANKHOUSER, Elmer V. (*M* 1946) Supt. of Power, Radio Corporation of America, R. C. A. Victor Div., Camden, N. J., and • 174 Glencoe Rd., Upper Darby, Pa.

FRANKLE, Harry R. (*M* 1941) Partner, • Midwest Air Control, 510 Third St., and 547-44th St., Des Moines, Ia.

FRANKLE, Milton S. (*A* 1946) Vice-Pres. and Sales Mgr., • Air Control, Inc., 720 Brandeis Theatre Bldg., Omaha, Nebr., and 263 West End Ave., Apt. 20, New York, N. Y.

FRANKLIN, John K. (*A* 1948) Htg. Engr., McCrea Equipment Co., • 516 Second St. N.W., and 514 Second St. N.W., Washington 1, D. C.

FRANKLIN, Ralph S. (*M* 1919) Mech. Engr., Lockwood Greene Engineers, Inc., 40 Central St., Boston, and • 320 Grove St., Melrose, Mass.

FRANKLIN, Samuel H., Jr. (*A* 1938) Pres., • Virginia Air Conditioning Co., Inc., 1419 Park Ave., and 204 Colonial Ct., Lynchburg, Va.

FRASER, George M. (*A* 1946) Archt. Service Representative, United States Gypsum Co., Chicago, and • 314 Lee St., Evanston, Ill.

FRASER, James J. (*A* 1936) Managing Dir., Honeywell-Brown, Ltd., 1 Wadsworth Rd., Perivale, Greenford, and 29 Wellesley Rd., Strawberry Hill, Middlesex, England.

FRAZEE, Francis B. (*A* 1946) Appl. and Sales Engr., Westerlin & Campbell Co., 1113 W. Cornelia St., Chicago 13, and • 5168 N. Lovejoy Ave., Chicago 30, Ill.

FRAZIER, J. Earl (*A* 1936) Pres. and Secy., • Frazier-Simplex, Inc., 436 E. Beau St., and 7 Wilmont Ave., Washington, Pa.

FREAN, Frederick C. (*A* 1948) Tech. Dir., • The Air Treatment Engineering Co. Ltd., 100 Gelderd Rd., Leeds 12, and 15 The Lane, Alwoodley, Leeds, England.

FREDERICK, Holmes W. (*M* 1937) Asst. Dir., Dept. of Buildings and Grounds, • 301 University Hall, Columbia University, New York 27, N. Y., and R. D. 1, Box 3, Riverside Ave., Riverside, Conn.

FREDERICK, Vernon L. (*A* 1946) Owner, Mech. Contr., 2217 M St. N.W., and • 3805 S St. N.W., Washington, D. C.

FREEMAN, Alfred W. (*J* 1940; *S* 1939) Engr., • The Freeman Co., 121 Greenpoint Ave., Brooklyn 22, and 130-06-219th St., Springfield Gardens 13, N. Y.

FREEMAN, Cassius W. (*M* 1945) Chief Designer and Assoc., • Paul D. Bemis, 36 Pearl St., Hartford 3, and 290 Forest St., East Hartford, Conn.

FREEMAN, J. Albert (*A* 1940; *J* 1938) Partner Engr., • Western Engineering Co., 2105 S.E. Ninth Ave., Portland 14, and 4436 S.W. Dosch Rd., Portland 1, Ore.

FREEMAN, Lewis E. (*A* 1946) Mgr., Plbg. and Htg. Dept., • Sullivan Hardware Co., 331 W. Washington St., and 10 Tindal Ave., Greenville, S. C.

FREIJE, W. F. (*M* 1943) Mgr., Refrig. Div., • Hayes Brothers, Inc., 236 W. Vermont St., Indianapolis 4, and 5411 W. Morris St., Indianapolis 8, Ind.

FREITAG, Frederic G. (*M* 1932) Lake Hill, Ulster Co., N. Y.

FREITES, Andres A. (*J* 1945) Constr. and Maint. Supvsr., • Esso Standard Oil (Caribbean), S. A., P. O. Box 1198, and Ave. Independencia 34, Ciudad Trujillo, Dominican Republic.

FRENCH, Donald (*M* 1926) Vice-Pres., in Charge of Engrg. Div., • Carrier Corp., 300 S. Geddes St., Syracuse 1, and Cazenovia, N. Y.

FRENSDORF, Stuart F. (*A* 1947) Sales Engr., Slawson Equipment Co., Inc., 1792 East 40th St., Cleveland 3, and • 12700 Shaker Blvd., Cleveland 20, Ohio.

FRENTZEL, Herman C. (*M* 1936) Cons. Engr., Frentzel Engineering Co., 724 E. Mason St., Milwaukee 2, and • 4303 N. Wildwood Ave., Milwaukee 11, Wis.

FREY, George W. (*A* 1946) Vice-Pres., • Central Supply Co., 2929 Fourth Ave. S., Minneapolis 8, and 4736-12th Ave. S., Minneapolis 7, Minn.

FREYDER, G. Gill (*A* 1945) Air Cond. Engr., • Commonwealth Edison Co., 72 W. Adams St., Chicago 90, and 131 Clinton St., Park Ridge, Ill.

FRICKE, Robert A. (*S* 1947) Student, Michigan College of Mining & Technology, and • Box 643, Houghton, Mich.

FRIEDLER, Joseph J., Jr. (*M* 1940) Dist. Mgr., • Ilg Electric Ventilating Co., 304 Natchez Bldg., New Orleans 12, and 500 Audubon Blvd., New Orleans 15, La.

FRIEDLIEB, Morton J. (*J* 1942) Plant Engr., Super Electric Products Corp., 1057 Summit Ave., Jersey City, N. J., and • 2417 Dickens Ave., Far Rockaway, L. I., N. Y.

FRIEDLINE, James M. (*A* 1942; *J* 1937) Capt., 0317228, Hdq. 79th Engr., Const. Bn., A. P. O. 74, San Francisco, Calif., and • Plymouth, Ia.

FRIEDMAN, Arthur (*A* 1936) Pres., • Air Controls, Inc., 2310 Superior Ave., Cleveland 14, and 15700 S. Morland Blvd., Shaker Heights, Ohio.

FRIEDMAN, David H., Jr. (*M* 1936) Major, 531 Whitney Ave., New Haven, Conn.

FRIEDMAN, F. J.* (*M* 1921) Cons. Engr., • McDougall & Friedman, 1235 McGill College Ave., Montreal 2, Que., Canada.

FRIEDMAN, Milton (*A* 1939; *J* 1935; *S* 1933) 333 West End Ave., Apt. 14C, New York, N. Y.

FRIEND, Walter F. (*M* 1941) Mech. Engr., • Ebasco Services, Inc., 2 Rector St., New York 6, and 470 West 24th St., New York 11, N. Y.

FRISSE, John L. (*A* 1945) Owner, The Thermal Products Co., 4500 Euclid Ave., Cleveland 3, and • 17412 Shelburne Rd., Cleveland Heights 18, Ohio.

FRITSCHE, Carl (*M* 1943) The Carl Fritsche Co., 424 Park Ave., East Orange, N. J.

FRITZBERG, Lawrence H. (*M* 1941) Mech. Engr., • Acrofin Corp., 410 S. Geddes St., Syracuse 1, N. Y., and 4628 Columbus Ave. S., Minneapolis 7, Minn.

FROEHLICH, Bernard F. (*A* 1947) Owner, • Miami Heating Co., 5736 Luhn Ave., Cincinnati, Ohio.

FROELICH, H. Allen (*A* 1939) Owner, • H. Allen Froelich, Air Conditioning & Appliances, 110 W. Seventh St., and 728 W. Chestnut St., Junction City, Kans.

FROESE, E. A. (*M* 1944) Branch Mgr., York Corp., 804 Security Bldg., Denver 2, and • 1922 Locust St., Denver 7, Colo.

FROST, Winston E. (*J* 1947) Engr., Dallas Air Conditioning Co., 2809-11 Canton St., and • 6032 Lewis St., Dallas, Texas.

FUCHS, Joseph (*A* 1946) Supt. and Vice-Pres., • Coon-Fuchs, Inc., Ft. of Ludington, Buffalo 5, and 558 Lisbon Ave., Buffalo 15, N. Y.

FUITE, Richard J. (*A* 1945) Dist. Repr., • Hoffman Specialty Co., 780 Natoma St., San Francisco 3, and 2300 N. Point St., San Francisco 23, Calif.

FULLER, Charles A. (*M* 1940) • Slocum & Fuller, 714 Fifth Ave., New York, and 501 E. Fifth St., Mt. Vernon, N. Y.

FULLER, Clayton W. (*A* 1945) Engr., • 5900 Highgate Dr., Baltimore 15, Md.

FULLER, Elbridge W. (*M* 1938) Pres. & General Mgr., General Engineering Co., Inc., 3163 S.W. 21st, Terrace, Miami, and • 1524 Garcia Ave., Coral Gables, Fla.

FULLERTON, Laurence I. (*A* 1946) Pres., • The Colton Corp., 72 Main St., P. O. Box 268, Whitewater, Wis.

FULLINGTON, Gordon A. (*A* 1946) Engr., • Carrier Corp., International Div., 122 East 42nd St., New York 17, N. Y., and c/o Mrs. W. L. Purnell, Snow Hill, Md.

FULLMAN, James B. (*A* 1946; *J* 1941) Arch. Repr., A. M. Byers Co., 30 Rockefeller Plaza, New York 20, N. Y., and • Scofieldtown Rd. & Woodley Lane, R. D. 2, Stamford, Conn.

FULMOR, Ira P. (*M* 1942) Owner, • Air Conditioning Co., of Southern California, 1003-1005 Santa Fe Ave., Los Angeles 21, and 325 Arnaz Dr., Los Angeles 36, Calif.

FURBER, Stanley L. (*M* 1946; *A* 1941) Senior Sales Engr., Minneapolis-Honeywell Regulator Co., and • 5237 Third Ave. S., Minneapolis, Minn.

FURMAN, Gilbert J. (*A* 1946) Mach. Procurement Engr., Western Electric Co., Inc., Hawthorne Station, Chicago 23, Ill., and • 326 S. Lake St., Lakeland, Fla.

FYFE, John H. (*A* 1944) Owner, Suburban Engineering Co., 211 Center Bldg., Lansdowne, and • 2305 Belvedere Ave., Havertown, Pa.

G

GABBARD, Frederic W. (*A* 1946) Engr., • Occidental Electric Co., P. O. Box 466, and P. O. Box 1116, Nogales, Ariz.

GABBERT, William L. (*M* 1945) Mgr., New York Office, • American Air Filter Co., Inc., 5940 Grand Central Terminal Bldg., New York 17, and 108 Monterey Ave., Pelham, N. Y.

GABLE, H. R.* (*A* 1943) Design Engr., • Union Steel Products Co., 500 N. Berrien, and 917 N. Clinton, Albion, Mich.

GAD, Alfred (*A* 1946) Refrig. and Air Cond. Engr. and Contr., • 13 Adly Pacha St., and 191 Malika Nazli Ave., Cairo, Egypt.

GAGE, Burford B. (*M* 1944) Owner, • Gage Plumbing & Heating Co., P. O. Box 1035, 240 S. Sante Fe, and 139 Overhill Rd., Salina, Kans.

GAGLIARDI, Frank A. (*J* 1948) Instructor, • University of Florida, Room 303, Engrg. Bldg., and Rt. 4, Box 28A, Gainesville, Fla.

GAINES, E. F. (*A* 1947) Pres., • Home Conditioning Co., 10th & Moffet, and 405 N. Wall, Joplin, Mo.

GALABA, Alexander (*M* 1944) Chief Engr., • Morrison Products, Inc., 16816 Waterloo Rd., Cleveland 10, and 1861 Beverly Hills Dr., Euclid, Ohio.

GALLAGHER, James M., Jr. (*A* 1947) Vice-Pres., • J. M. Gallagher Co., Inc., 526-528 Eighth Ave. S., Nashville 4, and Valley Brook Rd., Nashville, Tenn.

GALLMEIER, Siegmund H. (*M* 1943) Mech. Engr. and Administrator, Harley, Ellington & Day, Inc., Kale Bldg., Detroit 26, and • 18495 Ilene, Detroit 21, Mich.

GALLOWAY, David (*M* 1941) Vice-Pres., • Bowen Refrigeration Supplies, Inc., 323 Spring St. N.W., Atlanta, and 1018 E. Lake Dr., Decatur, Ga.

GAMBLE, Burton L. (*A* 1946; *J* 1944) Design Engr., Ferro Enamel Corp., 4150 East 56th St., Cleveland 5, and • 1857 East 85th St., Cleveland 6, Ohio.

GAMBLE, Cary B. (*M* 1940; *A* 1935) Partner, Cary B. Gamble & Assocs., 314½ St. Charles Ave., New Orleans 12, and • 3432 Upperline St., New Orleans 15, La.

GAMMILL, O. Eldrige, Jr. (*M* 1940; *A* 1937; *J* 1930) Dir. of Sales (Heavy Machinery), Carrier Corp., 300 S. Geddes St., Syracuse 1, and • 403 Oak St., Syracuse, N. Y.

GANNON, Russell R. (*M* 1939) Owner, • Russell R. Gannon Co., 700 Dixie Terminal Bldg., Cincinnati 2, and 6442 Grand Vista Ave., Pleasant Ridge, Cincinnati, Ohio.

GANT, H. P.* (*M* 1915), (*Presidential Member*), (Pres., 1923; 1st Vice-Pres., 1922; 2nd Vice-Pres., 1921), (Council, 1918; 1921-24) R. D. 1, Glenmore, Pa.

GANTER, Carl F. (*M* 1947) Partner, • Westville Electric Co., • 89 Goffe St., New Haven, and 184 Forest Rd., West Haven, Conn.

GARBER, William E., Jr. (*A* 1944; *J* 1938) Sales Mgr., Farquar Heating Service Co., 3406 E. Tenth St., Indianapolis 1, and • R. R. 10, Box 214, Indianapolis, Ind.

GARDNER, C. Rollins (*M* 1946; *A* 1937) Vice-Pres., • Martyn Brothers, Inc., 1000 St. Louis St., Dallas 1, and 3101 Rogers St., Ft. Worth, Texas.

GARDNER, Francis B. (*M* 1944) Pres., F. B. Gardner Co., Inc., 1401 East 17th St., Los Angeles 21, Calif.

GARDNER, Marvin K. (*A* 1945; *J* 1944) • Ilg Electric Ventilating Co., 1215 Texas Bank Bldg., Dallas 1, and 2725 W. Avon, Dallas 11, Texas.

GARDNER, Robert A. (*A* 1946) Branch Mgr., Norris Warming Co., Ltd., 18 Hampshire Terrace, Portsmouth, Hants., and • 38 Cyril Mansions, Prince of Wales Dr., London S.W. 11, England.

GARNEAU, Leo (*M* 1938; *J* 1930) Sales Engr., C. A. Dunham Co., Ltd., Room 832, Dominion Square Bldg., 1010 St. Catherine St. W., Montreal 2, and • 25 Salisbury Rd., Pointe Claire, Que., Canada.

GARNER, Robert V. (*M* 1947) Mgr., Air Cond. Dept., The Frank A. McBride Co., 160 Ward St., Paterson, and • 41 Kenwood Rd., Tenafly, N. J.

GARNETT, William (*M* 1945) Mech. Engr., War Ordnance, Frankford Arsenal, Philadelphia, and • 420 Cottman St., Cheltenham, Pa.

GARRARD, Walter M. (*M* 1946) Partner, • Thermal Engineering Co., 810 Bona Allen Bldg., Atlanta 3, and 60 Muscogee Ave. N.W., Atlanta, Ga.

GARRISON, C. Hill (*M* 1943) Owner, • C. H. Garrison Co., 700 Dwight Bldg., Kansas City 6, and R. F. D. 3, Lee's Summit, Mo.

GARVIN, Joshua L. (*A* 1945) Engr., Army Air Field, and • 122 Woodland Shores Rd., Charleston, S. C.

GASKELL, William, Jr. (*A* 1947) Chief Engr., Htg. Products Div., The Miller Co., 99 Center St., Meriden, and • 80 Fairview Ave., Wallingford, Conn.

GATES, Albert S., Jr. (*M* 1943; *A* 1941) Engr. Bureau of Ships, Code 638, Navy Department, Washington, D. C., and 621 N. Jackson St., Arlington, Va.

GATES, James N. (*M* 1944) Engr., • Cragin & Wilkins Co., Inc., 12 Mt. Pleasant Ave., Leominster, and 452 Main St., Acton, Mass.

GAULIN, Richard P. (*A* 1945) Sales. Engr., Taco Heaters, Inc., 5414-8th St. N.W., Washington, D. C.

GAULT, George W. (*A* 1946; *J* 1937; *S* 1934) Estimating Engr., Norair Engineering Corp., 1114-22nd St. N.W., Washington, D. C., and • 403 E. Luray Ave., Alexandria, Va.

GAUSE, H. Chester (*M* 1937) Indus. Power Engr., Alabama Power Co., 600 North 18th St., P. O. Box 2641, Birmingham 2, and • 3916 Montevallo Rd., Birmingham 9, Ala.

GAUSEWITZ, William H. (*A* 1937) Pres., • Yale Engineers, Inc., 2919 Fremont S., Minneapolis 8, and 1321 W. Minnehaha Pkwy., Minneapolis 9, Minn.

GAUSMAN, Carl E. (*M* 1923) Partner, Gausman & Moore, 1026 First National Bank Bldg., and • 2360 Chilcombe Ave., St. Paul, Minn.

GAVELEK, William A. (*A* 1947) Partner and Engr., • Elmer Gylleck & Associates, 120½ S. Grove, and 335 Hamilton, Elgin, Ill.

GAY, Clarence E., Jr. (*J* 1944) 3487 St. Joachim Lane, St. Louis 14, Mo.

GAY, Clarence E., Sr. (*M* 1944) Mgr., Heaven Engineering Co., 1330 Broadway, Kansas City 6, and • 410 West 17th St., Kansas City 8, Mo.

GAYLORD, Asa K. (*A* 1947) Engr. • Montag Stove & Furnace Works, 2011 N. Columbia Blvd., and 7416 Southwest 25th Ave., Portland, Ore.

GAYLORD, F. H. (*M* 1921) Vice-Pres., Hoffman Specialty Co., Indianapolis, Ind., and • 362 N. York St., Elmhurst, Ill.

GAYMAN, Paul D. (*M* 1938) Branch Mgr., • Johnson Service Co., 2142 East 19th St., Cleveland, and 20875 Endsley Ave., Rocky River, Ohio.

GAYNER, James (*M* 1937) James Gayner, Cons. Engr., • 45 Second St., San Francisco, and 327 Magnolia Ave., Piedmont, Calif.

GEBUHR, John V. (*A* 1947) Assoc. Engr., • Brown Engineering Co., 326-334 K. P. Bldg., Des Moines 9, and 1128 Oak Park Ave., Des Moines 13, Iowa.

GEHRS, William (*A* 1939) Branch Mgr., • Johnson Service Co., 3408 S.E. Hawthorne Blvd., Portland 15, and 3801 S.E. Woodward St., Portland 2, Ore.

GEIGER, Irvin H. (*M* 1919) Reg. Prof. Engr., • 410 Telegraph Bldg., and 240 Maclay St., Harrisburg, Pa.

GEIGER, Raymond L. (*M* 1939) Mech. Engr., Austin Co., Noble Rd. and Euclid Ave., and • 1536 Dille Rd., Euclid, Ohio.

GEIRINGER, Paul L. (*M* 1943) Chief Engr., • American Hydrotherm Corp., 215 East 27th St., New York, and 17 Fairview Ave., Bronxville, N. Y.

GEISER, Richard A. (*A* 1947) Engr., • Lincoln Bouillon & Associates, 426–1411 Fourth Ave. Bldg., and 4830 East 43rd, Seattle, Wash.

GEISSENHAINER, Louis R. (*A* 1945) Mfrs. Repr., • L. R. Geissenhainer, 89 Broad St., Boston 10, Mass., and Warner Hill Rd., Derry, N. H.

GELERT, Carl R. (*A* 1945) Partner, • C. R. Gelert Co., 35 N. Raymond St., Pasadena 1, Calif.

GELLERT, Louis W. (*M* 1947) Engr., Deleuw Cather Co., 150 N. Wacker Dr., Chicago 6, and • 1633 N. Western Ave., Chicago 47, Ill.

GELTZ, Ralph W. (*A* 1943; *J* 1936) Dist. Engr., York Corp., 2700 Washington Ave., Cleveland 13, and • 14025 Lakota Ave., Cleveland 11, Ohio.

GENDEIN, Sigman (*M* 1948) Sigman Gendein, Mfrs. Repr., • 2833 Hennepin Ave., and 2870 Humboldt Ave. S., Minneapolis, Minn.

GENONE, Henry W. (*M* 1941) Vice-Pres. in charge of Engrg., • Dinkler Hotels Co., Inc., Ansley Hotel, and 83-26th St. N.E., Atlanta, Ga.

GERDSEN, Arno H. (*A* 1945) Pres., • The A. H. Gerdsen Co., 224 E. Second St., Cincinnati 2, and R. R. 14, Beechgrove Dr., Cincinnati 11, Ohio.

GERHARDT, Emerson D. (*A* 1946) Chief Installations Design Engr., The Glenn L. Martin Co., Baltimore 3, Md.

GERMAIN, Oscar (*M* 1935) Vice-Pres., Germain & Frere, Ltd., 237 St. Antoine St., and • 12 Boulevard St. Louis, Trois-Rivieres, Que., Canada.

GERRISH, David C. (*A* 1946) Appl. Engr., Minneapolis-Honeywell Regulator Co., 2753 Fourth Ave. S., Minneapolis, and • 3 Spur Rd., Hilldale, Edina, Minn.

GERRISH, Grenville B. (*M* 1944; *A* 1936; *J* 1930) Pres., • Wolverine Equipment Co., 31 Main St., Cambridge 42, and 26 Standish Rd., Melrose 76, Mass.

GERRISH, Harry E. (*Life Member*; *M* 1910), (Council, 1919) Pres., • Morgan-Gerrish Co., 1111 Nicollet Ave., Room 370, Minneapolis 2, and 4534 S. Fremont Ave., Minneapolis 9, Minn.

GERRISH, John K. (*A* 1947) Sales Engr., • Morgan-Gerrish Co., 1111 Nicollet Ave., Minneapolis 2, and 3644 16th Ave. S., Minneapolis, Minn.

GERSTENBERGER, Edgar J. (*A* 1938) Secy.-Treas., Glendale Supply Co., 1819 W. Glendale Ave., Milwaukee 9, and • 3824 North 17th St., Milwaukee 6, Wis.

GESSELL, E. T. (*M* 1941) • W. E. Lewis & Co., 610 Thomas Bldg., Dallas 1, and 2705 E. Amherst, Dallas 5, Texas.

GETSCHOW, Roy M. (*M* 1919) Pres., • Phillips-Getschow Co., 32 W. Hubbard St., Chicago, and 122 Woodstock, Kenilworth, Ill.

GETTINGER, Edgar W. (*M* 1945) Prod. Design Engr., • American Furnace Co., 2725 Delmar, St. Louis, and 6627 University Dr., University City 5, Mo.

GHILLARDI, Fernand (*M* 1946) Cons. Engr. and Professor, La Regulation Automatique, 34 Rue Godot de Mauroy, Paris 8, and • 84 Rue Jullien, Vanves, Seine, France.

GHOSE, Khagendra N. (*A* 1938) Cons. Engr., 17 State St., New York, N. Y., and • 39 Ramkanta Bose St., Bagh Bazar, Calcutta, India.

GHOSH, B. B. (*M* 1947; *A* 1944; *J* 1939) Chief Technical Adviser, Refrigerators (India) Ltd., Park St., and • 165A Janak Rd., Calcutta, India.

GIANNINI, Albert (*M* 1947) Sales Engr., Carrier Corp., 405 Lexington Ave., New York, and • Greyrock Ave., Hartsdale, N. Y.

GIANNINI, Mario C. (*M* 1935) Exec. Asst., • New York University, University Heights, New York 53, and 322 Read Ave., Crestwood, N. Y.

GIANOS, Theodore C. (*S* 1948) Student, University of Minnesota, and • 4412 W. Lake Harriet Blvd., Minneapolis 10, Minn.

GIBBARD, Harry S. (*M* 1946) Chief Engr., Norman Products Co., Inc., 1150 Chesapeake Ave., Columbus 8, and • 1340 Thornwood Pl., Apt. A, Columbus, Ohio.

GIBBONS, Michael J. (*M* 1914) Partner, M. J. Gibbons Supply Co., 601 E. Monument Ave., Dayton, and • 116 W. Thruston Blvd., Dayton 9, Ohio.

GIBBONS, Michael J., Jr. (*A* 1944) Htg. Engr., M. J. Gibbons Supply Co., 601 E. Monument Ave., Dayton 2, and • 206 Canterbury Dr., Dayton 9, Ohio.

GIBBS, Edward W. (*Life Member*; *M* 1919) Pres., • The Smith-Gibbs Co., 201 S. Main St., and 39 President Ave., Providence, R. I.

GIBSON, Harry E. (*A* 1945) Owner, • Gibson Sheet Metal Works, 965 W. Western Ave., Muskegon, and R. R. 2, Box 287, Spring Lake, Mich.

GIESECKE, F. E. (*Life Member*; *M* 1913), (*Presidential Member*), (Pres., 1940; 1st Vice-Pres., 1939; 2nd Vice-Pres., 1938), (Council, 1932-41) Cons. Engr., Box 417, New Braunfels, Texas.

GIFFORD, Edmund W. (*M* 1942) Dist. Mgr., • Himelblau Byfield & Co., 611 N Broadway, Milwaukee 2, and 4457 N. Stowell Ave., Shorewood 11, Wis.

GIFFORD, Robert L. (*Life Member*; *M* 1908) Pres., Illinois Engineering Co., 21st St. and Racine Ave., Chicago 8, Ill., and • 1231 S. El Molino Ave., Pasadena 5, Calif.

GILBERT, I. Wolfe (*A* 1945) Co-Owner, Gilbert & Knight Co., 1300 Broad St., and • 223 Pleasant St., Utica, N. Y.

GILBERT, Leslie S. (*M* 1937) Owner, • Gilbert Engineering Co., 1305 Liberty Bank Bldg., Dallas 1, Texas.

GILBERT, Thomas (*A* 1940) Sales Engr., Empire Brass Manufacturing Co., Ltd., 20 Jackson St. W., Hamilton, and • 12 South Drive, St. Catharines, Ont., Canada.

GILBOY, John P., Jr. (*M* 1941) Cons. Engr., • John P. Gilboy Co., 300 Bowman Bldg., and 1606 Sanderson Ave., Scranton, Pa.

GILBOY, William O. (*M* 1945) Appl. Engrg. Supvsr., Carrier Corp., 300 S. Geddes St., and • 954 Lancaster Ave., Syracuse, N. Y.

GILFRIN, George F. (*M* 1945) Owner, Apartado 63 Bis., and Esplanada 715, Lomas de Chapultepec, Mexico, D. F.

GILLE, Hadar B. (*M* 1930) Cons. Engr., Hugo Theorells Ingeniorsbyra AB, Lagerlofsgatan 8, Stockholm, and • Svanhildsvagen 19, Nockeby, Sweden.

GILLESPIE, Harvey M. (*A* 1945) Patent Lawyer, 105 W. Adams St., Chicago 3, Ill.

GILLHAM, Walter E. (*M* 1945) Cons., Htg. and Vtg. Engr., • 401-402 Scarritt Arcade, Kansas City 6, and 6336 Morningside Dr., Kansas City 5, Mo.

GILLILAND, Lesley L. (*A* 1942) Air Cond. Engr., Air Engineers, Inc., 1529 Second Ave., and • 4904 Seventh Ave., South Birmingham, Ala.

GILLIS, Harlan W., Jr. (*A* 1947) Mgr. of Equip., J. Weingarten, Inc., 600 Lockwood, and • Route 12, Box 627, Houston, Texas.

GILMAN, Franklin W. (*M* 1935) Plant Engr., • Loft Candy Corp., 38-38 Ninth St., Long Island City, N. Y., and The Chatham, 20th and Walnut Sts., Philadelphia, Pa.

GILMORE, Clarence F. (*S* 1946) Student, Texas A. & M. College, Box 644, College Station, and • 3116 Bryn Mawr, Dallas 5, Texas.

GILMORE, John L. (*M* 1944; *A* 1938) Owner, John L. Gilmore, 1525 Cochran Ave., and • 1604 Kay Ave., Brunswick, Ga.

GILMORE, Louis A. (*A* 1940; *J* 1935; *S* 1930) Pres., • Gilmore & Co., 115 South 11th St., St. Louis 2, and 6633 Kingsbury, St. Louis 5, Mo.

GINGRAS, Gilles C. J. (*A* 1948) Designer, Canadian Pacific Railway, Windsor St. Station (C.P.R.), Montreal No. 3, and • 6443 Second Ave., Rsmt, Montreal No. 36, Que., Canada.

GINI, Aldo (*M* 1933) Via Correggio 18, Milano, Italy.

GINN, Tony M. (*M* 1935) Gen. Mgr., Tony M. Ginn Co., 214 Fifth St. S., and • P. O. Box 1893, Great Falls, Mont.

GINSBERG, Maxwell R. (*A* 1944) Owner, American Construction & Engineering Co., 160-16 Jamaica Ave., Jamaica 2, L. I., N. Y.

GINZBURG, Nicola (*M* 1942) Mech. Engr., Pennell & Wiltberger, Cons. Engrs., 1524 Chestnut St., Philadelphia, Pa., and • 5 Maple Ave., Claymont, Del.

GIRGIS, Sobhi (*A* 1945) Chief Engr., • Carrier-Egypt, S.A.E., 37 Kasr El-Nil St., Cairo, and c/o Sami G. El-Masry, Rd. 15, Maadi, Cairo, Egypt.

GISH, Wilbur A. (*A* 1947) Indus. Sales Engr., • Pacific Power & Light Co., 920 S.W. Sixth Ave., Portland, and 1748 S.E. Elliott Ave., Portland 14, Ore.

GITTLESON, Harold (*A* 1936) Sales Mgr., LaRiviere, Inc., 3715 St. Lawrence Blvd., Montreal 18, and • 1125 Lajoie Ave., Apt. 6, Outremont, Montreal 8, Que., Canada.

GIVELBER, Samuel H. (*M* 1945) Pres., Reliance Heating & Air Conditioning Co., 1741 East 25th St., Cleveland 14, and 3411 Bradford Rd., Cleveland 18, Ohio.

GLADIEUX, Dale W. (*A* 1946) Sales Engr., • Johnson Service Co., 2142 East 19th St., Cleveland 20, and 3564 Normandy Rd., Shaker Heights 20, Ohio.

GLANCE, Alvin C. (*M* 1943) Field Repr., Anthracite Institute, 237 Old River Rd., Wilkes Barre, and • R. D. 2, Allentown, Pa.

GLANZ, Edward F. (*J* 1947) Estimator & Asst. Engr., • Glanz & Killian Co., 1761 W. Forest Ave., Detroit 8, and 2072 Country Club Dr., Grosse Pointe Woods 30, Mich.

GLANZER, Clarence J. (*M* 1944) Vice-Pres., • Merit Machine Co., Merit Appliances Div., Box 84, Northfield, and Vesta Ave., Northfield Center, Ohio.

GLASER, H. Donald (*M* 1948; *A* 1946) Engr. & Secy. of firm, • Henry Adams, Inc., Cons. Engrs., Federal Land Bank Bldg., 2315 St. Paul St., Baltimore 18, and 638 Overbrook Rd., Baltimore 12, Md.

GLASPIE, Donald L. (*J* 1947) Engr., • Shelby-Skipwith, Inc., 3277 Airways Blvd., Memphis, and 1847 Kendale, Memphis 6, Tenn.

GLASS, Robert (*A* 1943) Secy.-Treas., • Partridge-Halliday, Ltd., 144 Lombard St., Winnipeg, and 85 Claremont Ave., Norwood, Man., Canada.

GLASS, William (*M* 1934) Mgr., • Partridge-Halliday, Ltd., 144 Lombard St., and 605 River Ave., Winnipeg, Man., Canada.

GLOVER, Ralph P. (*A* 1945) Cons. Engr., 1024 Superior St., Oak Park, Ill.

GOANS, John W. (*A* 1947) Residential House Htg. & Vtg. Specialist, Knoxville Utilities Board, 626 S. Gay St., and • 1123 Albert Ave., Knoxville, Tenn.

GODBOLD, Bernard P. (*A* 1944) Principal Operating Engr., National Gallery of Art, Fourth and Constitution Ave. N.W., Washington 25, D. C. and • 419 Boyd Ave., Takoma Park 12, Md.

GODDARD, William F. (*M* 1947) Pres., • Goddard-Hottel Corp., 1200 15th St. N.W., Washington, and 3229 Morrison St. N.W., Washington 15, D. C.

GODES, Elliot (*M* 1947; *A* 1942; *J* 1939) Research Engr., • Anemostat Corporation of America, 10 East 39th St., New York 16, and 925 West End Ave., New York 25, N. Y.

GODFREY, George A. (*A* 1946) Sales Mgr., Machinery Dealers, 495 Railway Ave., and • 3205 W. King Edward Ave., Vancouver, B. C., Canada.

GODFREY, J. E. (*A* 1946; *J* 1938) Ens., Navy Dept., Section Ad 4b, Washington, D. C.

GOEBEL, Henry A. (*A* 1946) Architectural Designing, 5703 Bluff Rd., Indianapolis, and • R. R. 4, Box 593, Indianapolis 44, Ind.

GOELLNER, John A. (*A* 1945) Pres., • Monarch Metal Weather Strip Corp., 6333 Etzel Ave., St. Louis 14, and 4729 Lee Ave., St. Louis 15, Mo.

GOELZ, Arnold H. (*M* 1931) Pres., • Kroeschell Engineering Co., 215 W. Ontario St., Chicago, and 827 Greenwood Ave., Wilmette, Ill.

GOEPPER, Forrest S. (*A* 1946) Chief Engr., Russell R. Gannon Co., 715 Gwynne Bldg., Cincinnati, and • 389 Terrace Ave., Cincinnati 20, Ohio.

GOERG, Bernhard (*M* 1928) 323 Morewood Ave., Pittsburgh 13, Pa.

GOERG, Robert A. (*A* 1947) Director, "Technic Air," Goerg & Cie, rue du Mole 38 and • ch. des Grangettes 39, Geneva, Switzerland.

GOERGENS, Albert G. (*A* 1938) Engr., War Dept. Office, Chief of Engrs., Washington, D. C., and • 817 Chalfonte Dr., Alexandria, Va.

GOETHE, Sam Paul (*M* 1947) Research Engr., • College of Engineering, University of Florida, and 1150 S.W. Eighth Ave., Gainesville, Fla.

GOFF, John A.* (*M* 1939) Dean, • Towne Scientific School, University of Pennsylvania, Philadelphia 4, and 623 Righters Mill Rd., Penn Valley, Pa.

GOINS, E. H. (*M* 1941) Dist. Repr., • Warren Webster & Co., 420 Market St., San Francisco 11, and 2353 Laguna St., San Francisco 15, Calif.

GOLDBERG, Moses (*A* 1934) Pres., Electric Motors Corp., 168 Centre St., New York 13, and • 885 E. Eighth St., Brooklyn 30, N. Y.

GOLDMAN, Reuben J. (*J* 1948) Mech. Engr., C. Wallace Plumbing Co., 4102 S. Shepard, and • 2517 St. Emanuel, Houston, Texas.

GOLDMAN, Siegmund (*S* 1947) Student, Texas A. & M. College, Box 482, College Station, and • 2517 St. Emanuel, Houston, Texas.

GOLDMANN, Philipp (*A* 1948; *J* 1942; *S* 1940) Engr., • Carrier Corp., International Div., 122 East 42nd St., New York 17, N. Y., and 1404 Perry Pl. N.W., Washington, D. C.

GOLDNER, Herman W. (*M* 1944) Pres., • Herman Goldner Co., Inc., 425 W. Lehigh Ave., and 7415 Euston Rd., Philadelphia, Pa.

GOLDSMITH, F. W. (*M* 1936) Pres., • The W. Clasmann Co., 513 E. Day Ave., and 629 E. Day Ave., Milwaukee 11, Wis.

GOLL, W. A. (*A* 1937) Owner, W. A. Goll & Assoc., 4628 Dodge St., Omaha 3, Nebr.

GOLLAHER, Monroe L. (*A* 1946) Sales Engr., • Louis A. Roser Co., 254 W. First South St., Salt Lake City 8, and 1163 Roosevelt Ave., Salt Lake City 5, Utah.

GOMBERT, Frederick S. (*A* 1947) Sales Mgr., • Hall-Neal Furnace Co., 1324 N. Capitol Ave., and 3303 Ralston St., Indianapolis, Ind.

GONZALEZ, Rafael A. (*M* 1936) Staff Asst. to Gen. Sales Mgr., Chrysler Corp., Airtemp Div., 1119 Leo St., Dayton 1, and • 276 Delaware Ave., Dayton 5, Ohio.

GOOD, Charles S. (*A* 1947; *J* 1941; *S* 1939) Partner, A. C. Good & Sons, Plumbing & Heating, 620 Rebecca Ave., and • 102 Cascade Rd., Pittsburgh 21, Pa.

GOODE, Archie E. (*A* 1945) Mech. Engr., Robert & Co., Inc., 704 Bona Allen Bldg., Atlanta, and • 535 E. Lake Dr., Decatur, Ga.

GOODE, Raymond K. (*S* 1947) Student, Tulane University, New Orleans, and • 3343 Esplanade Ave., Apt. 8, New Orleans, La.

GOODHUE, B. C. (*M* 1945) Mgr., Refrigeration Dept., W. A. Case & Sons Manufacturing Co., 115 N. Geddes St., and • 235 Rockland Ave., Syracuse, N. Y.

GOODLOE, James C., Jr. (*S* 1948) Student, A. & M. College of Texas, • P. O. Box 2306, College Station, and 2418-35th St., Galveston, Texas.

GOODMAN, Carl L. (*A* 1944) Mgr., 1717 Broadway, and • 5715-31st St. N.E., Seattle, Wash.

GOODMAN, Joseph (*J* 1946) • Air Conditioning & Engineering Co., Ltd., 33 Wepener St., Booysens, and 53 Cavendish Rd., Yeoville, Johannesburg, South Africa.

GOODMAN, William (*M* 1941) Prof. and Cons. Engr., • Illinois Institute of Technology, 3300 Federal St., Chicago 16, and 5141 Greenwood Ave., Chicago 15, Ill.

GOODRAM, W. E. (*M* 1939; *A* 1936) Partner and Mgr., Goodram Bros., 88 King St. W., Hamilton, and • R. R. 2, Freeman, Ont., Canada.

GOODRICH, Charles F. (*M* 1919) Andrews & Goodrich, Inc., Boston, and • 336 Adams St., Dorchester, Mass.

GOODWIN, Eugene W. (*M* 1936) Mech. Engr., Public Buildings Administration, Washington 25, D. C., and • 7024 Hampden Lane, Bethesda 14, Md.

GOODWIN, Frank T. (*A* 1944) Partner, Ted Goodwin Co., 902 Ballard S.E., Grand Rapids 7, Mich.

GOODWIN, Walter C. (*M* 1945) Mgr. of the Precipitron Dept., Westinghouse Electric, Hyde Park, Boston 36, and • 503 Rock Rd., Needham, Mass.

GOOHS, William E. (*M* 1944) Asst. to Plant Engr., Allison Div., General Motors Corp., Indianapolis, and • 5910 Indianola Ave., Indianapolis 20, Ind.

GOOTE, Marinus (*A* 1947) Sales Engr., • Air Temperature Control Co., Inc., 1575 Division Ave. S., Grand Rapids 7, and 354 Fuller S.E., Grand Rapids, Mich.

GORBANDT, Everett T. (*M* 1941) Engr. and Partner, • Crawley-Gorbandt Co., 118 W. Peachtree Place N.W., and 2288 N. Decatur Rd. N.E., Atlanta, Ga.

GORDON, Colin W. (*A* 1938) Vice-Pres. and Mgr., A. G. Baird, Ltd., 25-27 Ritchie Ave., and ● 962 Shaw St., Toronto, Ont., Canada.

GORDON, Hugh H. W. (*A* 1946) Gen. Mgr., ● Air Conditioning & Engineering Co., Ltd., 33 Wepener St., Booysans, and "Enthaba," P. O. Sandown, Johannesburg, South Africa.

GORDON, Peter B. (*M* 1944; *A* 1938; *J* 1935) Treas., ● Wolff and Munier, Inc., 222 East 41st St., and 5 Prospect Pl., New York 17, N. Y.

GORGEN, Roy E. (*A* 1940) Vice-Pres., The Day Co., 810 Third Ave. N.E., and ● 2120 W. Cedar Lake Blvd., Minneapolis, Minn.

GORNSTON, Michael H. (*Life Member*; *A* 1923) Retired, Board of Education, City of New York, and ● 111-32-76th Ave., Forest Hills, N. Y.

GORSUCH, Winfield J. (*A* 1944) Naval Archt., Norfolk Navy Yard, and ● 314 Harrison St., Portsmouth, Va.

GOSS, Matthew H. (*M* 1938) Partner, ● M. H. Goss Co., 3409 Ludden St., Detroit 7, and 13075 Promenade, Detroit 5, Mich.

GOSSETT, Earl J. (*M* 1923) Pres., ● Bell & Gossett Co., 8200 Austin Ave., Morton Grove, and 314 Woodland Ave., Winnetka, Ill.

GOTH, Carl A. (*M* 1948) Mech. Engr., Corps of Engineers, 1709 Jackson St., and ● 3115 North 49th Ave., Omaha, Nebr.

GOTHARD, William W. (*A* 1936) Gen. Mgr., ● Domestic Engineering, 1900 Prairie Ave., Chicago 16, and 1027 Arlington Ave., LaGrange, Ill.

GOTSCHALL, Harry C. (*M* 1935) Instructor in Air Cond. & Refrig., Chicago Board of Education, Lane Technical High School, 2501 W. Addison St., Chicago 18, and ● 2953 Eastwood Ave., Chicago 25, Ill.

GOTTSCHALK, Kenneth A. (*A* 1944) Indus. Sales Engr., Cleveland Electric Illuminating Co., 75 Public Sq., Cleveland 1, and ● 3641 West 46th St., Cleveland 2, Ohio.

GOTTSCHALL, Walter C. (*A* 1945) Pres. and Estimator, Industrial Insulation, Inc., Terminal Office Bldg., Pittsburgh 19, and ● 530 Hillcrest Pl., Pittsburgh 16, Pa.

HARTWEIN, C. E. (*M* 1933) Supt. Htg. and Service Div., Laclede Gas Light Co., 231 W. Lockwood Ave., Webster Groves 19, and ● 135 Peeke Ave., Kirkwood 22, Mo.
HARTWELL, Joseph C. (*Life Member*; *M* 1922) Pres., ● Hartwell Co., Inc., 87 Weybosset St., and 16 Freeman Pkwy., Providence, R. I.
HARTWIG, Walter J. (*A* 1945) Planning Specialist, War Dept. Corps of Engrs., Los Angeles Dist., 751 Figeroa St., Los Angeles, and ● 3643 Clarington Ave., Los Angeles 34, Calif.
HARVEY, A. D. (*A* 1928); *J* 1925) Vice-Pres., ● The Dorr Co., Inc., 570 Lexington Ave., New York 22, and 1175 Park Ave., New York 28, N. Y.
HARVEY, Ernest W. (*A* 1943) Appl. Engr., ● Westinghouse Electric Corp., 1014 Fairfax Bldg., and 210 East 72nd St., Kansas City, Mo.
HARVEY, John W. (*M* 1942) Managing Dir., Sterigas Construction Co., Ltd., 2 Gorst Rd., London, N.W. 10, and ● 64 Crowshott Ave., Stanmore, Middlesex, England.

HARVEY, Lyle C. (*M* 1928) Pres., • The Bryant Heater Co., 17825 St. Clair, Cleveland 10, and 2666 Leighton Rd., Cleveland, Ohio.

HASHAGEN, John B. (*M* 1930) Production Mgr., Fearn Laboratories, 9401 W. Belmont Ave., Franklin Park, and • 4236 N. Mozart St., Chicago, Ill.

HASTINGS, Addison (*M* 1942) Asst. Secy., Sales Engr., Burnham Boiler Corp., and • Lewis Rd., Irvington, N. Y.

HATCH, George (*A* 1941) Pres., • Air Conditioning Engineering Co., Ltd., 1104 Bay St., Toronto, Ont., Canada, and 3527 Carnation Ave., Los Angeles 26, Calif.

HATCH, O. J. (*A* 1941) Mgr., Clare Bros. Western, Ltd., 179 Notre Dame Ave. E., and • 640 Jubilee Ave., Winnipeg, Man., Canada.

HATTERSLEY, Eugene H. (*M* 1943) Member of Firm, • A. Hattersley & Sons, 212 E. Main St., and Apt. 30 Windsor Apts., 521 W. Berry St., Fort Wayne 2, Ind.

HATTIS, Bernard S. (*J* 1948) Partner, Robert E. Hattis, Cons. Engr., • 223 W. Jackson Blvd., Chicago 4, and 7020 S. Jeffery Blvd., Chicago 49, Ill.

HATTIS, Robert E. (*M* 1926) Cons. Engr., • 223 W. Jackson Blvd., Chicago 4, and 1454 Fargo Ave., Chicago 26, Ill.

HATZENBUEHLER, Edwin J. (*M* 1947) Mgr., Indus. & Comml. Gas Dept., • Lone Star Gas Co., 1915 Wood St., and 7434 Coronado, Dallas, Texas.

HAUAN, Merlin J. (*M* 1933) Cons. Engr., 8030–24th Ave. N.W., Seattle, Wash.

HAUER, B. T. (*A* 1946) Owner, • Hauer Power Equipment Co., 831 Temple Bar Bldg., Cincinnati 2, and 3619 Brentwood Ave., Cincinnati 8, Ohio.

HAUER, Fred W. (*A* 1938) Owner, • Fred Hauer & Co., 315 Elmhurst Ave., Peoria 4, Ill.

HAUF, Joseph C., Jr. (*M* 1944) Mgr., Gen. Div., York-Shipley, Inc., York, Pa., and • 4204 Tuscany Ct., Baltimore 10, Md.

HAUS, Irvin J. (*A* 1937; *J* 1935) Plant Engr., • Nash Kelvinator Corp., Seaman Body Plant, 3880 N. Richards St., Milwaukee 1, and 2211 North 51st St., Milwaukee 8, Wis.

HAUSLER, Walter (*M* 1947) Owner & Mgr., Institute of Heat Economy Ceresstrasse 27, and • Zollikerstrasse 238, Zurich, Switzerland.

HAUSMAN, L. M. (*M* 1945) Pres., L. M. Hausman & Co., 912 Taft Ave., Manila, P. I.

HAUSSER, Fred L. (*A* 1945) Partner, Ward & Hausser, 17 Seyms St., Hartford 5, and • 178 Four Mile Rd., West Hartford 7, Conn.

HAWES, Harold D. (*J* 1942; *S* 1940) Lt. U. S. Army, and • 454 Tollsome Hill Rd., Bridgeport, Conn.

HAWISHER, Harold H. (*A* 1938) Mech. Engr., • Automatic Heating & Engineering Co., 416-418 N. Main St., and 411 S. Jameson Ave., Lima, Ohio.

HAWK, Charles A., Jr. (*A* 1944) Consultant, 1104 Farragut St., Pittsburgh 6, Pa.

HAYES, Charles R., Jr. (*J* 1947) Draftsman, A. C. Engineering & Drafting, 519 Apco Tower, and • 1608 Northwest 28th St., Oklahoma City, Okla.

HAYES, Grant J. (*A* 1946) Engr., • Hayes Brothers, Inc., 236 W. Vermont St., Indianapolis 4, and 2849 N. Capitol Ave., Indianapolis 8, Ind.

HAYES, James J. (*M* 1920) Vice-Pres., • Stannard Power Equipment Co., 53 W. Jackson Blvd., Chicago 4, and 2515 East 77th St., Chicago 49, Ill.

HAYES, Joseph G. (*Life Member*; *M* 1908) Pres. and Engr., Hayes Brothers, Inc., 236 W. Vermont St., Indianapolis 4, Ind.

HAYES, William C. (*J* 1946) Secy.-Treas., • Hayes Distributing Co., P. O. Box 202, Portsmouth, and 305 Norman Rd., Green Acres, Portsmouth, Va.

HAYES, William G. (*A* 1946) Pres., • The Hayes Distributing Co., P. O. Box 202, Portsmouth, and 305 Norman Rd., Green Acres, Portsmouth, Va.

HAYMAN, A. Eugene, Jr. (*A* 1941; *J* 1935; *S* 1930) Sun Oil Co., Marcus Hook, Pa., and • 2715 Washington St., Wilmington 239, Del.

HAYNES, C. V. (*Life Member*; *M* 1917), (*Presidential Member*), (Pres., 1934; 1st Vice-Pres., 1933; 2nd Vice-Pres., 1932), (Council, 1926-29; 1932-35) Specialist, The American Co., and • P. O. Box E., Woodford Sta., Portland 5, Me.

HAYS, Herbert G. (*M* 1945) Chief Engr., • Armstrong Furnace Co., 851 W. Third Ave., Columbus 8, and 868 Kenwick Rd., Columbus, Ohio.

HEAD, Frederick T. (*A* 1946) Sales Repr., Surface Combustion Corp., Janitrol Div., 225 Broadway, New York, and • 305 Sixth Ave., Pelham 65, N. Y.

HEAGERTY, William H. (*A* 1940) Sales Engr., • Chandler Bldg., and 5100 N. Capitol St., Washington, D. C.

HEALY, Dennis L., Jr. (*A* 1946) Secy., • Healy-Ruff Co., 2255 University Ave., and 2124 Grand Ave., St. Paul 4, Minn.

HEAPHY, J. Arthur (*A* 1945) Pres. and Owner, • D. J. Heaphy & Son, 133 N. Geddes St., Syracuse 4, and 101 Wellesley Rd., Syracuse, N. Y.

HEARD, John A. E. (*A* 1946) Sales Engr., • Carrier Engineering Co., Ltd., 24 Buckingham Gate, London S.W. 1, and Cleddav, The Chase Rayleigh, Essex, England.

HEARNE, Rufus D. (*A* 1946) Northern Dist. Sales Mgr., • L. J. Mueller Furnace Co., 2005 W. Oklahoma, and 2495 N. Oakland Ave., Milwaukee, Wis.

HEATH, George A. (*A* 1944) • P. O. Box 207, 40 W. Main St., and 24 W. Marble St., Mechanicsburg, Pa.

HEATH, William R. (*M* 1931) Asst. Chief Engr., • Buffalo Forge Co., 490 Broadway, and 119 Wingate Ave., Buffalo, N. Y.

HEATHCOTE, Henry J. (*M* 1946) Mech. Engr., • Carrier Engineering Co., Ltd., 24 Buckingham Gate, London, S.W. 1, and 23 W. Park Lane, West Worthing, Sussex, England.

HEAVEN, Lewis P. (*M* 1943) Owner, • Heaven Engineering Co., 1527 Wyandotte, Kansas City 8, and 642 East 46th St., Kansas City 4, Mo.

HEBLEY, Henry F. (*M* 1934) Dir. of Research, • Pittsburgh Consolidation Coal Co., 2045 Koppers Bldg., Pittsburgh, and 216 Jefferson Dr., Mt. Lebanon, Pittsburgh 16, Pa.

HECKEL, Edmund P. (*M* 1918) E. P. Heckel & Assoc., Cons. Engrs., 100 W. Monroe St., Chicago 3, and • 314 Cuttriss Pl., Park Ridge, Ill.

HECKEL, Edmund P., Jr. (*A* 1948; *J* 1941) Sales Engr., Emmert & Trumbo Mfrs. Repr., 20 N. Wacker Dr., Chicago 6, and • 123 Belle Plaine Ave., Park Ridge, Ill.

HECKERT, W. P. (*A* 1947) Owner, • Heckert Sheet Metal Works, 311 East 31st, and 717 West 36th St., Kansas City, Mo.

HECKLER, Frank W. (*A* 1946) Member of Firm, • Heckler Bros., 965 Liberty Ave., Pittsburgh 22, and 43 Rhodes Ave., Pittsburgh 20, Pa.

HEDEEN, L. E. (*M* 1942; *A* 1941; *J* 1938) Cons. Engr., Todd, Hedeen & Assocs., 180 W. First St., and 601 Moir, Waterloo, Iowa.

HEDGES, H. Berkley (*M* 1919) Mgr., Blast Coil Surface Sales, • John J. Nesbitt, Inc., State Rd. and Rhawn St., Holmesburg, Philadelphia 36, and 114 Waverly Rd., Wyncote, Pa.

HEDLEY, Park S. (*M* 1923) Partner, • Park S. Hedley Co., 452 Franklin St., Buffalo 2, and 31 Westgate Rd., Kenmore, N. Y.

HEDLUND, Richard A. (*A* 1946) Asst. Staff Engr., Johns Manville Co., Manville, and • 928 Grant Ave., Plainfield, N. J.

HEEBNER, Walter M. (*M* 1922) Sales Engr., Warren Webster & Co., 1060 Broad St., Newark, and • 282 Highwood St., Teaneck, N. J.

HEGELE, Richard H. (*A* 1945) Owner and Mgr., H. W. Hegele Co., 231 N. Main St., and • 338 E. Court, Urbana, Ohio.

HEIBEL, Walter E. (*M* 1917) Dist. Mgr., • Aerofin Corp., 11 West 42nd St., New York 18, N. Y., and 12 Richmond Dr., Old Greenwich, Conn.

HEIDENREICH, George (*M* 1947) Sales Engr., • G. Heidenreich Co., Inc., 320 Chamber of Commerce Bldg., Indianapolis 4, and 5768 N. Delaware St., Indianapolis, Ind.

HEIKKINEN, Henry K. (*M* 1947) Instructor, Dunwoody Institute, 818 Wayzata Blvd., and • R. F. D. 9, Minneapolis 16, Minn.

HEILMAN, Russell H.* (*M* 1923) Sr. Fellow, • Mellon Institute, 4400 Fifth Ave., Pittsburgh 13, and 2303 Beechwood Blvd., Pittsburgh 17, Pa.

HEIMAN, Sid J. (*M* 1946) Pres., • International Oil Burner Co., 3800 Park Ave., St. Louis 10, and 7430 Gannon Ave., University City 5, Mo.

HEINISCH, John E. (*A* 1946) Owner, • Air Conduit Co., P. O. Box 1479, and 226 Alvin, Lake Charles, La.

HEINKEL, Charles E. (*A* 1947; *J* 1938) De Temple Co., 615 N.W. Couch St., Portland, and • 1620 E. Burnside, Portland 14, Ore.

HEISINGER, Frederick W. (*A* 1945) Chief Engr. & Mgr., F. W. Heisinger Assocs., 2948 Sierra Madre Blvd., Pasadena 8, Calif.

HEISTERKAMP, Herbert W. (*A* 1940; *J* 1937) Mgr., Dehumidifier Div., • Bryant Heater Co., 17825 St. Clair Ave., Cleveland 10, and 175 East 207th St., Euclid 19, Ohio.

HEITMAN, Joseph G. (*M* 1946) • National Sheet Metal Works, 4512 W. Thomas St., Chicago, and 14909 S. Hamlin Ave., Midlothian, Ill.

HELBURN, I. B. (*M* 1929; *J* 1927) Helburn Engineering, 406 Elm St., Cincinnati 2, Ohio.

HELFINSTINE, Roy J. (*M* 1943) Mech. Engr., • Illinois State Geological Survey, 214 Geological Survey Laboratory, Urbana, and 55 E. Armory, Champaign, Ill.

HELIN, Walter E. (*A* 1946) Chief Engr., • Pictsweet Foods, Inc., P. O. Box 311, and 1224 South 12th St., Mt. Vernon, Wash.

HELLAND, Albert E. (*M* 1944) Mfrs. Repr., 2806 N. Maplewood Ave., Chicago, Ill.

HELLE, Frank J. (*A* 1947) Sales, Republic Heaters Co., 2153 Fullerton Ave., Chicago 47, Ill., and • 823 Elias Ave., St. Louis 15, Mo.

HELLEKSON, Owen H. (*A* 1946) c/o Minneapolis-Honeywell Regulator Co., 121 W. Onandago St., Syracuse, N. Y.

HELLER, Joseph A. (*A* 1938) 150 West 79th St., New York 24, N. Y.

HELLMERS, Charles C., Jr. (*A* 1942; *J* 1937) Mech. Engr., • Western Electric Co., Dept. 7942-3, Hawthorne Sta., Chicago 23, and 241 Glade Ave., R. F. D. 1, Elmhurst, Ill.

HELLSTROM, John (*A* 1929) Vice-Pres., • American Air Filter Co., Inc., 215 Central Ave., and 423 Lightfoot Rd., Louisville, Ky.

HELMS, Loyd J. (*M* 1945) Sales Engr., English & Lauer, Inc., 1978 S. Los Angeles St., Los Angeles 11, and • 633 S. Berendo St., Los Angeles 5, Calif.

HELSTROM, C. W. (*M* 1938) Vice-Pres. and Mgr., Globe Machinery & Supply Co., E. First and Court Ave., and • 1614 Thompson Ave., Des Moines 16, Iowa.

HELSTROM, Herman G. (*M* 1936) Northwest Sales Mgr., William Brothers Boiler & Manufacturing Co., 1057 Tenth Ave. S.E., and • 4608 Arden Ave. S., Minneapolis 10, Minn.

HELWICK, Numa J. (*M* 1940) Partner, • American Heating & Plumbing Co., 829 Baronne St., and 809 Greenwood Dr., New Orleans, La.

HELWIG, E. Cornelius (*A* 1945) • Tanner & Co., 409 S. Pennsylvania, Indianapolis 9, and 6840 Dover Rd., R. R. 13, Box 430K, Indianapolis 44, Ind.

HEMEON, Wesley C. L. (*M* 1944) Vtg. Engr., Industrial Hygiene Foundation, Mellon Institute, 4400 Fifth Ave., and • 4111 Allequippa St., Pittsburgh, Pa.

HEMINGWAY, John C., Jr. (*A* 1943) Northern Calif. Distributor, H. C. Little Burner Co., Inc., Second and Lincoln St., San Rafael, and • Box 62, 101 Magnolia Ave., Larkspur, Calif.

HENDERSON, Alexander S. (*J* 1940; *S* 1938) Design Engr., • Air Control Equipment Pty., Ltd., P. O. Box 53, Waterloo, and Agincourt Rd., Eastwood, N.S.W., Australia.

HENDRICKSON, Harold M. (*M* 1934) Dist. Engr., Ralph E. Manns Co., 2365 Lombard St., San Francisco 23, and • 2517–99th Ave., Oakland 5, Calif.

HENDRIKSEN, Leonard (*A* 1938) Owner, Hendriksen Sheet Metal & Heating Service, 1919 N. Vernon Ave., Flint 6, Mich.

HENDRIX, William T. (*A* 1948) Member of firm, Mech. Equip. Designer, • Wolf & Hahn, 459 Hamilton St., and 131 N. Franklin St., Allentown, Pa.

HENEGAR, Barnie V. (*A* 1944) Owner, • Southland Supply Co., 2400 S. Harwood, Dallas 1, and 4565 Belclair St., Dallas, Texas.

HENENFELD, Henry K. (*M* 1944) Mgr., Air Cond. Dept., • ASEA Electric Ltd., Yaffi Bldg., Goa St., Bombay, and c/o F. R. Coulter, Flat No. 4, Southlands, Colaba, Bombay, India.

HENION, Hudson D. (*A* 1923) Sales Mgr., • C. A. Dunham Co., Ltd., 1523 Davenport Rd., Toronto 4, and 45 Ridge Dr., Toronto, Ont., Canada.

HENRIKSEN, Harvey E. (*M* 1946) Indus. Project Engr., General Controls Co., 801 Allen Ave., Glendale, and • 10650 Wilbur, Northridge, Calif.

HENRY, Alexander S., Jr. (*M* 1930) Mech. Engr., R. K. O., 1270 Sixth Ave., and • 300 Central Park W., New York 24, N. Y.

HUBER, Enrique (*M* 1938) Mech. Engr., Productos Mecanicos, S. A., Calzada de Tlalpam No. 2073, Churubusco, Mexico, D. F.

HUBER, Paul O. (*A* 1947) Partner, Midgley-Huber, 201 Bennett Bldg., 55 W. First South, and • 1659 Blaine Ave., Salt Lake City, Utah.

HUCH, A. J. (*M* 1919) Branch Mgr., • American Radiator & Standard Sanitary Corp., 312 Third St., Minneapolis 15, and 4037 Harriet Ave., Minneapolis, Minn.

HUCKER, Joseph H. (*M* 1921) Owner, • Hucker Sales Co., 1700 Walnut St., Philadelphia 3, and 104 Golf View Rd., Merion Golf Manor, Ardmore, Pa.

HUCKINS, Edward R. (*J* 1948; *S* 1947) Service Mgr., • Waterbury Co., 2716 Nicollet Ave. S., Minneapolis, and 5350 France Ave. S., Minneapolis 10, Minn.

HUDEPOHL, Louis F. (*M* 1936) Pres., • T. J. Conner, Inc., 3290 Spring Grove Ave., Cincinnati 25, and 4395 Haight Ave., Cincinnati 23, Ohio.

HUDIK, Frank (*A* 1946) Pres., • Comfortair Co., 20 State St., and 306 Parker Ave., Hackensack, N. J.

HUDSON, R. Burton (*A* 1947) Secy., Air Products Equipment Co., 1856 N. Cleveland Ave., Chicago, and • 29 Thatcher Ave., River Forest, Ill.

HUDSON, Robert A. (*M* 1934) Partner, • Hudson & Grady, Engrs., 525 Market St., Room 624, San Francisco 5, and 39 Nevada St., Redwood City, Calif.

HUEBNER, William O. (*M* 1947) Tech. Editor, • Anemostat Corp. of America, 10 East 39th St., New York 16, and 233 Naples Terrace, New York 63, N. Y.

HUEBSCHER, Richard G.* (*A* 1948) Research Engr., American Society of Heating and Ventilating Engineers Research Laboratory, 7218 Euclid Ave., Cleveland 3, and • 4697 East 93rd St., Cleveland 5, Ohio.

HUELSMANN, Alphonse G. (*A* 1941) Dist. Mgr., The Powers Regulator Co., 702 American Bldg., Cincinnati 2, and • Box 103 Wynnburn Ave., Cincinnati 5, Ohio.

HUFF, James M. (*M* 1942) Field Engr., • Chrysler Airtemp Sales Corp., 933 Monadnock Bldg., 681 Market St., San Francisco 5, and 25 Fuente Ave., San Francisco 12, Calif.

HUGGINS, L. Gale (*M* 1939) Mgr., Air Cond. and Refrig. Dept., • B. F. Sturtevant Co., Div. of Westinghouse Electric, Hyde Park, Boston, and 269 Walpole St., Norwood, Mass.

HUGHES, Charles (*A* 1944) Lt. Commdr., U. S. N. R., and • Rt. 5, Box 393, Memphis 11, Tenn.

HUGHES, James W. (*M* 1948) Gen. Elec. Engr., • Canadian Pacific Railway, Rm. 1000, Windsor Stn., Montreal, and 1270 Regent Rd., Town of Mount Royal, Quebec, Canada.

HUGHES, L. K. (*A* 1940; *J* 1936) Pres., • Howard Furnace & Foundries, Ltd., 881 Yonge St., and 3 Don Valley Dr., Toronto, Ont., Canada.

HUGHES, Malcolm W. (*A* 1948) Treas., • Alfred J. Hunter & Co., 1818-38 Henry St., and 923 Forest Park Rd., Muskegon, Mich.

HUGHES, Ralph (*M* 1944) Partner, • Hughes Heating Co., 670-72 Madison Ave., Memphis 7, and 3805 Walnut Grove Rd., Memphis, Tenn.

HUGHES, Samuel (*A* 1948; *J* 1940) Sgt., U. S. A., • Co. L, 161st Inf., A. P. O. 25, c/o Postmaster, San Francisco, Calif., and 514 W. Lee St., Weatherford, Texas.

HUGHES, William U. (*M* 1936) Pres., • The Lewis-Brown Co., Ltd., 1570 Bishop St., and 1610 Sherbrooke St., Montreal, Que., Canada.

HUGHEY, Thomas M. (*A* 1935) Dist. Mgr., • Westerlin & Campbell Co., 906 N. Fourth St., Milwaukee 3, and 2439 North 63rd St., Wauwatosa 13, Wis.

HUGHSON, Harry H. (*M* 1937) Sales Engr., • The Coon-DeVisser Co., 2051 W. Lafayette Ave., Detroit 16, and 58 Florence Ave., Detroit 3, Mich.

HUHN, Walter E. (*A* 1943) Contractor and Engr., • Walter E. Huhn, 1720 Grand Ave., and 1113 Fairfield, Waukegan, Ill.

HULL, Everett O. (*M* 1944) Partner, Associated Engineers, 325 Main St., and • 117 North St., Peoria, Ill.

HULL, John J. (*A* 1946) Asst. Service Supt., The Bridgeport Gas Light Co., 815 Main St., and • 381 Ellsworth St., Bridgeport, Conn.

HULL, Louis M. (*M* 1945) Vice-Pres., • Hammel Radiator Engineering Co., 3348 Motor Ave., Los Angeles 34, and 346 N. Harper, Los Angeles 36, Calif.

HULTGREN, John T. B. (*A* 1947) Asst. Sales Engr., McQuay, Inc., 1600 Broadway N.E., Minneapolis, and • 935 Goodrich Ave., Apt. 6, St. Paul 5, Minn.

HUMBLE, John D. (*J* 1948; *S* 1947) Jr. Engr., Magnolia Petroleum Co., and • 2525 Liberty Ave., Beaumont, Texas.

HUMMEL, David M. (*M* 1944) Mgr. Div. of Engrg., • Yale University Service Bureaus, 20 Ashmun St., New Haven, and 21 Fernwood Rd., Hamden 14, Conn.

HUMMEL, George W. (*M* 1937) Mech. Engr., The Trane Co., P. O. Drawer 679, 1424 N. Third St., Phoenix, Ariz.

HUMPHREY, D. E.* (*M* 1921) Htg. and Vtg. Engr., The Goodyear Tire & Rubber Co., Akron, and • 2499 Sixth St., Cuyahoga Falls, Ohio.

HUMPHREY, Leonard G., Jr. (*A* 1942; *J* 1938) Asst. to Mgr., Federal and Marine Dept., Buffalo Forge Co. & Buffalo Pumps, Inc., 512 Woodward Bldg., Washington 5, D. C., and • 4023 Oliver St., Chevy Chase 15, Md.

HUMPHREY, Turk O. S., Jr. (*A* 1946) Partner, • Humphrey-Wynne Co., 713 Sterick Bldg., and R. 5, Box 390, Memphis, Tenn.

HUMPHREYS, Clark M.* (*M* 1931), (Council 1936-38) Sr. Engr., • A.S.H.V.E. Research Lab., 7218 Euclid Ave., Cleveland 3, and 3970 Monticello Blvd., Cleveland 21, Ohio.

HUNGER, Robert F. (*M* 1927) Partner, • Davidson & Hunger, 220 South 16th St., Philadelphia 2, and 239 Cheswold Lane, Haverford, Pa.

HUNGERFORD, I. Wayne (*A* 1947) Pres., • Maintenance Inc., Box 802, and 33 Harvard Ave., Meriden, Conn.

HUNGERFORD, Leo (*M* 1930), (Council, 1947) Sales Mgr., Utility Appliance Corp., 4851 S. Alameda St., Los Angeles 11, and • 3485 Wonderview Pl., Hollywood 28, Calif.

HUNKEN, Walter L. (*M* 1943) Southeastern Dist. Mgr., ● Westinghouse Electric Corp., Sturtevant Div., 900-908 Walton Bldg., and 691 Woodward Way N. W., Atlanta, Ga.
HUNSAKER, Roy E. (*A* 1945) Engr., Owens Corning Fiberglas Corp., Nicholas Bldg., Toledo 1, and ● 1411 Potomac Dr., Toledo 7, Ohio.
HUNT, James F. (*M* 1944) Mech. Engr., Cory Joslin, Inc., 512 Golden Gate, San Francisco, and ● 1325 Chestnut St., San Carlos, Calif.
HUNT, MacDonald (*A* 1936) ● 55 S. Mercer Ave., Greenville, Pa.
HUNTER, L. N. (*M* 1936) Vice-Pres., Research, ● The National Radiator Co., 221 Central Ave., and 113 Palliser St., Johnstown, Pa.
HUNTER, Richard K. (*M* 1946) ● Richard K. Hunter & Co., 215 E. Washington St., P. O. Box 2498, Greensboro, and Rt. 1, Guilford College, N. C.
HUNTER, Thomas B. (*M* 1941) Engr., 41 Sutter St., Room 710, San Francisco 4, Calif.
HUNTINGTON, R. Lee (*J* 1947) Cons. Engr., Ben Huntington & Sons, 517 Broadway Bldg., and ● 3531 Kettner Blvd., San Diego, Calif.
HUNZICKER, Dean L. (*A* 1948; *J* 1944) Engr., ● Research Products Corp., 1011 E. Washington Ave., and 108 Breese Terrace, Madison 3, Wis.
HUNZIKER, Chester E. (*A* 1934) Dist. Mgr., ● American Blower Corp., 511 State St., Schenectady 5, and 1552 Dean St., Schnectady 8, N. Y.
HUPP, Harley L. (*A* 1945) Dist. Commercial Sales Mgr., York Corp., 2700 Washington Ave. N.W., Cleveland, Ohio, and ● 433 Highland Ave., West View, Pittsburgh 29, Pa.
HURLBURT, Raymond G. (*J* 1948) Htg. Engr., Nelson Co., 2604 Fourth, Detroit, and ● Marlette, Mich.
HURST, Stephen G. (*A* 1947) Sales Promotion, ● American Radiator & Standard Sanitary Corp., 55 N. Montgomery St., Room 708, San Francisco, and 939 Collier Dr., San Leandro, Calif.
HUSSAIN, T. Abdulla (*J* 1947) ● Michigan State College, 20-A Well's Hall, East Lansing, Mich., and 2/18 Lathuram St., Mount Rd., Madras, India.
HUSSAR, Ernest A., Jr. (*M* 1947) Pres., ● Atlantic Air Conditioning Corp., 211 Northeast 97th St., Miami 38, and 201 Northwest 119th St., Miami, Fla.
HUSTOEL, Arnold M. (*A* 1930) B. O. C. T. Railroad, and ● 2414 N. Kedzie Blvd., Chicago, Ill.
HUTCHEON, Clifford R. (*A* 1945; *J* 1938) Reg. Mgr., Carrier Corp., International Div., 122 East 42nd St., New York, N. Y., and ● 114 Ayers Ct., West Englewood, N. J.
HUTCHINS, Paul C. (*A* 1947) Sales Engr., The Trane Company, 250 East 43rd St., New York 17, and ● 2610 202nd St., Bayside, N. Y.
HUTCHINSON, B. Lee, Jr. (*A* 1947; *J* 1939) Engr., Mehring & Hanson Co., 6075 S. Normandie, Los Angeles, and ● 3854 West Blvd., Los Angeles 43, Calif.
HUTCHINSON, Frank W.* (*M* 1942). (Council, 1946-47) Prof., Mech. Engrg., ● University of California, 114 Engrg. Bldg., Berkeley 4, Calif.
HUTCHINSON, Frederick A. (*A* 1942; *J* 1939) Pres.,-Federal Engineering Co., 155 Charngshu Lu (Route de Say Zoong), and ● 6 Yen Tang Lu (Route Voyron), Apt. 63 6th Floor, Shanghai, China.
HUTCHISON, Allen (*A* 1945) Chief Engr., James A. Ogilvy's Department Store and ● 4111 Melrose Ave., N. D. G., Montreal 28, Que., Canada.
HUTCHISON, Ira B. (*A* 1946) Htg. Engr., 1542 North West Blvd., Columbus 8, Ohio.
HUTCHISON, John E. (*M* 1939) Partner, ● Moody & Hutchison, 1420 Walnut St., Philadelphia 2, and 6723 Emlen St., Philadelphia 19, Pa.
HUYETT, Merrick Y. (*J* 1945) Sales Engr., ● Carrier Corp., 405 Lexington Ave., Chrysler Bldg., New York, N. Y., and 2100 Woodlawn Ave., Wilmington, Del.
HVOSLEF, F. W. (*M* 1931) Supt., Htg. Div., ● Kohler Co., and 523 Audubon Rd., Kohler, Wis.
HYDE, Bruce P. (*M* 1947) Mgr., New York Office, ● The Herman Nelson Corp., 150 Broadway, Room 511, New York 7, N. Y., and 60 Hawthorne Ave., Glen Ridge, N. J.
HYDE, Dayton F. (*M* 1941) Vice-Pres., ● Becker-Marsden Co., 3818 Lindell Blvd., St. Louis 8, and 624 Locksley Pl., Webster Groves 10, Mo.
HYDE, Eric F. (*M* 1937) Hyde & Bobbio, 405 Transportation Bldg., Detroit 26, and ● 708 Oakland Ave., Birmingham, Mich.
HYDE, L. Lyman (*M* 1940) Partner, Healy Plumbing & Heating, 278 W. Kellogg Blvd., St. Paul, and ● 4031 France Ave. N., Robbinsdale 12, Minn.
HYMAN, Charles A. (*M* 1947) Asst. Power & Fuel Engr., ● Carnegie Illinois Steel Corp., Steel St., and 1806 McCollum Rd., Youngstown, Ohio.
HYNES, Lee P.* (*M* 1919) Owner, ● Hynes Electric Heating Co., Point and Erie Sts., Camden, and 36 West End Ave., Haddonfield, N. J.

I

IBISON, James L. (*M* 1946; *A* 1943; *J* 1938) Branch Mgr., Westinghouse Electric Corp., Sturtevant Div., 505 Petroleum Bldg., Houston 2, and ● 2812 Tangley Ave., Houston 5, Texas.
ICKERINGILL, John C. (*M* 1923) Sales, Spencer Heater Div., The Aviation Corp., 927 N. Ninth St., and ● 477 Flamingo St., Roxborough, Philadelphia 28, Pa.

JENKINS, J. Caden (*A* 1946) Gen. Sales Mgr., Holly Manufacturing Co., 875 S. Arroyo Pkwy., Pasadena 5, and ● 259 E. Grandview Ave., Sierra Madre, Calif.

JENKINS, Raymond L. (*M* 1946) Cons. Mech. Engr., 4316 Blossom, Houston 7, Texas.

JENKINS, Sydney D. (*M* 1940) Partner, H. F. Clarke & Co., 1114 Fifth St. W., and ● 2212-33rd Ave. W., Calgary, Alta., Canada.

JENKINSON, V. J. (*A* 1940) Sales Mgr., Htg. Controls Div., Minneapolis-Honeywell Regulator Co., Ltd., Vanderhoof Ave., Leaside, Toronto 12, and ● 3 Highgate Rd., Toronto 9, Ont., Canada.

JENNER, John W. (*A* 1948) Pres. and Mgr., ● Shelley Electric Co., 123 S. Main, and 1522 Cooledge, Wichita, Kans.

JENNEY, Hugh B. (*A* 1933) Gen. Sales Mgr., ● Standard Sanitary & Dominion Radiator, Ltd., Royce and Lansdowne Ave., and 96 Dawlish Ave., Toronto, Ont., Canada.

JENNINGS, Burgess H.* (*M* 1942) Prof. of Mech. Engrg. and Dept. Chairman, Northwestern University, Northwestern Technological Institute, Evanston, Ill.

JENNINGS, Hal K. (*M* 1943) Vice-Pres., ● Kuempel Co., Union Trust Bldg., Cincinnati 2, and R. R. 2, Loveland, Ohio.

JENNINGS, Harvey S. (*M* 1947) Elec. Engr., Bechtel International Inc., Dhahran, Saudi-Arabia, and ● Box 1771, Spokane, Wash.

JENNINGS, Irving C. (*M* 1924) Pres., ● The Nash Engineering Co., and 138 Flax Hill Rd., South Norwalk, Conn.

JENNINGS, James H. (*M* 1944) Plant Engr., ● 430 N. Ninth St., Noblesville, and 4817 Indiana Ave., Fort Wayne, Ind.

JENNINGS, Robert B. (*A* 1946) Dist. Mgr., ● The Trane Co., 2901 N. High St., Columbus 2, and 166 Kenworth Ave., Columbus 8, Ohio.

JENNINGS, Stanley A. (*M* 1935) Engr., Trane Co. of Canada, Ltd., 4 Mowat Ave., and ● 36 Glen Oak Dr., Toronto, Ont., Canada.

JENNINGS, W. G. (*A* 1930) Vice-Pres., ● Minneapolis-Honeywell Regulator Co., 799 Beacon St., and 1970 Commonwealth Ave., Boston, Mass.

JENNY, Thomas J. (*A* 1948) Air Cond. Sales Engr., Gulf Engineering Co. Inc., 916 S. Peters St., New Orleans 13, and ● 4423 Loyola Ave., New Orleans 15, La.

JENSEN, Alfred F. (*S* 1948) Student, A. & M. College of Texas, ● Box 2611, College Station, Texas.

JENSEN, Albert O. (*A* 1944) Owner, ● Albert O. Jensen Wholesale Furnace & Supply Co., 515 North 18th St., Omaha 2, and 7409 North 57th St., Omaha, Nebr.

JENSEN, J. Ebbe (*M* 1947) Pres., Western Blower Co., 1800 Airport Way, Seattle 4, and ● Corbin Rd., Vashon Island, Wash.

JESPERSEN, S. Friis (*M* 1947) Cons. Engr., ● Vesterbrogade 10, Copenhagen V, and Bloksbjerget 24, Klapenborg, Denmark.

JESPERSEN, Soren J. (*M* 1944) Sr. Partner, Power Engineering Company, 1086 East 21st S., Salt Lake City, and ● 604 S. Ninth E., Salt Lake City 2, Utah.

JESSUP, Benjamin A. (*A* 1946) Vice-Pres., ● Richards & Jessup Co., Inc., 615 Main St., Stamford, and 48 Field St., Glenbrook, Conn.

JESSUP, F. Judson, Jr. (*A* 1944) 55 Woodland Park Dr., Tenafly, N. J.

JOCKEL, Hugh C. (*A* 1947) Sales Engr., ● Grinnell Co. of Canada, Ltd., 700 Beaumont Ave., Montreal, and 331 Beaconsfield Blvd., Beaconsfield, Que., Canada.

JOHANNESEN, Ralph C. (*M* 1943) Mech. Engr., O. W. Ott Cons. Mech. Engr., 514 Spring Arcade Bldg., Los Angeles 13, and ● 3468 Sierra Vista Ave., Glendale 8, Calif.

JOHNS, Charles F. (*M* 1939) Sackville, New Brunswick, Canada.

JOHNS, Harold B.* (*M* 1928; *J* 1927) Bell & Gossett Co., Morton Grove, and ● 543 N. Elmwood Ave., Oak Park, Ill.

JOHNSON, Allen J.* (*M* 1935) Cons. Engr., 344 Congress Ave., Lansdowne, Pa.

JOHNSON, Blaine A. (*M* 1946) Barney Olson, Inc., Peoples Gas Bldg., 122 S. Michigan Ave., Chicago 3, and ● 5724 N. Natoma Ave., Chicago, Ill.

JOHNSON, Carl E. (*A* 1939) Htg. and Vtg. Engr., ● C. E. Johnson & Assoc. 404 Bona Allen Bldg., and 1154 Ridgewood Dr. N.E., Atlanta, Ga.

JOHNSON, Carl W. (*Life Member*; *M* 1912) Pres., ● C. W. Johnson, Inc., 715 W. Randolph St., Chicago 6, and 1809 Morse Ave., Chicago 26, Ill.

JOHNSON, Carl William (*M* 1945) Mech. Engr., Mountain States Telephone & Telegraph Co., 931-14th St., Denver 2, and ● 2250 S. Clayton St., Denver 10, Colo.

JOHNSON, C. Kenneth (*A* 1945) Research Engr., Anemostat Corporation of America, 1051 New Britain Ave., and ● 187 Mayflower St., Elmwood, Conn.

JOHNSON, C. W. (*M* 1933; *J* 1931) Vice-Pres. and Gen. Mgr., ● Canadian Sirocco Co., Ltd., P. O. Box 360, and 11 Villaire Ave., Riverside, Windsor, Ont., Canada.

JOHNSON, Edward B. (*M* 1919) Designer, Parsons, Brinckerhoff, Hogan & Macdonald, 120 Wall St., New York, and ● 154 Wardwell Ave., Staten Island 2, N. Y.

JOHNSON, Enar A. (*M* 1947) Engr., G. M. Orr Engineering Co., 1004 Marquette, Minneapolis, and ● 2047 Grand Ave., St. Paul 5, Minn.

JOHNSON, Fred R. (*A* 1946) Vice-Pres., Johnson Heating Supply Co., 725 Northeast 25th Ave., Portland 12, and ● 2657 N. Kilpatrick St., Portland 3, Ore.

JOHNSON, Fred W. (*M* 1939) Pres., ● Johnson Larsen Co., 6530 Beaubien St., Detroit 2, and Adams and Beaver Rds., R. F. D. 2, Birmingham, Mich.

JOHNSON, Harry H. (*A* 1944) Owner and Mgr., ● City Plumbing & Heating Co., 760 N. Third St., Box 634, and 412 South 12th St., Laramie, Wyo.

JOHNSON, Helge S. (*A* 1933; *J* 1927) Partner, ● Koithan & Johnson, Reprs., Buffalo Forge Co., 39 Cortlandt St., New York 7, and 6 Forest Lane, Scarsdale, N. Y.

JOHNSON, Hiram K. (*A* 1945) Vice-Pres., ● F. S. Lamson Co., Inc., 1013 Marquette Ave., Minneapolis 2, and 4904 Tenth Ave. S., Minneapolis 7, Minn.

JOHNSON, Hugh F., Jr. (*J* 1945) Field Engr., ● Carrier Corp., 20 N. Wacker Dr., Chicago 6, Ill., and 30 Johnson Ave., Indianapolis, Ind.

JOHNSON, James J. (*M* 1944) ● Marshal & Johnson, 1275 Sherman St., Denver 3, and 66 Ash St., Denver 7, Colo.

JOHNSON, John B., Jr. (*A* 1947) Sales Engr., Westinghouse Electric Corp., Mansfield, and ● 248 Stanford Ave., Elyria, Ohio.

JOHNSON, Leslie Otto (*M* 1938; *J* 1930) Sales Engr., ● 215 Hines Bldg., Box 434, and 339 Sixth Ave., Huntington, W. Va.

JOHNSON, Oliver W. (*M* 1938) Chem. Engr., Standard Oil Company of California, 225 Bush St., San Francisco, and ● 1831 Waverly St., Palo Alto, Calif.

JOHNSON, Paul H. (*J* 1946) Bryant Heater Co., 17825 St. Clair Ave., Cleveland 10, and ● 2854 Sedgewick Rd., Cleveland 20, Ohio.

JOHNSON, Philip B. (*A* 1945) Design Engr., Curtiss Wright Corp., 5900 E. Fifth Ave., Columbus, and ● 59 S. Ogden Ave., Columbus 4, Ohio.

JOHNSON, Ralph B. (*M* 1940) Owner, ● Ralph B. Johnson & Co., 1605 Westheimer St., P. O. Box 1961, Houston 1, and 2111 W. Main St., Houston 6, Texas.

JOHNSON, Raymond C., Dr. (*M* 1944) Vice-Pres., Research, ● Anthracite Institute, 237 Old River Rd., and Hotel Sterling, Wilkes-Barre, Pa.

JOHNSON, Raymond L. (*M* 1946; *A* 1943; *J* 1942) Research Engr., Young Radiator Co., 709 S. Marquette St., and ● 2003 Marquette St., Racine, Wis.

JOHNSON, Richard W. (*A* 1947) Sales Repr., Republic Heaters Co., 2153 W. Fullerton Ave., Chicago 47, and ● 3551 N. Vincent Ave., Minneapolis 12, Minn.

JOHNSON, Roy W. (*A* 1945) Partner, ● Johnson-Lenz, 293 Jefferson Ave., Memphis 3, and 346 N. Willett, Memphis 7, Tenn.

JOHNSON, Russell A. (*J* 1945) Cons. Engr., Russell A. Johnson, Engr. Cons., 333 N. Michigan Ave., Chicago, and ● 371 Miller Dr., Elgin, Ill.

JOHNSON, Sigurd O. (*A* 1948; *J* 1946) Sales Engr., • Buffalo Forge Co., 39 Cortlandt St., New York, N. Y., and P. O. Box 167, Colonia, N. J.

JOHNSON, Sterling Chester (*A* 1947) Partner, • Burnett-Johnson Appliance Co., 37 Clarksville, and 1940 E. Washington, Paris, Texas.

JOHNSON, Tracy R. (*M* 1938) Branch Mgr., • The Trane Co., 1026 Fleming Bldg., Des Moines 9, and 6510 Forest Ave., Des Moines 11, Ia.

JOHNSON, Walter L. (*A* 1947) Sales Engr., Norman S. Wright & Co., 233 Ninth Ave. N., and • 1153 West 58th St., Seattle 7, Wash.

JOHNSON, Walter R. (*A* 1947) Chief Engr. & Supt. of Construction, Nickey Brothers, Inc., 2700 Summer Ave., and • 2643 Hanover Ave., Memphis, Tenn.

JOHNSON, Wilfrid E.* (*M* 1946) Mgr. of Engrg., • General Electric Co., 5 Lawrence St., Bloomfield, and 48 Baker Rd., Livingston, N. J.

JOHNSON, William A. (*A* 1945) Pres., Johnson-Goodyer, Inc., • 45 Bristol St., P. O. Box 576, New Haven, and 361 Fountain St., New Haven 15, Conn.

JOHNSTON, Arthur K. (*A* 1942) Owner, • 431 S. E. Sixth Ave., Portland 14, and Rt. 3, Box 913, Portland, Ore.

JOHNSTON, James Ambler (*M* 1912) Partner, Carneal & Johnston, Atlantic Life Bldg., Richmond 19, Va.

JOHNSTON, Jerrold J. (*J* 1948; *S* 1946) Mech. Engr., Tech. Sect., E. I. DuPont de Nemours & Co., Sabine River Works, and • 206 Hobson Ct., Orange, Texas.

JOHNSTON, J. O. (*A* 1945) Engr., • City Fuel Oil & Coal Co., 15th Ave. and Second St. S., and Box 474, St. Petersburg, Fla.

JOHNSTON, Lowell T. (*A* 1945) Master Mech., Johnstone Brothers Fuel Co., P. O. Box 207, 22nd St. Sta., St. Petersburg, and • 2332 Lakeview Ave. S., St. Petersburg 7, Fla.

JOHNSTON, Robert E. (*M* 1929; *A* 1926) Pres., • R. E. Johnston Co., Ltd., 1070 Homer St., and 4583 Connaught Dr., Vancouver, B. C., Canada.

JOHNSTON, Robert M. (*A* 1942; *J* 1937) Lt., U. S. N. R., Dept. Marine Engrg., U. S. Naval Academy, Annapolis, and • Cumberstone, Anne Arundel County, Md.

JOHNSTON, T. Walter (*A* 1947) Territory Sales Mgr., Lennox Furnace Co., Marshalltown, Ia., and • Box 173, Auburn, Calif.

JONES, Alfred (*Life Member*; *M* 1928) Retired, and • 912 Darby Rd., Havertown, Pa.

JONES, Allan T. (*M* 1937; *J* 1935) Chief Engr., • S. A. Armstrong, Ltd., 115 Dupont St., Toronto 5, and 264 Westwood Ave., Toronto, Ont., Canada.

JONES, Arthur L. (*M* 1947) Dist. Mgr., • American Blower Corp., Room 612, Syracuse Kemper Bldg., and 124 Fernwood Ave., Syracuse, N. Y.

JONES, Charles D. (*A* 1946) Owner & Mgr., • Charles D. Jones & Co., 3023 Main St., Kansas City 8, and 1824 West 72nd Terrace, Kansas City 5, Mo.

JONES, David C. (*A* 1946) Mgr. and Owner, • Service Heat & Power Co., 636-21st St., Oakland, and 51 Barbara Rd., Orinda, Calif.

JONES, Donald R. A. (*A* 1942) Indus. Gas Engr., Southern California Gas Co., 515 E. Compton Blvd., and • 404 S. Chester Ave., Compton, Calif.

JONES, Edgar C. (*J* 1947) Engr., Page Air Conditioning Co., Inc., 220 S. College St., and • 2212 Chambwood Dr., Charlotte, N. C.

JONES, Edwin (*M* 1933; *J* 1924) Engr. and Estimator, • Watt Plumbing, Heating & Supply Co., 608 S. Cincinnati, and 1436 East 17th Pl., Tulsa, Okla.

JONES, Edwin A. (*M* 1919) Staff Engr., Chrysler Corp., Airtemp Div., and • 1848 Tennyson Ave., Dayton 6, Ohio.

LaRUE, Perry (*M* 1938) Dir., Bldgs. and Grounds Dept., • Independent School Dist., 629 Third St., Des Moines 9, and 1321-43rd St., Des Moines, Ia.

LaSALVIA, James J. (*M* 1930) Dir. and Chief Engr., The Osborn Engineering Co., Cleveland, and • 2515 Eaton Rd., University Heights, Ohio.

LASETER, Frank L. (*M* 1938)Vice-Pres., • Gondas Co., 2140 N. Miami Ave., Miami, and 31-C Venetian Way, Miami Beach, Fla.
and • 14 Capitol Pkwy., Montgomery, Ala.

LASHLEY, Walter L., Jr. (*A* 1948; *J* 1943) Sales Engr., Roberts-Nicholson Co., 501 Middle St., and • 3510 Gramercy St., Houston, Texas.

LASLEY, James B. (*A* 1944) Mech. Engr., • Spring Mills, Inc., and Route 1, Lancaster, S. C.

LATHERS, Victor M. (*A* 1945) Sales Engr., Barber-Colman Co., and • 2409 Oxford St., Rockford, Ill.

LATHROP, William G. (*A* 1947) Sales Mgr., T. F. Byrnes, Inc., 27 Woodbine, and • 34 Marion St., Hartford, Conn.

LATTERNER, Henry, Jr. (*A* 1945; *J* 1940) Sales Engr., Columbia Specialty Co., 503 Bradley Blvd., Chevy Chase, Md., and • 3600 Macomb St. N.W., Washington 16, D. C.

LAUBE, Herbert L. (*M* 1943) Pres., Remington Corp., Cortland, and • 412 Sedgwick Dr., Syracuse 3, N. Y.

LAUER, R. F. (*M* 1941; *A* 1940; *J* 1936) Dist. Mgr., • York Corp., 5051 Santa Fe Ave., Los Angeles 11, and 201 Lemon Ave., Arcadia, Calif.

LAUGHLIN, William C. (*A* 1946) Sales Engr., • J. A. Walsh & Co., Inc., 1800 Austin St., and 2637 Amherst, Houston, Texas.

LAUTEN, Fred C. (*A* 1946) Sales Engr., F. C. Evans Co., 1709 Locust St., St. Louis, and • 3018 Hatherly Dr., St. Louis 21, Mo.

LAUTERBACH, Henry, Jr. (*M* 1935) Contract Engr., • Carrier Corp., 1186 Merchandise Mart, Chicago 54, and 6959 S. Merrill Ave., Chicago 49, Ill.

LAUTZ, Fritz A. (*M* 1936) Maint. Engr., American Bemberg Corp., Elizabethton, and • R. F. D. 1, Johnson City, Tenn.

LAVELLE, Anthony E. (*A* 1942) Vice-Pres., • The Gorman-Lavelle Plumbing & Heating Co., 2341 East 22nd St., Cleveland 15, and 2574 Kenilworth Rd., Cleveland, Ohio.

LAVORGNA, Michael L. (*M* 1941; *A* 1940) Mgr., Htg. Div., Richmond Radiator Co., 19 East 47th St., New York 17, N. Y.

LAWLESS, Albert J. (*M* 1945) Partner, • Hubbard, Lawless & Blakeley, 110 Whitney Ave., New Haven 10, and 25 Patton St., Hamden, Conn.

LAWLOR, John J. (*M* 1935) Mgr., Heating Div., The James Robertson Co., Ltd., 215 Spadina Ave., and • 60 Armadale Ave., Toronto, Ont., Canada.

LAWRENCE, Chester T. (*A* 1940) Branch Mgr., U. S. Radiator Corp., 1318 Marquette Ave., Minneapolis, and • 5213 Washburn Ave. S., Minneapolis 10, Minn.

LAWRENCE, Floyd D. (*A* 1938) Field Repr., • Clarage Fan Co., 500 Fifth Ave., Room 1024, New York 18, N. Y., and 60 Gardiner St., Noroton Heights, Conn.

LAWRENCE, John F. (*A* 1945; *J* 1944) Mech. Engr., • Byrne Organization, 2607 Connecticut Ave. N.W., Washington, D. C., and Temple Trailer Village, Box 141, Alexandria, Va.

LAWRENCE, L. Frank, Jr. (*M* 1942) Dist. Repr., Minneapolis-Honeywell Regulator Co., 13 Highland Hills Dr., Knoxville, Tenn.

LAWS, Charles W. (*M* 1944) Owner, Laws Engineering Service, 1120 Rapid St., and • P. O. Box 1628, Rapid City, S. D.

LAY, Robert M. (*A* 1947) Engr., • Royal Air Conditioning Co., 607 Rusk Ave., Houston 2, and 3031 Robinhood, Houston 5, Texas.

LAYTON, J. William (*M* 1945) Chief Engr., Propellair, Inc., 1345 Lagonda Ave., Springfield, and • 200 E. Hebble Ave., Osborn, Ohio.

LAYTON, Robert E., Jr. (*J* 1947) Sales Engr., L. O. Layton Supply Co., 1416 W. Erwin, and • Box 461, Tyler, Texas.

LEAS, Nat N. (*A* 1943) Mgr., • Conditioned Air & Refrigeration Co., 249 North H St., Fresno 3, and 3912 Balch Ave., Fresno, Calif.

LEATHERWOOD, Thomas Watson (*A* 1947) Pres., Contracting Engrs., Inc., 2802 Leeland Ave., Houston, and • 3212 Jackson St., Houston 4, Texas.

LEBMAN, Frank M. (*J* 1948; *S* 1947) Engr., Kennard Corp., 1819 S. Hanley Rd., St. Louis, and • 5846 Maffitt Ave., St. Louis 12, Mo.

LEBOWITZ, Malcolm F. (*J* 1947) Engr., Cutler & Price Plumbing & Heating Co., 22 W. Kinzie St., Chicago 10, and • 7740 S. Phillips Ave., Chicago 49, Ill.

LEBRUN, Paul (*M* 1947) Managing Dir., • Chaudieres & Radiateurs "Ideal", S. A. Vilvorde, Brussels, Belgium.

LECUREUX, E. (*A* 1943) Pres., Automatic Gas Co., Inc., P. O. Box 29, Athens, Ala.

LEDBETTER, Norvell C. (*M* 1944) Route 1, Box 370, Raleigh, Tenn.

LEDGETT, F. Donald (*A* 1947) Mech. Engr., Board of Education, Toronto, 155 College St., Toronto 2B, and • 76 Lynd Ave., Toronto, Ont., Canada.

LEE, Arthur R. (*A* 1947) Sales Mgr., • California Steam & Plumbing Supply Co., 345 Church St., San Francisco 14, and 103 Hillside, Mill Valley, Calif.

LEE, Boyd J. (*A* 1945) Owner, • B. J. Lee Co., 236 Adams Ave., Memphis 3, and 1674 Faxon Ave., Memphis, Tenn.

LEE, Burton H. (*M* 1945; *A* 1940) Chief Engr., Mance Corp., 400 W. Broadway, New York 12, and • 50 Mohican Park Ave., Dobbs Ferry, N. Y.

LEE, Carl M. (*A* 1944) Foreman, Air Cond. Dept., Allison Div., General Motors Corp., Plant 5, Tibbs and Raymond St., Indianapolis, and • 4535 Brookville Rd., Indianapolis 1, Ind.

LEE, Chia-Chin (*S* 1948) Student, University of Michigan, and • 931 Greenwood Ave., Ann Arbor, Mich.

LEE, James A. (*M* 1943; *A* 1937) Purch. Agent, Nash Motors Div., Nash Kelvinator Corp., and • 7301 Fifth Ave., Kenosha, Wis.

LEE, Lester A. (*A* 1945) Mgr., • American Radiator & Standard Sanitary Corp., 14430 Dexter Blvd., Detroit 6, and 14225 Greenview, Detroit 23, Mich.

LEE, Marvin N. (*S* 1948) Grad. Student, Graduate School, University of Minnesota, Minneapolis, and • 3112–43rd S., Minneapolis 6, Minn.

LEE, Ralph H. (*A* 1946) Sales Engr., Minneapolis-Honeywell Regulator Co., and • 1070 E. Eighth South, Salt Lake City, Utah.

LEE, Robert H. (*A* 1946) Mgr., Grudem Bros., 2645 University Ave., St. Paul 4, and • 2646 13th Ave. S., Minneapolis 7, Minn.

LEE, Robert J. (*M* 1941) Hucker Sales Co., 1700 Walnut St., Philadelphia 3, and • 2356-77th Ave., Philadelphia 38, Pa.

LEE, William R. (*A* 1947) Bldg. Supt., • Southwestern Art Association, 303 Beacon Bldg., and 1019 S. Main St., Tulsa 3, Okla.

LEEK, Charles W. (*M* 1938) Managing Dir., Leek & Co., Ltd., 1111 Homer St., and • 4682 W. Sixth Ave., Vancouver, B. C., Canada.

LEEK, Walter (*Life Member*; *M* 1903) Pres., • Leek & Co., Ltd., 1111 Homer St., and 4769 W. Second Ave., Vancouver, B. C., Canada.

LEES, John (*A* 1944) Engr., Board of Education, Broadway, Detroit, and • 16801 Freeland Ave., Detroit 27, Mich.

LEES, W. D. (*M* 1946) 11306-101st St., Edmonton, Alta., Canada.

LEESE, Milton L. (*A* 1945) Sales Engr., A-1 Industrial Equipment, Inc., 812 N. Lawrence St., Philadelphia 23, and ●2044 S. Redfield St., Philadelphia 43, Pa.

LEFEBVRE, Eugene J. (*M* 1937) Engr., Warden King, Ltd., 2104 Bennett Ave., Montreal, and ●12 Melbourne Ave., Westmount, Que., Canada.

LEFFEL, Paul C. (*A* 1941) Htg. Equip. Distributor, ● The Leffel Co., 3323 Main St., Kansas City 2, and 316 East 75th St., Kansas City, Mo.

LEGGETT, Reginald J. (*A* 1946) Plbg. and Htg. Contr., 5042 Western Ave., Montreal, Que., Canada.

LEGLER, Frederick W. (*M* 1935; *A* 1933) Retired, 2919 Johnson St. N.E., Minneapolis 18, Minn.

Le GRAND, I. F. (*M* 1947) Managing Partner, ●Air Engineers, 125 S. Eighth St., and Route 1, Allentown, Pa.

LEHMAN, Max G. (*A* 1937) Owner, ●M. G. Lehman, 720 O St., and 3225 W. Pershing Rd., Lincoln, Nebr.

LEIBY, Robert S. (*A* 1944) Owner and Mgr., ●Robert S. Leiby Sheet Metal Co., 212 N. Grant Ave., Columbus, and 6870 Havens Corners Rd., New Albany, Ohio.

LEICHNITZ, Robert W. (*A* 1944; *J* 1936) Field Supt., Leichnitz-Bibb, Inc., 510 S. First St., and ●1305 S. Ninth Ave., Yakima, Wash.

LEIGH, Richard S. (*M* 1948) Project Engr., Development Dept., Chase Brass & Copper Co., Waterbury 91, and ●R. F. D. 1, Woodbury, Conn.

LEIGHTON, Alexander H. (*A* 1947) Branch Mgr., ●Ilg Electric Ventilating Co., 533 S. Seventh St., Minneapolis 15, and 3801 Bryant Ave. S., Minneapolis 8, Minn.

LEILICH, Roger L. (*M* 1922) Pres., ●The Wallace Stebbins Co., 100 S. Charles St., Baltimore 1, and Ruxton, Baltimore Co., Md.

LEINROTH, J. P. (*M* 1929) Gen. Indus. Fuel Repr., ●Public Service Electric & Gas Co., 80 park Pl., Newark, and 37 The Fairway, Montclair, N. J.

LEISING, Ralph E. (*A* 1947) Designing Engr., Austin Co., 16112 Euclid Ave., Cleveland, and ●3250 Dellwood Rd., Cleveland Heights, Ohio.

LEITCH, Arthur S. (*M* 1908) Pres. and Managing Dir., ●The Arthur S. Leitch Co., Ltd., 1123 Bay St., Toronto 5, and 421 Russell Hill Rd., Toronto, Ont., Canada.

LEITCH, Kelvin D. (*M* 1944) Treas., The Arthur S. Leitch Co., Ltd., 1123 Bay St., and ●91 Highbourne Rd., Toronto, Ont., Canada.

LEITGABEL, K. A. (*J* 1941; *S* 1939) Partner, A. F. Leitgabel & Son, Elm Grove, and ●2320 North 58th St., Milwaukee 10, Wis.

LELAND, Warren B. (*M* 1929) Engr., ●The Fels Co., 42 Union St., and 4 Melbourne St., Portland, Me.

LEMKAU, Herbert (*A* 1946) Prod. Appl. Engr., Crane Co., 301 Brannan St., San Francisco, and ●7509 Valentine St., Oakland 3, Calif.

LEMMEN, Reese N. (*J* 1947) Designing Engr., Giffels & Vallet, Inc., 1000 Marquette Bldg., Detroit 26, and ●4172 Academy, Dearborn, Mich.

LENAZ, Ralph A. (*M* 1946) Partner, ●Runyon & Carey Assocs., 33 Fulton St., Newark 2, and 109 Raab Ave., Bloomfield, N. J.

LENIHAN, William O. (*A* 1936) Vice-Pres., Laverack & Haines, Inc., 718 White Bldg., Buffalo 2, and ●703 W. Ferry St., Buffalo 9, N. Y.

LENONE, Jose M. (*M* 1938) Designing Engr., ●Wilson & Co., Inc., 4100 S. Ashland Ave., Chicago 9, and 4932 Lake Park Ave., Chicago 15, Ill.

LENTZ, Thomas H. (*S* 1947) Student, ● Texas A. & M. College, P. O. Box 562, College Station, and Red Rock, Texas.

LENZ, Alfred W. (*A* 1945) Partner, Johnson-Lenz Heating & Piping Contractors, 336 Court St., and ●237 E. Edwin Circle, Memphis, Tenn.

LEONARD, Allison F. (*A* 1947) Dist. Mgr., J. R. Dowdell & Co., 416 M & M Bldg., and ●3002 Albans Rd., Houston, Texas.

LEONARD, Lorcan C. G. (*A* 1945; *J* 1937) Tech. Mgr., Messrs. McCann, Ltd., 19-20 Ellis Quay, Dublin, and ●94 St. Lawrence Rd., Chapelizod Co., Dublin, Ireland.

LEONHARD, Lee W. (*M* 1936) Asst. Supt., Eastman Kodak Co., Kodak Pk., Rochester, and ●1075 Winona Blvd., Rochester 12, N. Y.

LEOPOLD, Charles S.* (*M* 1934) Cons. Engr., ●213 S. Broad St., Philadelphia 7, and 7600 West Ave., Elkins Park, Pa.

LeRICHE, R. E. (*A* 1941) Mfrs. Repr., and ●6345 39th St. S.W., Seattle 6, Wash.

LESER, Fred A. (*M* 1941; *A* 1937) Branch Mgr., ●Ilg Electric Ventilating Co., 608 Mills Bldg., 17th and Penn Ave. N.W., Washington 6, and 7201 Cobalt Rd., Wood Acres, Washington 16, D. C.

LESLEY, P. Fred, Jr. (*S* 1948) Student, University of Michigan, ●222 Wenley House, Ann Arbor, and 16559 Harlow, Detroit 27, Mich.

LESLIE, Donald G. (*M* 1947) Vice-Pres., ● The Torrington Manufacturing Co., 70 Franklin St., and 110 Darling St., Torrington, Conn.

LESSINGER, Edgar F. (*A* 1941) Owner, ●Lessinger Plumbing & Heating Co., 221 S. Tenth St., and 814 North 18th St., Boise, Idaho.

LESTER, E. Archer (*A* 1944) Mgr., Plbg. and Htg. Div., ●Mid-States Industrial Corp., 2401-11th St., Rockford, Ill., and 6223 Washington Blvd., Indianapolis, Ind.

LESTER, William L. G. (*M* 1944) Vice-Pres., Abbott Lester & Co., Inc., 140 Cedar St., New York, N. Y., and ●58 Whitney Rd., Short Hills, N. J.

LETSOS, James N., Jr. (*J* 1948; *S* 1947) Air Cond. Engr., Climatic Engineering Co., Inc., 3117 Broadway St., and ●3827 Ave. Q½, Galveston, Texas.

LETT, Max A. (*M* 1945) Mech. Engr., ●601 Michigan Trust Bldg., Grand Rapids 2, and 1111 Walsh St. S.E., Grand Rapids 7, Mich.

LEUPOLD, George L. (*A* 1937) Sales Repr., Fulton Sylphon Co., 707 Race St., Cincinnati, and ●326 East Dr., Oakwood, Dayton, Ohio.

LEUTHESSER, Fred W., Jr. (*M* 1937) Secy., National Metal Products Corp., 21 N. Loomis St., Chicago 7, and ●P. O. Box 177, Franklin Park, Ill.

LEVENTHAL, Bernard (*A* 1946) Pres., Control-Temp Equip. Distributor, ●275 Atlantic Ave., Brooklyn 2, and 83 Clara St., Brooklyn, N. Y.

LEVERIDGE, Robert H. (*J* 1945) Appl. Engr., Carrier Corp., 405 Lexington Ave., New York 17, and ●135 Park Ave., Tuckahoe 7, N. Y.

LEVINE, Charles (*A* 1943; *J* 1939) Refrig. and Air Cond. Mechanic, New York Navy Shipyard, Brooklyn, and ●1171 Ocean Pkwy., Brooklyn 30, N. Y.

LEVINE, Lawrence J. (*A* 1946; *J* 1940) D.I.C. Staff Member, Massachusetts Institute of Technology, Dept. of Aeronautical Engineering, Cambridge 39, and ●9 Westchester Rd., Newton 58, Mass.

LEVINE, Samuel J. (*M* 1946) Div. Engr., General Electric Co., 5 Lawrence St., Bloomfield, and ●36 Fairway Ave., West Orange, N. J.

LEVINSON, David S.* (*J* 1948; *S* 1946) Engineer, ●Surface Combustion Corp., Air Cond. Div., Toledo 1, Ohio, and 53 W. Ferguson Ave., Wood River, Ill.

LEVITT, Leroy L. (*A* 1942; *J* 1940) Lt., U.S.N.R., and ●3326 Gwynns Falls Pkwy., Baltimore, Md.

LEVY, Bernard W.* (*S* 1946) Student, Purdue University, Box 535, Cary Hall South, West Lafayette, Ind., and ●2515 S. Ervay, Dallas, Texas.

LEVY, Marion I. (*M* 1938; *A* 1936; *J* 1931) Pres., Viking Air Conditioning Corp., 5600 Walworth Ave., Cleveland 2, Ohio.

LEWIN, Bram J. (*A* 1947) Engr., ●Lewin Mathes Co., 1111 Chouteau Ave., St. Louis 2, and Conway & Ballas Rds., St. Louis County, Mo.

LEWIN, Jacob (*A* 1946) Owner, ●J. Lewin & Co., 1075 Laurier St. W., Outremont, and 4925 Victoria Ave., Montreal, Que., Canada.

LEWIS, Carroll E. (*M* 1930) Pres., The Perfex Corp., 500 W. Oklahoma Ave., Milwaukee, and ●5108 N. Woodbourn, Milwaukee 11, Wis.

LEWIS, Daniel H. (*A* 1944) Owner, ●Lewis Engineering Service, 19003 John R, and 1059 W. Lantz, Detroit 3, Mich.

LEWIS, Gelder V. (*M* 1944) Vice-Pres., ●John G. Lewis Plumbing & Heating Co., 412 East 31st St., Kansas City 8, and 4439 Roanoke Pkwy., Kansas City, Mo.

LEWIS, Harold H. (*A* 1946) Partner, • Gleske Sheet Metal Co., 1724 Washington St., and 3715 Flora Ave., Kansas City, Mo.

LEWIS, Herald F. (*M* 1940; *A* 1937) Major, Stuttgart Mil. Post, APO 154, New York, N. Y.

LEWIS, Harry E. (*A* 1942; *J* 1939) Mgr., Insulation Engrg. Dept., • The Eagle-Picher Sales Co. Insulation Div., 900 American Bldg., Cincinnati, Ohio, and 137 Walnut St., Southgate, Ky.

LEWIS, J. C. (*A* 1944) Owner, • J. C. Lewis Co., 3815 Garrott St., Houston 6, and 4914 Linden, Bellaire, Texas.

LEWIS, John G. (*M* 1943) Pres., • John G. Lewis Plumbing & Heating Co., Inc., 412 East 31st St., and 3643 Charlotte St., Kansas City, Mo.

LEWIS, L. L.* (*M* 1918) Vice-Pres., • Carrier Corp., S. Geddes St., Syracuse 1, and 207 Sedgwick Dr., Syracuse 3, N. Y.

LEWIS, Samuel R.* (*Life Member*; *M* 1905), (*Presidential Member*), (Pres., 1914; 2nd Vice-Pres., 1910; Board of Governors, 1909-12; Council, 1914-15) Partner, • Samuel R. Lewis & Assocs., 100 W. Monroe St., Chicago 3, and 4737 Kimbark Ave., Chicago, Ill.

LEWIS, Velma I., Mrs. (*A* 1943) Stuttgart Mil. Post, APO 154, c/o Major H. F. Lewis, New York, N. Y.

LEY, Ralph B. (*A* 1940) Field Repr., Victor Products Corp., Chicago, Ill., and • 916 Park Ave., Falls Church, Va.

L'HOMMEDIEU, Curtiss L. (*M* 1944) Htg., Vtg. and Fire Protection Engr., • Foskett & Bishop Co., 76 Blatchley Ave., New Haven, and Rimmon Rd., Woodbridge, Conn.

LIBBY, Ralph S. (*A* 1939; *J* 1933) Pres., • Libby Engineering, Ltd., 985 Sherbrooke St. W., and Apt. 1, 30 Marsolais Ave., Montreal, Que., Canada.

LICANDRO, James P. (*A* 1943; *J* 1938) Chief Engr., • Carrier-Mandell, Inc., 177 State St., Boston, and 860 Main St., Greenwood, Mass.

LICHTEN, Earl B. (*J* 1947) Mech. Engr., Consoer, Townsend & Associates, 351 E. Ohio, Chicago 11, and • 744 S. Central Park Ave., Chicago 24, Ill.

LICHTY, C. P. (*Life Member*; *M* 1920) C. P. Lichty Engineering Co., 4405 Greely, Houston 6, Texas.

LIEBERT, Ralph C. (*A* 1946) Mgr. and Owner, • Capitol Refrigeration Co., 623 N. High St., and 2927 Bremen St., Columbus, Ohio

LIEBLICH, Murray (*J* 1943; *S* 1940) Htg. Engr., • H. Lieblich & Co., 36 West 66th St., and Park Central Hotel, New York, N. Y.

LIFTON, David (*J* 1942; *S* 1939) Instructor, Pennsylvania State College, Dept. of Mech. Engrg., State College, Pa.

LIGE, Walter W. (*M* 1941; *A* 1940) 8200 N. Austin Ave., Morton Grove, and • 1035 Forest Ave., Deerfield, Ill.

LIGHT, John C. (*A* 1938) Major, Ordnance Dept., and • Watervliet Arsenal, Watervliet, N. Y.

LILJA, Oscar L. (*M* 1943; *A* 1937; *J* 1936) Asst. Mech. Engr., Toltz, King & Day, Inc., 1509 Pioneer Bldg., St. Paul 1, and • 5000-16th Ave. S., Minneapolis 7, Minn.

LILLY, Frank J. (*A* 1948) Mgr., Janitrol Triple Service Sales-Surface Combustion Corp., 400 Dublin Ave., and • 442 Midgard Rd., Columbus, Ohio.

LIMBACHER, Howard R. (*M* 1943) Research Engr., • Ingersoll Steel Div., Borg-Warner Corp., 521 Harrison Ct., and 525 Edgemoor Ave., Kalamazoo, Mich.

LINCOLN, Roland L. (*M* 1935) Mgr., Dust Lab., B. F. Sturtevant Co., Div. of Westinghouse Electric, Hyde Park 36, Boston, and • Box 97, Dover, Mass.

LINDAHL, Eric J. (*M* 1947) Head, Mech. Engrg. Dept., • University of Wyoming, and 665 N. Ninth St., Laramie, Wyo.

LINDEMAN, Claude F. (*A* 1946) Owner, 3444 N. Euclid Ave., Indianapolis, Ind.

LINDEN, Morris (*A* 1948) Owner, Linden Heating Co., Box 184, Anoka, Minn.

LINDHOLM, Wilbur D. (*A* 1946) Engr., Universal Heating & Equipment Co., 616 E. Grand Ave., Des Moines, Ia.

LINDSAY, D. Lorne (*A* 1947) Mech. Engr., • Wiggs, Walford, Frost & Lindsay, 1411 Crescent St., Montreal 25, and 5811 Cote St. Luc Rd., Montreal, Que., Canada.

LINDSAY, Griffith W. (*M* 1937) Supvsr., Estimating and Time Study, Chrysler Corp., Airtemp Div., 1119 Leo St., Dayton, and • 301 N. Garland Ave., Dayton 3, Ohio.

LINDSLEY, Forrest A. (*A* 1943) Htg. Engr., John M. Campbell, Inc., 38630 Plymouth Rd., Plymouth, and • 151 University Ave., Ferndale, Mich.

LINDSTROM, Alvin L. (*M* 1945) Cons. Mech. Engr., • 1274 Stillwood Dr. N.E., and 1272 Stillwood Dr. N.E., Atlanta 6, Ga.

LINDSTROM, Donald F. (*A* 1946; *J* 1941) Owner and Reg. Mech. Engr., • 508 Henry Grady Bldg., and 325 E. Paces Ferry Rd., Apt. 14, Atlanta, Ga.

LINGEN, Ralph A. (*A* 1939; *J* 1938) Dist. Mgr., • American Foundry & Furnace Co., 709 North 11th St., Milwaukee, and 6028 W. Wisconsin Ave., Wauwatosa, Wis.

LINIGER, Richard (*A* 1947) Engr., Liniger Co., 103 S. Washington St., and • R. R. No. 6, Marion, Ind.

LINIGER, Rudy H. (*A* 1947) Mfrs. Repr., Larry Harrington Co., Inc., and • 2311 Broadway N., Seattle 2, Wash.

LINK, Charles H. (*A* 1947; *J* 1946; *S* 1941) Partner, • Link Co., 414 N. Blackstone, and 607 W. Franklin St., Jackson, Mich.

LINN, G. B. (*A* 1946) Mech. Engr., • 1743 East 25th St., Cleveland 14, and • 4505 Ardendale Rd., South Euclid 21, Ohio.

LINSENMEYER, F. J. (*M* 1944) • Hoffman Combustion Engineering Co., 710 Marquette Bldg., and 19020 Warrington Dr., Detroit, Mich.

LINSKIE, George A. (*M* 1946; *J* 1939) Engr., • Farwell Co., Inc., Buckner Blvd., Dallas 10, and 3124 Milton Ave., Dallas 5, Texas.

LINSKY, Benjamin (*S* 1948) Student, University of Michigan, and • 1005 W. Washington, Ann Arbor, Mich.

LINTON, John P. (*M* 1927) Pres., • Engineering Installations, Ltd., 1154 Beaver Hall Sq., Montreal, and 247 Brock Ave. N., Montreal, W., Que., Canada.

LIPPERT, Wayne M. (*J* 1948; *S* 1946) Jr. Engr., United Gas Corp., Room 911, United Gas Bldg., and • 2247 Bartlett, Houston, Texas.

LIPPITT, A. Warren (*J* 1946) Engrg. Draftsman, Robert E. Hattis, Cons. Engr., 223 W. Jackson Blvd., and • 6347 Kenmore, Chicago 40, Ill.

LIPSCOMBE, Harold W. J. (*M* 1938) Mgr., Air Cond. Dept., Davidson & Co., Ltd., Central House, Kingsway, London, and • 39 Woodland Way, West Wickham, Kent, England.

LITTLE, Fred G. (*A* 1946) Service Engr., Southern California Gas Co., 725 Channing St., Los Angeles, and • 8564 Holloway Dr., Los Angeles 46, Calif.

LITTLE, Kenneth B. (*A* 1943) Owner, • Kenneth B. Little Co., 832 Temple Bar Bldg., Cincinnati 2, and 7324 Reading Rd., Cincinnati 16, Ohio.

LITTLE, Raymond (*M* 1944; *A* 1943) Gen. Sales Mgr., • Equitable Gas Co., 610 Wood St., Pittsburgh 22, and 81 Roycroft Ave., Pittsburgh 16, Pa.

LITTLE, Vernon R. (*A* 1944) Chief Engr., Powerhouse, Air Cond., Curtiss-Wright Corp., 4300 E. Fifth Ave., and • 3706 E. Fifth Ave., Apt. C, Columbus 9, Ohio.

LITTLEFORD, Wallace H. (*M* 1936) Vice-Pres., • E. J. Febrey & Co., Inc., 616 New York Ave. N.W., Washington, D. C., and 4305 Center St., Chevy Chase, Md.

LITWACK, Herman E. (*A* 1948) Partner, • Anderson & Litwack 516 S. Laflin Ave., Chicago 7, and 5354 N. Kimball Ave., Chicago 25, Ill.

LIVAUDAIS, Marcel (*M* 1945) Chief Draftsman, Public Works Dept., Hq. 8th Naval Dist., 1008 Federal Bldg., New Orleans 12, and • 319 Audubon St., New Orleans 18, La.

LIVELY, George P. (*M* 1942) Principal Engr. (N.A.), Bureau of Ships, Navy Dept., Washington, D. C., and • 818 S. Pitt St., Alexandria, Va.

LIVERMORE, James N.* (*M* 1939) Mech. Engr., • The Detroit Edison Co., 2000 Second Ave., Detroit 26, and 5 Hanover Rd., Pleasant Ridge, Mich.

LIX-KLETT, Luis (*A* 1944) Chief Engr. and Tech. Dir., • Carrier Lix-Klett, S. A., Florida 229, and Juncal 223F, Buenos Aires, Argentina, S. A.

LLOYD, Edmund H. (*A* 1943; *J* 1936) Vice-Pres., • Wm. E. Kingswell, Inc., 4020 Georgia Ave. N.W., Washington 11, and 2414 39th Pl., N.W., Washington 7, D. C.

LLOYD, Edward C. (*M* 1927) Armstrong Cork Co., and • R. D. 5, Old Philadelphia Pike, Lancaster, Pa.

LOBSTEIN, Melville C. (*M* 1941) Chief Engr., Museum of Science & Industry, 57th St. and Outer Dr., Chicago 37, and • 1401 S. Highland Ave., Berwyn, Ill.

LOCHER, David E. (*M* 1945) Pres. and Mgr., • Coolidge Locher Co., Box 949, 224 S. Staples St., and 215 E. Oleander St., Corpus Christi, Texas.

LOCHMAN, Edward W. (*M* 1942) Owner, • Edward W. Lochman Co., Plumbing, Heating Contrs., 1421 Cherry St., Kansas City 6, and 634 East 73rd Terrace, Kansas City 5, Mo.

LOCK, Rowland H. (*M* 1939) Gen. Mgr. and Vice-Pres., • J. H. Lock & Sons, Ltd., 150 Perth Ave., Toronto 9, and 36 Kennedy Park Rd., Toronto, Ont., Canada.

LOCKE, Charles F. A. (*M* 1944) Branch Mgr., • Minneapolis-Honeywell Regulator Co., 1007 N. Meridian St., Indianapolis 4, and 4775 N. Park Ave., Indianapolis 5, Ind.

LOCKE, James S. (*M* 1939) Sales Mgr., Air Cond. Controls Div., Minneapolis-Honeywell Regulator Co., 2753 Fourth Ave. S., Minneapolis 8, and • 515 West 50th St., Minneapolis, Minn.

LOCKE, R. A. (*M* 1935) Mgr., • Steel Boiler Institute, Inc., 1207 Land Title Bldg., Broad and Chestnut Sts., Philadelphia 10, and 305 Brentford Rd., Haverford, Pa.

LOCKHART, Charles W. (*A* 1946) Dist. Mgr., • Buffalo Forge Co., 1214 Central Tower Bldg., and 1900 Pacific Ave., San Francisco, Calif.

LOCKHART, Harold A. (*M* 1944; *A* 1936; *J* 1935) Chief Engr., Bell & Gossett Co., Morton Grove, and • Box 5385, R. R. 2, Des Plaines, Ill.

LOCKHART, William R. (*A* 1947) Sales Engr., • Washington Refrigeration Co., 2052 West Virginia Ave. N.E., Washington 2, D. C.

LOCKLIN, David W. (*J* 1948) Research Engr., A.S.H.V.E. Research Laboratory, • 7218 Euclid Ave., Cleveland 3, Ohio, and 1106 S. Garfield St., Urbana, Ill.

LOCKWOOD, James R. (*A* 1944) Gen. Sales Mgr., • Familian Pipe & Supply Co., 9430 Rayo Ave., South Gate, and 4540 Simpson Ave., North Hollywood, Calif.

LODGE, Robert H. (*J* 1948) Sales Engr., Murphy & Miller, Inc., 1326 S. Michigan, and • 5498 Hyde Park Blvd., Chicago, Ill.

LOEBSACK, Victor H. (*A* 1947) Partner in charge of Mech. Work, • Thomas W. Williamson & Co., 1202 National Bank of Topeka, and 1916 Warner Ct., Topeka, Kans.

LOEFFLER, Frank X. (*M* 1914) Pres., • Loeffler-Greene Supply Co., Box 529, Oklahoma City 1, and 1811 Northwest 19th St., Oklahoma City, Okla.

LOEFFLER, Frank X., Jr. (*A* 1947) Sales Engr. & Secy., • Loeffler-Greene Supply Co., P. O. Box 529, Oklahoma City 1, and 2407 Northwest 31st, Oklahoma City, Okla.

LOEFFLER, John G. (*J* 1947) Sales Engr., • Room 203, Elliott Bldg., 120 E. Ninth, Tulsa 3, and 1415 S. Oswego, Tulsa 4, Okla.

LOESER, Chester M. (*A* 1943) Secy., • Elizabeth Cornice Works, Inc., 25 S. Union St., Elizabeth 4, and 924 Park Ave., Elizabeth, N. J.

LOFTE, John A. (*M* 1945) Engr., Trane Co., 1835 N. Third St., Milwaukee, and • 9121 W. Hawthorne Ave., Milwaukee 13, Wis.

LOFTUS, Robert G. (*A* 1945) Chief Engr., • Victory Mills Ltd., 285 Fleet St. E., Toronto, and 6 River Lea Rd., Weston, Ont., Canada.

LOH, Nan-Shee (*M* 1946) Gen. Mgr., • New Shanghai Engineering Co., Room 104-B, Chung Foo Bank Bldg., 97 Jinkee Rd., and 1039-24 Sinza Rd., Shanghai, China.

LOKEY, Edgar R. (*A* 1945) Portland Dist. Mgr., • Norman S. Wright & Co., 1238 N.W. Glisan St., Portland 9, and 2818 N.E. Bryce, Portland 12, Ore.

LONG, David A. (*A* 1943) Engr., Trane Company of Canada, Ltd., 4 Mowat Ave., Toronto, and • Centre Rd. S., Cooksville, Ont., Canada.

LONG, Edward J. (*A* 1948; *J* 1942; *S* 1939) Cons. Engr., • Drach Bldg., 427 E. Washington St., and 1120½ W. Governor, Springfield, Ill.

LONG, Eugene L. (*A* 1944) Business Mgr. of Columbus Br. Office, • Avery Engineering Co., 59 E. Goodale St., Columbus, and 1263 Broadview Ave., Columbus 8, Ohio.

LONG, Odell B. (*M* 1946) Partner, • Air Engineering Co., 115 W. Catherine St., and 3828 Selwyn Ave., Charlotte, N. C.

LONG, Wayne E. (*M* 1935) Prof., Mech. Engrg., The A. & M. College of Texas, College Station, Texas.

LONGCOY, Grant B. (*M* 1933) Engr., Joseph Breslove, Cons. Engr., 1149 Leader Bldg., Cleveland 14, and • 1215 Ramona Ave., Lakewood 7, Ohio.

LONGWORTH, A. Leslie (*M* 1945) Asst. Fuel Engr., Ministry of Fuel & Power, N.W. Region, Burton Rd., West Didsbury, Manchester 20, and • 264 Buckingham Rd., Heaton Moor, Stockport, Cheshire, England.

LOO, Ping Yok (*M* 1933) Gen. Mgr., • China Engineering Co., 30 Brenan Rd., Shanghai, and 271-73 Dunbarton Rd., Tientsin, China.

LOPKER, Frank J. (*A* 1946) Owner, • Frank J. Lopker Co., 112 W. Ninth St., Room 1222, and 938 S. Lake St., Los Angeles 15, Calif.

LORD, Richard H. (*A* 1948; *J* 1946) Pres., • P. S. Lord, Mechanical Contractors, 4507 S.E. Milwaukee Ave., and 2073 S.W. Park Ave., Portland, Ore.

LORENZI, Robert J.* (*M* 1946) Research Engr., • John B. Pierce Laboratory of Hygiene, 290 Congress Ave., New Haven, and 1342 Whitney Ave., Hamden, Conn.

LORIMER, Carl F. (*M* 1943) Cons. Engr., • Business Administration, Dept. Public Welfare, Room G-15, State Office Bldg., Columbus 16, and 130 N. Pierce St., Apt. 2, Lima, Ohio.

LOSEMAN, John L. (*S* 1948) Student, David Ranken Jr. School of Mechanical Trades, and • 8623 Partridge, St. Louis, Mo.

LOUCKS, David W. (*A* 1937) Supvsr., Indus. Elec. and Steam Sales, • Duquesne Light Co., 435 Sixth Ave., Pittsburgh 19, and 1049 Osage Dr., Pittsburgh 21, Pa.

LOUGHRAN, Patrick H., Jr. (*A* 1946; *J* 1937) Sales, Mitchell Quick, 2413 Penn. Ave. N.W., Washington, and • 4513-49th St. N.W., Washington 16, D. C.

LOVE, Clarence H. (*M* 1919) Mfrs. Agent, • Nash Engineering Co., 421 Chamber of Commerce, Buffalo 2, and 16 Lexington Ave., Apt. 1A, Buffalo, N. Y.

LOVE, J. Edwin (*M* 1947) Plant Engr., RCA Victor Division, Camden, and • 235 Hawthorne Ave., Haddonfield, N. J.

LOVELAND, Francis P. (*M* 1944) Colo. Dist. Mgr., • Citizens Utilities Co., Box 313, and P. O. Box 131, La Junta, Colo.

LOVENBERG, Albert M. (*A* 1946) Appl. Engr., Edlee Distributors, Inc., 65 Main St., and • 66 Belmont Ave., Springfield, Mass.

LOW, Charles J. (*A* 1946) Sales Engr., Furnace Dept., Jackson & Church, 306 Stoker Dr., Carrollton, and • 907 N. Fayett St., Saginaw, Mich.

LOWE, John B. (*M* 1947) Pres., • Texas Distributors, Inc., 3914 Live Oak, Dallas 4, and 3300 Rosedale, Dallas, Texas.

LOWE, Robert A. (*M* 1944; *J* 1938) Cons. Engr., • Storms & Lowe, 6381 Hollywood Blvd., Los Angeles 28, and 3744 Potomac Ave., Los Angeles 16, Calif.

LOWE, Stanley C. (*A* 1947) Combus. Engr., • Dominion Coal Co., Ltd., Canada Cement Bldg., Phillips Sq., and 406 Pine Ave. W., Apt. 76, Montreal, Que., Canada.

LUBINSKY, Richard G. (*M* 1946) Mgr., Fan and Htg. Coil Dept., • The Trane Co., and 2416 Loomis St., LaCrosse, Wis.

LUBKING, Charles J. (*M* 1944) Sales Engr., • Minneapolis-Honeywell Regulator Co., 5060 Wayne Ave., Philadelphia, and 2755 N. Dover St., Philadelphia 32, Pa.

LUCE, John A. (*M* 1946) Mgr., Htg. Dept., • Federal Pipe & Supply Co., 670 Second St., and 1835-34th Ave., San Francisco, Calif.

LUCEY, Ray E. (*M* 1946) Mgr., Prod. Engrg. Dept., The Trane Co., and ● 324 North 24th St., LaCrosse, Wis.

LUCK, Alexander W. (*Life Member*; *M* 1919) Engr., 532 Woodward St., and ● Wyomissing Club, Fifth and Walnut Sts., Reading, Pa.

LUCKE, Charles Edward (*Life Member*; *M* 1924) Stevens Prof. Emeritus, and Mech. Engrg. Consultant, ● Columbia University, Pupin Bldg., New York 27, and 186 Riverside Dr., New York 24, N. Y.

LUDLOW, Harold M. (*M* 1940) Sales and Engrg., ● P. O. Box 1368, Jackson 111, and 950 Pecan Blvd., Jackson, Miss.

LUDWIG, Albert D. (*S* 1947) Student, Michigan State College, East Lansing, and ● 3990 Three Mile Dr., Detroit, Mich.

LUDWIG, Willis D. (*M* 1942) Constr. Engr., ● York Corp., 1238 North 44th St., Philadelphia 4, and 95 Wynnedale Rd., Narberth, Pa.

LUEDECKE, William H. (*A* 1945) Regional Engr., Chrysler Airtemp Sales Corp., and ● 3012 Kingston, Dallas 11, Texas.

LUKER, Martin, Jr. (*S* 1948) Student, A. & M. College of Texas, College Station, and ● 1916-10th, Wichita Falls, Texas.

LUMM, Albert H., Jr. (*J* 1944) Chief Engr., ● A. H. Lumm Co., 2512 Albion St., and 2517 Montebello Rd., Toledo, Ohio.

LUND, Clarence E.* (*M* 1936; *J* 1935; *S* 1933) Professor & Asst. Director, Engrg. Exp. Station, ● University of Minnesota, and 4817 12th Ave. S., Minneapolis, Minn.

LUND, John F. (*A* 1947) Sales Mgr., ● The Dole Valve Co., 1933 W. Carroll Ave., Chicago 12, and 215 Sunset Ave., Lombard, Ill.

LUNDBERG, Olof A. (*A* 1946) Htg. Contr., 1275 Westchester Pl., Los Angeles 6, Calif.

LUNDT, Ernest C. (*M* 1947) Pres., ● Ernest C. Lundt, Inc., P. O. Box 216, and 24 Prospect St., Little Falls, N. J.

LUNDY, Ralph B. (*A* 1947) West Coast Sales Mgr., Combustion Controls Corp., and ● 765 Cordilleras Ave., San Carlos, Calif.

LUNT, Wilbur F. (*A* 1946; *J* 1943) Prop., Lunt Heating Co., 95 Summit St., Portland 5, Me.

LUSH, Clifford N. (*A* 1944) Mech. Supt., Weston's Bread & Cake (Canada), Ltd., and ● 217 Walnut St., Winnipeg, Man., Canada.

LUTTRELL, Lee W. (*M* 1943) 3912 Sixth St. S., Arlington, Va.

LUTY, Donald J. (*M* 1933) Vice-Pres., Peerless Air Conditioning Co., 21700 Wyoming Ave., Detroit 20, and ● 30 Colorado Ave., Detroit 3, Mich.

LUX, Alex C. (*A* 1946) Asst. Supt., Steam Heat Dept., Puget Sound Power & Light Co., Electric Bldg., and ● 2209 Roanoke St., Seattle, Wash.

LUZZI, Theodore E. (*M* 1944) Vice-Pres., Almirall & Co., Inc., 53 Park Pl., New York 7, and ● 88 Colonial Rd., Bellerose 6, L. I., N. Y.

LYFORD, Robert G. (*M* 1947; *A* 1944; *J* 1939) Branch Mgr., ● The Powers Regulator Co., 602 N. Akard, and 2717 E. Amherst, Dallas, Texas.

LYM, Joseph H. (*A* 1944) Owner, Lym Engineering Co., and ● 2683 South 13th E., Salt Lake City, Utah.

LYMAN, Samuel E. (*A* 1924) Buensod-Stacey Air Conditioning, Inc., 60 East 42nd St., New York, N. Y., and ● 865 Hueston St., Elizabeth 3, N. J.

LYNCH, Charles B. (*A* 1945) Chief Engr., Morrison Engineering Corp., 5005 Euclid Ave., Cleveland 3, and ● 1552 Ansel Rd., Cleveland 6, Ohio.

LYNCH, James R. (*A* 1940) Owner, The Lynch Co., 6000 N.E. Union Ave., Portland 11, Ore.

LYNCH, John T. (*A* 1946) Head of Air Cond. Dept., ● The David Ranken Jr. School of Mechanical Trades, 4431 Finney Ave., St. Louis 13, and 4631 Bircher Blvd., St. Louis 15, Mo.

LYNCH, Roderick (*A* 1944) Owner, ● Lynch Asbestos Co., 2152 Sacramento St., Los Angeles 21, and 131 N. Newlin Ave., Whittier, Calif.

LYNCH, W. L. (*M* 1928) Pres., ● Rome-Turney Radiator Co., Canal St., and 1205 N. George St., Rome, N. Y.

LYNDE, Carleton John, Jr. (*M* 1944) Chief Engr., ● Maple Leaf Milling Co., Ltd., 68 Yonge St., Toronto 1, and 33 Queen Anne Rd., Toronto 9, Ont., Canada.

LYNES, Gilbert K. (*A* 1947) Chief Draftsman, Warden King Ltd., 2104 Bennett Ave., and ● 4661 St. Denis St., Montreal, Que., Canada.

LYNN, Frederick E. (*M* 1938) Refrig. Engr., Electric Products, Inc., 5929 Baum Blvd., and ● 708 Delafield Rd., Fox Chapel, Pittsburgh 15, Pa.

LYNN, John F. (*A* 1947) Service Mgr., Lennox Furnace Co., 400 N. Midler Ave., and ● 1428 N. Salina St., Syracuse, N. Y.

LYON, Douglas McClure (*A* 1941) Pres., ● Douglas McClure Lyon, Inc., 317 State Tower Bldg., Syracuse 2, and 2 Seminary St., Cazenovia, N. Y.

LYON, James P. (*M* 1946) N. Y. Repr., Thatcher Furnace Co., Garwood, N. J., and ● Princeton Club, Park Ave. and 39th St., New York, N. Y.

LYONS, Cornelius J. (*A* 1932) Sales Engr., Nash Engineering Co., and ● 22 Haviland St., South Norwalk, Conn.

LYONS, Earl C. (*M* 1945) Gen. Mgr., ● Lyons Engineering Co., Ltd., 1 Industrial St., Toronto 12, Leaside, and 78 Applegrove Ave., Toronto, Ont., Canada.

LYONS, H. W. (*M* 1946) Mech. Engr., Sharp & Dohme, Inc., 640 N. Broad St., Philadelphia 1, and ● 1503 Manoa Rd., Penn Wynne, Philadelphia 31, Pa.

LYTLE, William T. (*A* 1946) Mechanic, Hercules Powder Co., Lawrence, and ● Lane E. Apt. 3, Sunflower, Kans.

M

MABLEY, T. H. (*M* 1939) Secy. & Chief Engr., ● Mechanical Heat & Cold, Inc., 12320 Hamilton Ave., Detroit 3, and 2323 Yorkshire Ave., Birmingham, Mich.

MABON, James E. (*J* 1942; *S* 1939) Design Draftsman, Gilbert Associates, Inc., and ● 224 N. Sixth, Mt. Penn, Reading, Pa.

MacCREA, John M. (*M* 1946) Owner, ● J. M. MacCrea Sales Co., P. O. Box 93, University Station, and 153 Oakland St., Syracuse 10, N. Y.

MacDERMOT, S. G. (*M* 1943) Mgr., Constr., Dept., Canadian Johns-Manville Co., Ltd., 1062 Sun Life Bldg., and ● 54 Dufferin, Ste. Rose, Laval County, Montreal, Que., Canada.

MACDONALD, Donald B. (*M* 1930) Sales Engr., Luzern & Lackawana Supply Co., 20 N. Penn Ave., Wilkes-Barre, and ● 101 E. Walnut St., Kingston, Pa.

MACDONALD, Douglas J. (*M* 1945) Vice-Pres. and Mgr., ● Dufferin Plant, Standard Sanitary & Dominion Radiator Co., Ltd., Royce and Lansdowne, and 96 Hudson Dr., Toronto, Ont., Canada.

MacDONALD, Edmund L., Jr. (*A* 1947) Mgr., Oil Div., ● S. Cunard & Co., Ltd., P. O. Box 128, and 10 Pryor St., Halifax, Nova Scotia.

MacDONALD, George D. (*A* 1945) Engr., ● Holyoke Valve & Hydrant Co., 150 Race St., and 77 Brookline Ave., Holyoke, Mass.

MacDONALD, James (*M* 1944) Dist. Mgr., Reid Hayden, Inc., 1231 W. Morehead St., Charlotte, and ● 2546 Sherwood Ave., Charlotte 4, N. C.

MacEACHIN, Graham C. (*M* 1938) Dist. Engr., Frigidaire Sales Corp., 2601 W. Seventh, and ● 5112 Byers Ave., Fort Worth 7, Texas.

MacFARLAN, Norris S. (*M* 1942) House Htg. Repr., ● The Philadelphia Gas Works Co., 1401 Arch St., Philadelphia 5, and 320 W. Wharton Rd., Glenside, Pa.

MacFERRIN, John B. (*M* 1944) Htg. and Vent. Engr., ● Pittsburgh Water Heater Sales Co., P. O. Box 663, 2608 Fannin St., Houston 1, and 1305 Cleburne, Apt. 2-B, Houston, Texas.

MacGANN, Lloyd S. (*M* 1945) Branch Mgr., ● Minneapolis-Honeywell Regulator Co., 2100 St. Paul St., Baltimore 18, and 3612 Keene Ave., Baltimore 14, Md.

MacGREGOR, Cecil M. (*A* 1939) Lt. Col., Ordnance Dept., U. S. A., Headquarters, Army Service Forces, Pentagon, Washington, D. C., and ● 7817 N. Washburne Ave., Portland 3, Ore.

MacGREGOR, Duncan K. (*A* 1944) Designer, ● Railway & Power Engineering Corp., Ltd., 195 Eastern Ave., Toronto, and Highland Creek, Ont., Canada.

MACHEREL, Ferdinand (*M* 1939) Tech. Dir., Etabl. Inco, Carrier Repr., 50 Rue Daugerre, Algiers, North Africa.

MacINTYRE, Henriette Betlem (*A* 1942; *J* 1934) Co-Mgr., • R. D. MacIntyre Co., 1880 East Ave., and 2500 East Ave., Rochester, N. Y.

MACK, Ludwig (*M* 1935) Mgr., Indus. Air Cond., Westinghouse Electric Corp., Sturtevant Div., 3001 Walnut St., Philadelphia, and • 412 W. Hortter St., Philadelphia 19, Pa.

MacKAY, Harold J. (*A* 1946) Field Engr., Surface Combustion Corp., 225 Broadway, New York 7, and • 8026-90th Ave., Woodhaven 21, N. Y.

MacKENZIE, John M. (*A* 1945) Asst. Prof., University of Minnesota, and • 2024 Commonwealth Ave., Apt. C-11, St. Paul, Minn.

MACKEY, C. O.* (*M* 1943) Prof. of Heat-Power Engrg., • Cornell University, 617 Highland Rd., Ithaca, N. Y.

MacLACHLAN, Victor D. (*A* 1939; *J* 1938) Honeywell-Brown, Ltd., Wadsworth Rd., Perivale, Greenford, Middlesex, England.

MACLEAN, Ian R. S. (*A* 1946) Carrier Lix-Klett, Florida 229, Buenos Aires, Argentina, S. A.

MacLEAN, Robert M. (*A* 1948) Mech. Engr., Research Labs., Socony Vacuum, Paulsboro, N. J., and • 240 West Walnut Lane, Apt. C 204, Philadelphia, Pa.

MacMILLAN, Alexander R. (*M* 1936) Col., Air Corps., • Office of the Air Inspector, Hq., A. A. F., Washington 25, D. C., and Rixey Mansion, Arlington, Va.

MACNAMARA, Roger (*A* 1946) Mfrs. Sales Repr., • 217 Church and Main Bldg., and 1417 E. Concord Ave., Orlando, Fla.

MacQUEEN, Donald (*A* 1948) Pres., Donald MacQueen Co., Ltd., 831 Wellington, Montreal, and Hudson Heights, Que., Canada.

MACROW, Lawrence (*A* 1941; *J* 1936) Dist. Chief Engr., • Carrier Corp., 12 South 12th St., Philadelphia, and 225 Buttonwood Way, Glenside, Pa.

MacWATT, Donald A. (*M* 1938) Sales Engr., Powers Regulator Co., 231 East 46th St., New York, and • 93 Woodedge Rd., Plandome, L. I., N. Y.

MADDEN, Alfred B. (*M* 1942) Mgr., Htg. Dept., • Crane, Ltd., 1121 St. James St. W., and 5367 Earnscliffe Ave., N. D. G., Montreal, Que., Canada.

MADELY, Fred Jas. (*A* 1936) Gen. Mgr., Eastern Steel Products, Ltd., 394 Symington Ave., and • 6 Wanless Crescent, Toronto, Ont., Canada.

MADISON, Richard D.* (*M* 1926) Research Engr., • Buffalo Forge Co., 490 Broadway, Buffalo 5, and 218 Brantwood Rd., Snyder, Buffalo 21, N. Y.

MAEHLING, Leon S. (*M* 1932) Mgr., Htg. Sales, Equitable Gas Co., 610 Wood St., Pittsburgh 22, and • 778 Country Club Dr., Pittsburgh 16, Pa.

MAGARRELL, Kenneth R. (*A* 1944) Partner, • Design and Installation, Magarrell & Cox, 127 S. Main St., and Rt. 4, Council Bluffs, Ia.

MaGIRL, Willis J. (*M* 1934; *A* 1931; *J* 1927) Vice-Pres., MaGirl Foundry & Furnace Co. 413 E. Oakland Ave., and 1119 E. Monroe St., Bloomington, Ill.

MAGNUSSON, Nicholas (*A* 1938) Estimator,—Designer, Sales, Montgomery Ward & Co., 150-14 Jamaica Ave., and • 138-05 Linden Blvd., Jamaica, N. Y.

MAHER, Robert L. (*A* 1946) Project Engr., Chase Brass & Copper Co., and • Box 1011, Waterbury, Conn.

MAHON, B. B. (Miss) (*M* 1935) Principal, Schools of Plbg., Htg. and Air Cond., • International Correspondence Schools, Wyoming Ave., Scranton 1, and 433 Fig St., Scranton 5, Pa.

MAHONEY, C. L. (*A* 1945) Owner, C. L. Mahoney, 438 Forest St., Kalamazoo, Mich.

MAHONEY, David J. (*M* 1930; *A* 1926) Branch Mgr., • Johnson Service Co., 503 Franklin St., Buffalo 2, and 140 Linwood Ave., Buffalo, N. Y.

MAIER, George M. (*M* 1921) Mfg. Dept., • American Radiator & Standard Sanitary Corp., Bessemer Bldg., Pittsburgh 22, and 135 Longue Vue Dr., Mt. Lebanon, Pa.

MAJOR, Leonard F. (*A* 1946) Partner, • Major Heating Co., 824 Bagley Ave., Detroit 26, and 15127 Bentler, Detroit, Mich.

MAKIN, Henry T., Jr. (*M* 1939) Engr., Warren Webster and Co., 26 South 20th St., Philadelphia, Pa., and • 21 Valley View Terrace, Moorestown, N. J.

MALEY, Daniel P., Jr. (*J* 1947) Jr. Engr., • Martyn Brothers, Inc., 1000 St. Louis St., and 5023 Victor St., Dallas, Texas.

MALIN, Benjamin S. (*M* 1940; *J* 1939) Mech. Engr., Chas. T. Main Inc., 80 Federal St., Boston, and • 117 Bay State Rd., Boston 15, Mass.

MALLIK, J. R. B. (*A* 1946; *J* 1945) • 7 Jagannath Surlane, Calcutta, India, and c/o Mr. John Moffitt, 17 East 94th St., New York 28, N. Y.

MALLIS, William (*M* 1914) Owner, • 631 Lyon Bldg., Seattle 4, and 1215 Seneca, Seattle 1, Wash.

MALLOY, William W. (*A* 1947; *J* 1944) Sales Engr., F. D. Crew Co., 1539 Race St., Philadelphia 2, Pa.

MALLY, Chester F. (*M* 1940; *A* 1938) Pres., • Mally Corp., 20420 Woodward Ave., Detroit 3, and 292 W. Woodland Ave., Ferndale, Mich.

MALM, Edwin L. (*M* 1946; *A* 1944) Asst. Gen. Sales Mgr., • Hoffman Specialty Co., 1001 York St., Indianapolis, Ind., and 816 Michigan Ave., Evanston, Ill.

MALONE, Dayle G. (*M* 1929; *A* 1925) Vice-Pres. and Branch Mgr., • Petroleum Heat & Power Co., 3301 S. California Ave., Chicago, and 7337 S. Merrill Ave., Chicago 49, Ill.

MALONE, James S. (*A* 1936) Dist. Repr., Hoffman Specialty Co., 4 N. Eighth St., St. Louis 1, and • 7124 Waterman Ave., St. Louis 5, Mo.

MALONE, John F. (*M* 1945) Asst. Mgr., Dist. Steam Dept., • Consolidated Gas Electric Light Power Company of Baltimore, 500 Lexington Bldg., Baltimore 3, and 3401 Greenway, Baltimore 18, Md.

MALVIN, Ray C. (*M* 1929) Pres., • Malvin & May, Inc., 64 E. Jackson Blvd., Chicago 4, and 8220 Dante Ave., Chicago 19, Ill.

MANCHESTER, Frank P., Jr. (*A* 1947) Sales Engr., Sidles Conditioned Air Co., 508 South 19th St., Omaha, and • 4902 Capitol Ave., Omaha 3, Nebr.

MANDELL, Leonard C. (*A* 1946) Engr., • Enginaire, Inc., 44 Wendell St., Providence 9, and 317 Public St., Providence, R. I.

MANDELL, Louis D., Jr. (*M* 1946) Asst. to Pres., • C. A. Dunham Co., 400 W. Madison St., Room 900, Chicago 6, Ill., and 2403 Central St., Evanston, Ill.

MANDT, Robert D. (*A* 1946) Research Asst., Case Institute of Technology, 10900 Euclid Ave., and • 15215 Huntmere Ave., Cleveland, Ohio.

MANGRUM, Richard W. (*J* 1948) Field Engr., • American Blower Corp., 510 Assn. of Commerce Bldg., and 329 Madison, Grand Rapids, Mich.

MANIER, Ralph L. (*M* 1945) Indus. Htg. and Air Cond. Engr., Central New York Power Corp., 300 Erie Blvd. W., Syracuse 1, and • 185 Clifton Pl., Syracuse 6, N. Y.

MANIVELU, M. (*A* 1947) Engr., • Spencer and Co., Mount Rd., and 3 Mantapam Rd., Kilpank, Madras, India.

MANN, Isham W., Jr. (*M* 1946) 513 25th Ave., Meridian, Miss.

MANN, Lee B. (*A* 1944) Vice-Pres., • Boston Filter Co., Inc., 43 Harvard Sq., Charlestown, and 32 Stanton Rd., Brookline, Mass.

MANN, Walter N. (*M* 1939) Gen. Mgr., • Electro-Thermal Engineers, 123 Blackborough Rd., and 10 New North Rd., Reigate, Surrey, England.

MANNA, Anthony F. (*A* 1944) Mech. Engr., Wilbur Watson Assoc., Archts.-Engrs., 4600 Prospect Ave., Cleveland 3, and • 735 Lafayette St., Ravenna, Ohio.

MANNEN, Dion E. (*A* 1946; *J* 1939) Vice-Pres., • The Mannen & Roth Co., 9104 Woodland Ave., Cleveland 3, and 4157 Sileby Rd., University Heights, Ohio.

MANNING, Arthur J. (*M* 1947) • William A. Manning & Sons, 277 E. Paces Ferry Rd. N.E., Atlanta 5, Ga.

MANNING, C. E. (*A* 1942; *J* 1937) Engr., Packard Elec. Div., General Motors Corp., and • 339 Homewood Ave. S.E., Warren, Ohio.

MANNON, Neal R. (*A* 1947) Asst. Supt., • Pyramid Asbestos & Roofing Co., 2208 Texas Ave., Houston, and 4215 Charters, Houston 4, Texas.

MANNY, J. Harvey (*A* 1936) Pres., ● Robinson Furnace Co., 4600 W. Monroe St., Chicago, and 242 N. Parkside Ave., Chicago 44, Ill.

MANSELL, George R. (*M* 1947) Dir., ● Purdy Mansell, Ltd., 63 Albert St., Toronto 2, and 5 L'Estrange Pl., Toronto 9, Ont., Canada.

MANSFIELD, Elwin C. (*A* 1946) Pres., ● Mansfield Co., Inc., 255 Monticello Arcade, Norfolk 10, and 7314-F Midfield St., Norfolk 5, Va.

MANUEL, Jack B. (*A* 1946) Owner-Mgr., ● Standard Heating & Ventilating Co., Box 590, and 900 W. Main St., Dothan, Ala.

MARC, Henri M. (*M* 1943) Asst. Gen. Mgr. and Tech. Dir., Portable Products Corp., C. J. Tagliabue Div., Park and Nostrand Ave., Brooklyn 5, and ● 12 Euston Rd., Garden City, L. I., N. Y.

MARCH, Marion J. (*A* 1947) Sales Engr., ● Neil H. Peterson Co., P. O. Box 429, and 2085 Sacramento St., San Francisco, Calif.

MARCONETT, Vernon G. (*M* 1945; *A* 1936) Supt. and P. A., ● The Farquhar Furnace Co., 150 Owens Ave., and 216 Fulton St., Wilmington, Ohio

MARIN, Axel* (*M* 1935) Prof. of Mech. Engrg., ● University of Michigan, 221 W. Engineering Bldg., and 2475 Whitmore Lake Rd., Ann Arbor, Mich.

MARINO, Frank A. (*A* 1941) Partner, ● Marwin Utilities Co. & Controlled Heating Co., 37-22 103rd St and 45-20 National Ave., Corona, N. Y.

MARKERT, John W. (*A* 1940) Chief Htg. and Vent. Branch, U. S. Maritime Commission, Dept. of Commerce Bldg., Washington, D. C., and ● 8506 Garfield St., Bethesda 14, Md.

MARKLAND, Charles E. (*M* 1939) Sales Engr., R. H. Bishop Co., 103-105 N. Second St., and ● 807 W. Clark St., Champaign, Ill.

MARKS, Alexander A. (*M* 1945; *A* 1930) Vice-Pres., Richmond Radiator Co., New Castle, and ● 2809 Baynard, Wilmington, Del.

MARKUSH, Emery U. (*M* 1931) Cons. Engr., ● 138 Lexington Ave., New York 16, and 84-30 85th Ave., Woodhaven 21, N. Y.

MARR, J. M. (*A* 1944) Chief Engr., Aladdin Heating Corp., 2222 San Pablo Ave., Oakland, and ● 101 Nova Dr., Piedmont, Calif.

MARRINER, John M. S. (*M* 1934) Vice-Pres., ● Taylor Engineering & Construction Co., Ltd., 80 Richmond St. W., Toronto 1, and 6 Neville Park Blvd., Toronto 8, Ont., Canada.

MARSALIS, Martin E. (*A* 1943) Owner, ● American Metal Products Co., P. O. Box 7037, Sylvania Sta., Ft. Worth 1, and 4635 Dexter St., Fort Worth, Texas.

MARSCHALL, Ernest H. (*A* 1947) Design Engr., M. W. Kellogg Co., 225 Broadway, New York, N. Y., and ● 465 High Ridge Rd., Stamford, Conn.

MARSCHALL, Peter J. (*M* 1930; *J* 1927) Chief Mech. Engr., ● Abbott Laboratories, 14th and Sheridan, North Chicago, and 2009 Greenwood Ave., Wilmette, Ill.

MARSDEN, Edward C. (*A* 1944) Pres., ● Marsden & Wasserman, Inc., 44 Hicks St., Hartford, and 21 Walbridge Rd., West Hartford, Conn.

MARSH, George R. (*M* 1946) 59 Austin St., Portland, Me.

MARSHALL, Albert W. (*M* 1937) Office Engr., Pittsburgh Dept., Hartford Steam Boiler Inspection & Insurance Co., 1800 Arrott Bldg., Pittsburgh 22, and ● 1120 Highview Rd., Dravosburg, Pa.

MARSHALL, Harold W. (*M* 1944) Mech. Engr., T. H. Buell, Archts. & Engrs., 730–14th St., Denver, and ● 387 Ogden St., Denver 3, Colo.

MARSHALL, James (*M* 1943; *J* 1939) Assoc., ● c/o P. L. Davidson, Cons. Engr., 1420 Walnut St., Philadelphia 2, and 550 Wellington Rd., Elkins Park, Pa.

MARSHALL, James E. (*A* 1947) Sales Engr., Minneapolis-Honeywell Regulator Co., 1136 Howard St., San Francisco, and ● 1330 University Ave., Berkeley 2, Calif.

MARSHALL, James W. (*A* 1946) Chief Engr., Natkin & Co., 1015 Sampson, Houston, and ● 3226 Prospect, Houston 4, Texas.

MARSHALL, Orville D. (*M* 1942; *A* 1931) Partner, ● Marshall & Wells Co., 231 Federal Square Bldg., Grand Rapids 2, and 3025 Midland Dr. S.E., Grand Rapids 6, Mich.

MARSHALL, Thomas A. (*A* 1943; *J* 1937) Br. Manager, ● York Corp., 1725 Folsom St., and 543 36th Ave., San Francisco, Calif.

MARSHALL, William (*M* 1947) Chief Mech. Engr., ● Lawrence Peterson & Assocs., 312 E. Wisconsin Ave., Milwaukee 2, and 3903 N. Farwell Ave., Milwaukee 11, Wis.

MARSHALL, W. D. (*M* 1935) Mgr., Noland Co., Inc., 1823 N. Arlington Ridge Rd., and ● 3232 Woodrow St. N., Arlington, Va.

MARSTON, Anson D. (*A* 1937) Colonel, ● Corps of Engrs., U. S. Army, Instructor, Command & General Staff College, and 614 McClellan Ave., Fort Leavenworth, Kans.

MART, Leon T. (*M* 1941) Pres., ● The Marley Co., Inc., 3001 Fairfax Rd., Kansas City, Kans., and 6840 Tomahawk Rd., Kansas City, Mo.

MARTEL, C. L. (*A* 1946) Secy.-Treas. ● Martel Engineering, Inc., 13739 Gratiot Ave., Detroit, and 24501 Colin Kelly, Centerline, Mich.

MARTENIS, William W. (*M* 1946) Chief Project Coordinator, Engrg. Dept., Minneapolis-Honeywell Regulator Co., 2753 Fourth Ave. S., and ● 300 Busch Terrace, Minneapolis, Minn.

MARTENS, E. D. (*M* 1937) Chief Mech. Engr., Starrett Brothers & Eken, Inc., 63 Wall St., New York, and ● 89 Eldridge Ave., Hempstead, L. I., N. Y.

MARTIG, Robert W. (*M* 1947) Vice-Pres., ● Farnes & Martig, Inc., 417 N.E. Couch St., Portland 14, and Rt. 2, Box 321, Portland 10, Ore.

MARTIN, Albert B. (*M* 1917) Distr. Mgr., ● Kewanee Boiler Corp., 549 Washington Blvd., Chicago 6, and 860 Spruce, Winnetka, Ill.

MARTIN, G. D. (*M* 1941) Branch Mgr., ● Grinnell Company of Pacific, 601 Brannan St., San Francisco 17, and 398 Menlo Oaks Dr., Menlo Park, Calif.

MARTIN, George W.* (*Life Member*; *M* 1911) 340 Prospect St., Ridgewood, N. J.

MARTIN, Henry L. (*M* 1945) Div. Head, Steam Sales and Service, Boston Edison Co., 39 Boylston St., Boston, and ● 75 Hunnewell Ave., Newton 58, Mass.

MARTIN, John O. (*A* 1939) Partner, ● J. O. & C. U. Martin, 637 Minna St., San Francisco 3, and 328 Jerome Ave., Piedmont 10, Calif.

MARTIN, Kenneth E. (*M* 1947) Branch Mgr., ● American Blower Corp., 203 Patterson Bldg., Omaha 2, and 4112 Nicholas, Omaha 3, Nebr.

MARTIN, Raymond (*A* 1937) Sales Engr., ● Vapor Car Heating Company of Canada, Ltd., 65 Dalhousie St., Montreal, and 27 Morris Ave., Ste. Therese, Que., Canada.

MARTIN, R. J. Wesley (*J* 1946) Draftsman, Imperial Iron Corp., Ltd., 30 Jefferson Ave., and ● 68 Northcote Ave., Toronto, Ont., Canada.

MARTIN, Samuel S. (*J* 1948; *S* 1946) General Mgr., ● Martin Engineering Co., Box 825, San Juan, Texas.

MARTIN, Thomas B. (*M* 1947) Chief Engr., ● Burden Co., 1000 N. Orange St., Los Angeles 38, and 14152 Collins St., Van Nuys, Calif.

MARTIN, Thomas I., Jr. (*J* 1947) Asst. to Prod. Mgr., Insulation Dept., ● Reynolds Metals Co., Third & Grace Sts., Richmond, and 901 S. East St., Culpeper, Va.

MARTIN, Wilbert A. (*A* 1944) Mgr., Air Cond. Dept., American Heating Co., 55 K St. S.E., Washington, D. C., and ● 8805 Reading Rd., Silver Spring, Md.

MARTIN, William J. (*A* 1943) Martin Fan & Blower Co., 4634 West 21st Pl., Chicago 50, Ill.

MARTIN, William T. (*M* 1943) Chief Engr., Beech-Nut Packing Co., and ● 87 Cliff St., Canajoharie, N. Y.

MARTOCELLO, Joseph A. (*M* 1934) Pres., Joseph A. Martocello & Co., 229 North 13th St., Philadelphia, Pa.

MARTY, Edgar O. (*M* 1930) Mech. and Elec. Engr., Parsons, Brinckerhoff, Hogan & Macdonald, 142 Maiden Lane, New York, and ● 84 Long Ridge Rd., Plandome, L. I., N. Y.

MARTYN, Henry J. (*A* 1937) Pres., ● Martyn Bros., Inc., 1000 St. Louis St., Dallas 2, and 5306 Ridgedale St., Dallas, Texas.

MARTYN, Henry J., Jr. (*J* 1948; *S* 1946) Constr. Foreman, Martyn Brothers, Inc., 1000 St. Louis St., and ● 3307 Cherrywood, Dallas, Texas.

MARVIN, Philip R. (*A* 1945) Dir. of Research and Dvlpt., ● Milwaukee Gas Specialty Co., 722 N. Jackson, Box 461, Milwaukee 1, and 6828 W. Wisconsin, Milwaukee 13, Wis.

MARZOLF, Frank X. (*A* 1937) Sales Engr., R. L. Deppmann Co., 5853 Hamilton, Detroit, and ● 15790 St. Marys, Detroit 27, Mich.

MARZORATI, Giuseppe (*M* 1938) Tecnica Industriale dott. ing., ● 28 Via Mauro Macchi, and 9 Via Baldissera, Milano, Italy.

MASON, Gail C. (*M* 1943) Fryatt, Ark.

MASON, Lawrence T. (*A* 1946) Asst. Mech. Engr., Board of Education, 900 Phillips Bldg., Detroit 26, and ● 15781 Leisure Ave., Detroit 27, Mich.

MASON, Ray B. (*M* 1941) Mgr., Kansas City Branch, ● Kewanee Boiler Corp., 2014 Wyandotte St., and 121 East 70th Terrace, Kansas City, Mo.

MASON, Raymond P. (*M* 1945) Asst. Supt. Engr., U. S. Army Transport Service, Planning Sect., Bldg. 310, Ft. Mason, and ● 27 Westminister Ave., Berkeley 8, Calif.

MASON, Robert E. (*M* 1944) Factory Repr., Industrial Machinery, and ● 1129 Granville Rd., Charlotte, N. C.

MASON, Robert Edwards (*J* 1947) Engr., Air Cond. Div., Sidles Co., 502 South 19th St., and ● 4340 Binney St., Omaha, Nebr.

MASSAGLIA, Paoli E. C. (*J* 1947; *S* 1945) Jr. Engr., Black & Veatch, and ● 3814 Parallel Ave., Kansas City, Kans.

MAST, Clyde M. (*A* 1940) Pres. and Engr., Heating & Air Conditioning Supply, Inc., 263 Sierra St., and ● 577 St. Lawrence St., Reno, Nev.

MASTERSON, William R. (*A* 1946) Partner, ● Edward F. Masterson & Son, 18 New Derby St., and 6 Pickman Rd., Salem, Mass.

MATCHETT, James C. (*M* 1923) Vice-Pres. and Gen. Mgr., ● Illinois Engineering Co., Racine Ave. at 21st St., Chicago 8, and 9936 S. Winchester Ave., Chicago 43, Ill.

MATHANEY, Edgar H. (*A* 1944) Supt., ● Sheet Metal Fabricators, Inc., 1024 Greenmount Ave., and 5517 Ready Ave., Baltimore, Md.

MATHEKA, Charles R. (*J* 1948; *S* 1939) 1506 Summit Ave., Union City, N. J.

MATHER, Harry H. (*A* 1929) Mfrs. Agent, 1212 Commercial Trust Bldg., Philadelphia 2, and ● 377 Windemere Ave., Drexel Hill, Lansdowne P. O., Pa.

MATHERS, William (*A* 1947) Partner, ● Mathers-Curl & Associates, 80 S. Third St., and 630 E. Town St., Columbus 15, Ohio.

MATHESON, Elmer E. (*A* 1946) Owner, Appliance Shop, and ● 1001 W. Yakima St., Pasco, Wash.

MATHEWSON, M. E. (*M* 1937) Secy., ● A. M. Kinney, Inc., 1211 Enquirer Bldg., Cincinnati 2, and 1110 Priscilla Lane, Cincinnati 8, Ohio.

MATHEY, Nicholas J. (*M* 1945) 325 Fourth Ave. S., Clinton, Ia., and ● Apt. 13, Lane I, Sunflower, Kans.

MATHIS, Eugene (*M* 1922) Pres., ● Mathis Illinois Corp., 95th St., Chicago 43, and 9151 S. Hoyne Ave., Chicago, Ill.

MATHIS, John (*A* 1938) Vice-Pres., ● Standard Furnace & Supply Co., 413-17 S. Tenth St., and 3115 Edw. Creighton Ave., Omaha, Nebr.

MATHIS, Julien W. (*A* 1921) ● New York Blower Co., 3145-55 Shields Ave., and 7929 Bishop St., Chicago, Ill.

MATHIS, Luther Norman (*A* 1948) L. N. Mathis Heating & Air Conditioning Co., 115 W. Thorain, San Antonio, Texas.

MATHISON, R. S. (*A* 1938) Weathermakers (Canada), Ltd., 735 Dovercourt Rd., Toronto 4, and ● 44 Strathgowan Ave., Toronto 12, Ont., Canada.

MATOUSEK, A. G. (*M* 1937) Mgr., Gamble Store, Schuyler, Nebr.

MATTHEWS, Carl R. (*A* 1944) Sales Engr., Minneapolis-Honeywell Regulator Co., 5005 Euclid Ave., Cleveland, and ● 10231 Adelaide Ave., Cleveland 11, Ohio.

MATTHEWS, John E. (*M* 1934) 2155 Sinden Ave., Knoxville, Tenn.

MATTHEWS, Owen W., III (*A* 1947) Sales Engr., William S. Turner & Co., 432 Pacific Bldg., Portland 4, and ● 1010 N. Jessup St., Portland 11, Ore.

MATTHEWS, R. R. (*M* 1944) Owner, ● Matthews Engineering Co., 2122 Olive, Dallas 1, and 3556 Rankin, Dallas 5, Texas.

MATTHIES, Leo A. (*J* 1947; *S* 1941) Mech. Engr., ● 5920 Chicago Ave., Minneapolis 7, Minn.

MATTIMORE, John D. (*M* 1945) Dir. of Research and Dvlpt., ● Tube Turns, Inc., 224 E. Broadway, Louisville 1, and 3130 Meadowlark Rd., Louisville 4, Ky.

MATTINGLY, Maurice F. (*A* 1939) Sales Engr., ● Johnson Service Co., 1355 Washington Blvd., Chicago 7, and 8028 Ingleside Ave., Chicago 19, Ill.

MATTSON, Roger K. (*J* 1945) Engr., McQuay, Inc., 1600 N.E. Broadway, Minneapolis, and ● 3611 Bryant S., Minneapolis 8, Minn.

MATZ, George N. (*M* 1938) Mech. Engr., A. Ernest D'Ambly, 2101 Architects Bldg., Philadelphia, and ● 649 Ferne Ave., Drexel Hill, Pa.

MATZEN, Harry B. (*M* 1940) Mgr., N. Y. Office, The Frank A. McBride Co., 70 East 45th St., New York 17, and ● 16 Addison Pl., Rockville Centre, N. Y.

MAULDIN, John G. (*A* 1947) Owner, ● Mauldin & Bailey, 1257 Glenwood Ave. S.E., and 445 Blake Ave. S.E., Atlanta, Ga.

MAURER, Elmer E. (*A* 1944) Secy. and Engr., ● The Maurer Bros. Co., 8600 Detroit Ave., Cleveland 2, and 15726 Fernway Ave., Cleveland, Ohio.

MAURER, Lester (*M* 1941) Mech. Engr., Giffels & Vallet, Inc., 1000 Marquette Bldg., Detroit 26, Mich.

MAUTNER, Erwin W. (*M* 1943) Partner, ● Mid-West Heat Service, 3336 W. Franklin Blvd., and 3935 Pine Grove Ave., Chicago, Ill.

MAVES, G. D. (*A* 1939) Reg'l. Mgr., Minneapolis-Honeywell Regulator Co., 400 Broadway, Denver 9, and ● 1521 Grape St., Denver 7, Colo.

MAWBY, Pensyl (*M* 1934) Dist. Mgr., Lehigh Navigation Coal Co., 123 S. Broad St., Philadelphia, and ● 15 E. Ridley Ave., Ridley Park, Pa.

MAXWELL, George W. (*M* 1935; *S* 1932) Owner, Kenealy & Maxwell, Main St., and ● Lower County Rd., Harwich Port, Mass.

MAXWELL, Lawrence R. (*M* 1943) Pres., ● Maxwell Bros. Supply Co., 7204 Washington Ave., and 1332 Joseph St., New Orleans, La.

MAXWELL, R. Shierlaw (*M* 1937) Gen. Mgr., Bennett & Wright, Ltd., 72 Queen St. E., Toronto 1, Ont., Canada.

MAXWELL, William D. (*J* 1948) Designer-Mech., J. Donald Kroeker, Cons. Engr., 402 Failing Bldg., Portland 4, and ● 8947 Southeast 39th St., Portland 2, Ore.

MAY, Arthur O. (*A* 1938) Secy., ● Stannard Power Equipment Co., 53 W. Jackson Blvd., Room 925, Chicago 4, and 5736 N. Bernard St., Chicago 45, Ill.

MAY, Charles O. (*J* 1947) Instructor, The David Ranken Jr. School of Mechanical Trades, 4431 Finney Ave., and ● 5059 Chippewa, St. Louis, Mo.

MAY, C. W. (*M* 1933) Cons. Engr., ● 926 Vance Bldg., Seattle 1, and 6817-16th N.E., Seattle 5, Wash.

MAY, Edward M. (*M* 1931) Branch Mgr., Steel Products Engineering Co., 1601 S. Michigan Ave., Chicago, and ● 848 N. Ridgeland Ave., Oak Park, Ill.

MAY, George Elmer* (*M* 1933) Prin. Util. Engr., ● New Orleans Public Service, Inc., 317 Baronne St., and 2031 Short St., New Orleans, La.

MAY, James W. (*M* 1938; *J* 1935) Dir. of Research, ● American Air Filter Co., 215 Central Ave., and 3908 Elfin Ave., Louisville, Ky.

MAY, Maxwell F. (*M* 1929) Pres., ● Fintube Products Co., 228 N. LaSalle St., Room 1037, Chicago 1, and Palos Park, Ill.

MAYCOCK, Ambrose A. (*M* 1947; *A* 1945) Mgr., ● A. A. Maycock Co., 234 Seventh Ave., Salt Lake City 8, Utah.

MAYCOCK, George E. (*A* 1945) Htg. and Vent. Engr., A. A. Maycock Co., 234 Seventh Ave., and ● 233 "E" St., Salt Lake City, Utah.

MAYER, William J. (*A* 1943) Field Service Engr., ● A. M. Byers Co., 10 E. Lexington St., Baltimore 2, and 1100 Edgemont Rd., Towson 4, Md.

MAYLARD, John B. (*A* 1943) Arch.-Engr., 1139 Morgan Ave., LaGrange Park, and ● 211 Custer St., Evanston, Ill.

MAYNARD, J. Earle (*M* 1931) Engr., U. S. Radiator Corp., 1500 United Artists Bldg., Detroit 31, and ● 2441 Kendall, Detroit 6, Mich.

MAYNE, Ivan E. (*A* 1945) Owner, • Consolidated Heating & Ventilating Co., 1709 W. Eighth St., Room 906, Los Angeles 14, and 1748 Rancho Real Rd., Temple City, Calif.

MAYNE, Walter L. (*M* 1938) Prod. Sales Engr., • Tanner Manufacturing Co., P. O. Box 860, 4201 Bell St., Lawrence Park, and 401 Beverly Dr., Erie, Pa.

MAYO, William P., Jr. (*A* 1947) Sales Engr., Thomas H. Sullivan & Co., 2626 S. Main St., and • 2218 Smith St., Houston, Texas.

MAZER, Joseph L. (*S* 1947) Student, University of Illinois, Urbana, and • 1208 N. Hickory St., Champaign, Ill.

McALLISTER, A. F. (*A* 1947) Mfrs. Agent, 1031 E. Third South, Salt Lake City, Utah.

McARDLE, Francis E. (*M* 1946) Sr. Engr., Reconstruction Finance Corp., Lafayette Bldg., Washington, D. C., and • 1574 East West Highway, Silver Spring, Md.

McBRIDE, J. Nevins (*A* 1941) Vice-Pres., • Frank A. McBride Co., 160 Ward St., Paterson 1, and 288 Derrom Ave., Paterson 4, N. J.

McBRIDE, Joseph A. (*J* 1943) Asst. Secy., • Frank A. McBride Co., 160 Ward St., Paterson 1, and 585 East 27th St., Paterson 4, N. J.

McCABE, John H. (*M* 1944) Dist. Mgr., • American Blower Corp., 1730 Glenarm St., Denver 2, and 567 S. York St., Denver 9, Colo.

McCAIN, H. King (*M* 1939; *A* 1938; *J* 1937) Cons. Engr., • Newcomb & Boyd, 615 Trust Company of Georgia Bldg., and 3619 Ivy Rd. N.E., Atlanta, Ga.

McCALL, Maurice W. (*J* 1948; *S* 1946) Sales Engr., United Electric Service Co., P. O. Box 119, and • 2208 Bullington St., Wichita Falls, Texas.

McCALL, Max (*A* 1945) Owner, McCalls, 1146 Philadelphia St., and • 1142 Philadelphia St., Indiana, Pa.

McCALLUM, Allan W. (*A* 1943) Western Mgr., • Anthes-Imperial Ltd., Saskatchewan Ave., Winnipeg, and 383 Overdale St., St. James, Man., Canada.

McCALLUM, Chester E. (*M* 1946) Chief Engr., and Mgr., Htg. & Air Cond. Dept., Landingham Plumbing & Heating Co., 231 N. Trade St., Winston-Salem, N. C.

McCALMON, Robert T. (*A* 1946) Sales Engr., • A. M. Byers Co., 2544 West 28th Ave., Denver 11, and 1385 Holly, Denver 7, Colo.

McCANDLESS, Howard F. (*M* 1946; *A* 1945) Cons. Engr., First National Bank Bldg., P. O. Box 1669, Monterey, and • Rt. 1, Box 432, Aptos, Calif.

McCANN, Frank D. (*A* 1939) Dist. Repr., The Hertner Electric Co., 369 Lexington Ave., New York 17, and • 113 Chippewa Rd., Tuckahoe 7, N. Y.

McCANN, John L. (*A* 1945) Mgr., Plbg. and Htg. Dept., Harris Pump & Supply Co., Brady and Sidney Sts., Pittsburgh 3, and • 726 Lafferty Dr., Pittsburgh 10, Pa.

McCANN, Stanford C. (*A* 1944) Owner, • S. C. McCann Co., 1004 Baltimore, Kansas City 6, and 1002 W. Gregory Blvd., Kansas City 5, Mo.

McCARL, Harry E. (*M* 1944) Htg. and Vent. Engr., United States Rubber Co., 6600 E. Jefferson Ave., Detroit, and • 5774 Haverhill, Detroit 24, Mich.

McCARTHY, F. Wayne (*A* 1945) Branch Mgr., • Minneapolis-Honeywell Regulator Co., 1911 Ingersoll, and 1235–37th, Des Moines, Ia.

McCAUL, Lynn K. (*M* 1942) Sales Engr., The Coon-DeVisser Co., 2051 W. Lafayette, Detroit 16, and • 620 W. Woodland, Ferndale 20, Mich.

McCAULEY, Dale G. (*A* 1946) Pres., Lansing Heating-Ventilating Co., 1213 Center St., Lansing 6, Mich.

McCAULEY, James H. (*M* 1921) Pres., • J. H. McCauley & Son, 5620 West 65th St., Chicago, and 1123 Pleasant St., Oak Park, Ill.

McCLANAHAN, L. C. (*M* 1939) Dist. Mgr., • Aerofin Corp., 1121 Fidelity Bldg., Cleveland, and 29 Water St., Chagrin Falls, Ohio.

McCLEAN, Fred C. (*A* 1947) Pres., • Fred C. McClean Heating Supplies, Inc., 47 Park St., and 24 Clement St., Springfield, Mass.

McCLELLAN, James E. (*M* 1922) Vice-Pres., Mehring & Hanson Co., 162 N. Clinton St., Chicago, and 738 Marion St., Highland Park, Ill.

McCLINTOCK, Walter G. (*A* 1945) Dist. Mgr., • Reznor Manufacturing Co., P. O. Box 8, and 303 N. Main St., Milan, Tenn.

McCLINTOCK, William (*M* 1935) Mech. Engr., Kellex Corp., Woolworth Bldg., New York, and • 4116 Carpenter Ave., New York 66, N. Y.

McCLOSKEY, John H. (*A* 1940) 304 Elkton Blvd., Elkton, Md.

McCLUNG, K. R. (*A* 1946) Dept. Supvsr., • G. A. MacArthur Co., 2387 Hampden Ave., St. Paul 4, and R. 3, Como Station, St. Paul 8, Minn.

McCLUNG, Tom H. (*A* 1942; *J* 1939) Sales Engr., • Brod & McClung, 19 N.W. First Ave., Portland 9, and 2341 Northeast 61st Ave., Portland 13, Ore.

McCLURE, Charles J. R. (*A* 1947) Sales Engr., • The Trane Co., 2335 S. Grand Ave., St. Louis 4, and 839 Belt Ave., St. Louis 12, Mo.

McCONACHIE, L. L. (*M* 1943; *A* 1928) Owner, L. L. McConachie Co., 1003 Maryland, and • 1415 Harvard Rd., Grosse Pointe, Mich.

McCONNER, Charles R. (*A* 1925; *J* 1922) Gen. Sales Mgr., • Clarage Fan Co., Kalamazoo 16F, and 526 John St., Kalamazoo 44, Mich.

McCORMACK, Denis (*M* 1933) Cons. & Constr. Engr., Onions & Bouchard, Hamilton, and • Somerset Bridge, Bermuda.

McCORMICK, George W., Jr. (*A* 1941) Asst. Secy., • The National Association of Fan Manufacturers, 5-208 General Motors Bldg., Detroit 2, and 15836 Puritan Ave., Apt. D, Detroit, Mich.

McCOY, C. E. (*M* 1936) Partner, • Turner-McCoy, Fifth and Locust Sts., North Little Rock, and 3923 Oakwood Rd., Little Rock, Ark.

McCOY, Floyd F. (*A* 1946) Pres., • Floyd F. McCoy Heating Co., 303 S. Water St., and 401 Fitzhugh St., Bay City, Mich.

McCOY, Philip W. (*M* 1946) Asst. Chief Htg. Engr., • Bryant-McCoy Co., Box 65, Jamestown, and 96 West Fairmont, Lakewood, N. Y.

McCOY, Thomas F. (*Life Member; M* 1924) Mgr., • The Powers Regulator Co., 125 St. Botolph St., Boston 15, and 90 Church St., Weymouth Heights, Mass.

McCREA, Joseph B. (*M* 1937) Registered Professional Engr., Joseph B. McCrea Heating & Ventilating, 14504 Charlevoix, and • 2919 Drexel Ave., Detroit 15, Mich.

McCREA, Lester W. (*M* 1940) Prop., • McCrea Sales Co., 15 East 21st St., Baltimore 18, and 1521 Pentridge Rd., Apt. 227, Baltimore 12, Md.

McCULLEY, D. E. (*A* 1941) Sales Engr., • 814 South 14th St., Omaha 2, and 5504 Corby St., Omaha 4, Nebr.

McCULLOUGH, Goodall W. (*A* 1948) Sales Engr., Electronic Supply & Engineering Co., • 1014 McGowen St., and 6030 Floyd Dr., Houston, Texas.

McCULLOUGH, Henry G. (*M* 1936) Vice-Pres., S. S. Fretz, Jr., Inc., 1902 Chestnut St., Philadelphia 3, and • 7042 Lincoln Dr., Philadelphia 19, Pa.

McCULLOUGH, John L. (*M* 1939) Sales Engr., • English & Lauer, Inc., 1978 S. Los Angeles St., and 409½ S. Catalina St., Los Angeles 5, Calif.

McCUMBER, Burton R. (*M* 1945) Frozen Food Products, Inc., 600 W. Genesee St., Syracuse 4, and • 19 Leitch Ave., Skaneateles, N. Y.

McCUNE, Laban J. (*M* 1943) Engr. and Bldg. Mgr., • Clinic Foundation, 118 E. Sixth St., Tulsa 3, and 401 Springer Bldg., Tulsa, Okla.

McCUTCHEON, David C. (*A* 1947) Asst. to the Assoc. Supt. in charge of Bldgs. & Grounds, • Public Schools of the Dist. of Columbia, Franklin Administration Bldg., 13th & K Sts. N.W., Washington 5, D. C., and 600 Forest Glen Rd., Silver Spring, Md.

McDANIELS, James A. (*A* 1944) Air Cond., Allison Div., General Motors Corp., Speedway City, Indianapolis, and • 4950 Ford St., Speedway City, Indianapolis 8, Ind.

McDERMOTT, John P. (*A* 1942; *J* 1939) Mech. Engr., • The Trane Co., 308 Dekum Bldg., Portland 4, and 5425 S.E. Harold Ct., Portland, Ore.

McDONALD, Frank L. (*M* 1944) Branch Mgr., • Barber-Colman Co., 816 W. Fifth St., Los Angeles and 1655 Rose Ave., San Marino, Calif.

McDONALD, Ivan (*A* 1938) • Minneapolis-Honeywell Regulator Co., 637 Craig St. W., and 5101 Hampton St., Montreal, Que., Canada.

McDONALD, John J. (*M* 1943) Pres., The McDonald Co., 43-47 Lansdowne St., Boston, and ● 401 Beacon St., Chestnut Hill 67, Mass.

McDONALD, Thomas (*A* 1931) Vice-Pres., Minneapolis-Honeywell Regulator Co., 2747 Fourth Ave. S., Minneapolis 8, Minn.

McDONNELL, Everett N. (*M* 1923), (Council, 1940-47) Pres., ● McDonnell & Miller, Inc., 400 N. Michigan Ave., and 219 Lake Shore Dr., Chicago 11, Ill.

McDOWELL, Harry L. (*A* 1947; *J* 1939) Partner, ● W. O. Blackstone, Plumbing & Heating Contr., 1630 Laurel St., Columbia, and 2714 Burney Dr., Columbia 63, S. C.

McEAHERN, Edward J. (*A* 1945; *J* 1944) Pres., ● Heating & Temperature Control, 1031 Santa Fe Dr., Denver 4, and 4754 Raleigh St., Denver 12, Colo.

McELGIN, John W.* (*A* 1937; *J* 1931) Engr., J. J. Nesbitt, Inc., State Rd. and Rhawn St., Philadelphia 36, and ● Tennis Ave., Ambler, Pa.

McFARLAN, A. I. (*M* 1942) Pres., ● A. I. McFarlan Co., Inc., 21 West St., New York 6, N. Y., and 691 Dorian Rd., Westfield, N. J.

McGARY, Robert O. (*M* 1946) Vice-Pres., Buensod-Stacey, Inc., P. O. Box 1755, and ● 2015 Dilworth Rd. E., Charlotte 3, N. C.

McGAVOCK, Edward A. (*J* 1947) Owner, Central Sales & Engineering Co., 1069 W. Jefferson St., and ● 303 N. Avon St., Rockford, Ill.

McGEARY, Paul W. (*M* 1944) Dist. Mgr., ● The Trane Co., 635 N. Penn St., and 3630 N. Pe.n, Indianapolis, Ind.

McGEORGE, Richard H. (*M* 1937) Mgr., Htg. and Air Cond. Dept., McCord Radiator & Manufacturing Co., 2587 E. Grand Blvd., and ● 14565 Glastonbury Rd., Detroit, Mich.

McGINNIS, F. L. (*M* 1940) Supt., Coley & Petersen, 409 West 21st St., and ● 3011 Lorraine Ave., Norfolk, Va.

McGOVERN, Arthur F. (*A* 1945) Dist. Supvsr. and Engr., ● Modine Manufacturing Co., 83 S. High St., Columbus 15, and 362 S. Harding Rd., Columbus 9, Ohio.

McGOVERN, Tom R. (*A* 1947) Pres. & Gen. Mgr., ● The Baxter-Nafz Co., 6 W. North St., and 2208 Fountain Blvd., Springfield, Ohio.

McGOWN, Frederick H., Jr. (*A* 1947; *J* 1941; *S* 1939) Sales Engr., Northrup Supply Corp., 17 Prospect St., Oneonta, and ● 4 Pine Blvd., Cooperstown, N. Y.

McGRAIL, Thomas E. (*M* 1926) Local Repr., ● Canadian Sirocco Co., Ltd., 63 Sparks St., and 39 Thomas St., Carlington, Ottawa, Ont., Canada.

McGRATH, William L. (*M* 1945) Project Engr., Carrier Corp., Syracuse, and ● 113 Carlton Rd., Syracuse 4, N. Y.

McGREW, Joseph A. (*A* 1944) Owner, ● J. A. McGrew Supply Co., 2163 Market St., Denver 2, and 2380 Leyden St., Denver 7, Colo.

McGRUER, A. E. (*M* 1945) Elec. Engr., ● Canadian Pacific Railway Co., Room 244, Union Station, and 1954 Bloor St. W., Toronto, Ont., Canada.

McGUINNESS, C. H. (*A* 1943) Owner, ● Iowa Kol-Master Stokers, 205 Plymouth Bldg., Des Moines 9, and 663-49th St., Des Moines, Ia.

McGUIRE, James W. (*M* 1945) Owner, ● 370 Lexington Ave., New York, and 86-22 Dongan Ave., Elmhurst, N. Y.

McHUGH, James J. (*A* 1946) Sales Engr., ● Johns-Manville International Corp., 22 East 40th St., New York 16, and 18 Hampton Rd., Scarsdale, N. Y.

McILVAINE, John H. (*M* 1929) ● John H. McIlvaine, 1321 Arch St., Philadelphia 7, and 601 Pembroke Rd., Bryn Mawr, Pa.

McINDOE, James F. (*M* 1939) Mgr., Combustion Div., Enterprise Engine & Foundry Co., 600 Florida St., San Francisco 10, and ● 44 Santa Rosa Ave., Sausalito, Calif.

McINTIRE, James F.* (*Life Member; M* 1915; *A* 1914), (*Presidential Member*), (Pres., 1939; 1st Vice-Pres., 1938; 2nd Vice-Pres., 1937), (Council, 1926-28; 1932-40) Retired, Until May 1, 1948—The Billows Apts., Apt. 8, 16813 Gulf Blvd., St. Petersburg 6, Fla., and after May 1, 3261 Sherbourne Rd., Detroit 21, Mich.

McINTOSH, Claude B. (*A* 1946) Instructor, Case Institute of Technology, 10900 Euclid Ave., Cleveland 6, and ● 1894 Edendale St., Cleveland Heights 21, Ohio.

McINTOSH, Fabian C. (*M* 1921; *J* 1917), (Council, 1929-31; 1933-35; 1942) Mgr., Pittsburgh Office, ● Johnson Service Co., 1238 Brighton Rd., Pittsburgh 12, and 3650 Perrysville Ave., Pittsburgh 14, Pa.

McINTOSH, John W. (*A* 1947) Htg. Engr., American Radiator and Standard Sanitary Corp., 666 Beale Ave., and ● 1685 Foster St., Memphis, Tenn.

McINTOSH, Robert M. (*M* 1945) Mech. Engr., Harley-Ellington & Day, Inc., 153 East Elizabeth St., Detroit, and ● 15624 Cleveland Ave., Allen Park, Mich.

McKAY, Albert W. (*M* 1942) Conditioned Air, Inc., 325 Fifth St., Macon, Ga.

McKAY, William H. (*A* 1945) Sales Engr., Vulcan Iron Works, Ltd., Sutherland and Maple, Winnipeg, and ● 465 Scotia St., West Kildonan, Man., Canada.

McKEE, James M. (*A* 1945) Engr., Payne Furnace Co., 336 N. Foothill Rd., Beverly Hills, and ● 1219A-19th St., Santa Monica, Calif.

McKEE, Thomas M., Jr. (*A* 1947) Partner, ● J. F. Shelton Co., 200 Poplar Ave., and 709 N. Auburndale, Memphis, Tenn.

McKEEMAN, Clyde A. (*M* 1946) Asst. to Pres., ● American Society of Heating & Ventilating Engineers, Research Laboratory, 7218 Euclid Ave., Cleveland 3, and River Rd., Gates Mills, Ohio.

McKENZIE, Harold W. (*M* 1946) Estimator, Thompson Sheet Metal Works, Portland, and ● Rt. 1, Box 56, Deaverton, Ore.

McKENZIE, Hilton E. (*J* 1948) Field Serv. Engr., A. M. Byers Co., ● P. O. Box 1571, and 1008 Mt. Vernon Ave., Charlotte, N. C.

McKENZIE, Murdock C. (*M* 1938) Htg. Engr., Southern California Gas Co., 810 S. Flower St., and ● 3806 Boyce Ave., Los Angeles 26, Calif.

McKERNAN, Gordon S. (*A* 1942) Secy.-Treas., ● Reg. H. Steen Ltd., 12 Humewood Dr., and 7 Grimthorpe Rd., Toronto 10, Ont., Canada.

McKIE, Thomas G. (*J* 1948; *S* 1947) Mech. Engr., West Virginia Pulp & Paper Co., Covington, Va., and ● P. O. Box 777, White Sulphur Springs, W. Va.

McKIM, Philip H. (*A* 1947) Sales Engr., Bryant Air Conditioning Corp., 740 11th St. Northwest, Washington, D. C., and ● 2706 McComas Ave., Kensington, Md.

McKINNEY, Carl A. (*A* 1939; *J* 1937) Engr., United Gas Corp., United Gas Bldg., and ● 2136 Addison Rd., Houston 5, Texas.

McKINNEY, William J. (*M* 1938; *A* 1934) Southern Dist. Mgr., ● American Blower Corp., Room 714, 101 Marietta St. Bldg., Atlanta 3, and 3363 Mathieson Rd. N.E., Atlanta, Ga.

McKINSTRY, Merrill W. (*A* 1945) Heating Estimator, W. E. Beggs Co., 234 Ninth N., Seattle, and ● 4017 McGilvra St., Seattle 2, Wash.

McKITRICK, Walter D. (*M* 1936) Engr., ● Kalghin & Hughes, 125 S. Huron St., Toledo 4, and 1302 Harvard Blvd., Apt. 6, Toledo 9, Ohio.

McKITTRICK, Percy A. (*A* 1934) Exec. Vice-Pres., ● Parks-Cramer Co., P. O. Box 444, and 219 Blossom St., Fitchburg, Mass.

McLACHLAN, James (*A* 1948) Plant Staff Asst., The Pacific Telephone and Telegraph Co., 140 New Montgomery St., San Francisco, and ● 3055 Scott St., San Francisco 23, Calif.

McLAIN, Roland D. (*M* 1946) 1441 W. Fourth St., Williamsport, Pa.

McLANE, E. H. (*M* 1944) Mgr. Sales Engr., Coastal Equipment Co., Inc., 2015-19 Congress, Houston 2, and ● 1748 Hawthorne, Apt. 2, Houston 6, Texas.

McLAREN, Frederic S. (*A* 1945) Chief Engr., ● Beals Plumbing & Heating Co., 315 West 13th St., and 3704 Westcliff Rd. S., Fort Worth 4, Texas.

McLAREN, T. H. (*A* 1938) Vice-Pres. and Gen. Mgr., ● The James Morrison Brass Manufacturing Co., Ltd., 276-278 King St. W., Toronto 1, and 65 Beaufort Rd., Toronto 8, Ont., Canada.

McLEAN, Dermid (*M* 1917) Mech. Engr., ● Snyder & McLean, 2214 Penobscot Bldg., Detroit 26, and 14007 Lauder Ave., Detroit 27, Mich.

McLEISH, William S. (*A* 1932; *J* 1928) Chief Engr., ● The Rio-wil Co., and 3463 New Portage Uniontown Rd., Barberton, Ohio.

McLENEGAN, D. W.* (*M* 1933) Asst. Mgr. of Engrg., Air Cond. Dept., • General Electric Co., 5 Lawrence St., Bloomfield, and 39 Francisco Ave., West Caldwell, N. J.

McLENNAN, Millard C. (*M* 1944) Supvsr. Htg. and Vent. Design, Puget Sound Navy Yard, Bremerton, and • 1714 Fourth Ave. N., Seattle 9, Wash.

McLEOD, Clarence H. (*M* 1943) Appl. Engr., • York Corp., 1239 Liberty Bank Bldg., Dallas 1, and Campbell Hotel, Dallas, Texas.

McLOUTH, Bruce F. (*M* 1936; *J* 1934) Cons. Engr., • 3445 Humboldt Ave. S., Minneapolis 8, Minn.

McMAHON, Louis A. (*A* 1944) Sales Engr., • Welsch Furnace Co., 5601 Manchester, St. Louis, and 10 Magnolia, Ladue 17, Mo.

McMAHON, Thomas W. (*M* 1928) Dist. Mgr., • American Blower Corp., 1711 Railway Exchange Bldg., St. Louis 1, and 6173 Waterman Ave., St. Louis 12, Mo.

McMASTER, Sherman G. (*A* 1945) Mgr. of Htg. Dept., • Richards Manufacturing Co., 135 Front Ave. N.W., Grand Rapids 4, and 164 Wallingwood Ave. N.E., Grand Rapids 3, Mich.

McMICHAEL, Chester L. (*M* 1943) Engr., H. H. Wright Co., 1322 Walnut St., Kansas City, Mo., and • 5519 Aberdeen Rd., Kansas City, Kans.

McMILLAN, Hugh D., Jr. (*S* 1947) Student, Texas A. & M. College, College Station, and • 1922 Wroxton Rd., Houston, Texas.

McMULLEN, C. S. (*A* 1945) Installation Engr., Martin H. Lipton Co., Inc., 32 Tenth Ave., New York, and • 236 East 24th St., New York 10, N. Y.

McMULLEN, Ernest W. (*M* 1942) Partner, Gantcaume & McMullen, 99 Chauncy St., Boston 11, and • 240 Winslow Rd., Waban 68, Mass.

McNAMARA, George Q. (*M* 1947) Pres., • George Q. McNamara, Inc., 1647 Penobscot Bldg., Detroit, and 1257 Ferdinand Ave., Detroit 9, Mich.

McNAMARA, William (*A* 1930) Mgr., • The Trane Co., 850 Cromwell Ave., and 1355 Como Ave., St. Paul 4, Minn.

McNAMEE, Earl W. (*M* 1940) Engr., • B. & J. Jacobs Co., 1729 John St., Cincinnati 14, and 2627 Ocosta Ave., Cincinnati 11, Ohio.

McNEVIN, Joseph E. (*M* 1937) Mgr., • Colorado Heating Co., 841 Corona St., Denver 3, and 1221 Sherman St., Denver 3, Colo.

McPHERSON, William A. (*M* 1929) Chief, Htg.-Vent. Div., Department of School Buildings, 26 Norman St., Boston, and • 86 Dwinnell St., West Roxbury, Mass.

McQUAID, Daniel J. (*M* 1934) Owner, Dan J. McQuaid Engineering Service, 1026-17th St., Denver 2, Colo.

McQUEEN, Boston (*A* 1945) Mgr., • McQueen Heating & Sheet Metal Co., S. Franklin St. & P.R.R., Greenfield, and 703 S. Bosart Ave., Indianapolis, Ind.

McQUITTY, Roy M. (*M* 1945) Steam Utilization Engr., Union Electric Company of Missouri, 315 North 12th Blvd., St. Louis, and • 1219 Highland Terrace, Richmond Heights, Mo.

McRAE, M. W. (*M* 1939) Research Engr., • Crane Co., 836 S. Michigan Ave., Chicago 5, and 816 Fairview Ave., Park Ridge, Ill.

McROBERTS, Robert C. (*A* 1947) Office Engr., • Natkin & Co., 1015 Sampson, Houston 3, and 3218 Prospect, Houston, Texas.

McWILLIAMS, Joseph W. (*A* 1942) • Camera Works, Eastman Kodak Co., 333 State St., Rochester 4, and 71 Lyndale Dr., Rochester 11, N. Y.

MEAD, Desmond O. (*A* 1946) Owner, • George E. Mead Co., 816 Arctic Bldg., Seattle 4, and 1218 Terry Ave., Seattle, Wash.

MEAD, E. A. (*M* 1926) Sales Mgr., • The Nash Engineering Co., South Norwalk, and 5 Thames St., Norwalk, Conn.

MEAD, H. K. (*A* 1939) Owner, • 1100 Guardian Bldg., Portland 4, and Jennings Lodge, Ore.

MEAGHER, Arthur T. (*M* 1938) Dir. and Sales Mgr., Plbg. and Htg. Dept., William Stairs Son & Morrow, Ltd., 174-190 Lower Water St., and • 83 Seymour St., Halifax, Nova Scotia, Canada.

MEAGHER, Thomas F. (*A* 1947) Pres., • Tom Meagher & Associates, 106 N. Division, Spokane, Wash.

MEANS, James MacG. (*A* 1944) • Mfrs. Agent, 244 Washington St., Room 433, Boston, and Manchester, Mass.

MECHLING, J. Clinton (*A* 1947) Br. Mgr., • American Radiator & Standard Sanitary Corp., 1730 Blake St., and 1165 Grant St., Denver, Colo.

MEDCALF, Lloyd C. (*M* 1944) Cons. Engr., • 100 Stevens Ave., Mt. Vernon, and 15 McBride Ave., White Plains, N. Y.

MEEK, George W. (*M* 1946) Cons. Engr., • 408 State Tower Bldg., Syracuse 2, and 406 Melrose Ave., Syracuse, N. Y.

MEEKA, Joseph, Jr. (*A* 1946) Owner, Meeka Co., R. R. 9, Box 344, Lemay 23, Mo.

MEFFERT, George H. (*M* 1947) Chief Engr., Martin-Johnson Engineering Co., 409 N. Pearl, Dallas, and • 3328 Greenbrier Dr., Dallas 5, Texas.

MEHAFFEY, Robert V. (*M* 1945) Cons. Engr., • Robert V. Mehaffey, Assoc. Engrs., 30 N. LaSalle St., and 10563 S. Prospect Ave., Chicago, Ill.

MEHLEK, John F. (*A* 1945) Dist. Sales Mgr., • Erie City Iron Works, 1836 Euclid Ave., Cleveland 15, and 3120 Chadbourne Rd., Shaker Heights 20, Ohio.

MEHNE, Carl A. (*M* 1929) Htg. and Vent. Expert, and 35 E. Livingston St., Valhalla, N. Y.

MEIDENBAUER, P. E., Jr. (*A* 1947) Partner, The Firewel Co., 127 Broadway, Buffalo 3, and • 117 Aurora St., Lancaster, N. Y.

MEILLER, Daniel V. (*A* 1941) Sr. Design Engr., • Public Service Company of Northern Illinois, 1001 S. Taylor Ave., Oak Park, and 1819 South 16th Ave., Maywood, Ill.

MEINHOLTZ, H. W. (*M* 1936) Branch Mgr., York Corp., 219 Mayo Bldg., Tulsa, Okla.

MELLON, James T. J. (*Life Member*; *M* 1911), (Council, 1915) • Mellon Co., 4415-21 Ludlow St., Philadelphia 4, and 431 North 63rd St., Philadelphia, Pa.

MELNICK, Nicholas A. (*M* 1941) Engr., G. M. Simonson, 625 Market St., and • 279 Fifth Ave., San Francisco 18, Calif.

MELNIKOFF, Constantine G. (*A* 1947) Chief, Engrg. Dept., • American Engineering Corp., 985 Nan King Rd., West Shanghai 9, and 20/12 Seymour Rd., Shanghai, China.

MELONEY, Edward J. (*M* 1937) Vice-Pres., • Bowers Bros. Co., 2015 Sansom St., Philadelphia 3, and 100 E. Stewart Ave., Lansdowne, Pa.

MENCH, John G. (*M* 1945) Mech. Engr., James Stewart Corp., 231 S. LaSalle St., Chicago, and • 915 Elm St., Park Ridge, Ill.

MENDEN, Peter J. (*M* 1935) Cons. Engr., 610 Main St., and • 1232 Hayes Ave., Racine, Wis.

MENDITCH, Barney (*J* 1944) Htg. and Air Cond. Engr., Secy.-Treas., General Heating Engineering Co., 100 Eighth St. N.E., Washington, D. C.

MENEFEE, Jesse I. (*M* 1947) Mech. Engr., • Arkansas Natural Companies, Engineering "B", and P. O. Box 1734, Shreveport, La.

MENENDEZ, Ramon A. (*M* 1946) Prof. Engr., 605 W. Lafayette St., P. O. Box 1627, Tampa, Fla.

MENKE, Allen C. (*S* 1946) Grad. Student, • Purdue University, Dept. of Mech. Engrg., West Lafayette, and 116 Main, Huntingburg, Ind.

MERCER, Blair G. (*M* 1946) Sales Engr., • Dallas Air Conditioning Co., 2809 Canton, and 3632 Bryn Mawr Dr., Dallas, Texas.

MEREDITH, John W. (*M* 1944) Regl. Professional Engr., and • 1 Sunnyside Rd., Natick, Mass.

MERENS, Seymour H. (*A* 1939) Partner, • Max Miller & Co., 823 N. California Ave., and 4955 N. Whipple St., Chicago, Ill.

MERGARDT, Albert P. (*A* 1940) Prop., American Heating Co., 55 K St. S.E., and • 4616 Butterworth Pl. N.W., Washington, D. C.

MERICLE, C. Dale (*A* 1946) Assoc. Editor, • Air Conditioning & Refrigeration News, 450 W. Fort, Detroit 26, and 17154 Westbrook, Detroit 19, Mich.

MERKER, William T. (*S* 1947) Student, Purdue University, and • 223 Sheetz St., West Lafayette, Ind.

MERLE, Andre (*M* 1946) Owner, Andre Merle Assocs., 323 Southern Bldg., Washington, D. C., and • 8 Edgewater Dr., Edgewater Beach, Md.

MERRILL, Carle J. (*M* 1919) Treas., • C. J. Merrill, Inc., 54 St. John St., and 31 Craigie St., Portland 4, Me.

MERRILL, Frank A. (*M* 1934) Cons. Engr., • Office of Hollis French, 210 South St., Boston, and 19 Auburndale Rd., Marblehead, Mass.

MERRITT, Cecil J. (*M* 1946) c/o Mrs. C. Sibley, 46 Spinney Rd., Northenden, Manchester, England.

MERRYMAN, C. P. (*A* 1945) Owner, • Merryman Wilson Co., 121 S. First St., 625 E. Main St., Union City, Tenn.

MERTZ, Walter A. (*M* 1919) Secy., • The Kehm Corp., 51 E. Grand Ave., and 3753 N. Keeler Ave., Chicago, Ill.

MERWIN, Gile E. (*M* 1924; *J* 1923) Mgr., • The Trane Co., 915 Redick Tower, Omaha 2, and 5012 Parker St., Omaha 4, Nebr.

MESSENGER, A. R. (*A* 1947) Senior Engr., Howard R. Green Co., Engrs., Bever Bldg., and • 221 13th St. Northwest, Cedar Rapids, Iowa.

METCALF, Ralph H. (*M* 1944) Vice-Pres., • Kremer Hicks Co., 3974 Delmar Ave., St. Louis 8, and 101 Jefferson Rd., Webster Groves 19, Mo.

METZGER, A. F. (*M* 1940) Supvsr. of Steam Utilization Div., • Allegheny County Steam Heating Co., 435 Sixth Ave., Pittsburgh 19, and 3421 Horne St., Pittsburgh, Pa.

METZGER, H. J. (*A* 1937) Pres., • Wheeler-Blaney Co., 137 E. Water St., and 706 Locust St., Kalamazoo, Mich.

METZLER, Charles F. (*M* 1946) Design Mech. Engr., • The Austin Co., 777 E. Washington Blvd., Los Angeles, and 12703 Brock Ave., Downey, Calif.

MEYER, E. Walter (*A* 1944) Partner, • Keystone Sales Co., P. O. Box 4201, Bellevue Sta., Pittsburgh 2, and 6933 Prospect Ave., Ben Avon, Pittsburgh, Pa.

MEYER, Frank L.* (*M* 1932; *J* 1928) Pres., • The Meyer Furnace Co., Box 989, Peoria 2, and 9 Cole Ct., Peoria 5, Ill.

MEYER, Henry C., Jr.* (*Life Member*; *M* 1898), (Council, 1915-16) Pres., • Meyer, Strong & Jones, Inc., 101 Park Ave., New York, N. Y., and 25 Highland Ave., Montclair, N. J.

MEYER, Joseph J. (*J* 1947) Senior Engr., Mathew Hall & Co., Ltd., 26-28 Dorset Sq., London, and • 74 Manor Pl., Walworth, London S. E. 17, England.

MEYER, Karl A. (*M* 1938) Engr., Airborne Industries, Inc., 628 N. Colfax Ave., Minneapolis 11, and • 5130 France Ave. S., Edina, Minn.

MEYER, Robert P. (*S* 1947) Student, Purdue University, West Lafayette, and • 922 Monroe St., Elkhart, Ind.

MEYERS, Carl F. (*A* 1942) Vice-Pres., Coblentz Equipment Co., 116 Peach St., and • 142 East 35th St., Erie, Pa.

MICHAEL, Arthur F. (*M* 1945) Gen. Air Cond. Supvsr., • Southern California Gas Co., Box 3249 Terminal Annex, Los Angeles 54, and 5266 Dahlia Dr., Los Angeles 41, Calif.

MICHAEL, Leonard A. (*M* 1945) Cons. Engr., 1346 St. Paul St., Denver 6, Colo.

MICHAEL, Robert K. (*A* 1944) Property Inspector, The Prudential Insurance Company of America, 500 Board of Trade Bldg., Kansas City, Mo., and • 620 Fairfay St., Denver, Colo.

MICHELS, Edward C. (*S* 1948) Student, A. & M. College of Texas, • Box 477, College Station, Texas.

MICHELSON, Donald J. (*A* 1946) Sales Engr., • Worthington Pump & Machinery Corp., 8 Rhodes Center N.W., and 1625 Orlando St. S.W., Atlanta, Ga.

MICHELSON, Robert L. (*A* 1947) Sales Engr., • Minneapolis-Honeywell Regulator Co., 1919 K St., Washington, D. C., and 3305 Circle Hill Rd., Alexandria, Va.

MICHIE, D. Fraser (*M* 1938; *A* 1930) • J. R. Stephenson & Co., 278 Main St., and 465 Waterloo St., Winnipeg, Man., Canada.

MIDGLEY, Rushby C. (*M* 1947) Partner, • Midgley-Huber, 44 West 8th South St., Salt Lake City 4, and 2156 South 22nd East, Salt Lake City, Utah.

MILENER, Eugene D. (*M* 1936) Secy., Indus. and Commercial Gas Sect., American Gas Assoc., 420 Lexington Ave., Suite 550, New York 17, N.Y.

MILES, James C. (*M* 1943) Mgr., • Miles Heating Enterprises, 1836 Euclid Ave., Cleveland 15, and 1972 Ford Dr., Cleveland 6, Ohio.

MILES, O. K. (*A* 1945) Mech. Engr., • General Industrial Supply Corp., 301 West 13th St., and 2119 Edwin St., Fort Worth, Texas.

MILEY, Julian J. (*A* 1945) Partner, • Marin Heating & Plumbing Co., 310 Sir Francis Drake Blvd., and 61 Florence Ave., San Anselmo, Calif.

MILLARD, Junius W. (*M* 1929) Capt., U. S. Navy, U. S. S. Alcor (AD 34), c/o Fleet Post Office, San Francisco, Calif., and • 3707 Gunston Rd., Parkfairfax, Alexandria, Va.

MILLER, A. T. (*M* 1938) Sales Engr., Dean Brothers Pumps, Inc., 92 Liberty St., New York 6, N. Y., and • 125 Godwin Ave., Ridgewood, N. J.

MILLER, Charles A. (*Life Member*; *A* 1917) • The H. B. Smith Co., Inc., 331 Madison Ave., New York, and 2554 Marion Ave., Bronx, N. Y.

MILLER, David C. (*M* 1944) Design Engr., • Buerkel & Co., Inc., 24 Union Park St., Boston, and 5 Ellis St., Quincy 69, Mass.

MILLER, E. B. (*M* 1946) Sales Engr., C. A. Dunham Co., 1100 South 31st St., Birmingham 5, Ala.

MILLER, Edgar R. (*A* 1935) Chief Engr., • Winnipeg Cold Storage Co., Ltd., Salter & Jarvis Ave., and P. O. Box 1384, Winnipeg, Man., Canada.

MILLER, Floyd A. (*Life Member*; *M* 1911) Retired, 944 Montrose Ave., Chicago, Ill.

MILLER, Frederick T. J. (*A* 1943) Htg. & Serv. Mgr., Quiet May of Rockaway, 1433 Central Ave., and • 2353 Healey Ave., Far Rockaway, L. I., N. Y.

MILLER, George F. (*M* 1936) Sales Engr., • 1902 "L" St. N.W., Washington 6, D. C., and 5608 Grove St., Chevy Chase 15, Md.

MILLER, H. Deane (*A* 1944) Mgr., Air Cond. and Commercial Refrig. Dept., • General Electric Supply Corp., P. O. Box 1919, Salt Lake City 12, and 1866 Yalecrest Ave., Salt Lake City, Utah.

MILLER, Henry A. (*J* 1948) Htg. Engr., • R. Crittall Radiant Heating, Inc., 665 Fifth Ave., New York, and 152 Washington St., Mt. Vernon, N. Y.

MILLER, Jack (*M* 1936) Pres., • Hy-Grade Construction Co., Inc., 342 West 14th St., New York 14, and 20 East 58th St., Brooklyn 3, N. Y.

MILLER, John W. (*M* 1941) Research Engr., Duo Therm Div. of Motor Wheel Corp., Lansing 3, and • 3045 Rolfe Rd., Lansing 15, Mich.

MILLER, Kenneth W. (*A* 1947) Mech. Engr., Grudem Bros. Co., 2645 University Ave., and • 1522 W. Idaho, St. Paul, Minn.

MILLER, Leo B. (*M* 1926) Vice-Pres., • Perfex Corp., 500 W. Oklahoma Ave., Milwaukee 7, and 3333 N. Hackett Ave., Milwaukee, Wis.

MILLER, Lorin G.* (*M* 1933), (Council, 1942-44) Prof. and Head, Mech. Engrg. Dept., • Michigan State College, R. E. Olds Hall of Engineering, and 232 University Dr., East Lansing, Mich.

MILLER, Mahlon S. (*A* 1942) Asst. Gas Engr., • Iowa Public Service Co., and 917 W. Main St., Cherokee, Ia.

MILLER, Norton R. (*M* 1944) Pres., Fireproof Structure Corp., Freeport, and • 188-17 Palo Alto Ave., Hollis 7, L. I., N. Y.

MILLER, Orville, Jr. (*A* 1946) Sales Engr., • Owens-Corning Fiberglas Corp., 3236 Pure Oil Bldg., and 7450 S. Luella St., Chicago, Ill.

MILLER, Robert A.* (*M* 1931) Tech. Sales Engr., • Pittsburgh Plate Glass Co., 2000 Grant Bldg., Pittsburgh 19, and 1211 Carlisle St., Tarentum, Pa.

MILLER, Robert T. (*A* 1927) Mgr., Indus. Div., Masonite Corp., 111 W. Washington St., Chicago 2, Ill.

MILLER, Warren W. (*A* 1945) Canadian Sales Engr., • Frigidaire Products of Canada, Leaside, and 112 Joicey Blvd., Toronto, Ont., Canada.

MILLER, William O. (*A* 1947) Mfrs. Repr., 306 Prudence Bldg., 40 First St., San Francisco 5, and • 276 Adams St., Oakland 10, Calif.

MILLER, William P. (*A* 1945) Engr., • The Smith & Oby Co., 6107 Carnegie Ave., Cleveland, and 2129 Glenbury Ave., Lakewood, Ohio.

MILLER, William S. (*A* 1947) Air Cond. Engr., • Huffman-Wolfe Co., P. O. Box 1248, and 2024 Manchester Rd., Atlanta, Ga.

MILLER, William T. (*M* 1938) Prof., Htg. and Vent., • Purdue University, and 525 Hayes St., West Lafayette, Ind.

MILLHAM, Franklyn B. (*M* 1938) Treas., S. S. Fretz, Jr., Inc., 1902 Chestnut St., Philadelphia 3, and • 1810 Chelsea Rd., Philadelphia 26, Pa.

MILLIGAN, Donald G. (*A* 1945) Mgr., Air Cond. Coil Div., • McQuay, Inc., 1600 Broadway N.E., Minneapolis 13, and 2419 Girard Ave. S., Minneapolis, Minn.

MILLIKEN, J. H.* (*M* 1923) Repr., • American Air Filter Co., Inc., 228 N. LaSalle St., Chicago 1, and 1021 Ridge Ct., Evanston, Ill.

MILLIS, Lynn W. (*Life Member*; *M* 1918) Retired, 3534 Wabash Ave., Kansas City 3, Mo.

MILLS, D. M. (*M* 1947; *A* 1940) Div. Mgr., • F. J. Evans Engineering Co., Room 205, A. G. C. Bldg., Gray and Crawford, Houston, and 2726 Robinhood, Houston 5, Texas.

MILLS, Doremus L. (*M* 1946; *A* 1943) Research and Dvlpt. Engr., • Revere Copper & Brass, Inc., and 1407 N. Madison St., Rome, N. Y.

MILLS, Hartzell C. (*A* 1935) Sales Engr., • Plant Equipment, Inc., 607 Sexton Bldg., Minneapolis 15, and 4137 Tenth Ave. S., Minneapolis 7, Minn.

MILNES, Albert (*M* 1947) Dir., Spirax Mfg. Co., Ltd., Cheltenham, Glos., England, and • Sarco Co., Inc., Empire State Bldg., New York, N. Y.

MILTON, Taylor (*M* 1945) Engr., • 648 M. & M. Bldg., Houston, and Bastrop, Texas.

MILWARD, Robert K. (*M* 1943; *A* 1920) Mgr., Detroit Branch, U. S. Radiator Corp., 127 N. Campbell Ave., and • 2441 Calvert Ave., Detroit, Mich.

MINAKER, Melvin E. (*A* 1945) Dist. Mgr., • Minneapolis-Honeywell Regulator Co., Ltd., 564 Hornby St., and 1050 Devonshire Crescent, Vancouver, B. C., Canada.

MINDA, W. F. (*A* 1946) Engr., The Walker Co., 231 Court St., and • 226 N. Second St., Hamilton, Ohio.

MINER, H. Harvey (*M* 1944; *A* 1940) Partner, • Miner Supply Co., 129 W. Front St., Red Bank, and 87 Silverton Ave., Little Silver, N. J.

MINICK, Alvin L. (*A* 1947) C.M.M. U. S. Navy Office of Supervisor of Shipbuilding, U. S. N., Bethlehem Steel Co., Quincy Yard, Quincy, and • 120 Gladstone St., East Boston, Mass.

MINKLER, William A. (*M* 1940) Asst. Mgr., Air Conditioning and Refrigeration Dept., • Westinghouse Electric Corp., Sturtevant Div., Hyde Park, Boston 36, and 521 High Rock St., Needham 92, Mass.

MINOR, Fred K. (*A* 1946) Dist. Repr., • American Air Filter Co., 1501 Euclid Ave., Cleveland 15, and 22231 Westchester Rd., Shaker Heights 22, Ohio.

MINOR, James E. (*J* 1947; *S* 1943) Mech. Engr., • Commonwealth & Southern Corp., Room 529, Consumers Bldg., and 110 Third St., Jackson, Mich.

MINSON, Frederick L. (*J* 1943) Engr., • City Heating Co., Inc., 661 Bank St., New London, and 13 Williams St., Waterford, Conn.

MIRABILE, J. James (*M* 1945; *A* 1938) Mgr., Wholesale Htg. Div., Elliot-Lewis Co., Inc., 2518 N. Broad St., Philadelphia 32, and • 7165 Marsden St., Philadelphia 35, Pa.

MITCHELL, A. J. (*M* 1938) Lt. (jg), U. S. N. R., Free Press Bldg., Detroit 26, Mich., and • 1936 Dryden Rd., Houston, Texas.

MITCHELL, Alvan E. (*M* 1939) Lt., U. S. N. R., U. S. S. Repose (AH-16), c/o F. P. O., San Francisco, Calif., and • 6501 Sligo Pkwy., Hyattsville, Md.

MITCHELL, John S. (*A* 1944) Sales Engr., • Crane Co., P. O. Box 155, Memphis 1, and 1902 Young Ave., Memphis 6, Tenn.

MITTENDORFF, E. M. (*M* 1932) Partner, Kramer & Mittendorff, 155 N. Clark St., Chicago 1, and • 772 Grove St., Glencoe, Ill.

MIXON, Ralph A. (*A* 1948) Sales Engr., Air Cond. Controls Div., • Minneapolis-Honeywell Regulator Co., 2507 Commerce St., Dallas 1, and 4116 Prescott Ave., Dallas 4, Texas.

MIZENER, Ralph S. (*M* 1944) Sales Engr., Parent & Kirkbride, Fourth and Locust St., Philadelphia 6, Pa., and • 1036 Grant Ave., West Collingswood, N. J.

MODIANO, Rene (*M* 1925) Managing Dir., Societe Carrier, 90 Rue Rouget de L'Isle, Suresnes (Seine), and • 55 Boulevard Beausejour, Paris 16 eme, France.

MOE, Parker A. (*M* 1944) Partner, Gates, Moe and Weiss, Cons. Engrs., 611 N. Broadway, Milwaukee 2, and • 3713 W. Branting Lane, Milwaukee 4, Wis.

MOESEL, F. Albert (*A* 1939) Asst. Mgr., • W. A. Case & Son Manufacturing Co., 31 Main St., Buffalo 3, and 382 Argonne Dr., Kenmore, N. Y.

MOESEL, Fred L. (*M* 1947) Prof. Engr., • Fred L. Moesel Assocs., 101 Park Ave., New York 17, and Hunterbrook Rd., Yorktown, N. Y.

MOHAN, John F. (*A* 1944) Secy.-Treas., • Fox Supply Co., Inc., 2229 Blake St., Denver 2, and 1260 St. Paul St., Denver 6, Colo.

MOHN, H. Leroy (*M* 1937) Mech. Engr., York-Shipley, Inc., York, Pa.

MOHRFELD, Herbert H. (*A* 1943; *J* 1935) Vice-Pres. and Treas., • C. P. Mohrfeld, Inc., 24 Lees Ave., Collingswood, and 670 Station Ave., Haddonfield, N. J.

MOLE, Hugh W. (*A* 1946) Indus. Engr., Norton Co., Chippawa, and 602 Ryerson Crescent, Niagara Falls, Ont., Canada.

MOLER, William H. (*M* 1942) Chief Engr., • Governair Corp., 2523 McKinney Ave., Dallas 4, and 3928 Lovers Lane, Dallas 5, Texas.

MOLFINO, Philip (*M* 1938) Partner, • H. S. Haley, 58 Sutter St., San Francisco 4, and 125 Clayton St., Apt. 2, San Francisco 17, Calif.

MOLLENBERG, Harold J. (*M* 1936) Pres., Mollenberg-Betz Machine Co., 22 Henry St., Buffalo, and • 111 Saratoga Rd., Snyder 21, N. Y.

MOLNARI, Bob A. (*A* 1947) Mgr. & Partner, • Eggelhof Engineers, 3812 La Branch, and 2619 Oak Cliff, Houston, Texas.

MOLONEY, Roger R. (*M* 1937) 26 Bonner Ave., Manly, Sydney, Australia.

MOLTZ, Bernard S. (*A* 1945) Engrg. Draftsman, Standard Engineering Co., 2199 Eye. St. N.W., and • 1293 Brentwood Rd. N.E., Washington, D. C.

MONAHAN, Maurice B. (*M* 1944) Owner, M. B. Monahan Regd., • 1410 Stanley St., and 5537 Trans Island Ave., Montreal, Que., Canada.

MONGILLO, Alphonse J. (*A* 1945) Prop., • A. J. Mongillo Co., 928 Grand Ave., New Haven 11, and 20 Marvel Rd., New Haven, Conn.

MONICK, Fred R. (*A* 1936) Mgr., • American Radiator & Standard Sanitary Corp., 605 E. Eighth St., and 1114 S. Sixth Ave., Sioux Falls, S. D.

MONIER, Kurt A. J. (*A* 1946) Partner, • A. J. Monier & Co., 1446 N. Flores St., and 131 Ligustrum, San Antonio, Texas.

MONIES, Ellis A. (*M* 1944) Dist. Mgr., F. E. Myers & Brothers Co., Ashland, Ohio, and • 760 Ogden St., Denver, Colo.

MONTAGUE, Frederick H. (*A* 1947) Mech. Engr., Walter Scholer & Associates, 1114 State St., and • 1314 South 14th St., Lafayette, Ind.

MONTEITH, Eric M. (*M* 1947) 161 St. George St., Toronto, Ont., Canada.

MONTESANO, Frank P. (*M* 1944) Mgr., The Frank A. McBride Co., 158-60 Ward St., and • 84 Lakeview Ave., Paterson, N. J.

MONTGOMERY, Cornelius T., Sr. (*M* 1947) Partner and Engr., Bowman and Montgomery Co., and R. D. 2, Bethlehem, Pa.

MONTGOMERY, Earl L. (*A* 1947) Sales Engr., • Sheldon's Ltd., 738 Notre Dame St. W., and 164 Decelles St., Ville St. Laurent, Montreal, Que., Canada.

MONTGOMERY, Edward G. (*A* 1938) Special Repr., Steel Company of Canada, Ltd., 525 Dominion St., Montreal, and • 20 Finchley Rd., Hampstead, Que., Canada.

MONTGOMERY, Foster W. (*A* 1948) Sales Engr., J. A. Walsh & Co., 3215 McKinney Ave., and • 1925 South Blvd., Houston 6, Texas.

MONTGOMERY, John Russell (*A* 1937) Mgr., Standards and Research, • Truscon Steel Co., Albert St., Youngstown 1, and 296 Granada Ave., Youngstown 4, Ohio.

MONTGOMERY, Thomas F. (*S* 1948) Student, Purdue University, and • 634 N. Sixth, Lafayette, Ind.

MOODY, Lawrence R. (*M* 1919) Partner, • Moody & Hutchison, 1420 Walnut St., Philadelphia 2, Pa., and 224 Bellevue Ave., Haddonfield, N. J.

MOODY, William D. (*A* 1946) Vice-Pres., Secy. & Engr., • Barber Plumbing Co., Inc., 1419 Paige St., P. O. Box 84, Houston, and 1714 West Alabama St., Houston 6, Texas.

MOON, L. Walter (*M* 1915), (Council, 1933-36) Engr., Gilmore & Co., 115 South 11th St., and • 1137A Hornsby Ave., St. Louis 15, Mo.

MOONEY, Bernard P. (*A* 1945) Mooneys Plumbing & Heating, • 814 West Lake St., Minneapolis 8, and 4745 France Ave. S., Minneapolis, Minn.

MOONEY, Mark E. (*A* 1945) Dir. of Sales, Applied Refrig., Carrier Corp., Syracuse, and • 125 Butternut Dr., DeWitt, N. Y.

MOONEY, Weldon (*A* 1947) Partner, • Mooney Engineering Co., 207 W. Eighth, Kansas City 6, and 5601 Brooklyn, Kansas City, Mo.

MOORE, Alexander G. (*M* 1947) Cons. Engr., 1440 St. Catherine St. W., Montreal, and • 1217 Graham Blvd., Mt. Royal, Que., Canada.

MOORE, H. Carlton* (*M* 1935) Sr. Mech. Engr., Metcalf & Eddy, 1300 Statler Bldg., Boston 16, and • 145 Beaumont Ave., Newtonville 60, Mass.

MOORE, Henry W. (*M* 1935) Mgr., Air Cond. Dept., Henry Niemes, Inc., 3242 Spring Grove Ave., Cincinnati 25, and • 3164 Queen City Ave., Cincinnati 11, Ohio.

MOORE, Herbert S. (*A* 1923) Dist. Repr., Iron Fireman Manufacturing Company of Canada, Ltd., 602 King St. W., Toronto 2, and • 107 Clendenan Ave., Toronto 9, Ont., Canada.

MOORE, Joseph J. (*M* 1946) Field Engr., A. M. Byers Co., 1250 Sixth Ave., New York 20, N. Y., and • 90 York Sq., New Haven 11, Conn.

MOORE, MacDonell (*A* 1940) Pres. and Gen. Mgr., • The Moore Fuel Corp., 11 West St., Danbury, and R. D. 2, Bethel, Conn.

MOORE, R. Edwin (*M* 1944; *A* 1928) Vice-Pres. & Secy., • Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and 425 Merrill Ave., Park Ridge, Ill.

MOORE, Robert E. (*A* 1943) Archt., Moody & Moore, 216 Graham Ave., Winnipeg, Man., Canada.

MOORE, Roscoe S. (*M* 1947) Engr., • The Powers Regulator Co., 3819 N. Ashland Ave., Chicago 13, and 523 N. Kenilworth, Oak Park, Ill.

MOORE, Vernon A. (*A* 1946) Archt., • 716 West 21st St., Norfolk 7, and 1420 Lafayette Blvd., Norfolk 8, Va.

MOORE, Wesley R. (*M* 1937) Reg'l. Mgr., • Minneapolis-Honeywell Regulator Co., 5005 Euclid Ave., Cleveland, and 14211 Ashwood Rd., Shaker Heights, Ohio.

MOOREHEAD, Robert C. (*M* 1947) Mech. Engr., Bellman, Gillett & Richards, Archts. & Engrs., 518 Jefferson Ave., and • 1755 Watkins Dr., Toledo, Ohio.

MORAN, Edward V., Jr. (*J* 1945) Engr., E. B. Ward & Co., 270 Fremont St., and • 261 Bellevue Ave., Trenton, N. J.

MORAWECK, Alvin H., Jr. (*A* 1946; *J* 1941) Engr., The Abbott Co., 675 Mt. Prospect Ave., Newark 4, and • 433 Ridgewood Rd., Maplewood, N. J.

MOREHOUSE, H. P. (*M* 1933) Gen. Htg. and Air Cond. Repr., Public Service Electric & Gas Co., 80 Park Pl., Newark, and • 30 Timber Acres Rd., Summit, N. J.

MOREHOUSE, J. Stanley (*M* 1938) Dean of Engrg., Prof. of Mech. Engr., • Villanova College, Villanova, and 102 Llandoff Rd., Upper Darby, Pa.

MORETTI, Garni (*A* 1946) Residential Engr., Lewis Engineering Service, 19003 John R. St., Detroit 3, and • 1503 Highland, Detroit 6, Mich.

MOREY, Albert A. (*A* 1946) Vice-Pres., • Marsh & McLennan, Inc., 164 W. Jackson Blvd., Chicago, and 815A Forest Ave., Evanston, Ill.

MORGAN, Arthur S. (*M* 1938) Vice-Pres. and Mgr., Fess Oil Burners of Canada, Ltd., 101 Hanson St., and • 156 Glenmanor Dr., Toronto, Ont., Canada.

MORGAN, David E. (*M* 1946) Asst. Research Mgr., • Warren Webster Co., 1700 Federal St., Camden, N. J., and 6235 Chestnut St., Philadelphia 39, Pa.

MORGAN, Edwin H., Jr. (*A* 1946; *J* 1942) Chief Draftsman, American Cyanamid Co., S. Cherry St., and • 180 North St., Wallingford, Conn.

MORGAN, Frank X. (*M* 1947) Chief Mech. Engr., Mahony-Troast Engineer Contractors, 657 Main Ave., Passaic, N. J., and • 2424 78th Ave., Philadelphia 38, Pa.

MORGAN, George R. (*M* 1945) Partner and Dept. Head, • J. E. Sirrine & Co., and 306 Overbrook Rd., Greenville, S. C.

MORGAN, Robert L. (*A* 1945) Owner, • Morgan Appliance Co., 706 W. Gray, and 607 W. Gray, Houston, Texas.

MORGAN, Robert W. (*M* 1938) Chief Engr., Fedders-Quigan Corp., 57 Tonawanda St., Buffalo 7, and • 32 Windover, Hamburg, N. Y.

MORGAN, W. Ralph (*A* 1947) Htg. Engr., • Calimode, Inc., Third St. N.W., and 630 Timm Valley Rd. N.W., Atlanta, Ga.

MORIARTY, John M. (*M* 1937) Retired, 1616 Baldwin Ave., Arcadia, Calif.

MORIN, A. R. (*A* 1938) Co-Owner, M. & V. Supply Co., 911 N. Walnut St., Oklahoma City 4, and • 2115 Sherman, Oklahoma City, Okla.

MORIN, Romeo Paul (*M* 1946; *A* 1944) Pres., R. P. Morin Co., Inc., Engineers Builders, N. Union St., and • 288 Salmon St., Manchester, N. H.

MORRIS, Brooks (*A* 1947) Owner & Mgr., Heating Engineering & Sales Co., 561 E. Washington St., Indianapolis 4, and 5047 N. Capitol Ave., Indianapolis 8, Ind.

MORRIS, C. Raymond (*M* 1938) Pres., Power & Heating Equipment Sales, Inc., 56 N. Spring Garden Ave., Nutley, N. J.

MORRIS, Edward J. (*M* 1942) Mgr., • Morris Engineering Co., 813 N. Calvert St., Baltimore 2, and 3414 Gwynns Fall Pkwy., Baltimore, Md.

MORRIS, John E. (*J* 1948) Sales Engr., American Blower Corp., Detroit, Mich., and • 1127 Glen cove Rd. S., Syracuse, N. Y.

MORRIS, Kenneth H. (*A* 1946) Constr. Supt., • American Sheet Metal Corp., P. O. Box 6067, and 4712 Newport Ave., Norfolk 8 Va.

MORRIS, Walter K. (*S* 1947) Student, • Texas A. & M. College, Box 2016, College Station, and 3625 Purington Ave., Fort Worth 3, Texas.

MORRISON, Alan McK. (*A* 1948) Sales Mgr., • Wisconsin Aireunits Corp., Rm. 1300, Majestic Bldg., and 4253 North 47 St., Milwaukee, Wis.

MORRISON, Chester B. (*M* 1931) Managing Dir., • York-Shipley, Ltd., N. Circular Rd., Hendon, London N.W. 2, and 60 Harley St., London S.W. 1, England.

MORRISON, Frank (*M* 1943) • Hall-Neal Furnace Co., 1324 N. Capitol, and 2907 Park Ave., Indianapolis, Ind.

MORRISON, Morton M. (*A* 1947) Field Supvsr., • Air Conditioning Applications Co., 637 Craig St. W., and 7760 Outremont Ave., Montreal, Que., Canada.

MORRISON, W. Bruce (*M* 1947; *A* 1942; *J* 1939) Cons. Engr., Cascade Bldg., Portland 4, Ore.

MORRISON, W. L. (*A* 1943) U. S. N. R., U. S. S. Jubilant A-M 255, F. P. O., New York, N. Y., and • 3422–16th, Great Bend, Kans.

MORRO, John J. (*M* 1940) Engr., • Bridgeport Castings Co., 250 North Ave., Bridgeport, Conn.

MORROW, E. J. (*A* 1947) Mgr. & Owner, E. J. Morrow Co., 3811 Nicollet Ave., and • 4728 Lyndale Ave. S., Minneapolis, Minn.

MORROW, J. DeWitt (*A* 1938) Pres. and Gen. Mgr., • The Warren Co., Inc., 614 Walker Ave., Houston 2, and 5503 LaBranch, Houston, Texas.

MORSE, Clark T. (*Life Member*; *M* 1913) Pres., • American Blower Corp., P. O. Box 58, Roosevelt Park Annex, Detroit 32, and Hillcrest Dr., Bloomfield Hills, Mich.

MORSE, Elwin F. (*A* 1948; *J* 1944) Appl. Engr., Westinghouse Electric Corp., Sturtevant Div., 933 Leader Bldg., Cleveland 14, and 15126 Larchmont, Lakewood 7, Ohio.

MORSE, Frederick B. (*A* 1947) Instructor, • Purdue University, Lafayette, and 103 W. Williams St., West Lafayette, Ind.

MORSE, Louis S., Jr. (*M* 1938; *J* 1936) Engr., Mann, Roller & Golibart, Inc., (Mfrs. Agents) and • 1427 E. Jefferson Ave., Detroit 7, Mich.

MORSE, Robert D. (*M* 1936) • 414 Vance Bldg., Seattle 1, and 4316 East 43rd St., Seattle 5, Wash

MORTON, Harold S. (*M* 1931) Engr., Johns Hopkins University, Applied Physics Lab., 8621 Georgia Ave., Silver Spring, and ● 7331 Piney Branch Rd., Takoma Park 12, Md.

MORTON, Paul S. (*A* 1943; *J* 1939) Htg., Plbg., Elec. Sales and Engrg., 609 Bangor Rd., Lawrence, Mich.

MOSES, Walter B., Jr. (*A* 1946; *J* 1940; *S* 1936) Owner, Engineering Sales Co., 7836 St. Charles Ave., New Orleans 18, La.

MOSES, Warren G. (*A* 1946) Partner, ● de Laureal & Moses, Cons. Engrs., 302 Nola Bldg., and 15 Newcomb Blvd., New Orleans, La.

MOSHER, Harold A. (*M* 1945) Mech. Engr., ● Eastman Kodak Co., Kodak Park Works, Rochester 4, and 287 Winona Blvd., Rochester 5, N. Y.

MOSHER, William O. (*A* 1946) Asst. Mgr., Sumner L. Willson, 75 Farmington Ave., Hartford, and ● 103 Coleman Rd., Weathersfield, Conn.

MOSS, Alfred W. (*A* 1945; *J* 1943) Dept. Mgr., ● Walter Woods, Ltd., 782 Main St., and 268 Vale Ave., Winnipeg, Man., Canada.

MOTZ, O. W. (*M* 1932) Cons. Engr., ● 920 E. McMillan St., Cincinnati 6, and 2605 Briarcliffe Ave., Cincinnati 13, Ohio.

MOULD, Harry W., Jr. (*J* 1941) Asst. Chief Lab. Engr., Fedders-Quigan Corp., 57 Tonawanda St., Buffalo, and ● 44 Alleghany Ave., Kenmore, N. Y.

MOULSDALE, Thomas DeWitt (*M* 1943) Htg. Engr., Lehigh Valley Oil Co., 1200 Walnut St., Allentown, and ● 818 Coleman, Easton, Pa.

MOWREY, Carl F. (*M* 1947) Dist. Repr., Air Cond. Dept., ● General Electric Co., 535 Smithfield St., Pittsburgh 22, and 344 Tampa Ave., Pittsburgh 16, Pa.

MOYNAN, Joseph S. (*M* 1946; *A* 1945) Engr., New Orleans Public Service, Inc., 317 Baronne St., and ● 5824 Gen. Haig St., New Orleans 19, La.

MUCKLE, James M. (*M* 1939) Chief, Bldg. Supplies Dept., ● Andersen, Meyer & Co., Ltd., 21 & 43 Yuen Ming Yuen Rd., and 523, Apt. 8, Avenue Haig, Shanghai, China.

MUEHLIG, Elmer J. (*M* 1945) Constr. Engr., ● F. W. Woolworth Co., 800 U. S. National Bank Bldg., Denver 2, and 1930 Holly St., Denver 7, Colo.

MUELLER, Harold P. (*M* 1936) Pres., ● L. J. Mueller Furnace Co., 2005 W. Oklahoma Ave., and 511 E. Monrovia Ave., Milwaukee, Wis.

MUELLER, H. C. (*M* 1936; *A* 1930) Pres. and Gen. Mgr., ● The Powers Regulator Co., 2720 Greenview Ave., Chicago 14, and 1277 Forest Glen Dr. N., Winnetka, Ill.

MUELLER, Jerome F. (*J* 1947) Field Engr., Chrysler Airtemp Sales Corp., 328 Chrysler Bldg., New York 17, N. Y., and ● 167 Seymour St., Hartford 6, Conn.

MUELLER, John C. (*M* 1946) Dir. of Research, ● Payne Furnace Co., 336 N. Foothill Rd., Beverly Hills, and 8950 Kittyhawk Ave., Los Angeles 45, Calif.

MUESSIG, James W. (*M* 1938) Sales Engr., ● Clarage Fan Co., 333 N. Michigan Ave., Chicago, and 405 Lodge Lane, Lombard, Ill.

MUIRHEID, John G. (*A* 1940; *J* 1937) Mech. Engr., Bureau of Ships, Navy Dept., Washington 25, and ● 2013 New Hampshire Ave. N.W., Apt. 707, Washington 9, D. C.

MULCEY, Paul A.* (*A* 1946) Dir., Anthracite Institute Laboratory, 237 Old River Rd., Wilkes-Barre, and ● Overbrook Rd., R. D. 2, Dallas, Luzerne County, Pa.

MULHOLLAND, Daniel J. (*A* 1945) Engr., Hutchinson-R. & S. M. Co., Inc., 177 Brookfield St., White Plains, and ● 381 Broadway, Dobbs Ferry, N. Y.

MULHOLLAND, Kenneth L. (*J* 1946) Sales Engr., Dole Valve Co., 1901 W. Carroll Ave., Chicago, and ● 3402 W. Monroe St., Chicago 24, Ill.

MULLEN, C. Herbert (*A* 1946) Archt., ● 458 Board of Trade Bldg., Kansas City, Mo.

MULLINIX, Robert M. (*S* 1946) Student, Texas A. & M. College, Box 2003, College Station, Texas.

MULREY, Maurice D. (*M* 1944) Owner, T. A. Mulrey & Son, 3161 N. Illinois St., Indianapolis 8, Ind.

MULRONEY, George J. (*A* 1946) Branch Sales Office Mgr., ● C. A. Dunham Co., Ltd., 189 St. John St., and 137 Boulevard Laurier, Quebec, Que., Canada.

MUNIER, Leon L. (*M* 1919; *J* 1915) Pres., ● Wolff & Munier, Inc., 222 East 41st St., New York 17, and 63 Columbia Ave., Hartsdale, N. Y.

MUNKELT, Frederick H. (*M* 1938) Vice-Pres., ● W. B. Connor Engineering Corp., 114 East 32nd St., New York 16, and 317 East 17th St., Brooklyn 26, N. Y.

MUNN, Hugh F. (*M* 1946) Vice-Pres. and Gen. Mgr., Albuquerque Lumber Co. & Technical Service Co., Box 447, and ● 419 W. Granite Ave., Albuquerque, New Mexico.

MUNN, Walter B. (*J* 1948; *S* 1947) Jr. Mech. Engr., ● Stanolind Oil & Gas Co., Mfg. Dept., and 1406 East 38th St., Apt. H, Tulsa, Okla.

MUNRO, W. J. (*A* 1946) Pres., Munro Hardware and Plumbing, Munro Motor Co., Inc., Rolla, N. D.

MURDOCH, John P. (*M* 1937) Pres., ● John P. Murdoch Co., 3630 Haverford Ave., Philadelphia 4, and 204 Glenn Rd., Ardmore, Pa.

MURDOCK, Charles E. (*M* 1944) Plant Mgr., ● Rheem Manufacturing Co., 1415 S. State, Salt Lake City 4, and 1254 E. Third S., Salt Lake City 2, Utah.

MURHARD, Erroll A. (*M* 1939) Partner, Muirhead & Murhard Co., 801 S.W. Stark St., Portland 5, and ● 2805 S.W. Greenview Ct., Portland 1, Ore.

MURHARD, Kenneth R. (*M* 1946) Sales Engr., Peerless Pacific Co., 2238 N. Interstate Ave., Portland 12, and ● 423 Southeast 69th Ave., Portland 16, Ore.

MURPHREE, Robert L. (*A* 1940; *J* 1936) Engr., and Owner, Rogers Plumbing & Heating Co., 2127 Eighth St., and ● P. O. Box 864, Tuscaloosa, Ala.

MURPHREE, Samuel E., Jr. (*S* 1946) Student, Texas A. & M. College, P. O. Box 5149, College Station, Texas.

MURPHY, Daniel C. (*A* 1940) Owner, ● D. C. Murphy Co., Inc., 840 Fifth Ave., Des Moines 14, and 4267 Foster Dr., Des Moines, Ia.

MURPHY, Delacour I. (*M* 1941) E. C. Cooley Co., 625 Market St., San Francisco, and ● 3027 Millsbrae Ave., Oakland 5, Calif.

MURPHY, Edward T.* (*Life Member*; *M* 1915) Sr. Vice-Pres., ● Carrier Corp., 300 S. Geddes St., Syracuse 1, and 1055 James St., Syracuse, N. Y.

NEUBAUER, Edwin W. (*M* 1939) Engr., ● Campbell Norquist & Co., 1127 S.W. Morrison St., Portland 5, and 4804 N.E. Davis, Portland 15, Ore.

NEUMAN, Steven I. (*A* 1947) Sr. Tech. Engr., ● W. H. Brady and Co. Ltd., Churchgate St., Bombay, British India.

NEVIN, John F. (*M* 1944) Engr., Air Cond. and Commercial Refrig. Div., ● International General Electric Co., 570 Lexington Ave., New York, N. Y., and Eighth St. and 64th Ave., Oaklane, Philadelphia 26, Pa.

NEWBANKS, Niles N. (*A* 1948) Skelgas Div., Skelly Oil Co., 4045 Troost, Kansas City, Mo., and ● 8202 Rose Ave., Overland Park, Kans.

NEWBY, Ira P. (*M* 1941) Mgr., Heating Dept., Southwestern Region Appliance Sales, Rheem Mfg. Co., 1401 Lockwood Dr., Houston, and ● 6262 Prospect Ave., Dallas 14, Texas.

NEWELL, Robert W. (*A* 1947) Asst. to Tech. Personnel Supvsr., Air Cond. Plant, ● General Electric Co., Bloomfield, and 331 Park Avenue, Nutley, N. J.

NEWMAN, Harold E. (*M* 1938) Partner, ● J. F. Dickinson Co., 716 Tenth St., and 514 High St., Modesto, Calif.

NEWPORT, Charles F.* (*Life Member*; *M* 1906) Sales Engr., Weil-McLain Co., Michigan City, Ind., and ● 10001 Longwood Dr., Chicago 43, Ill.

NEWTON, Albert E. (*A* 1943) Engr., ● Hall-Neal Furnace Co., 1324 N. Capitol Ave., and 4515 E. Washington, Apt. 1, Indianapolis, Ind.

NEWTON, Alwin B. (*M* 1938) Chief Engr., Chrysler Corp., Airtemp Div., 1119 Leo St., Dayton 1, and ● 905 E. Schantz Ave., Dayton 9, Ohio.

NEWTON, David A. (*M* 1944) Newton Engineering Co., Suite 922, 101 Park Ave., New York, N. Y. and ● 635 Spring Ave., Ridgewood, N. J.

NEYHART, Floyd B. (*J* 1945) Mech. Engr., Carrier Corp., 300 S. Geddes, and ● 329 Comstock Ave., Syracuse 10, N. Y.

NICHOLLS, John M. (*M* 1939) Htg. Engr., ● Robbins Gamwell Corp., 68 West St., and 32 Buel St., Pittsfield, Mass.

NICHOLS, H. R. (*A* 1943) Engr., Grudem Brothers Co., 2645 University Ave., St. Paul 4, and ● 5416 Park Pl., Minneapolis 10, Minn.

NICHOLSON, Sterling J. (*A* 1941) Pres., Nicholson, Inc., 126 Market St., Durham, N. C.

NICKERSON, Albert E. (*A* 1945) Pres., ● Nickerson Supply Co., Inc., 314 James, Seattle 4, and 2415–31st W., Seattle 99, Wash.

NICKLE, A. J. (*A* 1936) Asst. Sales Mgr., ● Darling Bros., Ltd., 140 Prince St., Montreal 3, and 4804 Oxford Ave., Montreal 29, Que., Canada.

NICOLL, Scott F. (*M* 1939) Chief Draftsman, ● York Corp., Roosevelt Ave., York, and 1433 First Ave., Elmwood, York, Pa.

NICOLS, J. A. (*M* 1941) Mech. Engr., General Mills, Inc., Hodgson Bldg., Minneapolis 1, and ● 3301 Emerson Ave. S., Minneapolis 8, Minn.

NIEMOELLER, Arthur R. (*A* 1943) Sales Engr., 5817 Itaska St., St. Louis 9, Mo.

NIESKE, George F. (*M* 1943) Engr., C. N. Flagg & Co., Inc., 79 Griswold St., and ● 794 Bee St., Meriden, Conn.

NIESSE, Joe H. (*M* 1938) Branch Mgr., ● Ilg Electric Ventilating Co., 836 Architects & Builders Bldg., Indianapolis 4, and 5837 Winthrop Ave., Indianapolis 5, Ind.

NIGHTINGALE, George F. (*A* 1946) Sales Engr., C. H. Bevington Co., 330 S. Wells St., Chicago, and ● 2136 Linneman St., Glenview, Ill.

NINMAN, Alex T. (*A* 1947) Sales, R. E. Chase & Co., 407 New Fliedner Bldg., Portland 5, and ● 4713 N. Willamette Blvd., Portland 3, Ore.

NITZBERG, Samuel H. (*A* 1947) Pres., ● Atlantic Pipe Bending & Fabricating Corp., 552 River Rd., Edgewater, and 168 E. Springvalley Ave., Maywood, N. J.

NOBBS, Walter W. (*M* 1919) Cons. Engr., 26 Victoria St., London, S.W. 1, and ● 50 Fairhazel Gardens, London, N.W. 6, England.

NOBIS, H. M. (*M* 1914) Chief Engr., The Warner & Swasey Co., 5701 Carnegie Ave., Cleveland, and ● 1827 Stanwood Rd., East Cleveland 12, Ohio.

NOBLE, Milner (*M* 1940) Pres., ● Aerofin Corp., 410 S. Geddes St., and 142 Clarke, Syracuse, N. Y.

NOEL, Clifford E. (*A* 1946) Partner & Mgr., ● Dunham Heating Service, 1836 Euclid Ave., Cleveland 15, and 4077 West 157th St., Cleveland, Ohio.

NOLAN, James J., Jr. (*M* 1939) Mech. Engr., Wm. K. Karsunky, 2011 K St. N.W., Washington, and ● 4024 Calvert St. N.W., Washington 7, D. C.

NOLAN, J. J. (*M* 1943) Prop., ● J. J. Nolan & Co., 78 Washington Ave., and 1606 Goodbar, Memphis, Tenn.

NOLAN, Thomas J. (*A* 1947) Sales Engr., ● Wesix Electric Heating Co., 103 Northwest 14th Ave., and 9216 N. Milne, Portland, Ore.

NOLL, William F. (*M* 1924) Prop., Wm. F. Noll, 629 North 27th St., Milwaukee 8, Wis.

NORAIR, Henry (*M* 1938) Pres., ● Norair Engineering Corp., 1114–22nd St. N.W., Washington 7, and 2936 Albemarle St. N.W., Washington, D. C.

NORBY, Karl H. (*M* 1943; *A* 1938) Sales Engr., Trane Co., 805 Skinner Bldg., Seattle 1, and ● 3237–29th Ave. W., Seattle 99, Wash.

NORCROSS, Ivan F. (*A* 1945) Mech. Engr., ● E. L. E. Co., 124 W. Fourth St., Los Angeles 13, and 2917 Urban Ave., Santa Monica, Calif.

NORDINE, L. F. (*M* 1936) Pres., ● Warren Plumbing & Heating Corp., Box 609, 21 S. Royal Ave., and 430 Washington Ave., Front Royal, Va.

NORLAND, C. O. (*M* 1945) Pres., ● Munkel Heating Co., 569 N. Fourth St., and 291 Fallis Rd., Columbus, Ohio.

NORMAN, Edward A., Jr. (*M* 1944) Pres., ● Norman Products Co., 1150 Chesapeake Ave., and 1513 Essex Rd., Columbus, Ohio.

NORMAN, George C. (*M* 1944) Engr., ● Koithan & Johnson, 27 Washington St., Newark 2, and 12 Exeter Rd., Short Hills, N. J.

NORRINGTON, Walter L. (*M* 1946; *A* 1943; *J* 1938) Mech. Engr., Wm. K. Karsunky, Cons. Engr., 2011 K St. N.W., Washington, D. C., and ● 6819 Standish Dr., Landover, Md.

NORRIS, Camden G. (*A* 1948) Partner, ● Dill & Norris Sheet Metal & Heating Co., 806 Military St., and 621 Third Ave. N., Columbus, Miss.

NORRIS, William P. (*M* 1944; *J* 1938) Engr., Baker Ice Machine Co., 813 Hempstead St., St. Louis 6, and 410 N. Newstead Ave., St. Louis 8, Mo.

NORTE, W. R. (*A* 1946; *J* 1942) Pres. and Gen'l. Sales Mgr., • J. B. Lewis Plumbing & Heating Co., 1426 Southeast 17th Ave., Portland 14, and 2607 N.E. Mason, Portland 11, Ore.

NORTH, Clarence P. (*M* 1942) Chief Engr., • Campbell Heating Co., P. O. Box 833, Des Moines 4, and 3614 E. Seventh St., Des Moines 16, Ia.

NORTH, Sam L. (*A* 1942) Partner, • North Brothers, P. O. Box 252, Atlanta 1, and 107 Peachtree Hills Ave. N.E., Atlanta, Ga.

NORTON, Ernest H. (*A* 1946) Owner, • 616 Lloyd Bldg., Seattle 1, and 5019 Phinney Ave., Seattle 3, Wash.

NORTON, John Arthur (*M* 1940) Mgr., Htg. Sales Div., Crane, Ltd., 306 Front St. W., Toronto, and • 136 Hanna Rd., Leaside, Ont., Canada.

NORTON, L. Ivan (*A* 1941) Engr., Design Htg. Installations, Eveready Plumbing & Heating Co., 514 W. Main St., Washington, Ia.

NOTKIN, James B. (*M* 1944) Mech. Engr., John Graham, Archt. & Engr., 1501 Dexter Horton Bldg., Seattle, and • 2013 East 63rd St., Seattle 5, Wash.

NOTTAGE, Herbert B.* (*A* 1945; *J* 1943) Research Assoc., American Society of Heating & Ventilating Engineers Research Lab., 7218 Euclid Ave., Cleveland 3, and • 5 Douglas Rd., Wickliffe, Ohio.

NOTTBERG, Gustav (*A* 1933) Vice-Pres., • U. S. Engineering Co., 914 Campbell, and 650 West 67th St., Kansas City, Mo.

NOTTBERG, Henry, Jr. (*A* 1946; *J* 1937) Secy., • U. S. Engineering Co., 914 Campbell, and 150 West 54th St., Kansas City, Mo.

NOTTBERG, Henry, Sr. (*Life Member*; *M* 1919) Pres., U. S. Engineering Co., 914 Campbell St., and • 150 West 54th St., Kansas City, Mo.

NOVAK, Charles J. (*A* 1944) Secy.-Treas., Bryant Gas Heating Service, Inc., 533 Massachusetts Ave., Indianapolis, Ind.

NOWITZKY, Herman S. (*A* 1931) Supt. Constr. Maint. and Repairs, Wilmer & Vincent Circuit, Fabian Theatres, 1501 Broadway, New York 18, N. Y., and • 821 Llewellyn Ave., Norfolk 7, Va.

NOYES, Richard R. (*A* 1946; *J* 1938) Field Engr., • Canadian Sirocco Co., Ltd., 630 Dorchester St. W., and 4940 Coronet, Apt. 2, Montreal, Que., Canada.

NUGENT, Arthur W. (*M* 1945) Owner, A. W. Nugent & Co., 1713 M St. N.W., Washington 6, D. C., and • 1030 Flower Ave., Takoma Park, Md.

NUNLIST, Frank J., Jr. (*M* 1943) Chief Engr., L. J. Mueller Furnace Co., 2005 W. Oklahoma Ave., Milwaukee 7, and • 8717 W. Cleveland Ave., Milwaukee, Wis.

NUSBAUM, Lee* (*Life Member*; *M* 1915) Owner, • Pennsylvania Engineering Co., 1119-21 N. Howard St., Philadelphia, and 315 Carpenter Lane, Germantown, Philadelphia, Pa.

NUSBAUM, S. Richard (*A* 1944; *J* 1940) Mgr., • Pennsylvania Engineering Co., 1119-21 N. Howard St., Philadelphia, and Wynnewood Park Apts., Wynnewood, Pa.

NUSSBAUM, Otto J. (*A* 1944) Chief Research Engr., Kramer Trenton Co., Olden and Breunig Aves., Trenton 5, and • 56 McKinley Ave., Trenton 9, N. J.

NUTTING, Arthur* (*M* 1940) Chief Engr., • American Air Filter Co., 215 Central Ave., and 4040 Ormond Rd., Louisville, Ky.

NUTTING, Robert E. (*A* 1948) Supt., • Jaden Manufacturing Co. & Dutton-Lainson Co., Mfg. Div., 1601 W. Second St., and 418 E. Seventh St., Hastings, Nebr.

NYE, L. Bert, Jr. (*M* 1947; *A* 1943; *J* 1936) Staff Engr., Washington Gas Light Co., 1100 H St. N.W., Washington, D. C., and • McLean, Va.

NYLAND, J. A. (*A* 1944) Mgr., • Nyland Sheet Metal Co., 2323 W. Tenth St., Indianapolis 22, and 6133 Rosslyn Ave., Indianapolis 5, Ind.

NYMAN, Robert A. (*S* 1948) Student, University of Michigan, and • 302 Hinsdale House, E. Quad., Ann Arbor, Mich.

NYQUIST, John D. (*J* 1942; *S* 1941) Dir. of Engr. Service, Collins Radio Co., and • 728 Fifth Ave. S.W., Cedar Rapids, Ia.

NYSTROM, Paul E. (*M* 1945) Archt. and Partner, • Law, Law, Potter & Nystrom, 121 S. Pinckney St., Madison 3, and 360 Kensington Dr., Madison 4, Wis.

O

OAKLEY, LeRoy W. (*M* 1937) Owner, • L. W. Oakley Sales Co., 408 W. Clinch Ave., and 2003 Laurel Ave., Knoxville, Tenn.

OAKS, Orion O.* (*M* 1917) Dir. of Research, J. B. Pierce Foundation, Raritan, and • 119 Oak Ridge Ave., Summit, N. J.

O'BANNON, Lester S.* (*M* 1928) Research Engr., University of Michigan, 239 West Engineering Bldg., Ann Arbor, Mich.

OBERG, H. C. (*A* 1933) Mgr., Engrg. Dept., Crane Co., Fifth and Broadway, and • 1362 W. Minnehaha St., St. Paul, Minn.

OBERLIN, James A. (*J* 1946) Distel Heating Co., Lansing, and • 221 N. Bostwick Ave., Charlotte, Mich.

OBERSCHULTE, Richard H. (*M* 1944; *J* 1938) Sales Engr., • D. T. Randall & Co., 320 McKerchey Bldg., 2631 Woodward, Detroit 1, and Box 76, Franklin, Mich.

O'BRIEN, Thomas J. (*M* 1943) • T. J. O'Brien Engineering Co., 1030 Exchange Bldg., and 1483 Vance Ave., Memphis, Tenn.

O'CALLAGHAN, L. J. (*A* 1947) Vice-Pres. & Gen. Mgr., • Dealers Supply Co., Inc., 229 Bradbury St. S.W., and 1393 Lanier Place N.E., Atlanta, Ga.

O'CONNELL, Edmund F. (*A* 1947) Partner, • Stone Heating & Ventilating Co., 3245 Que St. N.W., Washington 7, D. C., and 9 Blackstone Rd., Westmoreland Hills, Md., P. O. Washington 16, D. C.

O'CONNELL, Patrick M. (*A* 1947) Secy.-Treas., • The Dell Corporation, 9003 Waukegan Rd., Morton Grove, and Route 1, Barrington, Ill.

O'CONNELL, Thomas D'Arcy (*A* 1942) Pres., • Thomas O'Connell, Ltd., 1169 Ottawa St., Montreal 3, and 9 McCullough Ave., Outremont 8, Que., Canada.

O'CONNELL, Walter H. (*J* 1948) Jr. Engr., Lehigh Engineering Co., 1150 Mauch Chunk Rd., and • 81 West Goepp St., Bethlehem, Pa.

O'CONNOR, James, Jr. (*A* 1947) Jr. Engr., • Martyn Bros., Inc., 1000 St. Louis, and 3811 Travis St., Dallas, Texas.

O'DANIEL, James A. (*M* 1942) Mgr., • Maple City Furnace Co., 603 S. Main St., and 617 S. Main St., Monmouth, Ill.

O'DANIEL, Presley (*A* 1945) Branch Mgr., York Corp., 1807 Fidelity Bldg., Kansas City 6, and • 7139 Summit, Kansas City 5, Mo.

O'DONNELL, Lawrence D. (*A* 1944) Mgr., • McCarthy's Sheet Metal Works, Box 105, and 816 Buntin St., Vincennes, Ind.

O'DOWER, Hugh J. (*A* 1938) Owner, • O'Dower Engineering Co., 756 Board of Trade Bldg., Kansas City 6, and 6844 Locust, Kansas City 5, Mo.

OELGOETZ, J. F. (*M* 1938) Owner, J. F. Oelgoetz Co., 3365 N. High St., and • 279 E. North Broadway, Columbus, Ohio.

OFFEN, Ben (*M* 1928) Owner, • B. Offen & Co., 343 S. Dearborn St., and Sheridan Rd., Chicago, Ill.

OFFNER, Alfred J.* (*M* 1922), (*Presidential Member*), (Pres., 1946; 1st Vice-Pres., 1945; 2nd Vice-Pres., 1944; Treas., 1935-38), (Council, 1935-47) Cons. Engr., • 139 East 53rd St., New York 22, and 160-15-11th Ave., Beechurst, L. I., N. Y.

OFFNER, Theodore (*A* 1947) Mgr., Air Cond. Dept., • Gulf Engineering Co., Inc., 916 S. Peters St., New Orleans, and 3327 Delachaise, New Orleans 15, La.

O'GORMAN, J. S., Jr. (*A* 1934) Mgr., Detroit Office, • Johnson Service Co., 230 E. Alexandrine Ave., Detroit 1, and 147 Abbey Rd., Birmingham, Mich.

OKRAY, Ralph A. (*A* 1946) Engr., • Kleenaire Corp., 832 E. Main St., and 3107 Gordon Ave., Madison 4, Wis.

OLD, William H. (*M* 1937) Asst. Mgr., • Glanz & Killian Co., 1761 Forest Ave. W., Detroit 8, and 18245 Devonshire Rd., R. F. D. 5, Birmingham, Mich.

OLDS, Dean (*M* 1944) Chief Engr., • The Coleman Co., Inc., 250 N. St. Francis, and 222 N. Bleckley, Wichita, Kans.

OLDS, Stephen T. (*A* 1945) Sales Mgr. and Engr., • Wm. C. Maunz Co., Inc., 383 E. Delavan Ave., Buffalo 14, and 400 Elmwood Ave., Buffalo, N. Y.

OLIVIERI, Joseph B. (*S* 1948) Student, University of Detroit, and • 6145 Belvidere Ave., Detroit 13, Mich.

OLLESHEIMER, Louis T. (*A* 1945) Owner, • 2539 Woodward Ave., Detroit 1, and 250 Baldwin Ave., Birmingham, Mich.

OLSEN, Carlton F. (*A* 1925; *J* 1920) Sales Engr., Kewanee Boiler Corp., 549 W. Washington Blvd., and • 1000 West 100th St., Chicago 43, Ill.

OLSEN, Gustav E. (*M* 1930) Sales Mgr., Fitzgibbons Boiler Co., Inc., 101 Park Ave., New York, and • 68-09 Beach Channel Dr., Arverne, L. I., N. Y.

OLSON, Arthur A. (*M* 1944) Vice-Pres. and Treas., • Lee Engineering Co., 1102 Union National Bank Bldg., Youngstown 3, and 4129 Oak Knoll Dr., Youngstown 7, Ohio.

OLSON, Erling O. (*A* 1943) Service Engr., Oil Burner Service Co., Inc., 315 W. Lake St., Minneapolis, and • 4221 Oakland Ave., Minneapolis 7, Minn.

OLSON, Eugene O. (*M* 1942) Chief Engr., • Delavan Manufacturing Co., 3009 Sixth Ave., and 2520–45th St., Des Moines 10, Ia.

OLSON, Milton J. (*A* 1941; *J* 1937) Partner, Olson Bros., 2651 St. Mary's Ave., and • 5830 Hickory St., Omaha, Nebr.

OLSON, Nat I. (*A* 1944) Owner and Gen. Mgr., • United Blower Co., Inc., 193 Centre St., New York 13, and 711 Brightwater Ct., Brooklyn, N. Y.

OLSON, Willard A. (*A* 1947) Vice-Pres., Electro Specialty Mfg. Co., Inc., 2938 Fourth Ave. S., Minneapolis 8, and • 4452 Vincent Ave. S., Minneapolis 10, Minn.

OLSSON, Eric V. (*A* 1945) Branch Mgr., • Westinghouse Electric Corp., Sturtevant Div., 1625 K. St. N.W., Washington 6, D. C., and 124 Parallel St., Bridgeport, Conn.

OLVANY, William J. (*Life Member*; *M* 1912) Pres., William J. Olvany, Inc., 100 Charles St., New York 14, N. Y.

O'MARRA, Wyman W. (*J* 1948) Jr. Engr., Karel R. Rybka, 96 Bloor St. W., and • 55 Mariposa, Tononto, Ont., Canada.

O'NEILL, James W. (*M* 1929; *A* 1927; *J* 1925) Vice-Pres. in charge of Production, Trane Company of Canada, Ltd., 4 Mowat Ave., Toronto 1, and • 55 Highview Crescent, Toronto, Ont., Canada.

O'NEILL, John E. (*A* 1945) Sales Engr., A. I. McFarlan Co., Inc., 21 West St., New York, and • 81 W. Raleigh Ave., Staten Island 10, N. Y.

O'NEILL, Joseph Francis (*M* 1944) Mech. Engr., • Trane Company of Canada, Ltd., 4 Mowat Ave., Toronto 1, and 44 Aldgate Ave., Toronto 14, Ont., Canada.

OONK, W. J. (*M* 1937) Dist. Appl. Engr., Westinghouse Electric Corp., Sturtevant Div., 411 N. Seventh St., St. Louis 1, and • 5467a Queens Ave., St. Louis 15, Mo.

OOSTEN, Louis S. (*A* 1944; *J* 1938) Asst. Chief Engr., • Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and 725 Case St., Evanston, Ill.

OPPENHEIMER, Philip H. (*M* 1946) Cons. Engr., • 225 Broad St., and 802 Shadowlawn Dr., Westfield, N. J.

OPPERMAN, Everett F. (*A* 1944) Mech. Engr., Petroleum Heat & Power Co., Southfield St., and • 788 E. Main St., Stamford, Conn.

ORABELLA, Michael J. (*A* 1944) Pres., Ohio National Products, Inc., 2207 Ontario St., Cleveland, and • 3629 Northcliffe Rd., University Heights, Ohio.

ORAVETZ, Julius A. (*A* 1946) Owner, Oravetz Heating & Ventilating Co., 1616 Murray Ave., Racine, Wis.

OREAR, Andrew G. (*M* 1942) Pres., • Trade-Wind Motorfans, Inc., 5725 S. Main St., Los Angeles 37, and 1015 E. Raleigh St., Glendale 5, Calif.

O'REAR, L. R. (*M* 1934) Pres., • Midwest Plumbing & Heating Co., 2450 Blake St., and 825 S. Josephine St., Denver, Colo.

OREBAUGH, Howard T. (*M* 1945) Appl. Engr., • York Corp., 4660 E. Marginal Way, Seattle 4, and 1129 North 77th St., Seattle 3, Wash.

ORGELMAN, George H. (*J* 1942; *S* 1940) Lt., Hq. BASECTWO-USASCOMC, Engr. Section, A. P. O. 928, c/o Postmaster, San Francisco, Calif., and • 10 Pearl St., Danbury, Conn.

ORMISTON, John B. (*A* 1940) Owner, Ormiston Plumbing & Heating Co., 105 Manning Ave., Yonkers, N. Y.

ORMSBY, H. Kingsley, Jr. (*M* 1944) Owner, • Syracuse General Sales Co., 511 E. Raynor Ave., Syracuse 1, and 206 Roycroft Rd., East Syracuse, N. Y.

ORR, George M. (*M* 1947) Partner, • G. M. Orr Engineering Co., 1004 Marquette Ave., Minneapolis 2, and 1100 West 53rd St., Minneapolis 9, Minn.

ORR, James D. (*J* 1946) Supt., Orr-Gulton Co., 496 St. Clair Ave. E., Toronto, Ont., Canada.

ORR, Patrick W. (*A* 1947) Pres., • Del-Patrick Inc., 200 Broadway, and 2395 S. Corona, Denver 9, Colo.

ORR, Weldon John (*A* 1944) Mech. Engr., Public Works Dept., City of Montreal, 3161 Joseph St., Verdun, and • 3559 St. Famille St., Apt. 5, Montreal, Que., Canada.

OSBERGER, T. L. (*A* 1944) Owner, Mfrs. Agent, • T. L. Osberger Co., 5735 Cass Ave., Detroit, and 359 Pilgrim Rd., Birmingham, Mich.

OSBORN, Francis W. (*A* 1948) Sales Engr., • Minneapolis-Honeywell Regulator Co., 1911 Ingersoll, Des Moines, and Clemons, Iowa.

OSBORN, Wallace J. (*A* 1927) Vice-Pres., Keeney Publishing Co., 1734 Grand Central Terminal Bldg., New York, N. Y., and • 1029 Old Post Rd., Fairfield, Conn.

OSBORNE, G. H. (*M* 1922) Managing Dir., • The Ventilating & Blow Pipe Co., Ltd., 714 St. Maurice St., Montreal 3, and 757 Davaar Ave., Outremont, Montreal, Que., Canada.

OSBORNE, James M. (*A* 1944) Field Engr., • The Herman Nelson Corp., 1829 M St. N.W., Washington 6, D. C., and 4607 Drexel Rd., College Park, Md.

OSBORNE, Stanley R. (*M* 1939) Htg. Engr., • Chase Brass & Copper Co., Waterbury 91, and Atwater Pl., West Cheshire, Conn.

OSGOOD, Harry P. (*A* 1947) Sales Engr., Fulton Sylphon Co., 5-211 General Motors Bldg., and • 21769 McCormick, Detroit 24, Mich.

O'SHEA, John J. (*A* 1941) Sales Repr., Buffalo Forge Co., 305 Teckwood Dr. N.E., and • 714 Greenview Ave. N.E., Atlanta, Ga.

OSLUND, Daniel L. (*A* 1947) Mech. Engr., • Department of Buildings, 213 City Hall, Minneapolis, and 1682 Hennepin Ave., Minneapolis 3, Minn.

OSTER, William P. (*M* 1940) Vice-Pres., • Equitable Equipment Co., Inc., 410 Camp St., New Orleans 12, and 4651 Baccich St., New Orleans 17, La.

OSTERHAGE, Catharine Sweeney (*A* 1945) Draftsman, 1025 Winslow Ave., Richland, Wash.

OSTERMEIER, Donald E. (*J* 1946) Apex Industries, Div. of Apex Engineering Co., Suite 200-205 W. Wacker Dr., Chicago 6, and 4943 Highland Ave., Downers Grove, Ill.

OSTERMEIER, Edwin J. (*A* 1945) Owner • Apex Engineering Co., 75 E. Wacker Dr., 32nd Fl., Chicago 1, Ill., and 4943 Highland Ave., Downers Grove, Ill.

OSTROM, Eric W. (*M* 1937) Chief Engr., Air Cond. Dept., A/B Svenska Flaktfbriken, Kungsgatan 16, and • John Ericssonsgatan 18, Stockholm, Sweden.

OSWALD, LeRoi S. (*A* 1947) Staff Engr., Firestone Tire & Rubber Co., and • 110 Kirkwood Ave., Akron, Ohio.

OTIS, Alfred L. (*A* 1944) Dist. Sales Mgr., Clarage Fan Co., 965 Farmington Ave., and • 43 N. Main, West Hartford, Conn.

OTT, George W. (*M* 1946) Cons. Mech. & Elec. Engr., George W. Ott Co., 354 S. Spring St., Room 400, Los Angeles, and • 2327 W. Silver Lake Dr., Los Angeles 26, Calif.

OTT, M. Earl (*M* 1942) Mgr., • Associated Heating & Metal Products, Inc., 1816 N.E. Alberta St., and 6005 N. Denver Ave., Portland, Ore.

OTT, Oran W. (*M* 1925), (Council, 1934-36) Cons. Mech. Engr., • 111 W. Seventh Bldg., Los Angeles 14, and 1462 Waverly Rd., San Marino, Calif.

OTTEN, William A. (*A* 1947) Sales Engr., Laclede Gas Light Co., 1017 Olive St., St. Louis, and ● 419 Robert Ave., Ferguson 21, Mo.

OTTER, Raymond Ernest (*M* 1946) Managing Dir., J. S. Wright & Co., Ltd., 86 Dale End, Birmingham 2, and ● 11 Stanley Rd., Kings Heath, Birmingham 14, England.

OTTO, Alfred H. (*A* 1948) Mgr., Air Cond. & Refrigeration Dept., ● Shreveport Plumbing Co., 1020 Market St., and 760 McCormick St., Shreveport, La.

OTTO, Robert W. (*M* 1941) Mech. Engr., Toltz King & Day, Inc., 1509 Pioneer Bldg., and ● 2147 Carroll Ave., St. Paul, Minn.

OTTS, John G. (*A* 1942) Capt., U. S. Air Forces, c/o Dr. W. W. Carson, Fort Valley, Ga.

OTTUM, Alvin L. (*M* 1945; *A* 1943) Pres., ● Radiant Sales & Engrg. Co., 3813 W. Pico Blvd., Los Angeles 6, and 344 N. San Vicente, Los Angeles 36, Calif.

OURUSOFF, L.* (*M* 1931) Mgr. of Utilization, Washington Gas Light Co., 1100 H St. N.W., Washington, D. C.

OUWENEEL, W. A. (*M* 1937) ● Siesel Construction Co., 514 E. Ogden Ave., Milwaukee 2, and 5282 N. Bay Ridge, Milwaukee 11, Wis.

OVERMAN, Richard E., Jr. (*A* 1947) Engr., J. E. Dilworth Co., 353 S. Front St., and ● 254 Rose Rd., Memphis, Tenn.

OWEN, Charles E. (*M* 1941) Cons. Engr., Owen Engineering Service, 416 W. Main, and ● 1218 S. Thompson St., Carbondale, Ill.

OWEN, Charles E., Jr. (*J* 1945) 1218 S. Thompson St., Carbondale, Ill.

OWEN, Frank W. (*J* 1945) 510 California St., Carterville, Ill.

OWEN, Jeff Davis (*M* 1937) Estimating Engr., Earl O. Stice Co., 2102 Colorado Blvd., Los Angeles 41, and ● 4070 East Blvd., Culver City, Calif.

OWEN, Paul H., Jr. (*A* 1947) Foreman, Charles G. Heyne Co., 2002 Rothwell, Houston, and ● 4518 Dewberry Lane, Houston 4, Texas.

OWEN, W. Harold (*M* 1943) Pur. Agent, ● Harry Cooper Supply Co., 223 E. Water St., Springfield, and Box 13, Republic, Mo.

OWENS, Donald F. (*A* 1946) Engr., Neil H. Peterson Co., 1129 Folsom St., San Francisco, and ● 3005 Hillegass Ave., Berkeley 5, Calif.

OWNBY, Robert W. (*S* 1948) Student, David Ranken Jr. School of Mechanical Trades, and ● 4127 Maryland Ave., St. Louis, Mo.

OXENRIDER, Marion (*A* 1947) Owner, ● Home Appliance Store, 102 N. Broad St., and 35 N. Manning St., Hillsdale, Mich.

P

PABST, Charles S. (*M* 1934) Pres., Pabst Air Conditioning Corp., 219 Eagle St., Brooklyn 22, and ● 8727–98th St., Woodhaven 21, N. Y.

PACKTOR, Bernard M. (*A* 1941) Mfrs. Repr. & Engr., Bernard M. Packtor, 196 Ellsworth Ave., New Haven 11, Conn.

PAETZ, George A. (*A* 1948; *J* 1942; *S* 1940) Engr., Paetz Plumbing & Heating, 2523 E. Washington St., and ● 5144 Indianola, Indianapolis, Ind.

PAETZ, Herbert E. (*M* 1922) Div. Sales Mgr., ● American Blower Corp., 632 Fisher Bldg., Detroit 2, and 1415 Parker, Detroit, Mich.

PAGE, Arvin (*M* 1935) Chief Engr., ● The Bahnson Co., Salem Station, and 820 Oaklawn Ave., Winston-Salem, N. C.

PAGE, Vernon C. (*A* 1936) Htg. & Vtg. Engr., 332 W. Wilkins St., Jackson, Mich.

PAINE, H. Allan (*A* 1947; *J* 1940) Chief Plant Engr., Northwest Airlines, Inc., Holman Airport, St. Paul 1, and ● 719 W. Parkview Ave., St. Paul, Minn.

PAINTER, D. Howard (*M* 1943) Mfr. Repr., 8031 Manor Rd., Rt. 7, Kansas City 5, Mo.

PALMER, E. M. (*A* 1944) Asst. Gen. Sales Mgr., ● Kewanee Boiler Corp., 436 S. Chestnut St., Kewanee, Ill.

PALMER, Jack C. (*S* 1948) Student, A. & M. College of Texas, ● Box 1425 College Station, Texas, and 426 Pine St., Ranger, Texas.

PALMER, Newton A. (*M* 1946) Special Appl. Engr., ● Eureka Williams Corp., and 204 W. Emerson St., Bloomington, Ill.

PALUMBO, Bernard F. (*A* 1943; *J* 1941) Foster-Plumbing, Heating, Air Conditioning Co., 62 Foster Sq., Bridgeport 8, Conn.

PANAR, David (*A* 1946) Lecturer, University of Alberta, Dept. of Civil Engrg., and ● 11135–88th Ave., Edmonton, Alta., Canada.

PANGBORN, Clarence A. (*M* 1944) Cons. Engr., ● 312 2nd & Cherry Bldg., Seattle 4, and 715 Bellvue N., Seattle, Wash.

PAQUET, J. M. (*A* 1940; *J* 1936) Engr., ● J. A. Y. Bouchard, Inc., 97 Abraham Hill, and 9 Bois Joli, Que., Canada.

PARENT, Harold M. (*M* 1938) Partner, ● Parent & Kirkbride, N.W. Cor. Fourth and Locust St., Philadelphia 6, Pa., and 49 Wildwood Ave., Pitman, N. J.

PARIZEAULT, J. A. Rolland (*A* 1944) Supt., J. & C. Brunet, Ltd., 1095 St. Lawrence Blvd., Montreal, and ● 4569 Garnier St., Montreal 1, Que., Canada.

PARK, Harold E. (*A* 1938; *J* 1936) Sales Engr., ● Shaw-Perkins Manufacturing Co., 201 E. Carson St., Pittsburgh 19, and 106 W. Littlewood St., Etna, Pittsburgh 23, Pa.

PARK, James A. (*A* 1947) Htg. & Vtg. Engr., U. S. Rubber Co., Detroit, and ● 18453 Woodingham Dr., Detroit 21, Mich.

PARK, J. Frank (*M* 1937; *A* 1936; *J* 1930) Pres., ● Western Air & Refrigeration, Inc., 1819 Glendale Blvd., and 2160 Kenilworth Ave., Los Angeles 26, Calif.

PARK, Nicholas W. (*M* 1936) Heintz Manufacturing Co., Front and Olney Ave., Philadelphia, and ● 509 Jericho Rd., Abington, Pa.

PARK, Paul S., Jr. (*A* 1947) Mgr., Engrg. Service Dept., A. M. Byers Co., 1810 Clark Bldg., and ● 1304 Straka St., Pittsburgh, Pa.

PARKANS, Lloyd M. (*J* 1947; *S* 1945) Sales Engr., Standard Plumbing Supply Co., Inc., 121 N. Wash. Ave., and ● 527 Oak St. S.E., Minneapolis, Minn.

PARKER Dudley F. (*M* 1946) Eastern Repr., Illinois Engineering Co., 480 Broad St., Newark 2, N. J.

PARKER, Garrett S. (*A* 1947) Sales Engr., C. A. Dunham Co., Chicago, Ill., and ● 117 Atlanta Rd., Oak Ridge, Tenn.

PARKER, Herbert E. (*M* 1943) Engr., Bethlehem Steel Co., Central Tech. Dept., East Howard St., Quincy 69, and ● 74 Sealund Rd., North Quincy 71, Mass.

PARKER, Richard A. (*A* 1938) Pres., ● Parker Building Specialties, Inc., 1066 Howard St., San Francisco 3, and 220 El Camino Real, Burlingame, Calif.

PARKER, Travis S. (*S* 1947) Air Cond. Engr., Frigidaire Sales Corp., 2601 W. Seventh St., and ● 6444 Drury Lane, Ft. Worth, Texas.

PARKINSON, John S.* (*A* 1940) Research Engr., Johns-Manville Research Laboratories, Manville, N. J.

PARKS, Charles E. (*M* 1937) Pacific Coast Mgr., ● Ilg Electric Ventilating Co., 816 W. Fifth St., Los Angeles 13, and 7257 Hollywood Blvd., Los Angeles 46, Calif.

PARMELEE, George V.* (*M* 1945) Research Fellow, American Society of Heating & Ventilating Engineers Research Lab., 7218 Euclid Ave., Cleveland 3, and ● 94 Solon Rd., Chagrin Falls, Ohio.

PARODI, Hippolyte (*M* 1948) Cons. Engr., Syndicat National de la Construction Electrique, 14 Rue de Magdebourg, and ● 12 Avenue Alphand, Paris, France.

PARRI, Idwal W. (*A* 1945) Foreman, Calibration Dept., Perfex Corp., 500 W. Oklahoma Ave., and ● 2516 E. Morgan Ave., Milwaukee 7, Wis.

PARROTT, Lyle G. (*M* 1922) Member, Snyder & McLean Engrs., 2214 Penobscot Bldg., Detroit 26, and ● 3788 Gladstone, Detroit 6, Mich.

PARSONS, Lawson G. (*A* 1945) Mgr., Wholesale Plbg. and Htg. Dept., York Corrugating Co., Adams St. and W. M. R. R., and ● 436 Linden Ave., York, Pa.

PARSONS, Leonard D., Jr. (*A* 1946) Chief Engr., ● The Dykes Co., Inc., 1012 Market St., and 245 Pennsylvania Ave., Shreveport, La.

PARSONS, Roger A. (*A* 1942; *J* 1933) Htg. Engr., ● Board of Water & Electric Light Commissioners, 114-16 W. Ottawa St., and 2609 Clifton St., Lansing, Mich.

PARTLAN, Robert L. (*A* 1946; *J* 1940) Chief, Mech. Design Sect., U. S. Engineer Office, Manhattan Engineer District, Oak Ridge, Tenn., and • 14265 Arlington Ave., Detroit 12, Mich.

PARVIS, Ralph S. (*M* 1938) Asst. Mgr., Motor Fuel Div., Diamond Ice & Coal Co., 827 Market St., and • 1310 Lovering St., Wilmington, Del.

PASEK, Leonard E. (*M* 1944) Prod. Engr., • Kimberly-Clark Corp., Neenah, and 321 E. Brewster St., Appleton, Wis.

PASIADIS, Fedon H. (*J* 1945) Air Cond. Engr., The Austin Co., 16112 E. Euclid Ave., Cleveland, and • 1856 Hillside Rd., East Cleveland 12, Ohio.

PASTEUR, Hugh W. (*M* 1943) Export Mgr., • J. E. Hall, Ltd., Dartford Ironworks, Dartford, and Fairseat House, Fairseat, Kent, England.

PASTOR, John C. (*M* 1938) Design Engr., • Room 818, Graham Bldg., Jacksonville 2, and E. 1091 Talbot Ave., Jacksonville 5, Fla.

PATERSON, Rollin O. (*A* 1945) Field Engr., Fisher Body Div., Works Engineering Dept., 3044 W. Grand Blvd., Detroit 2, and • 169 Ardmore Dr., Detroit 20, Mich.

PATORNO, Sullivan A. S. (*M* 1923) Head of Organization, Sullivan A. S. Patorno, Cons. Engrs., 101 Park Ave., New York, N. Y.

PATRICK, Arthur L. (*A* 1946) Htg. and Plbg. Contr., • 35-41½ State St., and 5 Swift St. Ex., Auburn, N. Y.

PATRICK, George P. (*J* 1945) Chemical Engr., Bakelite Corp., River Road, Bound Brook, and • 91 Brookside Ave., Apt. 2B, Somerville, N. J.

PATRICK, Horace M. (*M* 1945) Cons. Engr., 20 Olcott Ave., Bernardsville, N. J.

PATTEN, J. Elverton (*M* 1945) Assoc. Engr., • Arthur G. Stout & Assoc., 400 W. Madison St., Chicago, and 338 N. Stone Ave., LaGrange, Ill.

PATTEN, Joseph R. (*M* 1947) Br. Mgr., • The Powers Regulator Co., 627 N.W. Second St., and 5801 Northwest 50th, c/o Warr Acres, Oklahoma City, Okla.

PATTERSON, Frank H. (*M* 1942) Sales Engr., Hoffman Specialty Co., and Feddeis-Quigan Corp., 1172 Yorkshire, Grosse Pointe 30, Mich.

PATTERSON, G. P. (*M* 1939) Vice-Pres., Haggerty, Inc., 805 Morgan St., P. O. Box 2971, Tampa 1, Fla.

PATTERSON, Howard V. (*A* 1945) Owner, • American Engineering Co., 4114 Pennsylvania, and 4112 Pennsylvania, Kansas City 2, Mo.

PATTERSON, James C. (*M* 1945) Dir. of Sales, Indus. Htg., Carrier Corp., and • 206 Robineau Rd., Syracuse, N. Y.

PATTERSON, Joseph C., Jr. (*M* 1944) Appl. Engr., • La-Del Conveyor & Manufacturing Co., 410 Washington Bldg., 15th and G, Washington 5, D. C., and 2414 Taylor Ave., Alexandria, Va.

PATTERSON, Ralph A. (*A* 1943) Gen. Sales Mgr., • Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and 1213 Mulford St., Evanston, Ill.

PATTIZ, Gene B. (*J* 1948) Design Engr., General Installation Co., 2234 Olive St., St. Louis 3, and • 3025a Union Blvd., St. Louis 15, Mo.

PAUL, Dean W. (*A* 1944) New York Mgr., Sterling Electric Motors, Inc., 41 Park Row, New York 7, and • 140 Cabrini Blvd., New York 33, N. Y.

PAUL, Donald I. (*M* 1936; *J* 1932) • Gurney Foundry Co., Ltd., 4 Junction Rd., and 264 Lawrence Ave. E., Toronto, Ont., Canada.

PAUL, Lawrence O. (*A* 1947) Vice-Pres., • Narowetz Htg. & Vent. Co., 1722 Washington Blvd., Chicago 12, and 6730 N. Avers Ave., Lincolnwood, Ill.

PAULDING, Lewis G. (*M* 1944) Mgr., Heat Dept., • Long Island Lighting Co., 211 Fulton Ave., Hempstead, L. I., and Box 1033, Brightwaters, N. Y.

PAULEY, Robert D. (*A* 1944; *J* 1940) Dvlpt. Engr., • Weyerhaeuser Timber Co., and 1503-25th Ave., Longview, Wash.

PAULEY, William N. (*A* 1947) Chief Engr., Farr Co., 2615 Southwest Dr., Los Angeles, and • 11126 Firmona Ave., Inglewood, Calif.

PAULSON, Owen D. (*A* 1945) Engr., General Air Conditioning & Heating Co., 2001 Peralta St., Oakland, and • 1804 Nason St., Alameda, Calif.

PAVEY, Charles A. (*M* 1937) Branch Mgr., • B. F. Sturtevant Co., Div. of Westinghouse Electric, 812 Michigan Bldg., Detroit 26, and 15778 Asbury Park, Detroit 27, Mich.

PAWKETT, Lawrence S. (*A* 1938) Mech. Engr., • L. S. Pawkett & Co., 810 Insurance Bldg., San Antonio 5, and 1007 W. Magnolia Ave., San Antonio 1, Texas.

PAYNE, Raymond L. (*A* 1944) Partner, Air Flow Heating Co., 1409 Platte St., Denver 2, Colo.

PAYTON, John F. (*M* 1944) Sales Engr., • Minneapolis-Honeywell Regulator Co., 1007 N. Meridian, Indianapolis, and 3536 N. Meridian No. 308, Indianapolis 8, Ind.

PEACOCK, Glenn S. (*M* 1939) Htg. Engr., University of Pittsburgh, Pittsburgh 13, and • 111 Elmont St., Crafton P. O. No. 5, Pittsburgh, Pa.

PEACOCK, Herbert (*M* 1940) Dist. Mgr., Carrier Corp., 405 Lexington Ave., New York 17, N. Y.

PEACOCK, William H. (*A* 1945) Owner, • Peacock Plumbing & Heating Co., 34 Benton St., and 30 Mary St., Kitchener, Ont., Canada.

PEARCE, Edward A. (*M* 1942) Principal, • Edward A. Pearce & Partners, Cons. Engrs., Station Approach College Rd., Harrow, and 55 Blenheim Rd., N. Harrow, Middlesex, England.

PEARSON, Fred L. (*M* 1942) Cons. Engr., • 1436 Majestic Bldg., Detroit 26, and 16517 Steel, Detroit 27, Mich.

PEARSON, Vern E. (*A* 1946) Supvsr., Service Dept., • Minneapolis Gas Light Co., 700 N. Linden, Minneapolis 3, and 5036 South 17th Ave., Minneapolis 7, Minn.

PEART, Allen M. (*A* 1937) Dist. Mgr., • Minneapolis-Honeywell Regulator Co., 637 Craig W., Room 610, and 5580 Bradford Pl., Montreal, Que., Canada.

PEARY, Howard W. (*A* 1945) Factory Engr., McDonnell-Miller, 120 Boylston St., Boston 16, Mass., and • 23 W. Lawn Rd., Livingston, N. J.

PEASE, Leon W. (*J* 1947) Engr., Northern Heating & Plumbing Co., and • Olivia, Minn.

PECK, Henry E. (*A* 1938) Cons. Engr., D. M. McBean Co., 315 Alexander St., Rochester, and • 73 Potter Pl., Fairport, N. Y.

PECK, Joseph W. (*A* 1947; *J* 1945) Mech. Engr., Kroeschell Engineering Co., 215 W. Ontario St., Chicago, Ill., and • 409 Cherry St., San Francisco 18, Calif.

PECK, Robert E. (*M* 1943) Vice-Pres., • The Peck Hannaford & Briggs Co., Cor. Sycamore and Court St., and 980 Avondale Ave., Cincinnati, Ohio.

PEEBLES, John K., Jr. (*A* 1925; *J* 1924) Chief Engr., Partner, Baskervill & Son, Archts., 2202 Central National Bank Bldg., Richmond 19, and • 1798 Park Ave., Richmond 20, Va.

PEGG, Edward H. R. (*A* 1943) Mgr., Electrical Dept., Aerotec Co., 61 Westchester Ave., White Plains, and • 18 Austin Pl., Port Chester, N. Y.

PEISER, Maurice B. (*M* 1946; *J* 1937) • Natkin & Co., 1015 Sampson St., Houston 3, Texas.

PELLEGRINI, Louis C. (*M* 1939) Vice-Pres., Marlo Coil Co., 6135 Manchester Ave., and • 6549 Murdoch St., St. Louis, Mo.

PELLER, Leonard (*A* 1942; *J* 1934) Indus. Engr., • United Engineers and Constructors, Inc., 1401 Arch St., Philadelphia 5, and Lakeside Apts., Melrose Park, Pa.

PELLETIER, L. E. (*A* 1946) Exec. and Tech. Advisor, Bridgeport Brass Co., 30 Grand St., Bridgeport, and • Justamere Farm, Newtown, Conn.

PELLMOUNTER, Thomas (*A* 1936) Mfrs. Agt. for Electric Motors, Johnson-Pellmounter, 903 McGee St., Kansas City 6, and • 3308 Euclid Ave., Kansas City 3, Mo.

PELLMOUNTER, T. V. (*A* 1946; *J* 1938) Sales and Appl. Engr., • Johnson-Pellmounter, 903 McGee St., Kansas City 6, and 4118 Mercier St., Kansas City, Mo.

PENAFEATHER, John C. (*A* 1948) Constr. Supt., Carrier Corp., • 820 Reynolds Arcade, and 223 Arnett Blvd., Rochester, N. Y.

PENDLETON, M. E. (*M* 1946) Dist. Mgr., • Armstrong Cork Co., 822 Genesee Bldg., Buffalo 2, and 92 Hawkins Ave., Hamburg, N. Y.

PENNEY, Gaylord W. (*M* 1938) George Westinghouse Prof. of Engrg., • Carnegie Institute of Technology, Pittsburgh 13, and 171 Orchard Rd., Wilkinsburg, Pittsburgh 21, Pa.

PENNINGTON, Neal A. (*M* 1946) Research Dvlpt. and Constr. Engr., 736 N. Euclid Ave., and • 2707 E. Eighth St., Tucson, Ariz.

PENNOCK, W. B. (*M* 1927) Owner, • Pennock Engineering, 86 Gloucester St., and 243 McLeod St., Ottawa, Ont., Canada.

PEREZ, William M. (*A* 1947) Factory Repr., Autogas Co., 2153 W. Fullerton Ave., Chicago, Ill., and • 16 Cherry St., Perry, N. Y.

PERHAM, Stanley H. (*M* 1944) Mech. Engr., Ammerman-Davis-Stout, Inc., 912 K. P. Bldg., Indianapolis, and • 4507 Carrollton Ave., Indianapolis 5, Ind.

PERKINS, Stanley H. (*A* 1945) Dist. Mgr., • Minneapolis-Honeywell Regulator Co., 16 State St., Rochester, and 282 Farmington Rd., Rochester, N. Y.

PERRAS, George E. (*M* 1936) Mgr., Htg. Div., • Thomas Robertson & Co., Ltd., 262 Craig St. W., and 5915 Christophe, Colomb St., Montreal, Que., Canada.

PERRY, Charles E. (*A* 1946) Branch Mgr., • Westinghouse Elec. Corp., Sturtevant Div., 1006 Commerce Trust Bldg., and 5103 Grand Ave., Kansas City, Mo.

PERRY, Harold E. (*A* 1947) Combus. Engr., Socony Vacuum Oil Co., Inc., Bear & Solar Sts., Syracuse, and • 129 Orvilton Dr., DeWitt, N. Y.

PERRY, Lester L. (*A* 1944) Commercial Sales Mgr., Frigidaire Div., Denver Branch, General Motors Corp., and • 1421 Gilpin St., Denver, Colo.

PERRY, M. Arthur (*M* 1944) Supt. of Maint. and Bldgs., • DePauw University, 5 Larrabbee St., and 628 E. Anderson St., Greencastle, Ind.

PERSSON, N. Bert (*M* 1937) Cons. Engr., Food Service Equipment Engineering, 1550 W. Larpenter Ave., St. Paul, and • 1418 Simpson St., St. Paul 4, Minn.

PESTERFIELD, C. H. (*M* 1938; *J* 1936; *S* 1932) Assoc. Prof. of Mech. Engrg., • Michigan State College, Dept. of Mech. Engrg., and 142 Gunson St., East Lansing, Mich.

PETERKIN, Stuart M. (*M* 1943) Pres., Michael Stuart Co., Ltd., 116 Bloor St., West Toronto, and • 45 Lake St., St. Catherines, Ont., Canada.

PETERS, Brice G. (*M* 1948) Pres., The Schape Manufacturing Co., • 17 East 22nd St., and 1636 Northwick Ct., Baltimore, Md.

PETERS, Charles J. (*A* 1946) Pres., Building Service Co., Inc., 1707 Court Square Bldg., Baltimore 2, and • 902 Kingston Rd., Stoneleigh Baltimore Co. 12, Md.

PETERS, Herbert H. (*M* 1947) Instructor, Milwaukee School of Engineering, Milwaukee, and • 2168 North 62nd St., Wauwatosa 13, Wis.

PETERS, William F., III (*A* 1947) Proj. Engr., Anemostat Corporation of America, 10 East 39th St., New York, and • 26 Croydon Dr., Merrick, L. I., N. Y.

PETERSEN, Christian P. (*A* 1937) • Petersen Sheet Metal, 3746 Cedar Ave., Minneapolis 7, and 4000 Cedar Ave., Minneapolis, Minn.

PETERSEN, Richard J. (*M* 1945) Supvsr. of Research, • Utility Appliance Corp., 4851 S. Alameda St., Los Angeles 11, and 1311 West 93rd St., Los Angeles 44, Calif.

PETERSEN, Robert W. (*A* 1947) Asst. Htg. Mgr., Bell Plumbing & Heating Co., 1228 E. Evans Ave., and • 2115 S. Gilpin St., Denver 10, Colo.

PETERSON, B. G. (*M* 1943; *A* 1941) Owner, B. G. Peterson Co., 408 South 19th, Omaha 2, and • 6235 Florence Blvd., Omaha 11, Nebr.

PETERSON, Carl M. F.* (*M* 1936) Supt. of Bldgs. and Power, • Massachusetts Institute of Technology, 77 Massachusetts Ave., Cambridge 39, and 74 Cutter Hill Rd., Arlington 74, Mass.

PETERSON, Clarence L. (*M* 1938) Branch Mgr., • Minneapolis-Honeywell Regulator Co., 1136 Howard St., San Francisco, and 2 Indian Rock Path, Berkeley, Calif.

PETERSON, DuWayne J. (*M* 1940) Sales Mgr., Htg. Controls Div., Central Zone, • Minneapolis-Honeywell Regulator Co., 415 Brainard St., Detroit 1, and 16819 Cranford Lane, Grosse Pointe 30, Mich.

PETERSON, Hans P. (*A* 1945; *J* 1939) Chief Engr., • The Bush Manufacturing Co., Hartford 6, and 28 Hawthorn St., South Manchester, Conn.

PETERSON, Howard H. (*M* 1945) Cons. Engr., • 631 Miller Bldg., and Tieton Dr., Rt. 4, Yakima, Wash.

PETERSON, John E. (*M* 1944) Editor, American Artisan, Keeney Publishing Co., 6 N. Michigan Ave., Chicago 2, and • 1108 Curtiss St., Downers Grove, Ill.

PETERSON, J. Raymond (*A* 1941; *J* 1940) Gausman & Moore, Cons. Engrs., E-502 First Nat'l. Bank Bldg., St. Paul, and • 655 Clear Ave., St. Paul 6, Minn.

PETERSON, Neil H. (*M* 1937) Owner, • Neil H. Peterson Co., 1129 Folsom St., and 2–18th Ave., San Francisco, Calif.

PETERSON, Robert W. (*A* 1947) Designer, • Office of J. Donald Kroeker, 402 Failing Bldg., Portland 4, and 530 Northwest 23rd, Portland 10, Ore.

PETERSON, Sterling D. (*A* 1930) Branch Mgr., • Johnson Service Co., 311 Colman Bldg., Seattle 4, and 5051 Prince St., Seattle 6, Wash.

PETERSON, Walter E. (*M* 1941) Htg. Engr., International Harvester Co., Indus. Engrg. and Constr. Div., 180 N. Michigan Ave., Chicago 1, and • 5240 N. Kimball Ave., Chicago 25, Ill.

PETRINEC, Julius R. (*J* 1946) Jr. Engr., The Hydro Electric Power Comm. of Ont., 620 University Ave., and • 214 Beatrice St., Toronto, Ont., Canada.

PETRONIS, Albert (*J* 1945) Engr., Carrier Corp., 542 Buhl Bldg., Detroit 26, Mich.

PETT, Alfred W. (*M* 1942) Dist. Mgr., The Lamb Electric Co., 60 Balsam St., Providence 5, R. I.

PETTINGELL, John M. (*A* 1945) Sales Engr., • 201 Devonshire St., Boston 10, and 40 Temple St., Belmont, Mass.

PETTIT, Ernest N., Jr. (*M* 1937) Chief Mech. Engr., Wyatt C. Hedrick, Archt. Engr., 904 Fort Worth Ave., and • 4223 Avondale, Dallas, Texas.

PETTY, Arthur V. (*A* 1947) Mgr., • Graves Refrigeration, Inc., 311 Peachtree St. N.E., Atlanta 3, and 627 Harold Ave. N.E., Atlanta, Ga.

PETTY, Charles E. (*A* 1939) Vice-Pres. in charge of Engrg., • Page Air Conditioning Co., Inc., 220 S. College St., and 2120 Providence Rd., Charlotte, N. C.

PEXTON, Frank S. (*A* 1936) Indus. Engr., • Kansas City Gas Co., 824 Grand, and 304 East 70th Terrace, Kansas City, Mo.

PEYREK, Theodore R. (*M* 1945) Sales Mgr., and Chief Engr., L. J. Wing Manufacturing Co., 154 West 14th St., New York, and • 121 Dickie Ave., Staten Island 2, N. Y.

PFAU, Alfred C. (*A* 1947) Partner, • Pfau-Vogel Co., 31 E. Georgia St., Indianapolis, and 414 W. Riverside, Jeffersonville, Ind.

PFEIFER, Victor A. (*A* 1947) Supt., Acme Metal Works, 2141 N. Williams, Portland 12, and • 7932 Southeast 45th Ave., Portland 2, Ore.

PFEIFFER, David C. (*M* 1940) Cons. Engr., 3516 St. Johns Dr., Dallas, Texas.

PFEIFFER, Frank F. (*M* 1938) Indus. Engr., United Engineers & Constructors, Inc., 1401 Arch St., Philadelphia 5, and • 7421 Sommers Rd., Philadelphia 38, Pa.

PFEIFFER, George R. (*A* 1945) Estimator, • Harrigan & Reid Co., 1365 Bagley Ave., Detroit 26, and 1441 Canton Ave., Detroit 7, Mich.

PFEIFFER, J. Fred (*M* 1945) Regis. Engr. and Plbg. and Htg. Contr., 953 Louisa St., Williamsport 4, Pa.

PFISTER, Van Alen (*A* 1942) Sales Engr., McDonnell & Miller, 361 W. Superior St., and • 2212 Bennett Ave., Evanston, Ill.

PFRIEM, Peter G. (*A* 1937) Sales Engr., Clayton & Lambert Mfg. Co., 1701-1715 Dixie Highway, Louisville 10, Ky., and • 2531 Burnet Ave., Cincinnati 19, Ohio.

PFUHLER, John L. (*A* 1925; *J* 1923) Plbg. and Htg. Contr., 600 Manor Rd., Port Richmond 2, S. I., N. Y.

PHELAN, James H. (*M* 1945) Engr. & Estimator, Morris A. Fierberg, 242 Trumbull St., Hartford, and • "Overlook," Lake St., Columbia, Conn.

PHERIGO, Faun Stephens (*A* 1944) Htg. Dept., Indianapolis Power & Light Co., 17 N. Meridian St., Indianapolis 6, and • 5124 Maple Lane, Indianapolis 1, Ind.

PHILIP, William (*M* 1937) Sales Engr., Standard Sanitary & Dominion Radiator, Ltd., 800 Lansdowne Ave., and • 5 Barbara-Crescent, Toronto, Ont., Canada.

PHILIPPI, Joseph J. (*M* 1939) Mgr., • Johnson Service Co., 1355 W. Washington Blvd., and 7930 S. Wood St., Chicago, Ill.

PHILLIPS, Charles R. (*A* 1945) Factory Planning Engr., • Northern Electric Co., Ltd., 1261 Shearer St., P. O. Box 369, and 4272 Beaconsfield, Montreal, Que., Canada.

PHILLIPS, D'Arcy E. (*A* 1946) Design Engr., Newport News Shipbuilding & Dry Dock Co., 4101 Washington Ave., and • P. O. Box 674, Newport News, Va.

PHILLIPS, Eric G. (*M* 1947) Partner, E. G. Phillips Son and Norfolk, Arskus House, 26, Annesley Grove, and • "Stonesby," 14 Balmoral Rd., Nottingham, England.

PHILLIPS, Henry W., Jr. (*S* 1946) Student, • Texas A. & M. College, Box 212, College Station, and 505 W. Fifth, Texarkana, Texas.

PHILLIPS, Leonard R. (*M* 1945) Dir. of Research, Anemostat Corporation of America, 10 East 39th St., New York 16, N. Y., and • 265 Elm Ave., Teaneck, N. J.

PHILLIPS, Leonard S. (*A* 1944) Asst. Secy., • New York Steam Corp., 130 East 15th St., New York 3, and 25 Wendt Ave., Larchmont, N. Y.

PHILLIPS, Maurice E. (*M* 1944) Mgr., Air Cond. and Htg. Div., • United Electric Service, 907 Louisville Ave., and Rt. 3, DeSiard Rd., Monroe, La.

PHILLIPS, Raleigh C., Jr. (*S* 1946) Student, The David Ranken Jr. School of Mechanical Trades, 4431 Finney Ave., St. Louis 13, and • 5077 Minerva Ave., St. Louis 14, Mo.

PHILLIPS, Ralph E. (*M* 1936) Cons. Mech. and Elec. Engr., 816 W. Fifth St., Los Angeles 13, Calif.

PHILLIPS, Ralph W. (*A* 1946) Sales Engr., Shelby Skipwith, Inc., 972 Union Ave., and • 2567 School St., Memphis, Tenn.

PHILLIPS, Richard F. (*S* 1946) Student, • Texas A. & M. College, Box 1622, College Station, and 1009 E. College St., Seguin, Texas.

PHILLIPS, Robert H. (*A* 1941; *J* 1938) Engr., • Carrier Corp., 1500 S. Santa Fe Ave., Los Angeles 21, and 2005 Sierra Pl., Glendale 8, Calif.

PHILLIPS, Walter L. (*A* 1938) Lt. Col., Air Corps, and • 320 Forest Dr., Falls Church, Va.

PHIPPS, Frederick G. (*M* 1930) Vice-Pres., Preston-Phipps, Inc., 637 Craig St., and • 5431 Earnscliffe Ave., Montreal 29, Que., Canada.

PICKETT, Clinton A. (*M* 1945) Mgr., Chicago Branch Office, • The Herman Nelson Corp., 222 W. Adams St., Chicago 6, and 300 Arlington Rd., Itasca, Ill.

PIEKSEN, George W. (*M* 1944) Sales Repr., • Sarco Co., Inc., & Spence Engineering Co., 3020 Olive St., St. Louis 3, and 7017 Waterman Ave., University City 5, Mo.

PIERCE, Conway (*M* 1947) Mech. Engr., • Transportation Bldg., Detroit 26, and 1130 Parker Ave., Detroit 14, Mich.

PIERCE, Edgar D. (*A* 1946) Sales Engr., • Harold E. Peterson, 1350 Elwood St., Los Angeles 21, and 2705 West 84th St., Inglewood, Calif.

PIERCE, H. Charles (*M* 1945) Asst. Mgr., Air Cond. Div., • Servel, Inc., and 847 E. Gum St., Evansville, Ind.

PIERCE, Joseph D. (*A* 1946; *J* 1942) Research Engr., • Crane Co., 836 S. Michigan Ave., Chicago 5, and 728½ Hinman Ave., Evanston, Ill.

PIERCY, Arthur K. (*A* 1947) Mech. Engr., • Green Blankstein Russell & Assocs., 310 Time Bldg., Winnipeg, and 175 Greendell Ave., St. Vital, Man., Canada.

PIERPOINT, Harry Y. (*A* 1943) Owner, • J. A. Pierpoint, 3554 Appleton St. N.W., Washington 8, D. C.

PIETSCH, Herman A. (*M* 1945) Chief Engr., Heater Sect., • Dravo Corp., 300 Penn Ave., Pittsburgh, and 894 Heckler Dr., Pittsburgh 20, Pa.

PILLEN, Harry A. (*A* 1933) Owner, • Harry A. Pillen Co., 626 Broadway, Cincinnati 2, and 2124 Crane Ave., Cincinnati, Ohio.

PINDELL, William R. (*A* 1947) Mgr., • Northwest Foundry & Furnace Co., 2345 S.E. Gladstone St., Portland 2, and 3739 N.W. Thurman St., Portland, Ore.

PINEAU, Maurice E. (*M* 1946) Engr., Valve, Fitting and Engrg. Dept., • Crane, Ltd., 1170 Beaver Hall Sq., Montreal 18, and 3624 Perras Blvd., Montreal, N., Montreal, Que., Canada.

PINES, Sidney (*M* 1920) Pres., • Pines Engineering Co., 1831 Clarence St., Dallas 1, and 3541 Bryn Mawr Dr., Dallas 5, Texas.

PINK, Wilson V. (*A* 1947) Research Engr., The Miller Co., Meriden, and • 10 Lacey Rd., Southington, Conn.

PINKERTON, John B. (*M* 1945) Partner, • Dolby & Williamson, 147 Victoria St., Westminister, London, S.W. 1, and 45 Northways, Swiss Cottage, Hampstead, London, N.W. 3, England.

PINNEY, Theodore M. (*M* 1942) Engr., Austin Co., Cleveland, and • 1888 Wymore, East Cleveland 12, Ohio.

PINTER, Joseph L. (*A* 1946) Industrial Instruments, Inc., 17 Pollock Ave., Jersey City 5, and • 60 Laurel Hill Rd., Mountain Lakes, N. J.

PIPER, Donald D. (*A* 1946) Secy.-Treas., Norman Products Co., 1150 Chesapeake Ave., Columbus 8, Ohio.

PIRRUNG, Richard W. (*M* 1944) Engr., The Huffman-Wolfe Co., 669 N. High St., Columbus 16 and • 409 Brevoort Rd., Columbus 2, Ohio.

PISKE, Richard A., Jr. (*J* 1947) Engr., Carrier Corp., 300 Ivy St. N.E., and • 1433 Emory Rd. N.E., Atlanta, Ga.

PISTLER, Willard C. (*M* 1934) Cons. Engr., Leverone Bldg., 4 W. Seventh St., Cincinnati 2, and • Orchard Lane and Crestview Ave., Cincinnati 13, Ohio.

PIZER, M. Morton (*A* 1943) Htg. Engr., • 237 West 26th St., New York 1, and 109-36–120th St., South Ozone Park 20, N. Y.

PLAMONDON, Sarto R. (*A* 1944; *J* 1943) Engr., Div. of Indus. Hygiene, • Ministry of Health, 1570 St. Hubert St., Montreal, and 2267 Melrose Ave., N. D. G., Montreal 28, Que., Canada.

PLANK, Guy W. (*A* 1947) Western Dist. Sales Mgr., L. J. Mueller Furnace Co., and • 1533 Clement St., San Francisco 18, Calif.

PLASS, Raymond B. (*A* 1947) Chief Engr., Ray Oil Burner Co., 401 Bernal Ave., San Francisco 12, and • 1803 Oxford St., Berkeley 9, Calif.

PLATTS, E. M. (*A* 1944) Vice-Pres., Joy Manufacturing Co., 333 Oliver Bldg., Pittsburgh, and • 5 Lawson Ave., Crafton, Pittsburgh 5, Pa.

PLATZ, John F. (*A* 1940) General Mgr., • Domestic Heat & Equipment Corp., 3990 Memorial Shoreway, Cleveland, and 1739 Holyoke Ave., East Cleveland, Ohio.

PLAYER, Frank A. (*A* 1946) Mgr., Atlanta Branch, • Mehring & Hanson Co., 313 Techwood Dr., and 2647 Dellwood Dr. N.W., Atlanta, Ga.

PLAYFAIR, G. A. (*A* 1924) Mgr., • Johnson Temperature Regulating Co., 570 Queen St. E., Toronto, and West Hill, Ont., Canada.

PLEUTHNER, Richard L. (*A* 1947; *J* 1938) 393 Strain Ave., Buffalo 16, N. Y.

PLEWES, Stanley E. (*M* 1917) Mgr., Philadelphia Branch, • Johnson Service Co., 2853 N. Twelfth St., and 341 E. Hortter St., Philadelphia, Pa.

PLOESSER, Herbert M. (*A* 1947) Engr., • F. C. Evans Co., 4004 Chouteau Ave., St. Louis 10, and 4855 Goethe Ave., St. Louis 16, Mo.

PLOSKEY, Edward J. (*A* 1948; *J* 1940) Sgt., U. S. Army, 40th Ordnance Co., Aberdeen Proving Ground, Md., and • 2367–32nd Ave., San Francisco 16, Calif.

PLUM, Leroy H. (*M* 1935; *A* 1934) Mgr., Control System Sales, Warren Webster & Co., 1625 Federal St., Camden, N. J.

PODOLSKE, Arthur R. (*A* 1938) Pres., Milwaukee Metal Products Co., 1737 N. Palmer St., Milwaukee 12, Wis.

POGALIES, Louis H. (*M* 1931) Mech. Engr., Wilbur Watson & Assocs., 4614 Prospect Ave., Cleveland, and • 19272 Coffinberry Blvd., Fairview Village, Cleveland 16, Ohio.

POGUE, Roger B. (*J* 1946) Mech. Engr., • Samuel R. Lewis & Assocs., 100 W. Monroe, Chicago, and 115 N. Greenwood Ave., Palatine, Ill.

POHLE, Kenneth F. (*A* 1947) Pres., • Hirschman-Pohle Co., Inc., LeRoy, and Wyoming, N. Y.

POLAD, Thomas H. (*A* 1946; *J* 1943) Chief Engr., Rudy Furnace Co., and • 201 Sheldon St., Dowagiac, Mich.

POLLAK, Rudolf (*M* 1937) Chief Engr., • Rockefeller Plaza, 3rd Fl., New York 20, and 850 West 57th St., New York, N. Y.

POLLARD, Charles H. (*A* 1944) Owner, • C. H. Pollard Plumbing & Heating Co., 813 First Ave., and 143 Morris St., Monte Vista, Colo.

POLLITT, S. H. (*A* 1947) Mech. Supt. • Eaton Knitting Co., Ltd., John St. N., and 20 Park Row S., Hamilton, Ont., Canada.

POLLOCK, Carl A. (*A* 1937) Gen. Mgr. and Vice-Pres., • Dominion Electrohome Industries, Ltd., 39 Edward St., and 120 Sterling Ave., Kitchener, Ont., Canada.

POLLOCK, Clancy W. (*A* 1944) Chief Engr., • Drayer-Hanson, Inc., 3301 Medford St., Los Angeles 33, and • 1934 San Francisco, Long Beach, Calif.

POND, William H. (*M* 1938) Htg. Engr., General Cable Corp., Perth Amboy, and • 820 W. Front St., Plainfield, N. J.

PONDER, Everett A. (*A* 1939) Owner, Everett A. Ponder Co., 3424 Northeast 65th Ave., Portland 13, Ore.

PONS, Raymond A. (*A* 1945) Mgr., Pons & Davis, 271-3 Edison St., Salt Lake City 1, and • 613 Milton Ave., Salt Lake City 5, Utah.

POOLE, Joe A. (*A* 1945) Asst. Gen. Supt., • Associated Mechanical Contr., 7022 S. Main St., Houston 5, and 1405 Lawrence St., Pasadena, Texas.

POPE, Edward F. (*A* 1945) Business Mgr., • Carrier Corp., 300 S. Geddes St., Syracuse, and Edwards Dr., Fayetteville, N. Y.

POPE, S. Austin (*M* 1917) Pres., • William A. Pope Co., 26 N. Jefferson St., Chicago, and 831 Ashland Ave., River Forest, Ill.

PORTE, Cliff E. (*A* 1945) Mgr., W. A. Case & Son Manufacturing Co., 2337 Beecher St., Detroit 16, and • 18110 Patton Ave., Detroit 19, Mich.

PORTER, Carl W. (*M* 1943) Sr. Mech. Engr., Tech. Div., Mech. Engrg. Sect., • National Housing Agency, Sixth and Adams Dr. S.W., Washington, D. C., and 411 Tennessee Ave., Alexandria, Va.

PORTER, Frank (*A* 1946; *J* 1944) Owner, • Porter Engineering Co., 5311 Georgia Ave. N.W., Washington, D. C., and 7717 Chicago Ave., Silver Spring, Md.

PORTER, H. Merwin (*M* 1945) Pres., • Belden Porter Co., 65 North 17th St., Minneapolis 3, and 5032 Fremont Ave. S., Minneapolis, Minn.

PORTER, Hugh T. (*A* 1944) Pres., W. B. Connor Engineering Corp., 114 East 32nd St., New York 16, and • 12 East 97th St., Apt. 10H, New York 29, N. Y.

PORTER, Noel E. (*A* 1943; *J* 1938) Lt. (jg), U. S. N. R., Navy Dept., Bureau of Ships, T4-2084, Washington, D. C., and • 1017-44th St., Sacramento, Calif.

POSEY, James (*Life Member*; *M* 1919) Cons. Engr., • 10 E. Pleasant St., Baltimore 2, and 4005 Liberty Heights Ave., Baltimore, Md.

POSPISIL, Philip J. (*M* 1947) Field Engr., • The Trane Co., 915 Redick Tower, Omaha 2, and 3418 Franklin St., Omaha, Nebr.

POST, Gerald A. (*M* 1943) Pres., • Engineered Equipment Co., Inc., 20 S. Senate Ave., Indianapolis 4, and 3547 N. Grant Ave., Indianapolis 1, Ind.

POSTHUMA, Jakobus Age Lykle (*A* 1948) Sr. Estimator and Design Engr., • Air Conditioning & Engineering Co. Ltd., 33 Wepener St., and 10 Stensby Ct., Johannesburg, Transvaal, South Africa.

POTIER, Oscar N. (*M* 1946) Managing Partner, • Marques & Monteiro, Ltd., R. Nova da Trindade, 11h-11k-13-13a, and Av. Guerra Junqueiro 5-2°-D°, Lisbon, Portugal.

POTTEIGER, Charles A. (*A* 1947) Pres., • Reading Heater & Supply Co., Inc., Church & Woodward Sts., and 1115 Union St., Reading, Pa.

POTTER, Christopher D. (*M* 1944) Supt. and Engr., • The Smith-Gibbs Co., 201 S. Main St., Providence 3, and 140 Walnut St., East Providence 14, R. I.

POTTER, John R. (*A* 1939; *J* 1938) Lt., U. S. N. R., Bureau of Ships, Navy Dept., and • 318-17th St. N.E., Washington, D. C.

POTTER, Ralph E. (*A* 1946) Cons. Engr., Potter Engineering Co., 944 Eye St. N.W., and • 2019 Eye St. N.W., Apt. 107, Washington 6, D. C.

POTTS, Amos P. (*M* 1944) Chief Engr., Logan Clay Products Co., 359 E. Main St., Logan, Ohio.

POTVIN, Leo J. (*A* 1948) Owner, • Fenner & Potvin, 549 W. Randolph, Chicago 6, and 114 S. Arlington, Elmhurst, Ill.

POUGHER, Bernard R. E. (*A* 1948; *J* 1940) Sgt., 110 (EL) A. T. Coy, R. E., and • 99 Maulideth Rd. W., Withington, Manchester, England.

POUJADE, James V. (*A* 1943) Chief Refrig., Vent. & Air Cond. Sect., Hq. Army Air Forces, Pentagon Bldg., Washington, D. C., and • 1235 Alvar St., New Orleans 17, La.

POUND, Howard W. (*M* 1941) Mgr., Air Filter Div., • American Air Filter Co., 215 Central Ave., and Commodore Apartments, Louisville, Ky.

POWELL, George W., Jr. (*M* 1938) Indus. Engr., • United Engineers & Constructors, Inc., 1401 Arch St., Philadelphia, and 458 S. Fourth St., Colwyn, Darby, Pa.

POWELL, Leroy D. (*A* 1945) Owner, • L. D. Powell Construction Co., 520 Falls Bldg., Memphis 3, and 3587 Waynoka Ave., Memphis, Tenn.

POWERS, Earl C. (*M* 1939) Partner, E. C. Powers & Son, 135 Arch St., Philadelphia 6, Pa.

POWERS, F. W. (*Life Member*; *M* 1911), (Council, 1918-19) Chairman of the Board, • The Powers Regulator Co., 2720 Greenview Ave., Chicago 14, and 900 Castlewood Terrace, Chicago 40, Ill.

POWERS, Lowell G. (*A* 1937; *J* 1930) Branch Mgr., • Carrier Corp., 1235 Carew Tower, Cincinnati 2, and 2 Nita Lane, Cincinnati 8, Ohio.

POWERS, Robert W. (*J* 1943; *S* 1941) Engr., J. L. Powers, Plbg., Htg., Elect., Contr., 227 E. Main St., and • Powers' Apt., Bennettsville, S. C.

POWERS, Rowan E. (*A* 1945) Asst. Gen. Mgr., Sarco Canada, Ltd., 496 Church St., and • 998 Logan Ave., Toronto, Ont., Canada.

POWITZKY, Calvin E. (*A* 1946) Asst. Mgr., Jamar-Olmen Co., 3114 Canal St., Houston 3, and • 903 Live Oak, Pasadena, Texas.

PRIESTER, Gayle B.* (*M* 1943; *J* 1935; *S* 1934) Air Cond. Engr., • Consolidated Gas, Electric Light & Power Co., 617 Lexington Bldg., Baltimore 3, and 910 Old Oak Rd., Baltimore 12, Md.

PRINCE, Raymond F. (*A* 1943; *J* 1936) Owner, • R. F. Prince Co., 93-105 Parker St., Brewer, and Burleigh Hill, R. F. D. 1, Bangor, Me.

PRITCHARD, Henry T. (*A* 1946) Gen. Mgr., • Robert T. Purves, Ltd., 90 Vine Ave., and 63 Mason Blvd., Toronto, Ont., Canada.

PROCTOR, Charles William (*A* 1944) Sales Engr., The Conditioning Co., Inc., 19 Herbert Pl., Newark 4, and • 816 Dixie Lane, Plainfield, N. J.

PROIE, John (*M* 1936) Owner, • Proie Bros., 856 W. North Ave., Pittsburgh 12, and R. D. 10, Box 306, Broughton Rd., Pittsburgh 11, Pa.

PRUITT, Clarence H. (*A* 1944) Air Cond. Operator, Allison Division of General Motors Corp., Indianapolis, and • 651 N. Berwick Ave., Indianapolis 8, Ind.

PRUSSING, Ralph L. (*A* 1945) Cons. Mech. Engr., 2712 N. Ninth Ave., and • 33 Clark Ave., Billings, Mont.

PRYKE, John K. M. (*M* 1946; *A* 1937) Partner, • Slocum & Fuller, 714 Fifth Ave., New York 19, and 140 East 81st St., New York, N. Y.

PRYOR, Albert S. (*M* 1944) Vent. Engr., Fisher Body, Ternstedt Div., General Motors Corp., Columbus Plant, Columbus 4, and • 283 Brevoort Rd., Columbus, Ohio.

PUGH, Daniel C. (*A* 1946; *J* 1942; *S* 1939) Mech. Engr., Carbide & Carbon Chemicals Corp., McCorkle Ave., and • 1024 Village Dr. S.W., South Charleston 3, W. Va.

PULLUM, Clarence E. (*M* 1940) Vice-Pres., • Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and 1011 N. Grove Ave., Oak Park, Ill.

PULTE, John W. (*A* 1945) Mfrs. Agent, J. W. Pulte Co., 308 Gladstone S.E., Grand Rapids 6, Mich.

PURCELL, Frederick C. (*M* 1926) Sales Engr., Minneapolis-Honeywell Regulator Co., 415 Brainard St., Detroit 1, and • 18680 Santa Rosa Dr., Detroit 21, Mich.

PURDUE, Frank (*M* 1943) Chief Engr., Odhams (Watford), Ltd., St. Albans Rd., and • 46 Tudor Dr., Watford, Herts, England.

PURINTON, Dexter J. (*M* 1944; *A* 1923) 2166 Broadway, New York 24, N. Y.

PYSHER, Maurice W. (*A* 1944) Sales Mgr., • Standard Supply Co., 934 S.E. Sixth Ave., Portland 14, and 641 Northeast 79th Ave., Portland, Ore.

Q

QUACKENBUSH, John M. (*A* 1946) Partner, Quackenbush Co., 505 Franklin St., Buffalo 2, and • 610 Linwood Ave., Buffalo, N. Y.

QUACKENBUSH, Seelye M. (*M* 1940) Partner, • Quackenbush Co., 505 Franklin St., Buffalo 2, and 251 Parkside Ave., Buffalo, N. Y.

QUADE, Harry, Jr. (*A* 1944) Partner, • William Schupp & Co., 715 S. Eighth St., and 2937 Georgia Ave., St. Louis Park, Minneapolis, Minn.

QUALL, Clarence O. (*A* 1937) Owner, Quall Plumbing & Heating Co., 15 Ninth St., and • 54 Pearl St., Clintonville, Wis.

QUEENIN, Martin A. (*M* 1947) Pres., • Queenin & Co., Inc., 1691 Anthony Ave., New York 57, and 273 East 239th St., New York 66, N. Y.

QUEER, E. R.* (*M* 1933) Prof. of Engrg. Research • Pennsylvania State College, Engrg. Expt. Station, and 338 Arbor Way, State College, Pa.

QUICK, Leroy P. (*S* 1948) Student, David Ranken Jr. School of Mechanical Trades, and • 1479 Belt Ave., St. Louis, Mo.

QUIGLEY, Miles E. (*A* 1945) Engr., Harris Brothers Plumbing Co., 217 W. Lake St., Minneapolis, and • Rt. 2, Hopkins, Minn.

QUIN Charles C. (*A* 1944) Branch Mgr., The Powers Regulator Co., 809 Stuart Ave., Houston 6, Texas.

QUINBY, L. B. (*M* 1945) Indus. Engr., • Houston Lighting & Power Co., P. O. Box 1700, Houston 1, and 5919 Fordham, Houston, Texas.

QUINLIVAN, L. P. (*M* 1947) Appl. Engr., • York Corp., 659 E. Sixth St., Cincinnati 2, and 5807 Pandora Ave., Cincinnati 13, Ohio.

QUINN, Joseph J., Jr. (*A* 1947) Sales Engr., Quinn Bros., Inc., 1712 N. Second St., Philadelphia 22, and • 2800 Belmont St., Ardmore, Pa.

QUIRK, Clinton H. (*Life Member*; *M* 1916; *J* 1915) Engr., Htg., Plbg. and Air Cond., Third Naval Command, 90 Church St., New York, and • 465 Front St., Hempstead, L. I., N. Y.

QUIST, Oswald F., Jr. (*A* 1945) Sales, Air Cond. Controls Div., Minneapolis-Honeywell Regulator Co., 221 Fourth Ave., New York, and • 76 Nichols Ave., Brooklyn 8, N. Y.

R

RABE, Albert E. (*M* 1938) Pres., • Carrier Engenharia S/A, Caixa Postal 90, and Av. Epitacio Pessoa 3738, Apto. 302, Rio de Janeiro, Brazil.

RABER, B. F.* (*M* 1937) Prof., Mech. Engrg., • University of California, 114 Engineering Bldg., Berkeley 4, and 1124 Arch St., Berkeley 8, Calif.

RADOTINSKY, Joseph W. (*M* 1945) Owner, • 312 Commercial Nat'l. Bank Bldg., Kansas City 12, and Nearman Rd. and Kimball Ave., Kansas City, Kans.

RAIDER, George K. (*A* 1944) Mgr., • Multi-Vent. Div., Pyle National Co., 1367 West 37th St., Chicago 9, and 1825 N. Whipple St., Chicago 47, Ill.

RAINEY, Hugh D. (*A* 1945) Pres., • Rainey Roofing & Sheet Metal Co., 301 E. Fourth St., and 522 N. Pearl, Joplin, Mo.

RAINEY, Norman W. (*A* 1945) Air Cond. Engr., Danforth Co., 5820 Centre Ave., Pittsburgh 6, and • R. D. No. 2, Canonsburg, Pa.

RAINGER, Wallace F. (*A* 1930; *J* 1924) Jaros, Baum & Bolles, 415 Lexington Ave., New York 17, and • 441 Hawthorne Ave., Yonkers 5, N. Y.

RAINSON, Samuel J. (*A* 1948; *J* 1940) Secy.-Treas., • Rainson Heating & Plumbing, Inc., 88 Manor Dr., Great Neck, and 45-12 Glenwood St., Little Neck, L. I., N. Y.

RAISLER, Robert K. (*M* 1941; *A* 1933; *J* 1930) Raisler Corp., 129 Amsterdam Ave., and • 38 East 85th St., New York, N. Y.

RALSTON, Ernest E. (*A* 1946) Partner, • D. M. Allen Co., 101 B. M. A. Bldg., and 4112 Penn St., Kansas City, Mo.

RAMBO, Charles (*M* 1945) Owner, • Sunbeam Heating & Insulation Co., 509–12th St., P. O. Box 121, and 1606–16th Ave., Columbus, Ga.

RAMONEDA, Enrique (*M* 1947; *A* 1944; *J* 1941) Contr., Ing. Enrique Ramoneda, Bahia De Chachalacas 42, Mexico, D. F.

RAMSEUR, Vardry D., Jr. (*A* 1946; *J* 1940) Partner, • V. D. Ramseur & Sons, 853 W. McBee Ave., and 204 Riverside Dr., Greenville, S. C.

RAMSEY, Ernest C. (*M* 1944) Htg. Engr., The Ohio Fuel Gas Co., 109 N. Front St., and • 1493 Belmont Ave., Columbus, Ohio.

RAMSEY, Ralph (*A* 1946) Mgr., Blast Heater and Coil Dept., Trane Company of Canada, Ltd., 4 Mowat Ave., and • 84 Sorauren Ave., Toronto, Ont., Canada.

RAMSEY, Walter P. (*A* 1947) Partner, • Power Plant Engineering Co., 4069 N.E. Union Ave., Portland 12, and Skyline Crest, Skyline Blvd. N.W., Portland, Ore.

RAND, Fred R. (*M* 1938) Sales Mgr., Enamel & Heating Products, Ltd., Main St., and • P. O. Box 521, Sackville, N. B., Canada.

RANDALL, Gordon E. (*A* 1944) Vice-Pres., • Randall & Co., Ltd., 565 Portage Ave., and 699 Banning St., Winnipeg, Man., Canada.

RANDALL, Robert D. (*A* 1937) Partner, • D. T. Randall & Co., 320 McKerchey Bldg., Detroit 1, and 340 E. Grand Blvd., Detroit 7, Mich.

RANDALL, W. Clifton* (*M* 1928) Chief Engr., • Detroit Steel Products Co., 2250 E. Grand Blvd., Detroit, and 770 Shirley Dr., Birmingham, Mich.

RANDLEMAN, Kenneth B. (*A* 1947) Refrig. & Air Cond. Mgr., • Mideke Supply Co., 100 E. Main St., and 2508 N. Dewey, Oklahoma City, Okla.

RANDOLPH, Charles Hollis (*M* 1930; *A* 1928; *J* 1926) Air Cond. Engr., Wisconsin Electric Power Co., 231 W. Michigan St., Milwaukee, and • Lake Shore Rd., Thiensville, Wis.

RANDOLPH, Harold F.* (*M* 1940) Vice-Pres., • International Heater Co., 101 Park Ave., Utica 2, and 12 Woodlawn Ave. E., Utica 3, N. Y.

RAPP, Edgar A. (*M* 1947) Dist. Repr., General Electric Co., 1801 N. Lamar St., Dallas 2, and • 922 Chevez Dr., Dallas 11, Texas.

RASMUSSEN, Andrew A. (*A* 1947) Assoc. Prof., University of Houston, 3801 St. Bernard St., Houston, and • 7331 Oak Hill Dr., Houston 12, Texas.

RASTRICK, R. J. (*M* 1945) Prof. of Mech. Engrg., • Canterbury University College, P. O. Box 1026, and 21 Rastrick St., Christ Church, New Zealand.

RATHER, Maxwell F. (*M* 1919) Vice-Pres. and Dist. Mgr., • Automatic Temperature Control, 28 East 29th St., New York, N. Y., and 40 W. Elm St., Greenwich, Conn.

RAY, George A. (*A* 1947) Sales Engr., • Horne-Wilson, Inc., P. O. Box 469, and Dubsdread Circle, Orlando, Fla.

RAY, George E. (*A* 1946; *J* 1939) Engr., The Wise Furnace Co., Akron, and • 74 Washington Ave., Cuyohoga Falls, Ohio.

RAY, John A. (*M* 1942) Sales Engr., • W. E. Lewis & Co., 610 Thomas Bldg., and 5211 Stoneleigh Ave., Dallas, Texas.

RAY, Joseph A., Jr. (*J* 1946) Engrg. Draftsman, Ford Motor Co., 2424 Springfield Ave., and • 5606 Hugo St., Norview, Norfolk, Va.

RAY, L. Banks (*M* 1932) Owner, • Ray Engineering Co., 868 Broad St., Room 410, Newark 2, and 151 Augusta St., Irvington, N. J.

RAY, Sylvan E. (*S* 1947) Student, • Texas A. & M. College, Box 1718, College Station, Texas.

RAYL, Lawrence B. (*A* 1947) Air Cond. Engr., • Southern California Gas Co., 810 S. Flower St., Los Angeles, and 1665 Pandora Ave., Los Angeles 24, Calif.

RAYMER, William F. (*A* 1936; *J* 1934) Vice-Pres., Oliver & McClellan, Inc., 30 Church St., New York, N. Y., and • 413 Walker Rd., West Orange, N. J.

RAYMOND, Fred I.* (*A* 1929) Owner, F. I. Raymond Co., 629 W. Washington Blvd., Chicago 6, Ill.

RAYNIS, Theodore (*A* 1939; *J* 1934) Naval Archt., Navy Yard, Brooklyn, and • 58 Hilltop Dr., Manhasset, L. I., N. Y.

REA, Robert F. (*A* 1946) Mgr., Prod. Dvlpt., • Universal Zonolite Insulation Co., 135 S. LaSalle St., Chicago 3, and 11012 S. Hoyne Ave., Chicago 43, Ill.

READER, Joseph T. (*A* 1938) Partner, • Synchronized Systems Co., 608 Kerr Bldg., 642 Beaubien St., Detroit 26, and 8162 E. Jefferson Ave., Detroit 14, Mich.

REAMY, William C., Jr. (*A* 1947) Partner, • Meleney Engineering Co., 720 Mills Bldg., Washington 6, D. C. and 1318 21st St. S., Arlington, Va.

REARDON, John F. (*A* 1941) In Service, and • Rt. 3, Fourth and O St., David City, Nebr.

REBMANN, Charles P. (*A* 1946) Mech. Engr., • John D. Falvey, 316 N. Eighth St., St. Louis 1, and 2502 Ada Ave., Jennings, Mo.

RECK, William E. (*M* 1927) Research Engr., • The Reck Heating Co., Ltd., Esromgade 15, Copenhagen, and N. Strandvej 3, Rungsted Kyst, Denmark.

REDDINGTON, Richard T. (*A* 1947) Service Mgr., Delco Heat, Delco Appliance Div. of General Motors, 391 Lyell Ave., Rochester, and • Golf Ave., R. D. 1, Pittsford, N. Y.

REDMILE, Harry W. (*M* 1947) Cons. Engr., • H. Walton Redmile & Assoc., 1902 "L" St. N.W., Washington 6, D. C., and 5 Dupont Ave., Kensington, Md.

REDMOND, George J., Jr. (*A* 1948) Htg. Engr. • Reeves Wiedeman Co., 2611 Warwick, Kansas City, Mo., and 916 Brody Dr., Kansas City, Kans.

REDRUP, Will D. (*M* 1936) Chairman, • The Majestic Co., and 310 Randolph St., Huntington, Ind.

REED, A. G. (*M* 1948; *A* 1947; *J* 1944) Plant Engr., • The Gurney Foundry Co., Ltd., 4 Junction Rd., Toronto, and 478 Glen Park Ave., Toronto 10, Ont., Canada.

REED, C. Espy (*A* 1948) Vice-Pres., • Reed Unit-Fans, Inc., 1001 St. Charles Ave., and 1317 Octavia St., New Orleans, La.

REED, Frederick J. (*M* 1939) Assoc. Prof. Mech. Engrg., • Duke University, 263 College Station, and 2203 Englewood Ave., Durham, N. C.

REED, George G. (*M* 1944) Htg. and Vent. Engr., N. A. C. A., Cleveland Airport, Cleveland, and • 22913 Mastick Rd., Rocky River 16, Ohio.

REED, John C. (*M* 1946) Mgr., Research and Prod. Dvlpt., • American Radiator & Standard Sanitary Corp., Bessemer Bldg., Pittsburgh, Pa., and R. F. D. 1, Box 36, Prospect, Ky.

REED, Stanley F. (*A* 1948; *J* 1943) Reed Research, • 1048 Potomac St. N.W., Washington 7, and 4753 Reservoir Rd., Washington, D. C.

REED, T. M., Jr. (*M* 1944) Mgr., • John J. Nesbitt, Inc., 11 Park Pl., New York 7, and 89-25 Parsons Blvd., Jamaica, N. Y.

REED, Van A., Jr. (*M* 1930) Secy., • Federal Engineering Co., 239 Fourth Ave., Pittsburgh 22, and 114 Water St., Elizabeth, Pa.

REED, Vernon E., Jr. (*A* 1947) Mech. Designer A. M. Strauss, 415 Cal-Wayne Bldg., and • 835 E. Lewis St., Fort Wayne, Ind.

REED, Virgil C. (*M* 1938) Mgr., • James H. Pinkerton Co., 640 Natoma St., San Francisco 3, and 3117 Lakeview Way, Redwood City, Calif.

REED, William H., III (*A* 1938) Dist. Mgr., Indus. Htg. Dept., • Carrier Corp., 288½ N. College St., and Rd. 2, Providence Rd., Charlotte, N. C.

REES, Harold R. (*A* 1944) Owner, • Rees Plumbing & Heating Co., Box 639, and 1107 Warner Ave., Jonesboro, Ark.

REESE, Henry L. (*M* 1941) Cons. Engr., • 632 Washington St., Reading, and "The Pines," R. D. 4, Condersport, Pa.

REEVES, Ray O. (*A* 1947) Purch. Agent, • Airtherm Manufacturing Co., 700 S. Spring Ave., St. Louis 10, and 4 Silver Lane, Kirkwood, Mo.

REGER, Henry P. (*M* 1934) Pres., H. P. Reger & Co., 1501 East 72nd Pl., Chicago 19, Ill.

REH, Herbert C. (*A* 1946; *J* 1945) Designer, (Air Cond.), Rayon Consultants, 95 Maiden Lane, New York, and • 61-64 Linden St., Brooklyn 27, N. Y.

REICH, Herbert H. (*A* 1946) Mech. Engr., Power Piping Div., • Blaw-Knox Co., 1525 Pennsylvania Ave. N.S., Pittsburgh, and 5747 Woodmont St., Pittsburgh 17, Pa.

REICH, J. G. (*A* 1941) Vice-Pres., • Health-Aire, Inc., 10150 W. Wash. Blvd., Culver City, and 935 N. Genessee St., West Los Angeles 46, Calif.

REICHELT, Eugene (*A* 1947) Secy.-Treas., • Republic Heaters Co., 2153 Fullerton Ave., Chicago 47, and 627 Hannah Ave., Forest Park, Ill.

REICHOW, William A. (*A* 1945) Branch Mgr., Minneapolis-Honeywell Regulator Co., 3101 Gillham Plaza, Kansas City 3, and • 7331 Madison, Kansas City 5, Mo.

REID, Henry P. (*M* 1931; *A* 1927) Chief Engr., • Universal Atlas Cement Co., 135 East 42nd St., New York 17, and 72 Mercer Ave., Hartsdale, N. Y.

REIF, Allan F. (*M* 1937) Pres., • Reif-Rexoil, Inc., 37-43 Carroll St., Buffalo 3, and 110 Devonshire Rd., Kenmore 17, N. Y.

REIF, Charles A. (*M* 1937) Vice-Pres., • Reif-Rexoil, Inc., 37 Carroll St., Buffalo 3, and 77 Ruskin Rd., Eggertsville 21, N. Y.

REIFSCHNEIDER, Jake (*A* 1938) Maint. Mgr., • Eppley Hotels Co., 1802 Dodge St., Omaha 2, Nebr.

REIHER, Herman C. (*A* 1945) Mech. Engr., • Baker Properties, Inc., 510 Baker Bldg., Minneapolis 2, and 5501 Xerxes Ave. S., Minneapolis 10, Minn.

REIL, Henry W. (*M* 1945) Engr., B. F. Sturtevant Co., Div. of Westinghouse Electric, 900 Walton Bldg., and • 2000 Polifax Dr., Atlanta, Ga.

REILEY, Ralph L. (*A* 1946) Air Cond. Engr., • A. W. Johnson Co., P. O. Box 930, Texarkana, Ark.

REILEY, Trevor Dale (*A* 1947) Sales Engr., • Johnson Service Co., 1905 Dunlap St., and 671 Riddle Rd., Cincinnati, Ohio.

REILLY, Bertram B. (*M* 1946; *J* 1938) Engr., • Dravo Corp., Machinery Div., 300 Penn Ave., Pittsburgh, and 220 Ridge Ave., Ben Avon, Pa.

REILLY, J. Harry (*M* 1943) Partner, The Reilly-Fritsche Co., 50 Church St., New York 7, and • 14 Watson Ave., East Orange, N. J.

REILLY, Philip H., Jr. (*A* 1941) Purch. Agt., • Fraser & Johnston Manufacturing Co., 725 Potrero Ave., San Francisco 10, and 1321 Van Couver Ave., Burlingame, Calif.

REINHARDSEN, Daniel (*M* 1944) Dist. Sales Mgr., • Spencer Heater Div., The Aviation Corp., 101 Park Ave., New York 17, and 355 Hawthorne Terrace, Mt. Vernon, N. Y.

REINKE, Alfred G. (*A* 1940; *J* 1933) Secy., Gus Reinke Machinery & Tool Co., 385 Hillside Ave., Hillside, and • 321 Park Pl., Irvington, N. J.

REINKE, Louis F. (*A* 1937) Owner, • Louis Reinke Sheet Metal Works, 536 S. Fifth St., Milwaukee 4, and 1535 W. Walker St., Milwaukee, Wis.

REIS, Robert (*A* 1944; *J* 1939) Chief Mech. Engr., • Wigton Abbott Corp., 1225 South Ave., and 563 W. Eighth St., Plainfield, N. J.

REISBERG, Lester K. (*M* 1942; *A* 1939) Vice-Pres., • Goodin Co., 615 N. Third St., Minneapolis, and Rt. 1, Anoka, Minn.

RENSCH, Joseph R. (*J* 1948) Sales Engr., Coast Counties Gas and Electric Co., and 2646 Willow Pass Rd., Concord, Calif.

REPINO, Philip A. (*M* 1946) Plant Engr., • Lebanon Steel Foundry, Front and Lehman Sts., and 508 Chestnut St., Lebanon, Pa.

REPP, Harry L. (*M* 1940) Branch Mgr., • U. S. Radiator Corp., 5512 Euclid Ave., Cleveland 3, and 14611 Clifton Blvd., Lakewood 7, Ohio.

RESCH, Roy J. (*A* 1940) Pres., • McQuay, Inc., 1600 Broadway N.E., Minneapolis 13, and 3725 Glenhurst Ave., St. Louis Park, Minn.

RESS, Otto J. (*M* 1946) Research Dir., L. J. Mueller Furnace Co., 2005 W. Oklahoma Ave., Milwaukee 7, and • 727 North 59th St., Milwaukee 13, Wis.

RETTEW, Harvey F. (*M* 1929) Chief Engr., Board of Education, 21st and Parkway, and • 5466 Baltimore Ave., Philadelphia 43, Pa.

REUSCHLEIN, Clifford J. (*J* 1947) Engr., Hyland, Hall & Co., 218 N. Bassett St., and • 1705 Jefferson St., Madison, Wis.

REUTLINGER, Roland R., Sr. (*A* 1946) Vice-Pres. and Gen. Mgr., • Combustioneer Corp., 401-9 Tenth St. S.W., Washington 4, and 3713 Chesapeake St. N.W., Washington 16, D. C.

REX, Harland E. (*M* 1942) • Carrier Corp., 20 N. Wacker Dr., Chicago 6, and 7255 W. Greenleaf Ave., Chicago 31, Ill.

REYNOLDS, Clifford M. (*A* 1946) Shop Supvsr., Mountain Fuel Supply Co., 36 S. State, and • 313 N. Eighth W., Salt Lake City, Utah.

REYNOLDS, James C. (*A* 1945) Service and Constr. Engr., B. F. Sturtevant Co., Div. of Westinghouse Electric, 1506 First National Bank Bldg., Pittsburgh 22, and • 1041 Osage Dr., Pittsburgh 21, Pa.

REYNOLDS, John F. (*A* 1945) Refrig. and Air Cond. Engr., Stokley's Services, Inc., 2119 Colonial Ave., Norfolk, and • Gatling and Marble Ave., Norfolk 2, Va.

REYNOLDS, Thurlow W. (*M* 1922) 100 Pinecrest Dr., Hastings-on-Hudson 6, N. Y.

RHEAULT, Walter E. (*M* 1942) Research Dept., Young Radiator Co., and • 2246 Orchard St., Racine, Wis.

RHINE, George R. (*A* 1938) Cons. Engr., • 1208 Alamo National Bldg., and 2311 W. Mistletoe Ave., San Antonio, Texas.

RHOTON, W. R. (*M* 1936) Vice-Pres., The R. & H. Systems, Inc., 5501 Euclid Ave., Cleveland, and • 1728 Lee Rd., Cleveland Heights, Ohio.

RICE, John A. (*M* 1945) Mech. Engr., Buensod Stacey, Inc., 1001 N. Church St., Charlotte, N. C.

RICE, Percy L. (*A* 1944) Maint. Engr., War Dept., Fitzsimons General Hospital, Denver 8, and • 1965 Oakland St., Aurora 8, Colo.

RICE, Robert B. (*M* 1934) Head, Diesel School, • North Carolina State College, and 2712 Cambridge Rd., Raleigh, N. C.

RICHARD, Edwin J. (*M* 1933) Partner, • Richard Equipment Co., 2137 Reading Rd., Cincinnati 2, and 3147 Victoria Ave., Hyde Park, Cincinnati 8, Ohio.

RICHARDS, Guy H. (*A* 1939) Mgr., Heating Div., • Cowan Supply Co., 124 Walker St. S.W., and 129 North Ave. N.E., Atlanta, Ga.

RICHARDS, Leslie V. (*M* 1941; *A* 1940) Owner, • Richards Engineering Service, 31 Damon Ave., Melrose, Mass.

RICHARDSON, Eldon L. (*A* 1946) Dist. Mgr., • Minneapolis-Honeywell Regulator Co., 437 Atlas Bldg., and 618 N. Tenth W., Salt Lake City, Utah.

RICHARDSON, F. C., Jr. (*M* 1943) Branch Mgr., A. L. Vanderhoof, Inc., 2927 Oxbridge Dr., Toledo 9, Ohio.

RICHARDSON, Henry G. (*M* 1934) Cons. Engr., 1433 Harvard Ave., Salt Lake City 5, Utah.

RICHARDSON, Robert D. (*A* 1946; *J* 1938) Htg. & Vent. Engr., Hope's Heating & Engineering, Ltd., 26 Albion St., Leeds 1, and • 15 The Ring Road, Far Headingley, Leeds, England.

RICHEDA, Alfred (*A* 1944) Supt., • The Lang Co., P. O. Box 479, Salt Lake City 9, and 1557 Laird Ave., Salt Lake City 5, Utah.

RICHMOND, George B. (*M* 1946) Mgr. Vtg. Dept., • Hunter Fan & Ventilating Co., Inc., 4002 Front St., and 981 Rozelle St., Memphis, Tenn.

RICHMOND, John (*M* 1944) Engr., • The Sweeny & Wise Co., 10210 Woodland Ave., Cleveland 4, and 3863 Grosvenor Rd., South Euclid, Ohio.

RICHMOND, K. C.* (*M* 1943) Editor, "Coal-Heat," 20 W. Jackson Blvd., Chicago, and • 846 Park Ave., River Forest, Ill.

RICKS, Philip G., II (*A* 1946) Engr., Higgins Industries, Inc., 521 City Park Ave., New Orleans, and • 8721 Belfast St., New Orleans 18, La.

RIDDLE, J. Elmer (*A* 1947) Asst. Secy., • Pacific Electrical & Mechanical Co., 1801 16th St., San Francisco, and 1701 Cornell Dr., Alameda, Calif.

RIDDLE, Kemble L. (*A* 1946) Indus. Equipment Engr., Blaw-Knox Co., Blawnox, and • 954½ Kennebec St., Pittsburgh 17, Pa.

RIEHL, William L. (*A* 1945) Asst. to Vice-Pres., The Union Fork & Hoe Co., Rome, and • R. D. 1, Utica, N. Y.

RIES, August S., Jr. (*M* 1947) Engr., 1902 Minnehaha Ave., St. Paul 4, and • 5149 York Ave. S., Minneapolis 10, Minn.

RIES, Lester S. (*M* 1929) Supt., Dept. of Bldgs. and Grounds, Oberlin College, 32 E. College St., Oberlin, Ohio.

RIESECK, Wilbert L. (*J* 1943; *S* 1941) Draftsman, Theo. F. Rockwell, Cons. Engr., 900 Century Bldg., Pittsburgh, and • 225 Marshall Ave., Pittsburgh 14, Pa.

RIESMEYER, Edward H., Jr. (*M* 1945; *A* 1936; *J* 1930) Htg. Engr., • Schaffer Heating Co., 231-33 Water St., Pittsburgh 22, and 4702 Stanton Ave., Pittsburgh 1, Pa.

RIETZ, Elmer W. (*M* 1923) Export and Sales Promotion Mgr., • The Powers Regulator Co., 2720 Greenview Ave., Chicago 14, and 2250 S. Sheridan Rd., Highland Park, Ill.

RIGBY, Edward D. (*A* 1948) Owner, • E. D. Rigby Heating & Refrigeration, 7880 S.W. Capitol Highway, and 6310 S.W. Brugger St., Portland, Ore.

RIGGS, Oliver C. (*M* 1946) Managing Engr., • Delta Air Conditioning & Heating Co., 240 Peachtree St., and 1344 Peachtree St., Atlanta, Ga.

RILEY, Edward F. (*A* 1945) Vice-Pres., Palmer Supply Co., 222 Westlake Ave. N., and • 605 Spring St., Seattle 9, Wash.

RILEY, J. Norman (*M* 1942) Mgr., Air Cond. Dept., Danforth Co., 5820 Centre Ave., and • 450 Sul grave Rd., Pittsburgh, Pa.

RIND, Karel (*A* 1945) Supt. Engr. Air Cond. Div., Vale & Co., Ltd., 141-143 Armagh St., and ● Hotel Stonehurst, P. O. Box 1140, Christ Church, New Zealand.

RINGQUIST, Clarence L. (*M* 1946) Dept. Mgr., The Trane Co., Second & Cameron Sts., and ● 724 South 20th St., LaCrosse, Wis.

RINK, Charles N. (*M* 1942) Mfrs. Repr., 1230 Commercial Trust Bldg., Philadelphia 2, Pa.

RIOPELLE, Wilfred J. (*J* 1947; *S* 1946) Htg. Engr., ● Riopelle Bros., Htg. & Air Cond., and 106 College Ave., Dixon, Ill.

RIPLEY, Robert M. (*A* 1946) Factory Repr., Bell & Gossett Co., 708 Center St., Manchester, Conn.

RISLEY, George H. (*A* 1941) Mgr., ● Cole Draft Governor Co., 521 S.W. Pine St., Portland 4, and Rt. 10, Box 772, Portland 2, Ore.

RITCHIE, A. Gordon (*M* 1933) Pres., ● John Ritchie, Ltd., 102 Adelaide St. E., and 49 St. Clair Ave. W., Toronto, Ont., Canada.

RITCHIE, Edmund J. (*M* 1923) Vice-Pres., Sales, ● Sarco Co., Inc., Empire State Bldg., 350 Fifth Ave., New York 1, and 2 Grace Ct., Brooklyn 2, N. Y.

RITTELMEYER, John M. (*M* 1941) Pres., ● Rittelmeyer & Co., 150 Nassau St. N.W., Atlanta 3, and 2332 Woodward Way N.W., Atlanta, Ga.

RITTENHOUSE, O. R. (*J* 1943; *S* 1941) Tool Engr., ● Saginaw Steering Gear, foot of Holmes St., and 137½ S. Mason, Saginaw, Mich.

RITTER, Arthur (*Life Member*; *M* 1911) Office Mgr., ● American Blower Corp., 50 West 40th St., New York 18, and Chateau Champlain, 3N, Scarsdale, N. Y.

RITTER, Irving S. (*M* 1944) Design Engr., ● B. F. Sturtevant Co., Div. of Westinghouse Electric, Hyde Park, Boston 36, Mass., and 130 Farley Ave., Fanwood, N. J.

RIVARD, M. M. (*M* 1935) Mgr., Rivard Sales Co., 208 Alameda Rd., and ● 1805 West 49th Terrace, Kansas City 2, Mo.

ROACH, E. R. (*A* 1941) Baskervill & Son, Central National Bank Bldg., Richmond 19, and ● 2800 Garland Ave., Richmond, Va.

ROARK, I. L., Jr. (*A* 1946) Archt., 5205 West 77th St. Terrace, Overland Park, Kans.

ROBB, Joseph E. (*A* 1936) Sales Engr., Minneapolis-Honeywell Regulator Co., 2753 Fourth Ave. S., Minneapolis, Minn., and ● 1601 Kentucky St., Lawrence, Kans.

ROBERTS, Edward F., Jr. (*A* 1942) Partner, Gen. Mgr., ● Edward F. Roberts Co., 2622 Columbia Ave., Philadelphia 21, and 435 Righters Mill Rd., Penn Valley, Pa.

ROBERTS, Eric (*A* 1945) Sales Repr. and Mfrs. Repr., ● McDonald & Miller and H. A. Thrush & Co., 417 Market St., San Francisco, and 2741 Darnby Dr., Oakland, Calif.

ROBERTS, Harry H. (*A* 1944; *J* 1941) Dist. Repr., H. H. Robertson Co., P. O. Box 7185, Dallas, and ● 2916 Amherst St., Dallas 5, Texas.

ROBERTS, Henry L. (*Life Member*; *M* 1916) Htg. Engr. and Contr., ● 228 North 16th St., Philadelphia 2, and 1014 Allston Rd., Brookline, Delaware Co., Havertown P. O., Pa.

ROBERTS, Henry P. (*A* 1936) Vice-Pres., ● Roberts-Hamilton Co., 713 S. Third St., Minneapolis 15, and 4446 Thomas Ave. S., Minneapolis 10, Minn.

ROBERTS, Samuel N. (*A* 1947) Engr., ● Carrier Atlanta Corp., 306 Peachtree St. N.E., and 2 Collier Rd. N.W., Apt. 10, Atlanta, Ga.

ROBERTSON, Archie M. (*M* 1944) Chief Engr., ● Stewart A. Jellett Co., 1200 Locust St., Philadelphia 7, and 7314 Bryan St., Philadelphia 19, Pa.

ROBERTSON, John D. W. (*A* 1943) Engr. and Field Supvsr., Consolidated Conditioning Corp., 456 S. Tenth Ave., Mt. Vernon, and ● 660 East 242nd St., New York 66, N. Y.

ROBERTSON, Stanley F. (*A* 1948) Htg. & Vent. Engr., ● Anderson & Rowe, Inc., 2501 Harrison St., San Francisco, and 2141 Carmelita Dr., San Carlos, Calif.

ROBESON, Ben P. (*A* 1946) Chief Engr., Columbia Specialty Co., 503 Bradley Blvd., and ● 7037 Strathmore St., Chevy Chase, Md.

ROBINSON, A. S. (*M* 1936) Engr., E. I. duPont de Nemours Co., Wilmington, Del., and ● 730 Ogden Ave., Swarthmore, Pa.

ROBINSON, Donald M. (*M* 1947; *A* 1936) Branch Mgr., ● Buffalo Forge Co., 407 Scanlan Bldg., Houston 2, and 3747 University Blvd., Houston 5, Texas.

ROBINSON, Edgar R. (*M* 1947; *A* 1938) Plant and Constr. Engr., R. C. A.-Victor Bldg. 8, Camden, and ● 216 Carlton Ave., Westmont, N. J.

ROBINSON, Garfield W. (*A* 1946) Supt., Sheet Metal & Air Cond., Gurney Foundry Ltd., 4 Junction Rd., Toronto, Ont., Canada, and ● 16530 Normandy St., Detroit 21, Mich.

ROBINSON, George L. (*A* 1935) Design, E. I. duPont de Nemours Co., and ● 14 West 35th St., Wilmington 204, Del.

ROBINSON, James H. (*A* 1945) Mgr., ● B. A. Robinson Plumbing & Heating, Ltd., 92 Blantyre Ave., and 58 Willow Ave., Toronto, Ont., Canada.

ROBINSON, John Alfred (*A* 1940; *J* 1936) Managing Dir., ● The Radiator Co., Pty., Ltd., Box 4643, G. P. O., Sydney, and 76 Springdale Rd., Killara, N. S. W., Australia.

ROBINSON, Kenneth E. (*M* 1943; *J* 1941) Engr., Michigan Department of Health, Bureau of Industrial Hygiene, and ● 211 Smith Ave., Lansing 10, Mich.

ROBINSON, Mayes R. (*M* 1944) Pres., Robinson Fan Corp., Box 306, and ● 393 Fourth St., Gilroy, Calif.

ROBINSON, Parke D. (*M* 1947) Research Engr., Stainless & Steel Products Co., 1000 Berry Ave., St. Paul 4, and ● 5533 Pillsbury Ave., Minneapolis, Minn.

ROBINSON, William P. (*M* 1946) Mech. Engr., U. S. N., P. W. D. Naval Air Station, Norfolk 17, and ● 1442 W. Ocean View Ave., Norfolk 3, Va.

ROBISON, D. J. (*A* 1945) Engr. in charge of Indus. Dept., ● Mountain Fuel Supply Co., 36 S. State, Salt Lake City 10, and 1631 Browning Ave., Salt Lake City 5, Utah.

ROBSON, James W. (*A* 1946) Sr. Asst. Mech. Engr., Detroit Board of Education, 900 Phillips Bldg., Detroit, and ● 15777 Cloverlawn, Detroit 21, Mich.

ROBSON, Paul D. (*M* 1945) Pres., Cons. Engr., ● Robson & Woese, Inc., 2030 Erie Blvd. E., Syracuse 3, and 414 Bradley St., Syracuse 4, N. Y.

ROCHE, Austin O., Jr. (*M* 1943) Chief Engr., Hoffman Specialty Co., 1001 York St., Indianapolis 7, and ● 3950 Broadway, Indianapolis 5, Ind.

ROCHE, George J. (*A* 1946) Pres.-Treas., ● Roche & Hull, Inc., 1107-19 Maryland Ave., Baltimore 1, and 1520 Kingsway Rd., Baltimore 18, Md.

ROCHE, John M. (*A* 1945) ● Vice-Pres. & Secy., Harrison-Spielmann Co., 480 Milwaukee Ave., Chicago 10, and 6236 N. Sayre Ave., Chicago 31, Ill.

ROCK, George A. (*M* 1937) Pres., Arkin & Rock, Inc., Plbg. & Htg. Contrs., P. O. Box 2914, Raleigh, N. C.

ROCKWELL, Theodore F. (*M* 1933; *J* 1932) Cons. Engr., Theo. F. Rockwell, Century Bldg., Pittsburgh 22, and ● Glenover Pl., Pittsburgh 15, Pa.

RODEE, E. J. (*M* 1936) Engr., ● John B. Pierce Foundation, Raritan, N. J., and 130 Bellevue Ave., West Haven, Conn.

RODEFFER, Edgar W. (*A* 1941) Pvt., U. S. Army, Rodeffer & Cowan, Air Conditioning & Refrigerating, 533 N. Naomi, Burbank, and ● 1037 N. Lake, Pasadena 6, Calif.

RODENHEISER, George B. (*M* 1933) Asst. Dir., ● The David Ranken, Jr. School of Mechanical Trades, 4431 Finney Ave., St. Louis 13, and 3639A Dover Pl., St. Louis 16, Mo.

RODGERS, Frederick A. (*A* 1934) Partner, Rodgers-Barbeck Co., 207-9 Thomas Bldg., and ● 3913 Amherst, Dallas, Texas.

RODGERS, Joseph S. (*A* 1937; *J* 1934) Assoc. Mech., Engr., Naval Academy, U. S. N., Annapolis, and ● 16 Fourth Ave. S., Glen Burnie, Md.

RODGERSON, Henry T. (*J* 1946) Vice-Pres., Mansfield & Co., 255 Monticello Arcade, Norfolk, and ● 253 Bayview Blvd., Norfolk 3, Va.

RODKIN, David B. (*A* 1944) Sales Mgr., ● Valley Refrigeration & Air Conditioning Co., 800 S. Ophir St., and 905 N. Stockton St., Stockton, Calif.

RODRIGUEZ, Mario F. (*A* 1944) Mgr., ● Calefaccion Central, S. A., Paseo de la Reforma, 208, and Agustin Ahumada, 115, Mexico, D. F.

RODWELL, Robert D. (*A* 1944) Mech. Engr., • Downey Heating Co., 1739 W. St. Paul Ave., and 1305 South 29th St., Milwaukee 1, Wis.

ROEBUCK, William, Jr. (*M* 1917) Owner, • 220 Delaware Ave., Buffalo 2, and 1240 Delaware Ave., Buffalo, N. Y.

ROEDER, Winfield (*M* 1941) Branch Mgr., • American Blower Corp., 405 Temple St., and 484 Whitney Ave., New Haven, Conn.

ROFFEE, Lawrence W. (*A* 1947) Htg. & Vtg., Engr., • U. S. Bureau of Reclamation, Denver Federal Center Bldg., 1-B, and 435 Ogden St., Denver, Colo.

ROGERS, Charles S. (*A* 1940) Sales Engrg., • L. P. Steuart & Brothers, Inc., 138-12th St., N.E., and 1831 P St. S.E., Washington, D. C.

ROGERS, Walter M. (*A* 1947) Sales Engr., Thermal Products Co., 4501 Prospect Ave., Cleveland 3, and • Worton Blvd., Cleveland 21, Ohio.

ROHRABACHER, Warren E. (*J* 1946) Instructor, Mech. Engrg., Texas A. & M. College, College Station, Texas.

ROLAND, John (*M* 1944) Htg. Engr., • Conco Engineering Works, and 1104 Washington St., Mendota, Ill.

ROLL, Paul E. (*A* 1946) Branch Mgr., • Carrier Corp., 911 Electric Bldg., Houston 2, and 7505 Erath St., Houston 12, Texas.

ROMA, G. N. (*M* 1947) Estimator & Engr., Carlson Manufacturing Co., 50 E. Springfield Rd., Barberton, and • 964 Brittain Rd., Akron, Ohio.

ROMER, William H. (*A* 1945) Htg. Engr., • J. F. Higgins Heating Co., 509 Westminster St., Providence, and 124 Waverly St., Providence 7, R. I.

ROMPEL, Walter A. (*A* 1944) Refrigeration Engrg., P. O. Box 544, New Braunfels, Texas.

RONALD, Edward R. (*M* 1946) Partner, Warren & Ronald, 1705 Heyburn Bldg., Louisville 2, and • 554 Sunnyside Dr., Louisville 6, Ky.

ROOSE, Robert W.* (*J* 1946) Research Asst. in Mech. Engrg., 102 Mech. Engrg. Lab., University of Illinois, Urbana, and • 54 E. Grogory Dr., Champaign, Ill.

ROOT, Edwin B. (*M* 1936) Chief Engr. and Asst. Gen. Mgr., Jackson & Church Co., Furnace Div., and • 132 Wylie Ct., Saginaw, Mich.

ROSE, Harold J. (*M* 1938) Vice-Pres. and Dir. of Research, • Bituminous Coal Research, Inc., 912 Oliver Bldg., Pittsburgh 22, and 219 Lytton Ave., Pittsburgh 13, Pa.

ROSE, Howard J. (*M* 1934) Sales Co., Inc., 26 West 47th St., New York, and • 100 Norman Rd., New Rochelle, N. Y.

ROSE, James S. (*A* 1945) Branch Mgr., • Ilg Electric Ventilating Co., 55 New Montgomery St., San Francisco 5, and 41 Ethel Ave., Mill Valley, Calif.

ROSE, Jerome C. (*M* 1937) Air Cond. Engr., Buensod-Stacey, Inc., 60 East 42nd St., and • 80-31 213th St., Queens Village 8, N. Y.

ROSEBROUGH, J. Stoddard (*M* 1943; *A* 1937) 1014 Arcade Bldg., St. Louis 1, and 218 Parkhurst Terrace, Webster Groves 19, Mo.

ROSEBROUGH, Robert M. (*M* 1920) Central Dist. Mgr., • L. J. Mueller Furnace Co., 1012 Arcade Bldg., St. Louis 1, and 34 Hardith Hill Ct., Rockhill, St. Louis 19, Mo.

ROSEBY, Thomas A. (*M* 1939) Asst. Gen. Mgr., • Carrier Air Conditioning, Ltd., 36 Bourke St., and 4 Fernhurst Ave., Cremorne, Sydney, N. S. W., Australia.

ROSELL, Axel F. (*M* 1935) Cons. Mech. Engr., • Axlander & Rosell Konstruktionsbyra AB, Grevgatan 49, Stockholm, and Fafnervagen 12, Djursholm, Sweden.

ROSEN Edmond J. (*A* 1939) Tech. Engr., Merill N. Musgrave & Co., 2019 Third Ave., Seattle 1, and • 10238-18th Ave. S.W., Seattle 66, Wash.

ROSENBERG, Philip (*A* 1928) Vice-Pres. and Treas., Universal Steel Equipment Corp., 135 West 23rd St., and • Hotel Hamilton, 141 West 73rd St., New York, N. Y.

ROSENBLATT, Arthur M. (*M* 1938) Pres., • Rosenblatt & Kerstein, Inc., 923 Virginia St. E., P. O. Box 33, and 1250 Edgewood Dr., Charleston, W. Va.

ROSENSTEIN, David L. (*S* 1948) Student, University of Minnesota, and 316 17th Ave. S.E., Minneapolis, Minn.

ROSER, Edward, III (*A* 1944; *J* 1943) Air Cond. and Refrig. Engr., U. S. Engineers, Ft. Leavenworth, and • 318 North 20th St., Leavenworth, Kans.

ROSS, Burton W. (*A* 1947) Sales Engr., • South African General Electric Co., 30 Chiappini St., and De Waal Rd., Fish Hoek, Cape Town, South Africa.

ROSS, David S. (*J* 1943; *S* 1941) Vice-Pres., Sam Ross & Sons, 846 Broadway, Lorain, Ohio.

ROSS, Earl F. (*M* 1944) Chief Mech. Engr., W. C. Kruger & Co., Archts.-Engrs., Sena Plaza, P. O. Box 308, and • 315 Tesuque Dr., Santa Fe, N. M.

ROSS, J. D. (*A* 1937) Mgr., Htg. and Refrig. Div., • Railway & Engineering Specialties, Ltd., 5754 Western Ave., Montreal 28, and 88 Percival Ave., Montreal, W., Que., Canada.

ROSS, John H. (*M* 1946) Cons. Engr., • 102 Charles St. W., Toronto 5, and 438A Jane St., Toronto 9, Ont., Canada.

ROSS, John O.* (*M* 1920) Pres., • Ross Industries Corp., 350 Madison Ave., New York 17, and 3 East 69th St., New York 21, N. Y.

ROSS, Kenneth A. (*A* 1944) Chief Engr., Kitsilano High & Jr. High Schools, Vancouver School Board, 590 Hamilton St., and • 3204 West 13th, Vancouver, B. C., Canada.

ROSS, Morwick (*A* 1946; *J* 1945) 3234 Wellington Rd., Parkfairfax, Alexandria, Va.

ROSS, Roderick (*M* 1937) Sr. Partner, • Roderick Ross & Traill, Cons. Engrs., 4 St. James' Bldg., 123 William St., Melbourne C1, and 5 Burns St., Elwood, Melbourne, S 3, Australia.

ROSS, Sidney S. (*A* 1945) Owner, Air Cond.-Sheet Metal, 193 Bridge St., Brooklyn 1, and • 39-41-50th St., Woodside, N. Y.

ROSSITER, Irvin J. (*A* 1939) Field Engr., • American Blower Corp., 231 W. Wisconsin, Milwaukee 3, and 4517 N. Marlborough, Milwaukee 11, Wis.

ROTH, Charles F. (*A* 1930) Pres., • International Exposition Co., Grand Central Palace, 480 Lexington Ave., New York 17, and 141 East 36th St., New York, N. Y.

ROTH, Harold R. (*M* 1935), (Council, 1945-47) Dist. Mgr., • Canadian Sirocco Co., Ltd., 57 Bloor St. W., and 5 Castleview, Toronto, Ont., Canada.

ROTH, Herman P. (*M* 1945) Research Assoc. in Medicine, University of Southern California, School of Medicine, Los Angeles 7, and • 2000 Agnes Rd., Manhattan Beach, Calif.

ROTH, John L. (*M* 1946) In Charge—Comml. Activities, • General Electric Co., 1602 S. Hanna St., and 827 Kinnaird, Ft. Wayne, Ind.

ROTHENBACH, Walter J. (*A* 1946) Sales Engr., • John J. Nesbitt, Inc., 11 Park Pl., New York 7, N. Y., and 306 N. Bellevue Ave., Langhorne, Pa.

ROTHMANN, S. Charles* (*M* 1936) Indus. Hygiene Engrg. Consultant, Div. of Labor Standards, Room 6312, Labor Dept. Bldg., 14th & Constitution Ave., Washington 25, and • Apt. 208-25, Kennedy St. N.W., Washington, D. C.

ROTHROCK, Ralph K. (*A* 1944) Owner, 5316 Dryades St., New Orleans 15, La.

ROTTMAN, George B. (*M* 1944) Engr., • W. H. Sullivan Co., Inc., 313½ S. Greene St., and 401 S. Chapman St., Greensboro, N. C.

ROTTMANN, Paul O. (*M* 1948) Paul O. Rottmann, Cons. Engr., • 204 Hunter Bldg., and 456 Albany Ave., Shreveport, La.

ROTTMAYER, S. I. (*A* 1933; *J* 1928) Mech. Engr., • Samuel R. Lewis & Assocs., 100 W. Monroe St., Chicago 3, and 309 S. Oak Park Ave., Oak Park, Ill.

ROTZ, J. M. (*M* 1944) Owner, • J. M. Rotz Engineering Co., 804 Merchant's Bank, Indianapolis 4, and R. R. 16, Box 449, Indianapolis 44, Ind.

ROUSE, R. K. (*M* 1948) Owner, • R. K. Rouse, Sales Engr., Suite 1, 228 N. Main St., and 306 E. Faris Rd., Greenville, S. C.

ROUSH, Benjamin B. (*A* 1946) Mech. Engr., National Distillers Products Corp., and • Rt. 9, Frankfort, Ky.

ROWE, William A.* (*Life Member*; *M* 1921), (Council 1929-31) 718 Longfellow Ave., Detroit 2, Mich.

ROWE, William M. (*M* 1946; *A* 1944; *J* 1936) Field Engr., • American Blower Corp., 1302 Swetland Bldg., Cleveland 15, and 151 Bradley Ave., Chagrin Falls, Ohio.

ROWLEY, Frank B.* (*M* 1918), (*Presidential Member*), (Pres., 1932; 1st Vice-Pres., 1931; 2nd Vice-Pres., 1930; Council, 1927-33) Prof., University of Minnesota, Minneapolis, and • Excelsior, Minn.

ROY, Ernest W. (*M* 1945) Prcs., • Roy Equipment Co., Inc., 311 W. Church Ave., and 4638 Chambliss Ave., Knoxville, Tenn.

ROY, Raul (*A* 1945) Sales Engr., • Sarco Canada, Ltd., 496 Church St., and 105 Merrell E., Toronto, Ont., Canada.

ROYCE, Robert F. (*J* 1946; *S* 1945) Berrien Co., Lakeside, Mich.

RUBEL, Harry L. (*A* 1943) Pres., • Rubel & Jensen Co., 646 Central Ave., and 33 S. Munn Ave., East Orange, N. J.

RUBIN, Louis (*A* 1944) Co-Owner, • Hudson Heating Co., 11350 Schaefer Highway, Detroit 27, and 2917 Leslie, Detroit 6, Mich.

RUBIN, Saul (*J* 1947) Scientific Engr., Joy Manufacturing Co., La-Del Div., and • 214 Cedar Lane, N.W., New Philadelphia, Ohio.

RUCHTE, Carl O. (*A* 1943) Architectural Examiner, Federal Housing Administration, 12th Floor, W. O. W. Bldg., Omaha 2, and • 5035 Bedford Ave., Omaha 4, Nebr.

RUDBERG, John A. (*J* 1948) Ellerbe and Co., Archts. & Engrs., 1st National Bank Bldg., and • 2611 Upton N., Minneapolis, Minn.

WEIMER, Fred G. (*A* 1919) Mgr., • Milwaukee Branch, Kewanee Boiler Corp., Room 502, 312 E. Wisconsin Ave., and 3958 N. Stowell Ave., Milwaukee, Wis.

WEINER, Hyman R. (*A* 1947; *J* 1945) Field Engr., Avery Engineering Co., 1906 Euclid Ave., and • 3164 Meadowbrook Blvd., Cleveland Heights, Ohio.

WEINTRAUB, Jos. A. (*A* 1946) Pres. and Gen. Mgr., United Heating & Appliance Corp., 1317 W. Girard Ave., Philadelphia 23, and • 1522 Orland St., Philadelphia 26, Pa.

WEIR, Frank F. (*A* 1943) Mgr., • T. McAvity & Sons, Ltd., 171 Market St. E., Winnipeg, and 374 Overdale St., St. James, Man., Canada.

WEISNER, Clarence E. (*A* 1947) • Owner & Mech. Engr., 12 Church St., and 195 Eaton Ave., Meriden, Conn.

WEISS, Alex J. (*S* 1948) Student, University of Michigan, Ann Arbor, Mich., and • 6624 S. Whipple St., Chicago, Ill.

WEISS, Arthur P. (*M* 1928) Burnham Boiler Corp., Irvington, and • 134 Farrington Ave., North Tarrytown, N. Y.

WEISS, Carl A. (*M* 1936; *A* 1924) Vice-Pres., • Kornbrodt Kornice Co., 1811 Troost Ave., and 29 East 68th St., Kansas City, Mo.

WEISS, Edward J. (*M* 1942) Engr., 1101 Van Velsen St., Schenectady 3, N. Y.

WEITZEL, Cameron B. (*M* 1936) 714 N. Franklin St., Lancaster, Pa.

WEITZEL, Paul H. (*A* 1942; *J* 1936; *S* 1934) Supvsr., Htg. Application, Chrysler Corp., Airtemp Div., and • 547 Hadley Ave., Dayton 9, Ohio.

WELCH, Buster (*A* 1944) 3204 22nd St., Lubbock, Texas.

WELCH, Louis A., Jr. (*A* 1929) Owner, • Welch Bros., 443 Second St., and 2001 Campbell Ave., Schenectady, N. Y.

WELCH, Thompson I. (*S* 1946) Student, Texas A. & M. College, College Station, and • Box 183, Delhart, Texas.

WELDY, Lloyd O. (*M* 1930) Field Engr., • The Powers Regulator Co., 2012 West 25th St., Cleveland 13, and 19623 Laurel Ave., Rocky River 16, Ohio.

WELLFORD, Walker L., Jr. (*M* 1944) Pres., J. E. Dilworth Co., 353 S. Front St., Memphis 3, and • 1584 Harbert Ave., Memphis 4, Tenn.

WELLS, Donald E. (*M* 1942) Pres., • Products, Inc., 304 Home Federal Bldg., Des Moines 9, and 804 63rd St., Des Moines, Ia.

WELLS, Edward E. (*M* 1941) Gen. Engrg. Dept., Aluminum Company of Canada, Ltd., 1700 Sun Life Bldg., Montreal, and • 6 St. John Rd., Pointe Claire, Montreal 33, Que., Canada.

WELLS, William F.* (*M* 1939) Dir. of Lab. for Study of Air-Borne Infection, • University of Pennsylvania, Medical School, Philadelphia, and 112 Pine Ridge Rd., Media, Pa.

WELSHMAN, Hugh, Jr. (*M* 1946) Mgr., Indus. Piping Div., • Grinnell Co., Inc., 260 W. Exchange St., Providence, and 12 Woodford Rd., Barrington, R. I.

WELTER, Gustave (*M* 1946) Vice-Pres. and Chief Engr., • The Bigelow Co., P. O. Box 706, New Haven 3, Conn.

WEMPE, Robert H. (*A* 1948) Engr., McCarty Bros. Equipment Corp., • 7801 Lake St., River Forest, and 914 Sherman Ave., Evanston, Ill.

WENDEL, Frederick E. (*A* 1947) Owner, • Fred Wendel, Piping Contr., First National Bank Bldg., 617 Oradell Ave., and 442 Third St., Oradell, N. J.

WENDT, Edgar F. (*M* 1918) Pres., • Buffalo Forge Co., 490 Broadway, and 120 Lincoln Pkwy., Buffalo, N. Y.

WENDT, Edwin H. (*A* 1942; *J* 1936) Engr. and Treas., O. A. Wendt Co., 1655 W. Fullerton Ave., Chicago 14, and • 6205 Forest Glen, Chicago 30, Ill.

WENDT, William R., Jr. (*J* 1945) Sales Mgr., Westerlin & Campbell Co., 185 N. Wabash Ave., Chicago, Ill., and • 2443 North 66th St., Wauwatosa 13, Wis.

WENINGER, Merle (*A* 1945) Dist. Mgr., Powers Regulator Co., 1813 South Ave., and • 113 Eloise Terrace, Syracuse 7, N. Y.

WERKER, Herwart (*M* 1939) Engr., American Radiator & Standard Sanitary Corp., Inst. of Thermal Research, 675 Bronx River Rd., and • 38 Loring Ave., Yonkers 4, N. Y.

WERLEY, William C. (*A* 1945) Western Repr., Peerless Foundry Co., Indianapolis, Ind., and • 4023 Quincy St., St. Louis 16, Mo.

WERLLA, Billy C. (*S* 1946) Student, • Texas A. & M. College, Box 5543, College Station, and 905 Sears, Denison, Texas.

WERNER, Charles V. (*M* 1945) Sales Engr., H. H. Wright Co., 1322 Walnut St., and • 4219 Kenwood, Kansas City, Mo.

WERNER, John G. (*M* 1937) Mgr., • Bryant Air Conditioning Corp., 740 11th St. N.W., Washington 1, and 3130 Wisconsin Ave. N.W., Washington 16, D. C.

WERNER, P. H. (*A* 1941; *J* 1939) Sales Repr., • Barber-Colman Co., 90 New St., Newark 2, N. J., and 7926 Nichener St., Philadelphia 19, Pa.

WERNER, Richard K. (*M* 1936) Cons. Engr., • 316 W. T. Waggoner Bldg., Fort Worth 2, and 5436 Collinwood, Fort Worth 7, Texas.

WERWATH, Karl O. (*A* 1948) Vice-Pres., Milwaukee School of Engineering, • 1020 N. Broadway, and 2209 E. Newton Ave., Milwaukee, Wis.

WESBY, Vernon Lathrop (*A* 1944) Chief Engr.-Utilities, General Motors Corp., Electro-Motive Div., La Grange, and • 6827 S. Throop St., Chicago 36, Ill.

WESLEY, Edward D. (*A* 1945) Pres., E. D. Wesley Co., • 715 W. Lincoln Ave., and 2953 South 43rd St., Milwaukee 12, Wis.

WESLEY, Ray O. (*A* 1937) Partner, • Navarre Plumbing & Heating Co., 2308 Fourth Ave., Seattle, and R. F. D. 1, Woodinville, Wash.

WESLEY, William (*A* 1945) Owner, • Wesley Refrigeration Service, Box 423, and 315 Oakwood St., Rome, N. Y.

WESNER, Eugene L. (*J* 1947) Draftsman, • U. S. Rubber Co., 549 E. Georgia St., and 2458 N. Pennsylvania St., Indianapolis, Ind.

WESSLER, George H., Jr. (*A* 1947) Sales Engr., General Electric Co., 1801 N. Lamar, Dallas, and P. O. Box 372, Arlington, Texas.

WEST, Charles H., Jr. (*A* 1941) Vice-Pres., Massey, Wood & West, Inc., P. O. Box 5008, Richmond 20, Va.

WEST, J. Hoyt (*A* 1944) Owner and Mgr., • West Brothers Sheet Metal, 370 Jones Ave. N.W., and 106 W. Lake Ave. N.W., Atlanta, Ga.

WEST, Lionel C. (*A* 1947) Engr., • Iron Fireman Mfg. Co. of Canada, Ltd., 80 Ward St., and 190 Pacific Ave., Toronto, Canada.

WEST, William P. (*J* 1947) Sales Engr., • Johnson Service Co., 311 Bona Allen Bldg., and 1559 Westwood Lake S.W., Atlanta, Ga.

WESTBROOK, Charles H. (*A* 1945) Partner, • American Plumbing & Heating Co., 1806 Classen, and 1442 Northwest 25, Oklahoma City, Okla.

WESTENDARP, Francisco G. (*M* 1939) Engr., Apartado 1843, Mexico, D. F.

WESTON, Charles E. (*A* 1946) Partner, American Home Heating Co., 1433-35 Fillmore Ave., Buffalo 11, and • 484 Stockbridge Ave., Buffalo 15, N. Y.

WESTOVER, Wendell (*M* 1936) Pres., • Westover-Wolfe, Inc., 21 Plaza, Albany 7, and Loudon Heights, N. Y.

WESTPHAL, Edward R. (*M* 1945) Mgr. of Plants, • Weil-McLain Co., Blaine St., and Long Beach, Michigan City, Ind.

WESTPHAL, Norman E. (*A* 1946; *J* 1940; *S* 1937) Asst. Plant Mgr., • Weil-McLain Co., and Long Beach, Stop 21, Michigan City, Ind.

WETZELL, Horace E. (*M* 1934) Pres., • The Smith & Oby Co., 6107 Carnegie Ave., Cleveland 3, and 21144 Aberdeen Rd., Rocky River 16, Ohio.

WEYENBERG, Henry (*M* 1946) Chief Engr., • Holland Furnace Co., and 587 Lawndale Ct., Holland, Mich.

WHEALTON, Daniel J. (*A* 1944) Design Draftsman, Meyer, Strong & Jones, Inc., 101 Park Ave., New York 17, and • 593 Sixth St., Brooklyn 15, N. Y.

WHEELER, B. J. (*A* 1946) Owner, Wheeler Engineering Co., 2755 N.E. Broadway, Portland, Ore.

WHEELER, Charles A. (*M* 1941) Branch Mgr., • Johnson Service Co., 1217 Grand Ave., and 345 49th St., Des Moines, Ia.

WHEELER, Charles W. (*M* 1942) Engr., • The Ric-wiL Co., 1562 Union Commerce Bldg., Cleveland, and 11859 Edgewater Dr., Lakewood, Ohio.

WHEELER, Harold E. (*M* 1944) Pres., • Air Comfort Corp., 816 N. Kostner Ave., Chicago 51, and 32 Ravine Terrace, Highland Park, Ill.

WHEELER, James A. (*M* 1946) Branch Mgr., American Blower Corp., 631 M & M Bldg., Houston 2, and • 8514 Baker Dr., Houston, Texas.

WHEELER, Joe, Jr. (*M* 1938) Sales Repr., • Johnson Service Co., 28 East 29th St., New York, and P. O. Box 150, Port Washington, L. I., N. Y.

WHEELER, William H. (*A* 1948) Pres., • Airkem, Inc., 7 East 47th St., and 330 East 50th St., New York, N. Y.

WHELAN, Leo (*M* 1945) Dir. of Education, New York Technical Institute, 108 Fifth Ave., New York, and • 1017 Lincoln Pl., Brooklyn, N. Y.

WHELAN, William J. (*M* 1937) Purch. and Estimating, • Harrigan & Reid Co., 1365 Bagley Ave., Detroit 26, and 3790 Seminole Ave., Detroit 14, Mich.

WHELLER, Harry S. (*M* 1916) Pres. and Gen. Mgr., L. J. Wing Manufacturing Co., 154 West 14th St., New York 11, N. Y., and • 725 Union Ave., Elizabeth 3, N. J.

WHITACRE, Verne L. (*M* 1946) N. Y. Dist. Mgr. of Insulation, Johns-Manville Sales Corp., 22 East 40th St., New York 16, N. Y., and • 275 Engle St., Englewood, N. J.

WHITAKER, Kenneth L. (*A* 1947) Managing Dir., The Bristol Fan Co., Bath Rd., Totterdown, and • 29 Cooper Rd., Westbury-on-Trym, Bristol, England.

WHITE, Arthur A. (*A* 1945) Managing Dir., • Gilbert & Barker Manufacturing Co., Ltd., 64 Jefferson Ave., and 133 Hillhurst Blvd., Toronto, Ont., Canada.

WHITE, Eugene B. (*M* 1934) Archt. and Engr., • Y. M. C. A. Architectural & Engineering Bureau, 19 S. LaSalle St., Chicago 3, and 126 S. East Ave., Oak Park, Ill.

WHITE, Francis R. L. (*M* 1947) Chief Tech. Officer, The Brightside Foundry and Engineering Co. Ltd., Htg. & Air Treatment Div., 17 Summer Row, Birmingham 3, and • 28 Abbotts Rd., Kings Heath, Birmingham 14, England.

WHITE, James A. (*M* 1946) Engr. and Secy.-Treas., Sterling Engineered Welderies Ltd., 26 Athletic Ave., and • 108 Blantyre Ave., Toronto, Ont., Canada.

WHITE, Jesse E. (*M* 1946) Mech. Engr., Norfolk Naval Shipyard, Public Works Design Sect., Portsmouth, and • 7607 Gloucester Ave., Norfolk 5, Va.

WHITE, John C. (*Life Member; M* 1932) Cons. Engr., Steam & Mech., • 550 State St., Madison 3, and 1221 W. Dayton St., Madison 5, Wis.

WHITE, John Hazen (*A* 1944; *J* 1943) Pres. and Treas., • Taco Heaters, Inc., 342 Madison Ave., New York 17, N. Y., and Meadowbank Rd., Old Greenwich, Conn.

WHITE, Maxwell H. (*A* 1945) Archt., • 804 Finance Bldg., Cleveland 15, and 10120 Wilbur Ave., Cleveland 6, Ohio.

WHITE, Philip H. (*M* 1948) Engr., Bldg. Service Div., Stone & Webster Engineering Corp., 49 Federal St., Boston, and • 36 Richards Rd., Watertown 72, Mass.

WHITE, Ralph A. (*A* 1947) Owner, • White Engineering Co., Box 226, Graham, and R. F. D. No. 1, Haw River, N. C.

WHITE, Thomas J. (*A* 1941; *J* 1938) Engr., • American Blower Corp., 625 Market St., San Francisco 5, and 2340 Pelham Pl., Oakland 11, Calif.

WHITE, W. Emery (*M* 1941) Engr., H. H. Wright Co., 1322 Walnut St., Kansas City 6, and • 7411 Ward Pkwy., Kansas City 5, Mo.

WHITE, William Robert (*M* 1938; *A* 1936) Mfrs. Agent, The William R. White Co., 4916 Grand Ave., and • 4916 Grand Ave., Omaha 11, Nebr.

WHITE, William Russell (*A* 1946) Indus. Engr., • Washington Gas Light Co., 1100 H St. N.W., Washington 1, D. C., and 609 Park Ave., Falls Church Va.

WHITEHEAD, Emil R. (*A* 1946) Sales, Slater Engineering Corp., 627 Monroe Ave., and • 1138 Panama, Memphis, Tenn.

WHITELAW, H. Leigh (*M* 1916) Managing Dir., • Association of Gas Appliance & Equipment Mfrs., 60 East 42nd St., New York 17, N. Y., and Cummings Point, Stamford, Conn.

WHITMER, Robert P. (*M* 1935) Secy., • American Foundry & Furnace Co., and 1404 E. Washington St., Bloomington, Ill.

WHITNAH, Scott (*M* 1945) Mech. Engr., • Scott Whitnah, Lang & Assocs., Inc., 603 Second Ave. S., Minneapolis, and R. F. D. 3, Wayzata, Minn.

WHITNEY, C. W. (*M* 1935) Vice-Pres., Petrol Corp., 1132 N. Charles St., Baltimore 1, and • Box 216, Route 14, Baltimore 20, Md.

WHITT, Sidney A. (*M* 1946; *A* 1938; *J* 1937) Chief Engr., Cordley & Hayes, 443 Fourth Ave., New York 16, and • 630 Palisade Ave., Yonkers, N. Y.

WHITTAKER, Geoffrey S. (*M* 1947) Mech. Engr., Albert Kahn Associated Archts. & Engrs., 345 New Center Bldg., Detroit 2, and • 18285 Snowden, Detroit, Mich.

WHITTAKER, Wayne K. (*A* 1935) Engr., Irving Trust Co. Bldg., 1 Wall St., New York, and • 119-23-226th St., St. Albans, L. I., N. Y.

WHITTEMORE, William M., Jr. (*A* 1948; *J* 1945) Indus. Sales Engr., Crane Co., 532 Eighth Ave. S., and • 1501 Ashwood Ave., Nashville, Tenn.

WHITTEN, H. E. (*Life Member; M* 1924) Pres. and Treas., H. E. Whitten Co., 9 Federal Court, Boston, and • 56 Highland Rd., Somerville, Mass.

WHITTIER, F. Weston (*J* 1947) Prod. Engr., Western Electric Co., 418 N. Franklin St., Allentown, and • 4 W. Church St., Bethlehem, Pa.

WHITTINGTON, William P. (*M* 1944) Pres., • Whittington Pump & Engineering Co., 245 S. Meridian St., Indianapolis 4, and 7620 Central Ave., Indianapolis 44, Ind.

WHITTLESEY, Con. (*M* 1941) Engr., Combustioneer Corp., 409 Tenth St. S.W., Washington, D. C., and • 1500 S. Barton St., Arlington, Va.

WHYBREW, George H. (*M* 1944) Chief Mech. Engr., • Giffels & Vallet, Inc., 1000 Marquette Bldg., Detroit 26, and 4140 Fulton Pl., Royal Oak, Mich.

WHYTE, Frederic J. (*M* 1944) Tech. Advisor, • Norris Warming Co., Ltd., 5-11 Theobalds Rd., London W. C. 1, and 45 Sidcup Rd., Lee, London S. E. 12, England.

WIBALDA, R. K. (*A* 1944) 1460 Clinton St., Muskegon, Mich.

WIDDOWFIELD, A. S. (*A* 1941; *J* 1937) Sales Engr., The Mercoid Corp., 4201 Belmont Ave., Chicago 41, Ill.

WIDMER, Walter J. (*A* 1939) Secy.-Treas., • Widmer Plumbing & Heating Co., 34 N.E. Seventh Ave., Portland 14, and 1565 N. Shaver St., Portland 12, Ore.

WIEDEMAN, Walter (*A* 1945) Owner, • Reeves Wiedeman Co., 2611 Warwick, Kansas City 8, and 5343 Rockhill Rd., Kansas City 4, Mo.

WIEDENMANN, W. A. (*A* 1942) Owner, • W. C. Wiedenmann & Son, 1820-24 Harrison St., and 5718 Rockhill Rd., Kansas City, Mo.

WIEGAND, Horace M. (*A* 1947) Sales Engr., Wright Engineering Corp., 414 Stanley Ave., and • 1137 Jefferson Ave., Evansville, Ind.

WIEGMANN, Karl H. (*A* 1946) Plant Engr., Durite Plastics, Inc., 5000 Summerdale Ave., Philadelphia 24, and • 3305 Decatur St., Philadelphia 36, Pa.

WIEGNER, Henry B. (*Life Member*; *M* 1919) Office Mgr., Johnson Service Co., 20 Winchester St., Boston 16, and • 143 Standish Rd., Watertown 72, Mass.

WIELAND, John J. (*M* 1944) Mech. Engr., R. F. D. 1, Alto, Mich.

WIGGLESWORTH, George L., Jr. (*S* 1948) Student, University of Michigan, and • 1209 South State St., Ann Arbor, Mich.

WIGGS, G. Lorne* (*M* 1936; *A* 1932; *J* 1924), (Council, 1938-40) Sr. Partner, • Wiggs, Walford, Frost & Lindsay, Suite 405, Crescent Bldg., 1411 Crescent St., Montreal 25, and 429 Lansdowne Ave., Westmount 6, Que., Canada.

WIGLE, Kenneth G. (*A* 1945) Pres., • Bruce Wigle Plumbing & Heating Co., 9117 Hamilton, Detroit 2, and 16565 Baylis, Detroit 21, Mich.

WIIK, Alfred (*A* 1946) Mgr. and Partner, Twin City Plumbing & Heating Co., 2912 Bloomington Ave., and • 4732–16th Ave. S., Minneapolis 7, Minn.

WIIK, Edward M. (*A* 1945) Htg. Engr., Twin City Plumbing & Heating Co., 2912 Bloomington Ave. S., Minneapolis, and • 3429 Portland Ave. S., Minneapolis 7, Minn.

WILCOX, Leland J. (*A* 1948) Dvlpt. Engr., Surface Combustion Corp., 400 Dublin Ave., and • 860 Northwest Blvd., Columbus, Ohio.

WILD, Harry (*A* 1947) Design Engr., Ministry of Supply, and • 41 Heaton Moor Rd., Heaton Moor, Stockport, Cheshire, England.

WILDE, Dale R. (*M* 1944) Engr., Williams, Gritton and Wilde, 204 Dooly Bldg., Salt Lake City 1, and • 153 S. Seventh, E., Salt Lake City 2, Utah.

WILDER, Edward L. (*Life Member*; *M* 1915) Retired, 369 Bonnie Brae Ave., Rochester 7, N. Y.

WILDER, Frank B. (*J* 1946) Engr., Charles S. Leopold, Cons. Engr., 213-5 S. Broad St., Philadelphia, and • 118 Fayette St., Conshohocken, Pa.

WILDER, Wentworth (*A* 1947) Indus. Sales Engr., • York Corp., 911 Walnut St., Kansas City 6, and 2840 Forest Ave., Kansas City, Mo.

WILDERMUTH, Russell O. (*A* 1946) 2435 Frisby Ave., Bronx 61, N. Y.

WILDMAN, Eugene L. (*A* 1942; *J* 1939) Mech. Engr., W. M. Anderson Co., 600 Schuylkill Ave., and • 4909 Catharine St., Philadelphia, Pa.

WILE, Daniel D. (*M* 1944) c/o Refrigeration Engineering, Inc., 7250 East Slauson Ave., Los Angeles, Calif.

WILHELM, Joseph E. (*M* 1943; *J* 1936; *S* 1934) Vice-Pres. and Chief Engr., Avery Engineering Co., 1906 Euclid Ave., Cleveland 15, and • 294 East 195th St., Euclid 19, Ohio.

WILKE, Ira W. (*M* 1946) Htg. Engr., Texas Public Service Co., 422 Congress Ave., and • 2201 Quarry Rd., Austin, Texas.

WILKES, Gordon B.* (*M* 1937) Prof. of Heat Engrg., • Massachusetts Institute of Technology, Cambridge 39, and 51 Everett St., Newton Centre, Mass.

WILKINS, E. Spencer (*M* 1945) Chief Engr., Air Handling Dept., Wertz Engineering Co., Inc., 441 N. Second St., Reading, and • R. D. 2, Mohnton, Pa.

WILKINSON, Arthur (*A* 1936) Mgr., The Wilkinson Engineering Agencies, 985 Sherbrooke St., West Montreal 2, Que., Canada.

WILKINSON, F. J. (*M* 1933) Mgr., Central Engrg. Service Dept., Montgomery Ward & Co., Chicago Ave. and Larabee St., Chicago, and • 18257 Martin Ave., Homewood, Ill.

WILL, Clarence A. (*A* 1944) Owner, • 5402 Broadway, P. O. Box 6009, Indianapolis 20, and R. R. 4, Box 161, Noblesville, Ind.

WILL, Donald S. (*A* 1947) Br. Mgr., Payne Furnace Co., 4019 Atlantic Ave., and • 1831 Marshall Pl., Long Beach 7, Calif.

WILL, Harold C. (*M* 1946) Mgr., Air Conditioning Div., J. A. Walsh and Co., P. O. Box 1773, Houston 1 and • 5017 Winnetka, Houston 4, Texas.

WILLARD, A. C.* (*Life Member*; *M* 1914) 1203 W. Nevada St., Urbana, Ill.

WILLEY, Earl C.* (*M* 1934) Prof., Gen. Engrg., • Oregon State College, and 121 North 29th St., Corvallis, Ore.

WILLIAM, Frederic C. (*M* 1943) Field Engr., • American Blower Corp., 1003 Statler Bldg., Boston 16, and 91 Parker Rd., Wellesley 81, Mass.

WILLIAMS, Allen W. (*Life Member*; *A* 1915) Secy.-Treas., • National Warm Air Register Manufacturers Inst., 5 E. Long St., Room 808, Columbus 15, and 51 Meadow Park, Bexley 9, Ohio.

WILLIAMS, Charles R. (*M* 1945) Vice-Pres., Dickie Construction Co., Ltd., 17 Yorkville Ave., and • 91 Dewbourne Ave., Toronto, Ont., Canada.

WILLIAMS, Chester D. (*M* 1938) Mgr., • General Air Conditioning & Heating Co., 2001 Peralta St., Oakland 7, and 5747 Country Club Dr., Oakland 11, Calif.

WILLIAMS, Donald D. (*M* 1942; *A* 1940; *J* 1938) Product Supvsr., A. O. Smith Corp., Box 584, and • 2656 N. Lefeber, Milwaukee, Wis.

WILLIAMS, Donald L. (*M* 1941) Engr., • General Air-Conditioning & Heating Co., 2001 Peralta St., and 67 Glen Ave., Oakland 11, Calif.

WILLIAMS, E. Bryan (*A* 1943) Asst. Chairman Mech. Engrg., • Armour Research Foundation, 35 West 33rd St., Chicago 16, and 413 Dempster, Evanston, Ill.

WILLIAMS, Edgar H. (*J* 1945) Air Cond. Engr., • Hungerford Coal Company, Inc., 1604 E. Broad St., and 4802 Old Brook Rd., Apt. 21, Richmond, Va.

WILLIAMS, Elwin C. (*A* 1939) Hoffman Specialty Co., Inc., 4028 Egbert Ave., Cincinnati 20, Ohio.

WILLIAMS, F. K. (*A* 1947) Designer, Public Works Dept., State of Victoria, Australia, Treasury Gardens, Melbourne, and • 203 Raleigh St., Thornbury N. 17, Victoria, Australia.
